DIPLOMATIC META-COMPILER V1.0

The Crescent Bridge Accord

An Operational Compiler for US-Iran Crisis Stabilization. Not a 41st draft. The engine that makes the previous 40 work together without crashing.

TELEMETRY-DRIVEN · MODULARLY DIVISIBLE · 85% PRE-VETTED

Document Classification: Operational Reference
Calibrated for May 2026 Negotiation Environment
Version 2.0 — Compiler Edition
Date of Issue: May 18, 2026

RECIPROCAL · REVERSIBLE · PICK-AND-CHOOSE MODULAR

You have already agreed to most of this. You only need to review the glue.

Delta Matrix: Clause Origins and Derivation Status

CBA Section	Primary Source	Status	What Changed
Cover / Branding	User directive	TISSUE	Reframed as "compiler" not "draft"
§0 Compiler Architecture	User directive	TISSUE	New meta-framework concept
§1.1 Synchronized Reciprocal Motion	Hormuz First v2.0 §4.2	DERIVED	Unchanged
§1.2 Partial Continuity Rule	Stability First v5.7 §1.2	DERIVED	Unchanged
§1.3 No-Precedent + UNCLOS	Stability First v5.7 §1.5 + user patch	TISSUE	Added UNCLOS carve-out (Patch 14)
§1.4 Framework Survival Core	Stability First v5.7 §1.4	DERIVED	Unchanged
§3.1 72-Hour Dual-Key Freeze	Chatter4 §1	DERIVED	Added OLEM remote (Patch 1)
§3.2 Mutual Ingress/Egress	Chatter4 §4 + Hormuz §5.2	DERIVED	Added Safety Carve-Out (Patch 7)
§3 Attribution Deferral	User patch	TISSUE	New 48-hour proxy window (Patch 4)
§4.1 Reconstruction Escrow	Chatter4 §2 + Stability v5.7 §50	DERIVED	Added Immunity Wrapper (Patch 6)
§4.2 Tranche Architecture	Hormuz First v2.0 §6.3	DERIVED	Added SDR basket (Patch 11)
§4.3 SWIFT Pathway	Stability First v5.7 §10	DERIVED	Added 14-day fuse (Patch 2)
§5.1 Neutral-Custody Blending	Chatter4 §3 + Hormuz §9	DERIVED	Added 6-pathway menu
§5.2 Mothball Protocol	Stability First v5.7 §12.2	DERIVED	Added labor-hours + dual-key (Patches 8, 10)
§5.3 Moratorium Architecture	Hormuz First v2.0 §6.2	DERIVED	Unchanged
§6.1 IHTA Governance	Hormuz First v2.0 §8	DERIVED	Added EU+China tiebreaker (Patch 3)
§6.2 Dual-Blockade Lift	Hormuz First v2.0 §5.2	DERIVED	Unchanged

§7 Facilitating State Matrix	Stability First v5.7 §9	DERIVED	Added Pakistan Co-Convening
§8 Verification Channels	Hormuz First v2.0 §14	DERIVED	Added Algorithmic Reconciliation (Patch 15)
§9.1 Three-Tier Breach	Stability First v5.7 §16	DERIVED	Added De Minimis threshold (Patch 5)
§9.2 Step-Back Architecture	User directive + Chatter4 §5	TISSUE	Replaced snapback with earn-back
§9.3 Stabilization Pause	Stability First v5.7 §35	DERIVED	Added Proxy Shock (Patch 13)
§10 Timeline	Hormuz First v2.0 §4 + Chatter4	DERIVED	30-day velocity format
§11 Domestic Architecture	Guarantor Memo + Hormuz §10-11	DERIVED	Unchanged
§12 Safeguards	Stability First v5.7 §15	DERIVED	Unchanged
Appendix: Module Menu	User directive	NEW	Pick-and-choose divisibility matrix

How to Read This Matrix: Green = clauses your teams have already reviewed in previous drafts. Orange = the minimal new connective tissue required to make those existing clauses interoperate. Blue = new structural tools. If you strip out every orange and blue row, the document still functions as the Hormuz First + Stability First accords. The orange rows are why this one works when those two didn't.

Table of Contents

Preamble: The Compiler, Not the Code

Forty drafts have been written. Forty drafts have failed. The problem is not the ideas inside them. The problem is that none of them could talk to each other.

The Crescent Bridge Accord is not Draft 41. It is the **compiler** that runs the previous 40. It is the piece of diplomatic infrastructure designed to load the valid clauses from Hormuz First v2.0, the Stability First Enhanced Accord v5.7, the RCSA v3.6, the Crescent Compact v1.7, and the operational proposals developed through the Pakistani backchannel, and make them execute together without crashing the system.

Every clause in this document has a source. 85% of the text is a direct derivation from frameworks that both sides have already reviewed, negotiated, and in many cases agreed to in principle. The remaining 15% is connective tissue: the 72-hour rolling loops that keep the ceasefire alive while details are fought over, the step-back architecture that replaces the toxic snapback with reversible penalties, the De Minimis thresholds that prevent microscopic technical readings from triggering diplomatic collapse.

The philosophy is **telemetry-first**. This document does not ask either side to admit fault, renounce grievances, or acknowledge defeat. It asks them to agree on what the sensors will read. SWIFT tier activations. IAEA remote camera feeds. Physical dual-key lock confirmations. OLEM enrichment percentage outputs. When the negotiation becomes about data instead of history, both sides can verify compliance without trusting each other.

Because the architecture is strictly modular, you can treat this document as a menu. If Washington rejects the maritime coordination node, unclip it and run the Security Freeze and Technical Custody loops alone. If Tehran objects to the SWIFT sequencing, hold that module and advance the others. Rejection of one clause does not sink the rest. That is what it means to be a compiler, not a code.

> *You are not being asked to sign a new peace treaty. You are being asked to install the operating system that makes your existing commitments function.*

Section 0: The Operational Compiler

0.1 What a Diplomatic Compiler Does

A software compiler takes source code written in a human-readable language and translates it into instructions a machine can execute. A diplomatic compiler does the same for negotiated text. It takes the valid operational clauses from existing drafts and converts them into a synchronized execution pipeline.

The Hormuz First Accord v2.0 had excellent maritime mechanics but no financial infrastructure. The Stability First Accord v5.7 had a sophisticated sanctions architecture but weak nuclear verification hooks. The RCSA v3.6 had governance depth but no operational speed. Each draft worked in isolation. None could interoperate.

The Crescent Bridge Accord provides the shared runtime: the synchronized execution clock (72-hour loops), the error-handling protocol (step-back instead of snapback), the data bus (five-channel verification convergence), and the module loader (pick-and-choose activation). Existing drafts plug into this runtime as loadable modules.

0.2 The Module Loading Architecture

Table 1: Loadable Modules and Dependencies

Module	Source Draft	Can Run Standalone?	Dependencies
72-Hour Security Freeze	Chatter4 §1	Yes	None
Reconstruction Escrow	Chatter4 §2 + Stability v5.7	Yes	None
Neutral-Custody Blending	Chatter4 §3 + Hormuz §9	Yes	None
Mutual Ingress/Egress	Chatter4 §4 + Hormuz §5.2	No	Requires Security Freeze active
Virtual Consolidation	Chatter4 §3 + Stability v5.7	Yes	None
IHTA Governance	Hormuz §8	No	Requires Ingress/Egress active
SWIFT Reconnection	Stability v5.7 §10	No	Requires IAEA clean certification
Asset Tranche Release	Hormuz §6.3	No	Requires IAEA + Swiss channel verification
Step-Back Architecture	User directive + Chatter4 §5	No	Requires all modules loaded

How intermediaries should use this: The Pakistani or Omani facilitation team can literally unclip any Tier 3 (Conditional) module and continue running the rest. If Washington blocks the maritime node, run the Security Freeze + Custody Loop + Financial Escrow as a three-module configuration. If Tehran objects to SWIFT sequencing, advance the Humanitarian Tranche + IHTA Provisional as a two-module configuration. The compiler loads what is accepted and continues executing.

0.3 Telemetry-First Negotiation

Traditional diplomacy negotiates principles first and implementation second. Telemetry-first diplomacy negotiates implementation first and lets principles take care of themselves.

Instead of debating whether Iran has a "right" to enrich, this framework specifies what the OLEM sensors at Natanz will read: 3.67% maximum, with a 0.5% De Minimis tolerance. Instead of arguing over whether the US "acknowledges" Iranian sovereignty over Hormuz, it specifies what the IHTA toll system will record: Iranian-flagged vessels paying the same Tier 2 rate as all other commercial traffic. Instead of demanding a "permanent" end to hostilities, it specifies what the 72-hour loop counter will display: auto-renewal at Hour 71 if compliance telemetry is green.

When both sides can point to independent sensor data and agree on what it means, the political framing becomes a secondary concern. Washington can call it "maximum pressure verification." Tehran can call it "sovereign technical cooperation." The sensors read the same thing either way.

The Telemetry Rule: Every commitment in this framework must be expressible as a sensor reading, a data feed, a physical lock confirmation, or a financial transaction record. If it cannot be verified by a neutral machine, it does not belong in the operational text.

Section 1: Core Principles

1.1 Synchronized Reciprocal Motion

Neither side moves alone. Every Iranian commitment triggers a corresponding US commitment on the same clock cycle. Verification is shared. Both governments can defend the sequencing as responding only when the other has moved first or simultaneously.

Iranian Telemetry Output

Freeze enrichment above 60%. IAEA OLEM confirms within 72 hours; physical inspectors verify within 7 days.

Iranian Narrative: "NPT rights preserved;

enrichment continues at 3.67%; sovereign annual review."	**Synchronized US Telemetry Output** Partial blockade lift. $250M humanitarian tranche via Swiss escrow. Omani naval observers confirm reduction within 48 hours. **US Narrative:** "60% weapons-grade enrichment halted; IAEA inside Natanz within 7 days."

1.2 Modular Architecture with Partial Continuity

Failure in one module does not cascade. The compiler continues executing all other loaded modules.

Table 2: Module Survival Tiers

Tier	Modules	Behavior During Pause
Tier 1 (Inviolable)	Ceasefire hotline, humanitarian access, emergency diplomatic channel	Never pause under any circumstances
Tier 2 (Protected)	IAEA basic monitoring, Hormuz non-military transit, asset tranches 1-2	Continue during most stabilization pauses
Tier 3 (Conditional)	SWIFT, bonus tranches, successor framework talks, Fordow advanced phases	May enter hold during disputes

1.3 Sovereignty Preservation and No Precedent

Article 1.3: The No-Precedent Clause

This Accord establishes no legal or political precedent. Each provision is *sui generis*, tailored to May 2026. No inference may be drawn regarding positions on any matter not expressly addressed.

The unique maritime coordination mechanisms herein apply exclusively to the Strait of Hormuz during the operational lifespan of this Accord. This text shall not be cited in any international court or treaty to define or alter sovereign rights under UNCLOS elsewhere in the world.

1.4 Framework Survival Core

Under all circumstances, including total framework suspension, three telemetry channels remain active:

1. **Ceasefire Hotline:** Omani-facilitated 24/7 bilateral military hotline. Neither party may disable without 30 days' notice to the UN Secretary-General.
2. **Humanitarian Access:** Zero-fee, no-inspection-delay humanitarian corridor through Hormuz. Survives all disputes.
3. **Emergency Diplomatic Channel:** Backchannel through the Coordination Secretariat. Survives all suspensions.

Legal Status: The Survival Core is a standalone UN humanitarian arrangement. It survives for 180 days even if both parties formally withdraw.

Section 2: Situation and Structural Diagnosis

Table 3: Demands Matrix: May 2026

Issue	US Demand	Iranian Demand	CBA Landing Zone
HEU Disposition	Transfer 400kg to US	No transfer under pressure	Third-country IAEA custody (Iran selects pathway)
Facilities	Single facility only	All facilities sovereign	Virtual consolidation: mothball non-core sites with real-time IAEA feeds
War Reparations	No compensation	Full reparations	International Gulf Reconstruction Fund (no fault admission)
Frozen Assets	No release of even 25%	Full unfreezing	Graduated tranche release through Swiss escrow
Ceasefire	Conditional on final deal	Immediate, permanent, irreversible	72-hour auto-renewing loops + 30-day structural phases
Hormuz	Freedom of navigation	Sovereign regulatory control	Joint IHTA with permanent Iranian seat
Sanctions	Phased, conditional	Immediate lifting of all	Eight-tranche architecture tied to IAEA milestones
Enrichment Moratorium	20 years	5 years	12-15 years with violation-extension mechanism

Why Prior Frameworks Failed

Table 4: Pathology Analysis

Pathology	Fix
Negotiation Complexity: bundling all issues simultaneously	Modular three-stage structure; failure of Stage 3 does not unwind Stages 1-2
Political Survivability: large upfront concessions for promised future benefits	Synchronized same-day exchanges; visible wins at every stage
Verification Credibility: punitive surveillance framing	Sovereign Energy Partnership; Iran issues the IAEA invitation
Economic Invisibility: relief invisible to ordinary citizens	Humanitarian tranche Day 1; oil exports Day 30; SWIFT Day 60

Section 3: The Security Module

3.1 The 72-Hour Dual-Key De-Escalation

Article SM-1: Simultaneous Operational Freeze

A legally binding, 72-hour cessation of hostilities across all fronts, matching a pause in US/allied airstrikes and naval blockade enforcement with a verifiable freeze on proxy movements and Iranian enrichment above 5%.

Article SM-2: The Escrow Ceasefire

The ceasefire is a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews for another 72 hours. Peace is maintained without either side signing away long-term leverage upfront.

Why This Works: Separating the ceasefire clock (72-hour loops) from the implementation clock (30-day phases) neutralizes the "negotiation about negotiation" trap. If talks stall on Day 14 over HEU downblending details, the guns do not automatically resume firing. The 72-hour military freeze module continues auto-renewing quietly in the background.

> **Article SM-3: OLEM Remote Verification**
>
> The 60% enrichment freeze is verified immediately via Online Enrichment Monitors (OLEM) and real-time camera feeds. Physical on-site IAEA inspector verification follows within 7 days. The 72-hour clock starts on OLEM confirmation, not physical arrival. This eliminates the Day 3 bottleneck that would collapse the synchronized humanitarian tranche.

> **Article SM-4: Attribution Deferral Window for Proxy Incidents**
>
> If a regional proxy strike occurs, neither side may unilaterally declare a material breach. The Joint Coordination Secretariat has 48 hours to conduct forensic telemetry and attribute the incident. During this window, the 72-hour military freeze remains active, provided Iran issues an immediate public condemnation and freezes matching local militia supply logistics. Only the Secretariat's attribution finding can trigger Tier escalation. Rogue actors and false-flag operations are excluded from bilateral penalties.

3.2 The Mutual Ingress/Egress Protocol

Each side holds the other's primary economic leverage hostage. This protocol unlocks both simultaneously:

> **Article SM-5: Synchronized Maritime De-Escalation**
>
> The US Navy pulls back its inspection perimeter to allow three pre-verified Iranian commercial vessels per week to exit the Persian Gulf without interference. Simultaneously, Iran opens a verified, monitored transit lane through Hormuz for neutral commercial energy transport. Neither step happens before the other. Both are confirmed by Omani naval observers and Lloyd's List AIS tracking within the same 60-second window.

Table 5: Ingress/Egress Verification Telemetry

Time	Iranian Output	US Output	Neutral Verification
T-60 min	IRGC Commander transmits stand-by	5th Fleet Commander transmits stand-by	Omani logs both signals

T-15 min	IRGC craft withdraw to 5nm; AIS broadcast	US Navy withdraws to 5nm; AIS broadcast	Lloyd's List confirms
T=0	Hormuz opening declaration	Blockade lift declaration	SIMULTANEOUS within 60s
T+15 min	First vessel commences transit	Notice to Mariners issued	Lloyd's List, AIS confirm

Article SM-6: Emergency Maritime Safety Carve-Out

Vessels experiencing verified mechanical distress, severe weather, medical emergencies, or environmental containment failure are exempt from the weekly transit quota. Such vessels may seek safe harbor under IHTA monitoring without triggering a blockade violation. Emergency status is verified by the Maritime Operations Cell within 2 hours. Applies symmetrically to all flagged vessels.

Section 4: The Financial Module

4.1 The Third-Party Reconstruction Escrow

The US maintains its stance against direct reparations. Iran demands economic relief. The Reconstruction Escrow threads this needle without either side admitting political defeat.

Article FM-1: Reconstruction Escrow Structure

A slice of frozen funds (30%) is transferred to an independent third-party account (Switzerland or Oman), legally designated for civilian infrastructure reconstruction and verified humanitarian relief. Washington maintains no direct restitution was paid. Tehran secures immediate economic relief. Both statements are factually correct.

Table 6: Escrow Allocation

Category	Allocation	Administrator	Rollback Protected?
Humanitarian (medicine, food)	25%	UN OCHA / WHO	Yes - Humanitarian Firewall
Critical Infrastructure	45%	World Bank / Swiss Financial Cell	Yes - Tranches 1-2

Iranian Civilian Reconstruction	20%	IHTA with Iranian programmatic control	No - Subject to Tier 3
Maritime Safety	10%	International Maritime Safety Fund	Yes

Article FM-2: Sovereign Immunity Wrapper

The International Gulf Reconstruction Fund is legally structured under sovereign immunity protections within Oman. As a precondition for Day 1 signature, the US issues a binding national security waiver protecting all fund assets from domestic judicial seizure, private civil litigation, or secondary sanctions enforcement. No US court may attach, freeze, or garnish Fund assets. This shield applies retroactively from first deposit and survives any framework suspension.

Article FM-3: OFAC Comfort Letters

The US Treasury issues comprehensive, irrevocable OFAC general licenses and formal Comfort Letters to all participating European and Gulf clearinghouses. These letters explicitly immunize designated banking nodes from all secondary US sanctions, including legacy human rights and counter-terrorism listings, for any transaction within the approved framework. Immunization is legally binding and cannot be revoked by executive discretion without 90 days notice.

4.2 Asset Return Tranche Architecture

~$100 billion in frozen assets. Graduated release through Swiss escrow.

Table 7: Asset Release Schedule

Tranche	Timing	Amount	Telemetry Trigger	Reversibility
Pilot	Day 1	$250M	Signature	Non-reversible
1	Day 14	25% minus pilot	Stage 1 closed; IAEA deployed; stockpile custody verified	Non-reversible
2	Day 44	25%	60-day compliance; nuclear exchange verified	Non-reversible
3	Day 120	20%	Permanent IHTA operational	30-day remediation
4	Day 180	15%	180-day compliance review	JIG breach review

Reserve	Day 365	10%	12 months clean certification	Material-breach hold
Balance	Year 2-3	Remainder	Full successor framework compliance	Successor risk appetite

The pilot and Tranches 1-2 are non-reversible because Iran's Stage 1 nuclear and maritime concessions are physically irreversible once executed. The asset return mirrors this physical reality.

Article FM-4: Currency-Basket Peg

All downstream asset releases from Tranche 3 onward are denominated in IMF Special Drawing Rights (SDR) or a fixed basket of Swiss Francs and Omani Rials (60/40). This protects real economic value from dollar inflation or monetary shocks. Exchange rate locked at signature using IMF published rate; reviewed quarterly by Swiss Financial Cell. Tranches 1-2 remain in USD for immediate liquidity.

4.3 SWIFT Reconnection

Table 8: SWIFT Pathway Tied to IAEA Milestones

Phase	Timing	Access	IAEA Milestone Trigger
Phase 0 (Pre-SWIFT)	Days 1-30	No SWIFT. Qatari riyal bridge.	OLEM confirms 60% freeze within 72h
Phase 1 (Restricted)	Days 30-60	5 banks; MT 103/202 only	Moratorium declared; standard monitoring active
Phase 2 (Expanded)	Days 60-120	All clean-record banks	Continuous monitoring; no diversion detected
Phase 3 (Full)	Day 120+	Full membership	Year 1 clean certification

Article FM-5: SWIFT Remediation Fuse

If IAEA identifies a Tier 2 compliance concern, the SWIFT phase holds for exactly 14 days as a remediation window. Resolved within 14 days: phase advances normally. Unresolved after 14 days: SWIFT rolls back exactly one tier. Tier 1 technical disputes do not trigger the fuse. Only Tier 2 material disruptions and above activate the 14-day clock.

Section 5: The Technical Module

5.1 Neutral-Custody Blending

Iran rejects surrendering 400kg of HEU to the US. The US demands immediate transfer and facility consolidation. Neutral-custody blending resolves both.

Article TM-1: Third-Party Custody with Dual-Lock

The 400kg HEU stockpile is transferred to a neutral third-party nation (Oman or Kazakhstan) under strict IAEA dual-lock custody. Down-blending to LEU or conversion to civilian fuel plates proceeds on a fixed timeline, pegged to phased oil export sanctions relief. Neither Iran nor the US holds unilateral access. Iran selects the pathway. IAEA verifies the chain of custody.

Table 9: Six Pathways for HEU Disposition (Iran Selects)

Path	Description	Destination	Timeline
A	In-place downblending to medical-grade LEU at Esfahan	Medical isotope production in Iran	142 days
B	HEU export to IAEA custody in Oman	IAEA facility, Oman (NOT US)	14 days
C	Downblended in Iran, transferred to IAEA LEU Bank	Oskemen, Kazakhstan	75 days
D	Transfer to Rosatom under IAEA safeguards	Russian Federation	60-90 days
E	Conversion to reactor-grade LEU fuel assemblies	Bushehr reactor supply	180 days
F	Hybrid: stockpile divided into batches through different pathways	Multiple destinations	Concurrent

Article TM-2: Third-Party Destination Guarantee

Under no circumstances may Iran's enriched uranium be transferred to US territory, custody, or control. All six pathways specify third-party destinations. This is binding and non-negotiable.

5.2 Virtual Consolidation and the Mothball Protocol

Rather than physically destroying facilities, Iran places non-core sites under "mothball status" with continuous real-time IAEA remote feeds. The US gets operational limitation to a single site. Iran keeps its sovereign infrastructure intact.

Article TM-3: Mothball Protocol

All centrifuge rotors and bellows producing enrichment above 3.67% are removed, sealed in IAEA-tamper-evident containers, and stored in a UN-monitored facility within Iran. Centrifuge casings and infrastructure remain in place.

Table 10: Mothball Procedure

Phase	Window	Action
Inventory	Day 1-14	IAEA inventories all rotors and bellows at Natanz and Isfahan above 3.67%
Removal	Day 15-44	Iranian technicians remove rotors under IAEA supervision; sealed with serial numbers
Storage	Day 45-60	Sealed containers to UN-monitored facility; IAEA continuous access
Monitoring	Day 60+	IAEA continuous cameras; quarterly environmental sampling; 72h safety extensions permitted if OLEM confirms no active enrichment

Article TM-4: Physical Dual-Key Custody

The storage facility uses a two-stage digital and physical locking system. IAEA holds digital encryption keys to monitoring arrays and tamper-evident seal controls. Iran holds physical keys and armed outer-perimeter security. Neither party can access containers without the other's physical presence. Both keys required simultaneously. Unauthorized access triggers Tier 2 breach. Verified quarterly by IAEA Nuclear Verification Cell.

Article TM-5: Operational Labor Hours Safety Extension

> The Mothball timeline is linked to verified operational labor hours, not fixed calendar days. Documented safety delays, equipment failure, or labor stoppages extend the timeline up to 72 hours without penalty, provided OLEM remote monitoring confirms no active enrichment during the delay. IAEA certifies the delay and issues a Safety Extension Certificate within 24 hours.

5.3 Enrichment Moratorium Architecture

Table 11: 12-Year Renewable Moratorium

Phase	Duration	Standard	Advancement
Moratorium	Years 1-12	Zero enrichment above 3.67%; higher centrifuges under IAEA seal	Clean IAEA certification at Year 12 review
Civilian Transition	Years 13-15	3.67% enrichment at Natanz only	Fuel supply guarantee in escrow
Steady-State	Year 16+	3.67% under full IAEA safeguards	Successor framework confirmed

Material breach triggers automatic 2-year extension per breach. Determined by JIG majority on IAEA technical reporting, not unilateral US certification.

Section 6: The Maritime Sovereignty Module

6.1 Joint Hormuz Transit Authority (IHTA)

The IHTA is simultaneously the US freedom-of-navigation achievement and Iran's permanent governance seat replacing decades of US unilateralism. Both statements are factually correct.

Table 12: IHTA Council Composition

Member	Status	Role
Islamic Republic of Iran	Permanent voting member	Senior seat; territorial sovereignty; Chair in alternating years
United States	Permanent voting member	Permanent seat; maritime security provider; Co-chair alternating

GCC Rotating Chair	Permanent voting member	Rotates among Oman, Qatar, UAE; primary tie-breaking authority
European Union	Observer	Chairs Environmental and Safety Subcommittee
People's Republic of China	Observer	Largest Gulf-oil importer; technical observer
UN Appointee	Neutral chair	Tie-breaking on procedural matters only

Article MM-1: Tie-Breaking Override

If the GCC representative abstains on an enforcement vote, tie-breaking defers to joint consensus of the EU and PRC observers. Their shared commercial interest in open shipping lanes provides an automatic override that bypasses regional political gridlock.

Article MM-2: Automated Toll Disbursal Default

If the IHTA Council fails to pass an annual budget due to US-Iran deadlock, toll revenues automatically distribute per baseline percentages (40% Iranian Reconstruction, 35% Maritime Safety, 25% Operations). The neutral Secretariat executes within 7 days. Political deadlock cannot freeze baseline distributions.

6.2 Synchronized Dual-Blockade Lift

Day 7, 0000 GMT: Both blockades lift simultaneously within a 60-second window. Confirmed by Omani naval observers, Lloyd's List AIS tracking, and JHA observation vessels.

Table 13: IHTA Tolling

Tier	Vessel Category	Rate
Tier 1	Humanitarian (medicine, food, medical equipment)	Zero (24h fast-track)
Tier 2	Standard commercial	$0.15/ton
Tier 3	Energy/premium (oil, LNG, chemicals)	$0.25/ton or $35K flat VLCC
Member States	IHTA Council member vessels	Exempt

Annual revenue: ~$500M. Allocation: 40% Iranian Civilian Reconstruction Fund; 35% International Maritime Safety Fund; 25% IHTA Operations.

Section 7: Institutional Governance

Table 14: Distributed Facilitating State Matrix

State	Domain	Function	Activated
Oman	Maritime Deconfliction	Hotline; naval encounter facilitation; Hormuz oversight	Throughout
Switzerland	Financial Verification	Escrow; asset transfer verification; sanctions monitoring	Throughout
Qatar	Escrow and Liquidity	Emerergency liquidity; bridging finance; humanitarian corridor	Throughout
IAEA	Nuclear Verification	Enrichment monitoring; stockpile custody; facility inspection	Day 1
UN Appointee	Procedural Mediation	Governance; dispute resolution; deadlock breaking	Upon dispute
Pakistan	Emergency Diplomatic Convening	Crisis summits; backchannel relay; leadership relay	Crisis only

Article IG-1: Pakistan Co-Convening Authority

Pakistan is elevated to Co-Convening Authority alongside Oman, institutionalizing the existing Islamabad channel. Pakistan convenes emergency diplomatic summits and executive-level backchannel relay. Pakistan does not assume financial, maritime, nuclear, or procedural mediation functions.

Article IG-2: Mandatory Escalation Pause

When a facilitating state determines escalation is imminent, it issues a Mandatory Escalation Pause Recommendation. This activates a 30-minute review window. Neither party may take escalatory action. Both must designate senior officials for consultation within 30 minutes. Either party may request extended Cooling-Off (24-72 hours). If either party supports the pause, the freeze continues.

Section 8: Verification Architecture

8.1 Five-Channel Verification Convergence

No single channel can trigger or block compliance findings. Every material finding requires convergent evidence from at least two independent channels.

Table 15: The Five Channels

Channel	Coverage	Authority
Pakistani Mediator	Diplomatic channel; ceasefire compliance; crisis hotline	Pakistani PM Office
Omani Technical	Maritime operations; JHA observation; nuclear custody oversight	Omani Foreign Ministry
Swiss Financial	Asset transfer; sanctions relief; escrow management	Swiss Federal DFA
IAEA	Nuclear exchange: stockpile custody, moratorium, Fordow conversion	IAEA Director General
National Technical Means	Satellite imagery, signals intelligence. Backstop and discrepancy detector only.	US and partner intelligence

8.2 Nuclear Monitoring Technology Menu

Table 16: Sensor Technologies

Technology	Measures	Data Output
OLEM	Real-time enrichment at cascade headers	Quantitative enrichment %, flow rates
Black-Box Sensors	Tamper-evident data logging	Continuous operational parameter logs, encrypted
UGES	Non-intrusive UF6 cylinder enrichment	Cylinder-by-cylinder verification
ICS	24/7 visual monitoring	Encrypted video, AI anomaly detection
Digital Twin	Virtual facility modeling	Behavioral pattern analysis (requires physical cross-verification)
Satellite Data Feed	Daily imagery of all facilities and Hormuz	AIS, SAR, EO high-resolution

Article SF-3: Algorithmic Reconciliation Step

Before any Digital Twin anomaly is submitted as a compliance discrepancy, it must be cross-verified by manual physical data from at least two independent non-software channels (environmental sampling, on-site inspector logs, or OLEM telemetry). The algorithm alone cannot trigger a breach report. The Nuclear Verification Cell issues a Reconciliation Certificate confirming multi-channel physical convergence before any Tier escalation.

Privacy: Data filtered at source; dual-key encryption; IAEA receives only compliance data, not industrial secrets.

Section 9: Compliance and the Step-Back Architecture

9.1 Three-Tier Breach System

Article CB-6: De Minimis Threshold

Tier 1 technical disputes are defined by strict mathematical boundaries: enrichment fluctuations not exceeding 0.5% above the 3.67% ceiling; up to two un-mothballed centrifuge rotors; IAEA reporting delays not exceeding 48 hours. Deviations below these thresholds are handled via confidential engineering adjustments. Hardliners cannot weaponize microscopic anomalies into deliberate breach allegations. IAEA certifies above/below the De Minimis line within 24 hours.

Table 17: Three-Tier Breach Classification

Tier	Classification	Telemetry Signature	Response
Tier 1	Technical Dispute (De Minimis)	<0.5% above ceiling; ≤2 rotors; ≤48h reporting delay	Engineering resolution 14 days; no rollback; confidential
Tier 2	Material Disruption	>0.5% above ceiling; >2 rotors; >72h IAEA obstruction	25% benefit reduction; 30-day remediation; earn-back via compliance

Tier 3	Deliberate Violation	Hostile	Nuclear weapons activity; fissile diversion; IAEA attack	50% reduction; 90-day remediation; full earn-back after sustained compliance

9.2 Graduated Step-Back and Earn-Back

> *Do not use the snapback. Use the step-back and earn-back method.*

Snapback is toxic to trust. When one side loses everything overnight, it has no remaining stake in the framework. Step-back preserves a cooperation floor during disputes, creating a pathway back to full compliance.

> **Article CB-1: Graduated Step-Down**
>
> **Tier 1:** No benefit reduction. 14-day resolution. JIG technical assistance. Quiet compliance corrections confidential.
>
> **Tier 2:** 25% reduction in non-humanitarian benefits. Humanitarian tranches protected. SWIFT phase holds (14-day fuse active). 30-day remediation. Full restore on IAEA clean certification within 14 days.
>
> **Tier 3:** 50% reduction in non-humanitarian benefits. Tier 3 modules enter hold. 90-day remediation. Full earn-back requires: 90-day sustained compliance + IAEA clean certification + JIG majority confirmation.

9.3 Stabilization Pause and Reconstitution

> **Article CB-2: Stabilization Pause**
>
> When disagreement occurs, the framework pauses, reviews, and seeks reconstitution. It never collapses. The Framework Survival Core (hotline, humanitarian access, diplomatic channel) survives everything.

> **Article CB-3: Reconstitution Mechanism**

If the framework enters full suspension, all parties attend a Reconstitution Conference within 30 days, convened by Pakistan and the UN Appointee. Root causes reviewed. Modifications proposed. Conditions for graduated restoration defined. No party may unilaterally block reconstitution.

Article CB-4: Political Shock Absorber

Framework implementation enters automatic Review Pause (not termination) upon: elections; assassination of senior leadership; cabinet collapse; mass protests; leadership transitions; kinetic disruptions within regional security architectures (e.g., proxy command decapitation).

During Review Pause: Tier 1-2 modules continue; Tier 3 enters hold; Secretariat issues Review Pause Certificate within 48 hours; 30 days to confirm continuation. Max 90 days, extendable by mutual agreement. Does NOT constitute material breach. Does NOT trigger the three-tier system.

Article CB-4A: Regional Proxy Shock Extension

If a leadership vacuum or unauthorized structural fracture occurs within a key regional non-state ally, the 72-hour ceasefire loops enter a mandatory 72-hour hold. Secretariat deploys stabilization teams to re-establish local command lines. No material breach may be declared during the hold.

Article CB-5: Cooling-Off Default

If disagreement occurs and attribution is unclear, all escalation freezes automatically for 24-72 hours. Negotiations continue. Verification teams investigate. No escalatory action permitted. Cyber incidents affecting protected infrastructure trigger Cooling-Off automatically. Any detection of potential false-flag activity triggers Cooling-Off.

Section 10: Implementation Timeline

The 72-hour rolling loops feed into a broader tiered schedule. Every milestone has a telemetry verification gate.

Stage 0: Micro-Pilot (Days -30 to -1)

Trust-building through limited, reversible exchanges

Iran: Freeze enrichment above 60%; IRGC presence reduced 30%.

US: $250M humanitarian tranche via Swiss escrow; partial blockade reduction.

Telemetry Gate: OLEM confirms 60% freeze within 72h; physical IAEA within 7 days; Omani observers confirm blockade reduction within 48h.

Transition: Auto-graduates to Stage 1 on verified completion.

Stage 1: The 14-Day Opening (Days 1-14)

End the war; transfer stockpile; reopen Hormuz

Day 1: Joint signature. Permanent ceasefire 0000 GMT. Iran transfers 60% stockpile to IAEA Oman custody. US issues $250M OFAC license, suspends offensive operations. First humanitarian vessel cleared for Hormuz transit.

Day 7: Synchronized dual-blockade lift. Hormuz opens fully. US lifts naval blockade. 200+ commercial transits verified by Lloyd's List and Omani observers.

Day 14: Stage 1 closing certification. JHA provisional mode confirmed. IAEA custody verified. Pakistan, Oman, Switzerland concurrent certification. Auto-transition to Stage 2.

Stage 2: The 30-Day Deferred Window (Days 15-44)

Nuclear specifics; staggered cap; facility protocols

Day 15: Fordow sealed; Natanz cap at 3.67% verified. First sanctions tranche (aviation, consumer exports). Second asset tranche.

Day 30: Downblending begins under IAEA cameras. Oil exports to Swiss escrow (2.1M barrels/day). SWIFT Phase 1.

Day 44 (+7 extension available): Moratorium ratified; HEU export confirmed. 50% assets returned. SWIFT Tier B/C. Stage 2 closing.

Stage 3: Permanent Architecture (Days 45-180)

Joint Transit Authority; regional dialogue; normalization

Day 60: Fordow medical-isotope conversion verified. Third tranche (50% cumulative). SWIFT Tier A.

Day 90: Permanent IHTA charter ratified. Iranian co-chair begins. Fourth tranche (70% cumulative).

Day 120: Regional Security Dialogue on missiles and proxies. Fifth tranche (85% cumulative).

> **Day 150:** Section 123 Agreement opens for guaranteed civilian fuel supply.
>
> **Day 180:** Stage 3 closing. Successor framework opened. 180-day compliance review published.

Table 18: 30-Day Velocity Milestones

Milestone	Target	Telemetry Deliverable
Escrow Lock	Day 7	Swiss escrow accounts active; first asset release confirmed
Custody Shift	Day 15	HEU under dual-lock IAEA seals; Fordow sealed; OLEM reads <3.67%
Oil Trigger	Day 30	First legal Iranian tankers clear port; sanctions tranche 1 active
Banking Bridge	Day 45	SWIFT Phase 1 active; 50% assets returned
Authority Charter	Day 90	Permanent IHTA operational; Iranian co-chair authority live
Successor Opening	Day 180	Full regional dialogue opened; successor framework negotiation begins

Section 11: Domestic Political Architecture

Technical compliance does not generate its own political support. This section engineers the domestic conditions that give the framework breathing room to survive.

11.1 Dual Narrative Telemetry

US Domestic Narrative

- "We forced Iran to open Hormuz and eliminate its weapons-grade uranium."
- "We got their assets returned in tranches with Congressional review at every step."
- "We didn't give up a single base. Gas prices are coming down."
- "We did it without losing another American life."

- "This is what maximum pressure looks like when it works."

Iranian Domestic Narrative

- "We ended the war the United States started against us."
- "The American naval blockade of our ports has been lifted."
- "Hormuz is governed by an authority on which Iran holds a permanent seat."
- "We chose to redirect our nuclear program toward civilian energy leadership."
- "Our NPT rights remain inviolable; our sovereignty is intact."

11.2 Hardliner Management

Table 19: Architectural Elements for Domestic Survival

For Tehran	For Washington
No clause requires acknowledging defeat	Each tranche 3+ subject to 30-day Congressional review
IRGC Navy retains authority in Iranian waters	All US Gulf bases preserved
NPT rights preserved; moratorium is time-limited	"Toughest inspections ever" with OLEM + Black-Box
Missile program untouched	Israeli security backstop via stockpile elimination
Asset return framed as sovereign property restitution	Explicit "no precedent" clause prevents future binding
Lebanon track separated	Lebanon referred to successor framework
Nuclear exchange framed as Iran's initiative	Front-loaded nuclear concessions Day 1-15

Section 12: Safeguards and Face-Saving Instruments

12.1 The Crisis Lock

Article SF-1: Crisis Lock Escape Valve

If negotiations collapse, both sides have an exit ramp that does not blow up the Middle East. Funds frozen in Switzerland, not seized. Cameras stay on. For 30 days, mediators force both sides to the table. After 30 days, walk away or re-engage. You are not locked in.

12.2 Minimum Viable Accord (Emergency Fallback)

If the full architecture is rejected, a stripped-down version covers four essential elements: ceasefire, Hormuz reopening, humanitarian channel, and enrichment freeze.

1. Either party proposes MVA by written notice to the Coordination Secretariat
2. Facilitating state convenes within 48 hours
3. Both parties confirm MVA acceptance through exchange of letters
4. MVA activates 72 hours after confirmation
5. IAEA advance team deploys within 48 hours

MVA auto-graduates to full Accord when: (a) both confirm objectives met, (b) 14 consecutive days verified compliance, (c) neither objects within 7-day review window.

12.3 Thirty-Day Drop-Dead Auto-Transition

Article SF-2: Auto-Transition to MVA

If the full framework is not ratified by Day 30, automatic transition to Minimum Viable Accord. The US can claim it did not accept open-ended commitment. Iran can claim humanitarian and ceasefire

> elements survive regardless. Framed as a "life support protocol" while both sides negotiate modifications.

12.4 Rebranding Protocol

Remove terms: "deal," "rollback," "concessions." Washington: "regional stability mechanism." Tehran: "sovereignty-protecting de-escalation tool." Neither narrative contradicts the other. Both are factually supported by the telemetry.

Appendix A: The Module Menu

Because the architecture is strictly modular, intermediaries should treat this document as a menu. If one module is rejected, unclip it and continue executing the rest. The compiler loads what is accepted.

Table 20: Independent Module Activation Matrix

Configuration	Modules Loaded	Minimum Viable?	Political Framing
Emergency Brake (2 modules)	Security Freeze + Humanitarian Escrow	Yes - MVA core	"Crisis containment only"
Humanitarian Core (3 modules)	+ Reconstruction Escrow	Yes	"Civilian relief first"
Nuclear Freeze (4 modules)	+ Neutral Custody	Yes	"Stockpile secured, blockade reduced"
Maritime Opening (5 modules)	+ Ingress/Egress	Yes	"Hormuz open, shipping restored"
Stability First (7 modules)	+ Virtual Consolidation + IHTA Governance	Yes - Medium option	"Full Stage 1 operational"
Economic Bridge (8 modules)	+ SWIFT Phase 1 + Asset Tranche 1	Yes	"Banking reconnected, assets flowing"
Full Compiler (all modules)	+ Step-Back + Full Timeline + Successor	Yes - Maximal option	"Comprehensive stabilization"

How to Use This Menu (for Pakistani/Omani facilitators): If Washington rejects the maritime node, propose the "Nuclear Freeze" configuration. If Tehran objects to SWIFT sequencing, propose the "Maritime Opening" configuration. Each configuration is independently executable. The full compiler is the goal, but partial compilation is always better than system crash.

Module Dependency Graph

Table 21: What Each Module Requires to Function

Module	Requires Active	Required By
72-Hour Security Freeze	None (root module)	All other modules
Humanitarian Escrow	Security Freeze	Reconstruction Escrow
Reconstruction Escrow	Humanitarian Escrow	Asset Tranche Release
Neutral Custody Blending	Security Freeze	Virtual Consolidation
Virtual Consolidation	Neutral Custody	SWIFT Reconnection
Ingress/Egress Protocol	Security Freeze	IHTA Governance
IHTA Governance	Ingress/Egress	Toll Disbursal
Asset Tranche Release	Reconstruction Escrow + IAEA clean	SWIFT Phase 2+
SWIFT Reconnection	Virtual Consolidation + Asset Tranche 1	Full economic normalization
Step-Back Architecture	All modules loaded	None (meta-module)

Appendix B: Quick Reference Matrix

Table 22: Side-by-Side: US 9-Point vs. Iran 14-Point vs. CBA Landing Zone

Issue	US 9-Point	Iran 14-Point	CBA Landing Zone
HEU Disposition	Transfer to US	No transfer	Third-country IAEA custody (Iran selects)
Facilities	Single facility	All sovereign	Virtual consolidation; real-time IAEA feeds
War Reparations	No payment	Full reparations	Int'l Gulf Reconstruction Fund (no fault)
Frozen Assets	No 25% release	Full release	Graduated tranches via Swiss escrow
Ceasefire	Conditional on final deal	Immediate, permanent	72-hour auto-renewing loops
Hormuz	Freedom of navigation	Sovereign control	Joint IHTA; permanent Iranian seat

Sanctions	Phased, conditional	Immediate lifting	Eight-tranche IAEA-linked architecture
Enrichment Cap	20-year moratorium	5-year moratorium	12-15 years with violation extension
Missiles	Limitations required	Not negotiable	Deferred to Stage 3 Dialogue
Lebanon	Hezbollah disarmament	Immediate ceasefire	Iran: operational pause only

Table 23: Core Telemetry Outputs by Day

Day	Iranian Telemetry	US Telemetry	Neutral Verification
1	60% freeze; stockpile transfer initiated	$250M OFAC license; offensive ops suspended	IAEA DG + Pakistan + Oman + Swiss concurrent
7	Hormuz open; IRGC craft withdrawn 5nm	Naval blockade lifted; Project Freedom suspended	Lloyd's List + JHA vessels + UN OCHA
15	Fordow sealed; Natanz ≤3.67% OLEM	Sanctions tranche 1; asset tranche 2	IAEA continuous monitoring + JIG
30	Downblending begins; oil exports to escrow	SWIFT Phase 1; 30-day Congressional notice	IAEA cameras + Swiss escrow confirmation
44	Moratorium ratified; HEU export plan	50% assets returned	JIG closing certification
90	Permanent IHTA member; co-chair active	Full IHTA charter ratified	UN SG + JIG unanimous certification
180	Successor framework opened	85% assets returned; 180-day review published	JIG comprehensive compliance review

Document Status: CBA v2.0 Compiler Edition — May 18, 2026. 85% derived from Hormuz First v2.0, Stability First v5.7, RCSA v3.6, and Chatter4 operational proposals. 15% connective tissue. All 15 structural vulnerability patches integrated.
