

THE HORMUZ FIRST ENHANCED ACCORD

*A Comprehensive Emergency Stabilization and Regional Architecture Plan
to End the US–Iran War, Resolve the Nuclear Question, and Establish
Permanent Governance of the Strait of Hormuz*

Document Status:	Diplomatic Reference Draft — Enhanced Synthesis Edition
Date of Issue:	May 7, 2026
Version:	1.0 — Enhanced Accord
Source Frameworks:	Hormuz First Accord v2.0 · RCSA v3.6 Final Diplomatic Edition
Mediation:	Pakistan (primary) · Oman (technical) · Switzerland (financial) · IAEA (nuclear)
Successor Pathway:	RCSA v3.6 / Crescent Compact v1.7 / RAMES v9.1

This Enhanced Accord integrates the operational architecture of the Hormuz First Accord v2.0 with the governance, verification, sovereignty, and economic frameworks of the Regional Cooperation and Stability Architecture v3.6. It is calibrated to the diplomatic situation as of May 7, 2026, reflecting the one-page MOU discussions mediated through Pakistan and the current proximity of both governments to a war-termination framework. It is designed to be a reference instrument for negotiators, not a final treaty text.

TABLE OF CONTENTS

APPENDIX B	Public Communication Templates — Authorized Terminology Registry
APPENDIX C	Risk Appetite Framework — RCSA Integration

PREAMBLE — SYNTHESIS PREMISE AND DIPLOMATIC CONTEXT

The United States and Iran are, as of May 7, 2026, the closest they have been to a deal since the war began — and the closest a diplomatic window has come to closing. This Enhanced Accord is the instrument that can fill that window.

This Enhanced Accord is a synthesis instrument built from two sources: the Hormuz First Accord v2.0 (the operational stabilization framework designed for the immediate US–Iran war-termination window), and the Regional Cooperation and Stability Architecture v3.6 (a comprehensive, stress-tested governance and verification architecture built for durable regional order). The synthesis produces something neither source document achieves alone: an instrument that is simultaneously operationally executable within days, politically defensible for both governments, institutionally durable across decades, and calibrated to the specific diplomatic configuration as of May 7, 2026.

The Hormuz First Accord v2.0 contributed the operational architecture: the three-stage framework, the synchronized dual-blockade lift mechanism, the nuclear sovereignty exchange, the Joint Hormuz Authority design, and the public communication templates. The RCSA v3.6 contributed the governance depth: the modular sovereignty preservation doctrine, the eight-tranche sanctions relief architecture, the five-tier risk appetite framework, the guarantor domain model, the quiet compliance track, the capital flight circuit breaker, and the seven pathologies of previous frameworks. Together they form an instrument with operational speed and institutional depth — neither of which alone is sufficient.

P.1 The May 7 Diplomatic Situation

As of the morning of May 7, 2026, the following operational facts define the diplomatic environment this Accord is designed to address:

- The United States and Iran are reviewing a one-page Memorandum of Understanding (MOU) that would declare an end to the war and open a 30-day negotiating period on nuclear issues, Hormuz, and sanctions. US officials describe this as the closest the parties have been to agreement since hostilities began on February 28.
- Project Freedom — the US Navy escort operation in the Strait of Hormuz — was launched on May 4 and paused on May 6 by President Trump, citing 'great progress' toward a 'complete and final agreement.' Pakistani mediators have relayed positive signals to Washington.
- The nuclear enrichment moratorium under active discussion would last between 12 and 15 years — a compromise between Iran's 5-year offer and the US demand for 20 years. After the moratorium, Iran would enrich at 3.67% for civilian fuel purposes. Iran has conditionally indicated willingness to transfer its highly enriched uranium stockpile out of the country.
- Iran's parliament speaker and hardline factions have publicly dismissed US reports as optimistic spin, while Iranian moderates and the foreign ministry have continued engagement through Pakistani channels. The dual-track Iranian response reflects internal political dynamics that any viable accord must accommodate.

- The French aircraft carrier Charles de Gaulle is en route to the southern Red Sea as part of a 40-nation multinational initiative to prepare for Hormuz reopening, providing additional multilateral legitimacy for a joint governance solution.
- Gas prices in the United States have reached \$4.53 per gallon nationally and over \$6 in California. The midterm election clock and economic pressure on the Trump administration create a defined window for deal closure.
- The approaching Hajj pilgrimage (~May 25) creates an additional convergence deadline — escalation during that period would carry severe political costs for all parties, including Saudi Arabia.

The Enhanced Accord is calibrated to convert the one-page MOU framework currently under review into a full operational architecture. It does not compete with the MOU; it is the MOU's successor instrument — the comprehensive text that fills the 30-day negotiating period with concrete, verifiable, politically defensible deliverables.

SECTION 0 — DOCUMENT PURPOSE AND STRATEGIC FRAMEWORK

0.1 What This Accord Is

This Enhanced Accord is a synthesis instrument. It does not displace either side's stated proposal; it harvests the points of overlap that already exist between the United States' negotiating framework and the Islamic Republic of Iran's peace requirements, and converts them into a sequenced, verifiable, politically defensible path out of active hostilities — one that also establishes the institutional architecture for a durable regional order.

The premise is precise. As of May 7, 2026, the two sides are exchanging a one-page MOU through Pakistani mediators that would declare an end to the war and open a 30-day negotiating period. That MOU is necessary but insufficient: a 30-day negotiating period without a pre-agreed architecture for what will be negotiated risks producing the same stalemate as prior frameworks, at the cost of the diplomatic momentum that now exists. This Accord is the architecture that converts a 30-day negotiating mandate into a 180-day stabilization framework with irreversible facts on the ground at each stage.

The single-sentence version: Iran voluntarily transfers its weapons-grade stockpile to IAEA third-country custody and accepts a civilian enrichment ceiling under guaranteed fuel-supply backing, in synchronized exchange for the immediate opening of Hormuz under joint authority, the lifting of both blockades, the return of Iran's sovereign assets in irreversible tranches, and permanent Iranian co-governance of the world's most important maritime chokepoint — letting each government tell its own story about what it won.

0.2 What This Accord Is Not

This Accord is not a comprehensive peace treaty. It does not resolve the ballistic-missile question comprehensively, the Lebanon final-status question, the Yemen reconstruction question, the Iraqi militia-integration question, the Syrian reconstruction question, or the Israeli-Palestinian political-settlement question. Those are matters for the successor framework — the RCSA v3.6, the Crescent Compact, or RAMES — for which this Accord is explicitly the bridge.

It also does not require Iran to abandon its NPT rights; rather, it exercises those rights within a guaranteed civilian fuel-cycle architecture that Iran controls. It does not require the United States to withdraw its forces from the Gulf region or to dismantle its treaty commitments to Gulf partners. It does not require any government to acknowledge defeat, capitulation, or unconditional surrender.

0.3 The Relationship Between the Two Source Documents

The Hormuz First Accord v2.0 was designed as an emergency stabilization instrument — lean, fast, operationally executable within 14 days. Its virtue is speed; its limitation is institutional depth. The RCSA v3.6 was designed as a comprehensive regional architecture — modular, durable, stress-tested against all known failure modes of previous frameworks. Its virtue is depth; its limitation is that it cannot be implemented in a crisis window without an operational bridge.

This Enhanced Accord provides that bridge. Stage 1 and Stage 2 operate on the Hormuz First timeline (14 days and 60 days respectively). The institutional architecture throughout — verification channels, risk appetite framework, sovereignty milestones, guarantor roles, sanctions tranche structure, crisis management pathways — is drawn from the RCSA v3.6. Stage 3 is the explicit handoff to the full RCSA successor framework.

SECTION 1 — SITUATION AS OF MAY 7, 2026

1.1 The War and the Ceasefire

The United States and Israel launched coordinated strikes on Iranian nuclear, military, and leadership infrastructure on February 28, 2026 — Operation Epic Fury. Supreme Leader Ali Khamenei was killed in the opening days; succession passed to Mojtaba Khamenei. Iran responded with strikes on US bases and Gulf-state infrastructure, and on approximately March 1 effectively closed the Strait of Hormuz to non-Iranian shipping, reducing monthly transits from approximately 3,000 vessels to 154 in March. A ceasefire was agreed April 7–8 through Pakistani mediation and has technically held for nearly a month, despite ongoing maritime incidents and episodic cross-border fire.

On May 5, Secretary of State Rubio declared Operation Epic Fury 'concluded,' shifting the stated US objective from military pressure to a 'memorandum of understanding for future negotiations.' On May 6, Trump paused Project Freedom — the US Navy Hormuz escort operation begun May 4 — citing positive signals from Pakistani mediators. This represents a significant US posture shift toward Iran's preferred sequencing: Hormuz and blockade first, nuclear details later.

1.2 The MOU Framework Under Discussion

The parties are reviewing a one-page, 14-point Memorandum of Understanding that would: (a) declare an end to the war; (b) open a 30-day negotiating period in Islamabad or Geneva on nuclear issues, Hormuz governance, sanctions relief, and frozen asset return; and (c) begin gradual lifting of both blockades during the 30-day period. US forces would be able to restore the blockade or resume military action if negotiations collapse.

Key Term	US Position	Iran Position	Likely Landing Zone
Enrichment moratorium duration	20 years	5 years	12–15 years (actively negotiated)
Highly enriched uranium disposition	Transfer to US	Remain in Iran	Third-country IAEA custody (Oman)
Underground facilities	Prohibited operation	NPT rights asserted	IAEA-monitored conversion
Hormuz governance	Freedom of navigation	Iranian co-governance	Joint International Authority
Blockade lifting	Conditional/phased	Unconditional	Synchronized Day 7
Frozen assets	Phased, conditional	Released as restitution	Tranche architecture
Snap inspections	Required	Rejected	Enhanced declared-site + IAEA unannounced
Violation consequence	Automatic moratorium extension	Not accepted	JIG-determined extension

1.3 The Pressure Convergence

Multiple pressure vectors are converging to create a short but genuine diplomatic window. US gasoline prices have reached \$4.53 nationally (\$6+ in California), creating domestic political urgency for deal closure before the midterm election cycle hardens positions. Iranian hardliners have publicly mocked US reporting as spin — 'Operation Trust Me Bro' — while moderates continue engagement; this internal Iranian division creates both a risk and an opportunity. The approaching Hajj (~May 25) imposes a soft deadline. The French carrier deployment signals that a 40-nation multilateral framework for Hormuz transit is forming, which strengthens the case for the International Hormuz Transit Authority architecture over unilateral US enforcement.

1.4 What Both Sides Have Implicitly Conceded

Beneath the public positions, the operational basis for this Accord exists in what each side has already implicitly accepted through its actions:

- The United States has accepted Iran's demand for Hormuz-first sequencing by pausing Project Freedom and accepting the MOU framework that defers nuclear details to a 30-day period.
- Iran has signaled conditional willingness to transfer highly enriched uranium out of the country — a position Iran's foreign ministry had categorically rejected as recently as April 2026.
- Both sides accept Pakistan as primary mediator and have not sought to displace this channel.
- Both sides accept that the dual blockade cannot remain in its current configuration; the question is only the institutional form of resolution.
- Both sides accept that frozen Iranian assets should return; the only question is sequencing and conditionality.
- The US has accepted that 'zero enrichment' — its stated demand since 2025 — is not achievable; the negotiation has shifted to moratorium length and enrichment ceiling.

SECTION 2 — WHY ALL PRIOR PROPOSALS STALLED

Understanding structural failure is the precondition for structural success. This section integrates the Hormuz First Accord's analysis of the specific 9-point/14-point stall with the RCSA's broader analysis of the four pathologies that have caused every comprehensive Middle East framework to fail over the past three decades.

2.1 The Four RCSA Pathologies

The RCSA v3.6 identifies four structural pathologies that have defeated every comprehensive settlement attempt since the Iranian Revolution. Each is present in the current negotiation.

Pathology	Definition	Present in Current Talks
Negotiation Complexity	Attempts to resolve nuclear, proxy, normalization, humanitarian, and economic issues simultaneously, creating insurmountable veto points.	The 15-point March proposal bundled missile dismantlement, Fordow closure, Hezbollah disarmament, and reparations into a single package.
Political Survivability Deficit	Frameworks demand large upfront concessions in exchange for promised future benefits; no government survives the political cost.	US zero-enrichment demand and Iran reparations demand both require the other side to make concessions that would be domestically framed as capitulation.
Verification Credibility Gap	Monitoring architectures framed as punitive surveillance create resistance; mutual transparency creates partnership.	Snap inspections are framed by Iran as sovereignty violation; US frames them as essential safeguard. Neither framing is wrong.
Economic Viability Failure	Generic relief invisible to ordinary citizens fails to create domestic constituencies for cooperation.	Sanctions relief that reaches ordinary Iranians is slow and indirect; hardliners exploit the visible gap.

2.2 Seven JCPOA Deficiencies Now Repeated

The RCSA v3.6 also identifies seven structural deficiencies of the JCPOA that risk being repeated in any hastily constructed framework. This Enhanced Accord specifically addresses each:

- **Deficiency 1: Monolithic Architecture — when one element fails, everything fails.** Fix: Modular three-stage structure; failure of Stage 3 does not unwind Stages 1–2.
- **Deficiency 2: Political Naivete — technical compliance does not generate its own political support.** Fix: Domestic political architecture engineered for both governments (Section 18).
- **Deficiency 3: Western Anchoring — framework structured around US concerns, excluding multipolar actors.** Fix: China and India as IHTA observers; RCSA multipolar integration in Stage 3.

- **Deficiency 4: Economic Thinness — relief without institutional infrastructure does not create sticky interdependence.** Fix: Eight-tranche sanctions architecture building toward full normalization; IHTA revenue sharing.
- **Deficiency 5: Binary Design — compliance or collapse, no middle terrain.** Fix: Five-tier risk appetite framework; stabilization holds; graduated exit architecture.
- **Deficiency 6: Social Blindness — no attention to human terrain and civilian constituencies.** Fix: Iranian Civilian Reconstruction Fund; humanitarian tranche Day 1; youth and civil society components.
- **Deficiency 7: Informational Nakedness — no defense against narrative warfare.** Fix: Authorized Terminology Registry; Joint Communication Windows; Public Wins Ledger.

2.3 Specific Stalls in the Current Proposals

Beyond the structural pathologies, the specific 9-point and 14-point proposals stalled on five discrete structural problems that this Accord directly resolves:

Stalled Element	Root Cause	This Accord's Fix
Front-loaded nuclear conditionality (US 9-point)	Iran cannot accept enrichment restrictions before receiving visible sovereignty wins.	Nuclear Sovereignty Exchange: each nuclear deliverable synchronized with a corresponding sovereignty deliverable on the same day.
Reparations as gateway condition (Iran 14-point)	Politically impossible for Trump administration; constitutionally problematic; deal-killer.	Replaced by: pilot \$250M asset release; tranche architecture; \$200M/year IHTA reconstruction revenue.
30-day total war termination (Iran)	Operationally impossible even if agreed; banking, sanctions, and institutional steps cannot complete in 30 days.	Stage 1 closes the war-fighting domain in 14 days. Iran can say 'the war ended in 14 days.' Institutional work proceeds in Stages 2–3.
US force-posture concession (Iran demand)	Gulf basing commitment incompatible with US treaty obligations to Saudi Arabia, UAE, Bahrain, Qatar, Kuwait.	No basing changes. Carrier transit windows in Hormuz become pre-notified. Iran frames as ending US unilateralism; US frames as multilateral normalization.
Lebanon bundled into bilateral accord (Iran 14-point)	Lebanon involves Israel, Hezbollah, LAF, UNIFIL, Lebanese government — none party to US-Iran negotiation.	Lebanon track separated. Iran commits to Hezbollah operational pause only. Full Lebanese settlement referred to Crescent Compact.

SECTION 3 — THE RCSA STRATEGIC LOGIC: THE MODULAR SOLUTION

3.1 The Structural Stability Deficit

The RCSA v3.6 opens with a precise diagnosis of the Middle East's fundamental problem: a structural stability deficit that has persisted for decades because every comprehensive settlement attempt used a diplomatic architecture structurally unsuited to the region's political realities. The deficit manifests in five dimensions that this Accord and its successor frameworks are designed to address:

- **Nuclear Ambiguity:** Iran's program creates permanent crisis conditions that preclude normal economic and diplomatic relations.
- **Proxy Warfare Networks:** Operate across multiple borders; cannot be resolved through bilateral state-to-state negotiation alone.
- **Humanitarian Crises:** Refugees, food insecurity, water scarcity create displacement that destabilizes host states.
- **Economic Containment:** Produces poverty and radicalization that undermine moderate political forces.
- **Absence of Regional Security Architecture:** Every bilateral tension can escalate into systemic crisis because there are no institutional de-escalation mechanisms.

3.2 The Modular Solution: Six Independent Tracks

The RCSA v3.6 replaces monolithic architecture with parallel independent tracks that advance based on track-specific compliance metrics. Failure in one track does not cascade to others. This Enhanced Accord implements the same modularity in its three-stage structure. The six tracks of the full RCSA — nuclear, economic, humanitarian, security, governance, and reconstruction — are introduced in this Accord at the appropriate pace:

Track	Introduced In	Governing Institution	Full Activation
Nuclear	Stage 1 (Day 1)	IAEA + JIG	Stage 2 (Day 60, verified exchange complete)
Economic / Sanctions	Stage 1 (Day 7, humanitarian)	JIG + Swiss Channel + OFAC	Stage 3 (Day 180, full RCSA architecture)
Humanitarian	Stage 1 (Day 3, first transit)	UN OCHA + IHTA Tier 1	Stage 2 (Day 30, banking channels)
Maritime Security	Stage 1 (Day 1, JHA provisional)	IHTA Council + Maritime Coordination Cell	Stage 3 (Day 90, permanent IHTA)

Track	Introduced In	Governing Institution	Full Activation
Regional Security Dialogue	Stage 3 (Day 75)	JIG + expanded membership	Successor Framework (Day 180+)
Reconstruction / Development	Stage 2 (IHTA revenue begins)	Iranian Civilian Reconstruction Fund + World Bank trustee	Successor Framework (Day 180+)

3.3 Why Hormuz and Nuclear Together

The nuclear file cannot be solved without Hormuz, and Hormuz cannot be solved without a nuclear resolution that both sides can claim as a win. By bundling the nuclear exchange with the Hormuz reset — not as conditionality but as synchronized reciprocal sovereignty — the Accord creates an architecture in which each side's concession is matched by a visible, tangible gain. Iran does not give up its nuclear ambiguity for nothing; it trades that ambiguity for permanent co-governance of Hormuz, the return of over \$100 billion in sovereign assets, and guaranteed civilian nuclear fuel supply. The United States does not lift the blockade for nothing; it receives verifiable elimination of Iran's weapons-grade stockpile, a civilian enrichment ceiling, and conversion of Fordow.

SECTION 4 — ARCHITECTURE: A THREE-STAGE FRAMEWORK

The Accord is structured as three sequenced stages, each with a defined entry condition, a defined set of obligations, a defined verification standard, and a defined transition trigger to the next stage. The architecture is deliberately modular: failure at any stage does not collapse prior stages. Stage 1 deliverables are irreversible once verified; Stage 2 deliverables are irreversible once verified; only Stage 3 is open-ended.

	Stage 1: Hormuz Reset	Stage 2: Nuclear Exchange	Stage 3: Permanent Architecture
Duration	Days 1–14	Days 15–60	Days 61–180
Primary Objective	End dual blockade; stand up Joint Hormuz Authority; halt war-fighting; initiate nuclear stockpile transfer.	Return first asset tranches; lift first sanctions tranche; complete nuclear exchange; verify Fordow conversion.	Convert JHA to permanent IHTA; complete sanctions relief; open regional security dialogue on successor framework.
Closing Trigger	Verified bilateral lifting of both blockades; first 200+ commercial vessels through Hormuz; IAEA confirms weapons-grade stockpile custody.	Asset return mechanics; sanctions sequencing; nuclear exchange verified (enrichment ceiling + Fordow).	Permanent IHTA charter; comprehensive successor framework (RCSA, Crescent Compact, RAMES) opened.
Reversibility	Stage 1 deliverables irreversible upon verification.	Pilot + first two tranches irreversible. Subsequent tranches subject to 150-day snapback friction.	Each measure subject to RCSA risk appetite framework and snapback friction ladder.
What is deferred	Nothing — all immediate triggers addressed or referred to successor.	Ballistic-missile architecture; comprehensive Lebanon settlement.	Comprehensive regional proxy architecture; Israel-Lebanon final status; Saudi-Israeli normalization.

4.1 Why Three Stages

A single comprehensive agreement is operationally and politically infeasible in this window. The MOU framework under discussion on May 7 has correctly accepted this reality by proposing a 30-day negotiating period after a war-termination declaration. This Accord converts that 30-day mandate into 180 days of structured, irreversible progress. Stage 1 ends the war-fighting domain. Stage 2 resolves the nuclear question. Stage 3 establishes the permanent institutional architecture and hands off to the successor framework. Each stage produces irreversible facts on the ground that cannot be rescinded even if subsequent stages face difficulty.

4.2 The Waltz Philosophy: Synchronized Reciprocal Motion

The Accord's sequencing follows what the RCSA and its predecessor frameworks call the Waltz Philosophy of synchronized reciprocal motion: each commitment by one party is matched by a corresponding commitment by the other; neither party is exposed to defection; verification is shared. This is not mere political optics — it is structural. The Iranian government can defend the sequencing as Iran responding only when the United States has moved first or moved simultaneously. The US administration can defend the sequencing as the US moving only when Iran has moved first or moved simultaneously. Both characterizations are factually correct.

SECTION 5 — STAGE 1: THE HORMUZ RESET (DAYS 1–14)

5.1 The Seven Stage 1 Deliverables

Stage 1 is the heart of the Accord. It runs for 14 days from signature and produces seven irreversible operational deliverables. By Day 14, the dual blockade is lifted, the Joint Hormuz Authority is operating in provisional mode, the war-fighting domain is closed, the first sovereign asset transfer is complete, and Iran's weapons-grade enriched uranium stockpile is under verified IAEA custody in a third country.

Day	Deliverable	Verification Standard
1	Joint signature of Accord. Permanent ceasefire at 0000 GMT on all US-Iran fronts.	Pakistani PM Office certification; UN Secretary-General notification; simultaneous published statements.
1	Nuclear Sovereignty Exchange Step 1: Iran transfers entire 60%-enriched uranium stockpile to IAEA custody in Oman for secure storage.	IAEA Director-General confirmation; mass spectrometry verification; continuous CCTV and satellite monitoring.
1	Pilot Iranian sovereign asset release: USD \$250 million to Iranian Central Bank. Unconditional; non-reversible.	US Treasury OFAC general license; Iranian Central Bank confirms receipt; IMF and World Bank registration.
1	Project Freedom suspended. US naval assets remain in position for transition to JHA convoy support on Day 7.	CENTCOM operational order; Pakistani guarantor confirmation.
3	First humanitarian-flagged vessel transits Hormuz under JHA observation. Zero fee, no inspection delay.	Lloyd's List vessel tracking; UN OCHA confirmation; JHA observation post at Khasab, Oman.
7	Synchronized lifting of dual blockade. Iran removes all Hormuz restrictions; US lifts naval blockade on Iranian commercial ports. Simultaneous declarations.	JHA observation vessels (US, Iranian, Omani flagged); Lloyd's List; UN OCHA; guarantor naval observers.
14	Stage 1 closing certification. JHA provisional mode confirmed; first 200-vessel transit count; IAEA custody verified; ceasefire intact.	Pakistan + Oman + Switzerland concurrent certification; transition to Stage 2 automatic.

5.2 The Synchronized Lift Mechanism

The single most important mechanical element of Stage 1 is the synchronized lifting of the dual blockade on Day 7. This mechanism is drawn from the RCSA Wartime Entry and Post-Conflict Baseline Protocol, with operational hardening for the current configuration.

- **Step 1 (Day 1):** Both governments issue identical written declarations to the Pakistani guarantor, Omani technical channel, and Swiss financial channel, committing to the synchronized lift on Day 7.

- **Step 2 (Days 1–6):** The Joint Hormuz Authority's Maritime Coordination Cell in Muscat finalizes Day 7 operational protocols. Iran's transit-permit system transitions to JHA-coordinated electronic clearance. US Fifth Fleet establishes coordination links with Iranian Navy and IRGC-Navy through the Omani-hosted hotline.
- **Step 3 (Day 7, 0000 GMT):** Both lifts declared operative simultaneously. JHA observation vessels (US, Iranian, Omani flagged, with international observers) take station at Khasab and Bandar Abbas to monitor first transits.
- **Step 4 (Day 7 +24h):** First commercial vessel transits in each direction under JHA observation. Lloyd's List and UN OCHA confirm. JHA issues first daily transit report.
- **Step 5 (Day 7 +72h):** If both lifts not verified by this point, unlifted side's lift commitment suspended. Matter referred to JHA emergency session and Pakistani guarantor. Default: maintain both blockades until synchronization achieved.

5.3 Project Freedom Transition

Project Freedom, already paused as of May 6, is addressed as follows under this Accord. From signature, the pause becomes a formal suspension rather than a tactical delay. On Day 7, Project Freedom assets are re-tasked under the Joint Hormuz Authority's Maritime Safety Fund as convoy-support vessels available to all commercial transits regardless of flag, in coordination with Iranian Navy and Omani Navy. The political framing for the United States is that Project Freedom 'succeeded' in establishing freedom of navigation. The political framing for Iran is that unilateral US escort has been replaced by joint multilateral authority. Both framings are factually accurate.

5.4 US Commitments in Stage 1

- Cease all offensive military operations against Iran, Iranian forces, Iranian-linked installations, and Iranian-linked vessels.
- Lift the naval blockade on Iranian commercial ports on Day 7 in synchronized motion with Iran's Hormuz reopening.
- Suspend Project Freedom unilateral escort operations on Day 1; transition assets to JHA-coordinated convoy support on Day 7.
- Issue OFAC general license for \$250M pilot asset transfer on Day 1.
- Issue OFAC general license for humanitarian trade (medicine, medical equipment, food, agricultural inputs, aviation safety parts) within 14 days; unconditional and not subject to reversal.
- Pause all new sanctions designations against Iranian individuals and entities for Stage 1 (existing designations remain).
- Confirm in writing that the nuclear exchange is a Sovereign Energy Partnership, not an imposed dismantlement.
- Guarantee, through the Section 123 Agreement negotiation (opened Day 150), that Iran will have guaranteed civilian reactor fuel supply through an international consortium with multilateral backstop.

5.5 Iranian Commitments in Stage 1

- Cease all offensive operations against US forces, US bases, US-flagged or US-affiliated vessels, and US-allied Gulf state infrastructure.
- Open the Strait of Hormuz beginning Day 3 (humanitarian vessels) and Day 7 (full commercial reopening), synchronized with US blockade lift.
- Withdraw IRGC small craft from positions within 5 nautical miles of the central transit corridor; cease vessel boardings except in JHA-coordinated scenarios.
- Commence good-faith mine-clearing operations with JHA Maritime Safety Working Group, with technical support from Oman, UK (NATO mine countermeasures), and UN-supervised civilian mine-clearance mission.
- Initiate Nuclear Sovereignty Exchange Step 1: Transfer entire 60%-enriched uranium stockpile to IAEA custody in Oman on Day 1; maintain no enrichment above 3.67% from Day 1 forward.
- Transmit to Houthi leadership an instruction to implement a Red Sea operational pause on commercial shipping, with acknowledgment that confirmed Houthi attacks using Iranian-supplied weapons constitute a material breach.
- Refrain from passage of the proposed parliamentary 12-point Hormuz statute for the duration of Stage 1.

SECTION 6 — STAGE 2: DE-ESCALATION AND NUCLEAR EXCHANGE (DAYS 15–60)

Stage 2 converts the operational stabilization achieved in Stage 1 into durable economic, institutional, and nuclear measures. By the end of Stage 2, half of Iran's frozen sovereign assets have been returned, the first sanctions tranche is operative, the IAEA has fully redeployed under partnership terms, and the comprehensive nuclear exchange is verified complete: enrichment is capped at 3.67% with a moratorium structure on higher enrichment, Fordow is converted to medical-isotope use, and continuous monitoring is active.

6.1 Stage 2 Deliverables

Day	Deliverable	Conditionality
15	Stage 2 activation. Joint Implementation Group (JIG) inaugurated, hosted in Geneva. Membership: US, Iran, Pakistan, Oman, Switzerland, EU observer, UN Special Envoy.	Triggered by Stage 1 closing certification.
20	IAEA full redeployment under Sovereign Energy Partnership terms. Continuous monitoring at Natanz, Isfahan, and Oman custody facility.	Iran issues invitation; IAEA Director General confirms.
30	Nuclear Sovereignty Exchange Step 2: Iran declares and verifies civilian enrichment ceiling at Natanz; all higher-enrichment centrifuges idled under IAEA seal. Second asset tranche (25% of remaining frozen assets). First sanctions tranche (aviation safety, consumer exports).	JIG verification; 30-day Congressional review window.
45	Joint Hormuz Authority transitions to operating mode. Tier 1 humanitarian transit (zero toll) and Tier 2 standard commercial transit (\$0.15/ton) operative.	JHA Council unanimous certification.
60	Nuclear Sovereignty Exchange Step 3: Fordow converted to medical-isotope research center under IAEA oversight. Iran hosts inaugural International Medical Isotope Summit. Third asset tranche (additional 25%, cumulative 50%). SWIFT reconnection process commenced for FATF-compliant Iranian banks.	JIG verification; nuclear exchange certified complete.

6.2 The Enrichment Moratorium Architecture

The current MOU discussions include a moratorium on uranium enrichment of between 12 and 15 years, with Iran's 5-year offer and the US 20-year demand converging toward this range. This

Enhanced Accord incorporates a moratorium architecture that resolves this disagreement through a graduated structure consistent with RCSA Phase progression:

Phase	Duration	Enrichment Standard	IAEA Monitoring	Condition for Advancement
Moratorium Phase	Years 1–12 (minimum; extendable)	Zero enrichment above 3.67% (all higher-enrichment centrifuges under IAEA seal)	Continuous + unannounced inspections	Clean IAEA certification at 12-year review; no material breach
Civilian Transition	Years 13–15	3.67% enrichment for civilian fuel-cycle purposes at Natanz only	Continuous monitoring; weekly environmental sampling	Fuel supply guarantee deposited in escrow; Section 123 Agreement operative
Steady-State Civilian	Year 16 onwards	3.67% enrichment under full IAEA safeguards; RCSA Phase 3 architecture	Standard IAEA additional protocol + enhanced bilateral verification	RCSA five-year renewal confirmed; all compliance indicators at green

Any material breach of enrichment limits triggers automatic moratorium extension of 2 years per breach, as proposed in the current MOU discussions. Extension is determined by JIG majority on the basis of IAEA technical reporting, not by unilateral US certification. This prevents the extension mechanism from becoming a tool for geopolitical pressure unrelated to actual nuclear behavior.

6.3 Asset Return Architecture

Approximately \$100–120 billion in Iranian sovereign assets remain frozen across multiple jurisdictions. The Accord adopts the tranche structure from the RCSA Sanctions Synchronization Module:

Tranche	Timing	Amount	Trigger	Reversibility
Pilot	Day 1 (Stage 1)	\$250M	Signature	Non-reversible
1	Day 30 (Stage 2)	25% minus pilot	Stage 1 closed; IAEA deployed; stockpile custody verified	Non-reversible
2	Day 60 (Stage 2 close)	25%	60-day verified compliance; nuclear exchange verified	Non-reversible
3	Day 120 (Stage 3)	20%	Permanent IHTA operational; Stage 3 dialogue opened	30-day remediation window for material breach
4	Day 180 (Stage 3 close)	15%	180-day comprehensive compliance; nuclear exchange maintained	Subject to JIG material-breach review
Reserve	Day 365	10%	12 months sustained compliance; clean RCSA certification	Held pending material-breach determination
Balance	Year 2–3 (RCSA Tranches 5–8)	Remainder	Full RCSA Phase 2–3 compliance; banking normalization	RCSA risk appetite framework

The pilot and Tranches 1 and 2 are explicitly non-reversible upon transfer. This matches operational reality: Iran's Stage 1 nuclear and maritime concessions are physically irreversible once executed. The non-reversibility of the first 50 percent of asset return therefore reflects the non-reversibility of Iran's Stage 1 concessions.

SECTION 7 — STAGE 3: PERMANENT ARCHITECTURE (DAYS 61–180)

Stage 3 runs from Day 61 through Day 180 and is the bridge to the comprehensive successor framework. Its dual purpose is to convert the provisional Joint Hormuz Authority into the permanent International Hormuz Transit Authority, and to open the broader regional dialogue on ballistic-missile architecture, proxy stabilization, and the Lebanon track.

Day	Deliverable	Conditionality
61	Stage 3 activation. JIG expanded to include People's Republic of China and a GCC rotating chair (Oman, Qatar, or UAE) as observers.	Stage 2 closing certification.
75	Regional Security Dialogue opened. US and Iran begin formal dialogue on ballistic-missile confidence-building measures, range notification protocols, and regional non-proliferation architecture.	Stage 3 activated; both governments confirm willingness to engage.
90	Provisional Joint Hormuz Authority converted to permanent International Hormuz Transit Authority (IHTA) by treaty. Permanent Council seats established.	JIG unanimous certification; UN Secretary-General confirms neutral chair appointment.
120	Third asset tranche: 20% transferred. Cumulative 70% returned. Sanctions relief Tranche 2 operative (petrochemicals; oil services; Tier 2 banking).	JIG verification; nuclear moratorium maintained; Congressional review window.
150	Section 123 Agreement negotiation commenced. Civilian reactor fuel supply guarantee through international consortium initiated. IAEA fuel bank backstop confirmed.	Iran formally requests; US Department of Energy confirms negotiation framework.
180	Stage 3 closing. Fourth asset tranche: 15% transferred (cumulative 85%). Successor framework — RCSA v3.6, Crescent Compact v1.7, or RAMES v9.1 — formally opened for negotiation.	JIG closing certification; comprehensive 180-day compliance review.

7.1 The Regional Security Dialogue

Stage 3 does not produce a comprehensive missile agreement. It produces a Regional Security Dialogue framework establishing the parameters for confidence-building measures. The Dialogue is expected to address: ballistic-missile range notification protocols; regional non-proliferation architecture; proxy operational monitoring mechanisms; and verification architecture including satellite monitoring and JIG-facilitated incident review. These elements are drawn from the architecture proven in the RCSA Annex A (Nuclear Verification Pathways) and the Crescent Compact regional security modules.

7.2 What Stage 3 Explicitly Does Not Do

Stage 3 is bounded. The following are referred to the successor framework:

- Comprehensive ballistic-missile limitations (RCSA Part VIII regional security architecture or Crescent Compact Part VIII)
- Israel-Lebanon-Hezbollah final-status terms (Crescent Compact Part II)
- Israeli-Palestinian political settlement (excluded entirely; no party to this Accord is party to that question)
- Saudi-Israeli normalization (Crescent Compact Part IV; not bundled with this Accord)
- Houthi political integration in Yemen (RCSA Annex N or successor)
- Syria reconstruction (Crescent Compact Part VII)
- Iraq militia integration (RCSA sub-state authority modules)

This bounded scope is the Accord's primary virtue. By refusing to be a comprehensive treaty, it avoids the comprehensive treaty's failure mode: collapse under the weight of every regional issue. Hormuz, blockades, assets, ceasefire, nuclear exchange — closed by Day 60. Permanent IHTA and regional dialogue — closed by Day 180. Everything beyond referred to its proper instrument.

SECTION 8 — THE HORMUZ MECHANISM: INTERNATIONAL HORMUZ TRANSIT AUTHORITY

The single most important institutional element of this Accord is the International Hormuz Transit Authority — in its provisional Stage 1–2 form as the Joint Hormuz Authority, and in its permanent Stage 3 form as the IHTA. The Hormuz mechanism is what allows both sides to characterize the outcome as a sovereign win. It is simultaneously the United States' freedom-of-navigation achievement and Iran's permanent governance seat replacing decades of US unilateralism.

8.1 IHTA Council Composition

Member	Status	Role
Islamic Republic of Iran	Permanent voting member	Senior permanent seat reflecting territorial sovereignty over northern and eastern shores. Chair authority in alternating years.
United States of America	Permanent voting member	Permanent seat reflecting principal maritime security provider role. Co-chair authority in alternating years.
GCC Rotating Chair	Permanent voting member	Single seat rotating annually among Oman, Qatar, and UAE. Tie-breaking authority on enforcement matters where US and Iran disagree.
European Union	Observer (speaking rights, no vote)	Major energy consumer. Chairs Environmental and Safety Subcommittee.
People's Republic of China	Observer (speaking rights, no vote)	Largest single Gulf-oil importer. Technical observer. Activated in Stage 3.
UN Secretary-General Appointee	Neutral chair (non-voting; tie-breaking on procedural matters)	Appointed from standing pool: Switzerland, Singapore, Brazil, Sweden, Oman. Either Iran or US may strike one candidate per cycle.
Iraq	Conditional observer	Observer when issues directly affect Iraqi maritime exports.
India	Conditional observer	Observer when issues directly affect Indian energy imports.
France / NATO	Observer (Stage 3)	Reflecting multinational Hormuz security initiative; operational coordination with IHTA Maritime Safety Working Group.

8.2 Decision Rules

- **Routine operational decisions:** Weighted majority of permanent voting members (any 2 of 3 agree). Tolling rate adjustments within the inflation-plus-2% annual cap; safety protocols; maintenance scheduling.

- **Enforcement actions affecting Iranian-flagged vessels:** Requires Iranian concurrence or neutral chair casting vote.
- **Enforcement actions against all other vessels:** Consensus-minus-one (either Iran or US may object; GCC chair resolves with neutral chair).
- **Structural changes to tolling architecture or governance:** Unanimous permanent member consent plus 90-day notice.
- **Emergency enforcement in imminent threat scenarios:** 24-hour mandatory consultation via de-escalation hotline; narrowly tailored temporary enforcement permitted with 24-hour post-hoc notification to Council.

8.3 Tolling Architecture and Revenue Allocation

Tier	Vessel Category	Rate	Clearance
1	Humanitarian essential (medicine, food, medical equipment)	Zero	24-hour fast-track
2	Standard commercial (general cargo, container, bulk)	\$0.15/ton	48-hour standard
3	Energy/premium (oil tankers, LNG, chemicals)	\$0.25/ton or \$35,000 flat for VLCC	Standard with surcharge structure
Military (member states)	Vessels of IHTA Council member states	Exempt	Pre-notified transit window

Annual estimated revenue: ~\$500 million, allocated as follows:

Allocation	Percentage	Annual Estimate	Use
Iranian Civilian Reconstruction Fund	40%	~\$200M	Repair of infrastructure damaged in Operation Epic Fury. Administered by IHTA with World Bank trustee oversight; EITI-published quarterly. Iran controls reconstruction priorities.
International Maritime Safety Fund	35%	~\$175M	Joint hotline operations, coast-guard coordination, pollution response, navigational safety, mine clearance reserve.
IHTA Operations and Reserve	25%	~\$125M	Headquarters operations (Muscat), staff salaries, technology infrastructure. Capped at 24 months operating costs; surplus redirected to Reconstruction Fund.

8.4 Maritime De-Escalation Protocols

- **Maritime Incident Hotline:** 24/7 Omani-hosted hotline linking IRGC-Navy, US Fifth Fleet, Iranian Navy, and JHA Maritime Coordination Cell. 2-hour mandatory response window.
- **Vessel Harassment Parameters:** Approach within 100 meters at speed; illumination with targeting radar; simulated attack maneuvers. Any harassment triggers immediate hotline and 24-hour JIG notification.
- **No-Seizure Zone:** Commercial vessels in IHTA corridor international waters may not be seized by any party without prior JHA notification and attribution process.
- **Lane Separation:** Three lanes separated by 5-nautical-mile buffers. Lane 1 northbound near Iranian coast; Lane 2 center neutral; Lane 3 southbound near Omani coast. Speed limit 15 knots.
- **Mine Prohibition:** Any detected naval mine in the IHTA corridor triggers automatic UN Security Council emergency session and JIG material-breach review.
- **Carrier Transit Notification:** US carrier-group transits occur only during pre-announced 48-hour windows. Iranian Navy may observe from beyond 20 nm but may not intercept or simulate attack runs.
- **Toll-Evasion Enforcement:** Vessels refusing to pay IHTA tolls are denied port access in framework-compliant states until paid. Kinetic interception for toll enforcement is explicitly prohibited.

SECTION 9 — THE NUCLEAR SOVEREIGNTY EXCHANGE: FULL ARCHITECTURE

The nuclear exchange is the most technically complex and politically sensitive element of this Accord. Unlike the original nuclear-deferred framework, which merely promised not to advance — leaving Iran's weapons-grade stockpile in place and the enrichment cascades spinning — this Accord resolves the nuclear question in the opening stages as a Sovereign Energy Partnership that Iran proposes, controls, and claims as a sovereign choice.

Iran trades strategic nuclear ambiguity for three permanent, irreversible gains: co-governance of Hormuz, return of sovereign assets, and guaranteed civilian fuel supply that can never be denied. The United States trades sanctions and blockade relief for concrete, verifiable elimination of Iran's weapons-grade material. Both sides win something they cannot win any other way.

9.1 Three Governing Principles

- **Principle 1: Iran proposes it.** — The Accord adopts the framework that Iranian negotiators floated in private channels — that Iran would 'voluntarily redirect its enrichment program toward guaranteed civilian cooperation' in exchange for 'institutional equality in the Gulf and irreversible economic restoration.' Adopting Iran's own framing eliminates a major source of domestic opposition.
- **Principle 2: Every nuclear deliverable is matched by a sovereignty deliverable.** — Day 1 stockpile transfer is synchronized with Day 1 Hormuz Authority signature and Day 1 pilot asset release. Day 30 enrichment ceiling synchronized with Day 30 first sanctions tranche. Day 60 Fordow conversion synchronized with Day 60 second asset tranche and SWIFT reconnection. Iran receives something permanent and valuable for every nuclear step.
- **Principle 3: Iran retains all NPT rights and gains additional guaranteed protections.** — The enrichment ceiling is framed as a sovereign reciprocal commitment for civilian fuel-cycle purposes, not an imposed restriction. The Section 123 Agreement (Day 150) provides guaranteed civilian reactor fuel supply. The multilateral fuel-bank backstop ensures Iran can never be denied fuel for civilian purposes.

9.2 The Three Exchange Steps

Step	Day	Iranian Action	US/IAEA Response	Verification
Step 1	Day 1	Transfer entire 60%-enriched uranium stockpile to IAEA custody in Oman. Issue formal invitation to IAEA for Natanz and Isfahan monitoring.	Issue \$250M pilot asset release. Suspend Project Freedom. Confirm Sovereign Energy Partnership framing in writing.	IAEA Director-General confirmation; mass spectrometry; continuous CCTV and satellite monitoring of Oman facility.
Step 2	Day 30	Declare and verify civilian enrichment ceiling at Natanz; idle all higher-enrichment centrifuges under IAEA seal. Begin moratorium phase.	Issue first sanctions tranche (aviation safety, consumer exports). Process second asset tranche.	IAEA continuous monitoring at Natanz; weekly environmental sampling; JIG certification.
Step 3	Day 60	Fordow conversion to medical-isotope research center (molybdenum-99, iodine-131) under IAEA oversight. Host International Medical Isotope Summit.	Process third asset tranche. Begin SWIFT reconnection process for FATF-compliant Iranian banks.	IAEA certifies Fordow conversion; international scientific collaboration agreements confirmed; JIG closing certification.

9.3 Stockpile Disposition

The disposition of Iran's transferred weapons-grade material follows IAEA procedures with Iranian consent. Three options are available, consistent with the current MOU discussions:

- **Option A — Third-Country IAEA Custody (Oman, preferred):** Material remains in IAEA-controlled storage at the Oman custody facility pending disposition decision. This is the Enhanced Accord's default option. The Oman facility is under IAEA control — not US control. The United States cannot unilaterally seize or redirect the material.
- **Option B — Fuel Assembly Conversion:** Weapons-grade material is diluted and fabricated into fuel assemblies for use in Iran's Bushehr nuclear power plant, with international consortium technical support. This option maximizes Iranian economic value from the exchange.
- **Option C — Third-Country Transfer (Russia or multilateral):** Material is transferred to a third country's IAEA-supervised storage or processing facility (Russia, under the precedent of the 2015 deal, or an alternative multilateral arrangement). This option was proposed in the current MOU discussions. The Enhanced Accord accepts this option with the condition that Iran must consent to the specific receiving country.

Note on the US transfer demand: President Trump has stated a preference for Iran's highly enriched uranium to be transferred to the United States. This Enhanced Accord accommodates this preference as Option C with the United States as the receiving country, subject to Iranian consent and IAEA

monitoring of the transfer. The Accord does not preclude this option; it ensures it can only occur with Iranian sovereign consent, not as a condition imposed on Iran.

9.4 The Fuel Supply Guarantee

The nuclear exchange is only politically survivable for Iran if it comes with an unbreakable guarantee that Iran can never be denied civilian nuclear fuel as a tool of geopolitical pressure. The RCSA v3.6 and the Hormuz First Accord both identify the Section 123 Agreement and multilateral fuel-bank backstop as the institutional answer. The fuel supply guarantee activates on Day 150 as follows:

- Section 123 Agreement negotiation commenced with US Department of Energy: guaranteed civilian reactor fuel supply for all existing and planned Iranian civilian reactors.
- International consortium arrangement with Russia, France, and/or other nuclear fuel suppliers as backstop.
- IAEA fuel bank access: Iran joins the IAEA low-enriched uranium bank, providing a second-tier guarantee.
- Escrow mechanism: fuel-supply commitment deposited in an escrow arrangement that survives any snapback of non-nuclear sanctions.
- Survival clause: even if the US triggers sanctions snapback on non-nuclear grounds, the fuel supply guarantee remains in force unless the JIG determines a nuclear material breach.

SECTION 10 — WHAT THE UNITED STATES WINS

10.1 Headline Wins

- **Strait of Hormuz reopened within 7 days of signature.** Verified by Lloyd's List, UN OCHA, and JHA observation. Gas-pump prices begin to fall within weeks. The single most impactful domestic political deliverable before the midterm election cycle.
- **Project Freedom characterized as having succeeded.** Project Freedom escort assets transition to JHA convoy support. The President can credibly claim the announced operation achieved its stated objective: opening the Strait. No Iranian-American kinetic exchange; no loss of US naval positioning.
- **Freedom of navigation institutionalized in international law.** IHTA Charter formally guarantees freedom of transit under international treaty. Iran cannot unilaterally close the Strait without committing a treaty violation triggering automatic UNSC and JIG sessions.
- **Verified elimination of Iran's weapons-grade uranium stockpile.** Iran's entire 60%-enriched uranium stockpile transferred to IAEA custody on Day 1, verified by mass spectrometry and continuous monitoring. A concrete, irreversible nuclear rollback exceeding anything achieved in the JCPOA.
- **Enrichment verifiably capped under moratorium.** 12–15 year moratorium on enrichment above 3.67%, with IAEA continuous monitoring. After moratorium, 3.67% civilian ceiling. Violation extends moratorium. Trump administration can credibly claim Iran's nuclear program has been civilianized and moratorium-bound.
- **Fordow converted to medical use.** The fortified Fordow facility verified by Day 60 to be producing medical isotopes under international scientific collaboration, not enriching uranium.
- **No basing concessions; no force-posture concessions.** US bases in the Gulf remain. No troop withdrawals required. The only US force-posture adjustment is conversion of Project Freedom escort to JHA convoy support — itself characterizable as a US-led multilateral framework.
- **Bipartisan domestic political defensibility.** Asset return structured as Iranian sovereign property restitution, not US expenditure. Each major asset tranche after the pilot subject to Congressional review window. Snapback authority preserved with narrowly defined material-breach triggers.
- **Israeli security backstop preserved.** Iran's enrichment is verified to be moratorium-bound and civilianized. Lebanon track separated. Israeli intelligence operations and self-defense rights unaffected. Israel retains observer status on Iran-related JIG matters in Stage 3.

10.2 Domestic Political Messaging

"We forced Iran to open Hormuz, eliminate its weapons-grade uranium, accept a 12-year moratorium on enrichment, and convert Fordow to peaceful use. We got their sovereign assets returned in tranches with Congressional review at every step. We didn't give up a single base. American forces did not leave the region. Gas prices are coming down. And we did it without losing another American life. This is what maximum pressure looks like when it works."

SECTION 11 — WHAT IRAN WINS

11.1 Headline Wins

- **Permanent end to active hostilities within 14 days of signature.** The bilateral war is ended under terms registered with the United Nations and witnessed by Pakistan, Oman, and Switzerland. Iran can credibly claim it has terminated the war Israel and the United States started, on terms Iran accepted as sovereign reciprocal commitments.
- **US naval blockade lifted on Day 7.** The naval blockade on Iranian commercial ports — imposed April 13 — is lifted in synchronized motion with Iran's Hormuz reopening. Iranian ports return to commercial operation.
- **Project Freedom unilateral escort terminated.** The US Navy unilateral escort operation is suspended on signature and replaced by joint multilateral authority in which Iran holds a permanent co-equal governance seat.
- **Permanent governance seat on the IHTA.** Iran holds a permanent voting seat on the International Hormuz Transit Authority Council, with chair authority on alternating years. The unilateral US-led order in the Strait is replaced with formal Iranian co-equality.
- **\$200 million per year in Hormuz toll revenue.** 40% of IHTA revenues — approximately \$200 million annually — earmarked for the Iranian Civilian Reconstruction Fund. Audited by World Bank trustee; Iran controls reconstruction priorities.
- **Return of frozen sovereign assets in staged tranches.** Approximately \$100–120 billion in frozen sovereign assets returned. Day 1 pilot of \$250M; cumulative 50% by Day 60; cumulative 85% by Day 180. Pilot and first two tranches explicitly non-reversible.
- **Nuclear program reoriented, not dismantled.** Iran retains all NPT rights. The moratorium is a sovereign reciprocal commitment, not coerced dismantlement. Iran's enrichment continues at 3.67% after the moratorium under guaranteed fuel supply. Fordow is converted to medical-isotope research under Iranian scientific leadership. Iran can never be denied civilian nuclear fuel.
- **Recognition as a major regional power.** Iran's permanent IHTA seat, framing of commitments as sovereign reciprocal acts, hosting of the International Medical Isotope Summit, and institutional co-equality with the United States collectively constitute formal acknowledgment of Iran as a co-equal regional power.
- **Missile program not addressed in this Accord.** This is a major Iranian win. The ballistic-missile file is referred entirely to the Stage 3 Regional Security Dialogue and successor framework, where Iran negotiates from the position of a recognized regional power — not from the position of a wartime adversary under maximum pressure.
- **Constitutional governance preserved.** No requirement on Iranian internal governance. The Mojtaba Khamenei succession is unaffected. Guardian Council and Assembly of Experts retain full constitutional authority.

11.2 Domestic Political Messaging

"We have ended the war the United States and Israel started against us. The American naval blockade of our ports has been lifted. Our frozen sovereign property is returning to the Iranian nation. The Strait of Hormuz is governed by an international authority on which Iran holds a permanent seat — replacing decades of American unilateralism. We have chosen to redirect our nuclear program toward guaranteed civilian energy leadership: our stockpile is under IAEA custody, our enrichment serves only civilian fuel, Fordow hosts international medical-isotope collaboration. Our NPT rights remain inviolable; our constitutional governance is unaffected; our sovereignty is intact. The Iranian nation has prevailed through wisdom and sovereign choice."

11.3 Hardliner Management Architecture

Critical to the Accord's Iranian survivability is endorsement by the IRGC, the Mojtaba Khamenei succession, and the senior clerical establishment. The following architectural elements are designed to facilitate that endorsement:

- Sovereign reciprocal-commitment language throughout — no clause requires Iran to acknowledge defeat or accept US conditions.
- IRGC Navy retains operational authority in Iranian territorial waters; JHA jurisdiction restricted to international waters.
- NPT rights preserved in full — the nuclear exchange is a moratorium and reorientation, not dismantlement.
- Missile program not addressed — Iran retains its full missile deterrent through this Accord.
- Asset return framed as restitution of Iranian sovereign property — not as US payment, not as concession.
- Hormuz toll revenue is Iranian property — 40% of IHTA revenues flow to Iranian Civilian Reconstruction Fund under Iranian programmatic control.
- Lebanon track separated — Iran not required to deliver Hezbollah disarmament as a condition.
- Nuclear exchange framed as Iran's initiative — Iran proposed the Sovereign Energy Partnership, selected Oman as custody destination, and chose medical-isotope conversion.
- Domestic Iranian narrative sovereignty explicitly protected — the government may characterize Iranian commitments in any terms consistent with meeting objective benchmarks.

SECTION 12 — WHAT THE REGION WINS

12.1 Saudi Arabia and the United Arab Emirates

The Gulf states have the largest direct stake. The dual blockade has driven energy market volatility costing regional revenues and depressing sovereign investment programs (Saudi Vision 2030, UAE diversification). Reopening Hormuz is a primary Gulf-state interest. The GCC rotating chair (annually rotating among Oman, Qatar, UAE) on the IHTA Council provides direct Gulf-state representation. The nuclear exchange — specifically the removal of Iran's weapons-grade stockpile and the moratorium — also reduces the perceived nuclear threat to Gulf capitals, making the Accord more palatable in Riyadh and Abu Dhabi. The Accord does not require Gulf states to normalize relations with Iran beyond what they have already initiated.

12.2 Israel

Israel is not a party to this Accord. Israeli interests are protected through four architectural elements: verified transfer of Iran's weapons-grade stockpile (eliminating the rapid-breakout threat); the 12–15 year enrichment moratorium (removing the timeline for weapons reconstitution); Iran's commitment to instruct Hezbollah on an operational pause; and explicit preservation of Israeli intelligence operations and self-defense rights. Israel's quiet acquiescence, rather than endorsement, is the design assumption. Israeli leadership is unlikely to actively oppose an accord that eliminates Iran's weapons-grade stockpile and imposes a decade-plus moratorium on enrichment — outcomes Israel could not achieve militarily at acceptable cost.

12.3 Pakistan, Oman, and Switzerland

Each of the three mediating channels gains institutionally. Pakistan gains a confirmed primary mediator role in a successful Middle East stabilization — the diplomatic achievement of a generation — plus access to GCC reconstruction financing as a stability broker. Oman hosts the IHTA secretariat in Muscat, the Maritime Coordination Cell in Khasab, and the IAEA nuclear custody facility — extending its decades-long backchannel role into formal institutional centrality. Switzerland gains the financial channel role for asset return and the JIG secretariat hosting function in Geneva.

12.4 France and the Multinational Initiative

France's deployment of the Charles de Gaulle and its role in convening a 40-nation maritime security initiative provides the multilateral legitimacy that converts the IHTA from a US-Iran bilateral arrangement into a genuinely international institution. France chairs the IHTA Environmental and Safety Subcommittee through the EU observer role, contributing the technical and institutional depth that differentiates the IHTA from prior bilateral maritime arrangements.

12.5 China and India

Both are major energy importers and both gain as IHTA technical observers. China gains a documented role in a US-orchestrated Middle East stabilization and predictable Gulf energy supply — a strategic prestige gain that outweighs the cost of abstaining from Iran-maximalist positioning. India gains predictable supply for its growing energy demand and the stability that supports Indian shipping interests.

12.6 Global Commerce and the Energy Market

The Hormuz closure has reduced monthly transits from ~3,000 vessels to 154, driving Brent crude to \$107/barrel and WTI to \$98/barrel before the current diplomatic movement drove prices back to \$96 and \$88 respectively on May 6 news. Full Hormuz reopening restores 20% of global oil and gas to predictable transit. The IHTA's rule-governed tolling architecture and crisis hotline reduce the volatility premium that has haunted Hormuz shipping since 1980.

SECTION 13 — SEQUENCING MATRIX AND RECIPROCAL MOVEMENT

The complete 90-day sequencing matrix, specifying both governments' exact obligations and the verification standard for each movement:

Day	United States Moves	Iran Moves	Verification
1	Suspends Project Freedom; ceases offensive operations; issues OFAC license for \$250M pilot transfer; confirms Sovereign Energy Partnership framework.	Ceases offensive operations; initiates weapons-grade stockpile transfer to IAEA Oman custody; transmits Hezbollah operational pause; transmits Houthi Red Sea pause.	Pakistan PM Office + UN Special Envoy + Oman + Switzerland concurrent.
3	Maintains ceasefire; OFAC humanitarian license issued.	First humanitarian-flagged vessel cleared for Hormuz transit.	Lloyd's List + UN OCHA + JHA observation post Khasab.
7	Lifts naval blockade on Iranian commercial ports; transitions Project Freedom assets to JHA convoy support.	Opens Hormuz to all commercial transit; withdraws IRGC small craft from central corridor; commences mine-clearing.	JHA observation vessels (US, Iran, Oman flagged); Lloyd's List; UN OCHA.
14	Stage 1 closing certification.	Stage 1 closing certification.	Pakistan + Oman + Switzerland; transition to Stage 2 automatic.
20	Welcomes IAEA full redeployment under partnership terms.	Issues invitation to IAEA inspectors for declared sites and Oman custody facility.	IAEA Director General confirms; satellite imagery corroborates.
30	OFAC issues licenses for aviation safety parts and specialty exports; first sanctions tranche operative; processes second asset tranche.	Declares and verifies 3.67% enrichment ceiling; idles higher-enrichment centrifuges under IAEA seal; moratorium formally entered.	JIG verification; 30-day Congressional review window.
45	Confirms JHA transition to operating mode.	Confirms IHTA Tier 1 and Tier 2 tolling operative.	JHA Council unanimous certification.
60	Processes third asset tranche; SWIFT reconnection commenced for FATF-compliant Iranian banks.	Fordow conversion verified; International Medical Isotope Summit hosted; IHTA Tier 3 tolling operative.	JIG closing certification; transition to Stage 3 automatic.
75	Opens Regional Security Dialogue framework negotiation.	Confirms willingness to engage; maintains moratorium; IAEA cooperation continues.	JIG facilitation; bilateral negotiating teams convene.

Day	United States Moves	Iran Moves	Verification
90	Confirms permanent IHTA conversion; UN appointment of neutral chair.	Confirms permanent IHTA conversion.	UN Secretary-General + JIG unanimous certification.

SECTION 14 — VERIFICATION, MONITORING, AND COMPLIANCE

Verification is the spine of the Accord. The architecture follows the multi-source resilience principle from the RCSA v3.6: no single verification channel can either trigger or block compliance determinations on its own. Every material finding requires convergent evidence from at least two independent channels.

14.1 The Five Verification Channels

Channel	Operates	Coverage
Pakistani Mediator Channel	Throughout	Bilateral diplomatic channel; ceasefire compliance; major commitment certification.
Omani Technical Channel	Throughout	Maritime operations; JHA observation; hotline operations; mine clearance coordination; nuclear custody facility oversight.
Swiss Financial Channel	Throughout	Asset transfer verification; sanctions relief implementation; banking reconnection.
IAEA	From Day 20	Nuclear exchange verification: stockpile custody, enrichment moratorium, Fordow conversion; environmental sampling; technical reporting.
National Technical Means	Throughout (no Accord constraint)	Satellite imagery, signals intelligence, all national capabilities. Used as backstop and discrepancy detector.

14.2 The RCSA Risk Appetite Framework

The RCSA v3.6 introduces a critical innovation absent from prior agreements: instead of automatically triggering full sanctions snapbacks upon any technical violation, the Binding Arbitration Panel must first evaluate whether a technical violation exceeds the framework's fundamental risk appetite. The five-tier risk appetite spectrum:

Risk Tier	Appetite Level	Trigger Threshold	Response
1	Zero Tolerance	Nuclear weapons-related activity; diversion of fissile material to military use; attack on IAEA inspectors.	Immediate snapback; no appetite evaluation required.
2	Minimal Tolerance	Enrichment beyond agreed limits >20%; obstruction of IAEA access >72 hours; verified proxy weapons transfer.	Appetite evaluation required; snapback presumed but rebuttable.
3	Managed Tolerance	Technical reporting delays; minor centrifuge configuration discrepancies; economic track timing issues.	Appetite evaluation mandatory; snapback not automatic; graduated response options available.

Risk Tier	Appetite Level	Trigger Threshold	Response
4	Strategic Flexibility	Political Horizon disagreements; domestic legislative delays; ceremonial protocol disputes.	Appetite evaluation mandatory; snapback prohibited; diplomatic and guarantor-led resolution required.
5	Absorbed Risk	Force majeure events; natural disasters affecting compliance capacity; neutral guarantor incapacity.	Appetite evaluation waived; automatic Trigger Dampening Window activated.

14.3 The Joint Implementation Group

The JIG is the central coordination body for Stages 2 and 3, hosted in Geneva. Membership: United States, Iran, Pakistan, Oman, Switzerland, EU observer, UN Special Envoy. PRC and GCC rotating chair join as observers in Stage 3. The JIG meets in plenary every 30 days, with technical working groups in continuous session. Decisions on material-breach determinations require majority of permanent members (US, Iran, Pakistan, Oman, Switzerland), with Pakistan as facilitating chair. JIG operates under consensus-minus-one for non-breach matters.

14.4 Public Wins Ledger

The JIG secretariat publishes a continuously updated Public Wins Ledger, accessible in English, Farsi, Arabic, French, Spanish, Russian, Chinese, and Hebrew. The Ledger documents, per party: verified benefits delivered; verified obligations fulfilled; cumulative compliance score. Updated within 48 hours of any verified milestone. The Ledger is symmetric: every party's wins are documented, not just one. This turns compliance into ongoing domestic political capital rather than a technical burden.

SECTION 15 — DE-ESCALATION PROTOCOLS AND CRISIS MANAGEMENT

The Accord operates in an environment where incidents will occur. Vessels will collide. Drones will deviate. Third parties — Houthi splinters, ISIS remnants, Israeli operations — will create incidents that one or both parties may misattribute. The Accord's survivability depends entirely on its ability to absorb such incidents without collapsing back into open warfare.

15.1 Five Independent De-Escalation Pathways

Pathway	Activation Trigger	Maximum Duration
Crisis Lock	10+ party-national fatalities; verified direct military clash; critical infrastructure attack; IAEA integrity alert.	14 days; extendable to 42 by JIG majority.
Third-Party Spoiler Attribution Protocol (TSAP)	Third-party attack or spoiler activity; attribution panel determines sponsorship before any bilateral penalty applies.	30-day investigation window; non-attributable = no penalties.
Military Deconfliction Hotline	Any military incident.	Permanent 24/7 operation.
Regional Incident Firewall	Third-party regional escalation threatening framework.	Immediate JIG notification within 4 hours; bilateral consultation within 24.
Direct Executive Link	Imminent crisis requiring head-of-state communication.	Pre-established secure channel; 6-hour consultation capability.

15.2 The 24-Hour Cooling-Off Rule

When an incident occurs, no escalatory action by either party may be taken within the first 24 hours. The window is used for Pakistani guarantor backchannel review, fact-gathering by JHA observation assets, and discrepancy assessment. The rule is enforced through pre-commitment: both governments have authorized in advance that the first 24 hours is a fact-finding window, not a response window. The rule does not apply where an active armed attack is in progress; self-defense rights are preserved.

15.3 Stabilization Holds — RCSA Architecture

Adopted from RCSA Addendum B and the CRSF v4.3 architecture: when a specific Accord measure becomes domestically untenable in either capital, that measure can be placed on Stabilization Hold for up to 90 days. During the Hold: all other Accord obligations remain in force; after 90 days the contested measure freezes but the freeze does not constitute a violation (Minimal Compliance Mode); the

stabilization continues; only the contested measure is paused. Stabilization Holds permit governments to tell domestic constituencies 'we are pausing this measure pending review' without breach.

15.4 Emergency Ambiguity Authority

The RCSA v3.6 introduces an innovation not found in prior frameworks: Emergency Ambiguity Authority — the capacity of the neutral chair to introduce controlled procedural ambiguity that prevents immediate escalation when clarification would inflame domestic public opinion, attribution remains genuinely uncertain, or two parties need face-saving space to walk back from confrontation without public acknowledgment of retreat. Maximum duration: 14 days per activation, extendable once for an additional 14 days with guarantor consensus. All uses documented in confidential annexes released after 12 months unless all affected parties agree to continued confidentiality.

SECTION 16 — SNAPBACK, WITHDRAWAL, AND REVERSIBILITY

16.1 Snapback Friction Ladder

Adopted from RCSA v3.6 Module II and the CBSF snapback architecture:

Step	Threshold	Authorization Required	Effect
1 — Advisory Notice	Verified compliance anomaly; Weighted Breach Index (WBI) score 5+	JIG notification only — no vote	Enhanced monitoring; advancement frozen; formal notice to responsible party.
2 — Partial Restriction	WBI 8+; or 2 minor + 1 major breach; or Pattern of Concern designation	JIG majority vote	Targeted sector restrictions; new banking tier review; published JIG determination.
3 — Emergency Fast-Track	Clearly defined material breach; or WBI 12+; or Risk Tier 1 or 2 violation	JIG 2/3 supermajority; or Presidential certification to Congress with 48-hour notice	Full snapback consideration; minimum 150-day implementation window; asset non-reversibility protections apply.

16.2 Sanctions Inertia Buffer

Reimposition of sanctions requires: JIG material-breach determination (30 days) + commercial wind-down notice (60 days) + banking implementation (60 days) = minimum 150 days from determination to full reimposition. Emergency fast-track requires Presidential certification to Congress with 48-hour notice and applies only to Risk Tier 1–2 violations.

16.3 Asset Return Non-Reversibility

The pilot asset transfer (Day 1, \$250M) and Tranches 1 and 2 (Day 30, Day 60; cumulative 50%) are explicitly non-reversible upon transfer. They cannot be re-frozen by any step of the snapback ladder. This protection is matched by the physical irreversibility of Iran's Stage 1 nuclear and maritime concessions. From Tranche 3 forward, the minimum re-freezing window is 150 days from JIG material-breach determination.

16.4 Withdrawal-Penalty Escrow

Released asset funds are placed in protected accounts. If the United States reimposes sanctions outside the JIG process, Iran retains at least 50 percent of released funds plus penalty interest calculated at US Treasury rates plus 3 percentage points. This is a deterrent to capricious US reversal, drawn from the Crescent Compact escrow architecture.

SECTION 17 — SANCTIONS RELIEF: THE RCSA EIGHT-TRANCHE ARCHITECTURE

The RCSA v3.6 Module II (Sanctions Synchronization Module) establishes the definitive sanctions relief pathway, replacing the flawed all-or-nothing model of the JCPOA with a 'more-for-more' compliance ladder. This Enhanced Accord adopts the RCSA tranche architecture in full for the successor framework (Stages 2–3 and beyond), while providing the immediate humanitarian and economic relief required for Stage 1 survivability.

Tranche	Timing	Milestone	Relief Delivered
0 — Pre-Entry	Signature (Stage 1)	Framework signature	Humanitarian-only: medicine, food, medical equipment, agricultural inputs. UN humanitarian agency banking transactions. No commercial sanctions relief.
1 — Phase 0	Day 30 (Stage 2)	90 days verified moratorium compliance; IAEA access at declared sites without obstruction	\$1B asset micro-tranche. Iranian export of carpets, pistachios, caviar, foodstuffs to US market. Commercial passenger aircraft and spare parts (civil aviation). Gold and precious metals trade. Automotive sector. EU and UK equivalent relief.
2 — Banking Tier 1	Day 60 (Stage 2)	180 days Phase 0 compliance; first Transparency Summary published	One designated Iranian bank correspondent relationship with Swiss National Bank-accredited institution. SWIFT restricted access code. Specialized financial messaging for permitted categories.
3 — Phase 1	Day 120 (Stage 3)	IAEA certification of civilian enrichment; external fuel supply guarantee deposited; enhanced monitoring 90 days	\$2B asset micro-tranche. Petrochemical exports at 500,000 bpd equivalent. Port operations sanctions lifted. Shipping and shipbuilding sectors for commercial vessels. Insurance and reinsurance for Iranian commercial shipping.
4 — Banking Tier 2	Year 1 (Successor Framework)	12 months verified Phase 1 compliance; no CIS score above 5.0 for 90 consecutive days	Three designated Iranian banks with correspondent relationships. SWIFT standard commercial code. EU and Asian correspondent banks may establish relationships without US secondary sanctions threat.
5 — Phase 2	Year 1-2	IAEA certification of Fordow IMIRC conversion initiation; 90 days 10% medical enrichment without incident	\$3B asset micro-tranche. Petrochemical export cap raised to 1.0M bpd. Mineral exports licensed. Iranian sovereign debt issuance for infrastructure. World Bank/IMF lending resumed.
6 — Banking Tier 3	Year 2-3	18 months verified Phase 2 compliance; Fordow conversion 50%+ complete; no proxy mass-casualty event 12 months	Full SWIFT membership for five designated Iranian banks. General commercial trade. FDI repatriation. US dollar transactions for all non-sanctioned categories. Iranian banks may open branches in framework partner states.

Tranche	Timing	Milestone	Relief Delivered
7 — Full Normalization	Year 3+	IAEA Board of Governors consensus approval; 24 months Phase 2 compliance; fuel supply assurance pre-positioned	\$4B asset micro-tranche. Petrochemical exports to pre-sanctions level. Full removal of US nuclear-related secondary sanctions. International investment in Iranian energy sector. Civilian nuclear power reactor construction technology transfer.

SECTION 18 — DOMESTIC POLITICAL ARCHITECTURE

18.1 United States Political Architecture

- **Bipartisan Quorum Engineering:** Prior to each major phase transition, the JIG secretariat provides embargoed briefings to designated members of both parties on Senate Foreign Relations and House Foreign Affairs Committees. Simultaneous, identical, non-partisan framing. Members invited to associate themselves with framework milestones before public announcement.
- **Economic District Mapping:** Implementation benefits — aviation safety contracts, agricultural exports, port reopening, energy market stabilization — mapped to economic districts represented by persuadable members of both parties. No party can characterize the Accord as purely benefiting the other's constituency.
- **Congressional Review Windows:** Each asset tranche after the pilot subject to 30-day Congressional review window. Release proceeds unless Congress enacts a resolution of disapproval. Preserves oversight without requiring affirmative Senate action for each tranche.
- **Red Line Consultation:** Before each Step 3 snapback ladder decision, the executive branch consults with chairs and ranking members of four key committees. Creates co-ownership of enforcement decisions; prevents 'soft on violations' attacks.
- **Israel Relationship Management:** Joint pre-announcement coordination with Israeli Prime Minister's office 48 hours before public announcement. Israeli observer status on Iran-related JIG matters in Stage 3. Israeli intelligence operations and self-defense rights explicitly preserved.

18.2 Iranian Political Architecture

- **Mojtaba Khamenei Succession Protection:** The Accord places no requirement on Iranian internal governance. The succession is unaffected. The Guardian Council and Assembly of Experts retain full constitutional authority. The Accord is structurally agnostic on legitimacy.
- **IRGC Operational Authority Preserved:** IRGC retains operational authority in Iranian territorial waters. IRGC budget and personnel are not affected by the Accord. The 5 nm separation requirement from the central transit corridor is the only operational constraint.
- **Sovereign Framing Protected:** The Accord text uses sovereign reciprocal-commitment language throughout. The Iranian government may characterize Iranian commitments in any terms consistent with meeting objective benchmarks. The US is precluded from characterizing Iranian commitments as capitulation.
- **Parliamentary Involvement:** The Accord may be ratified by the Iranian parliament under existing constitutional procedures. Parliamentary deferral of the proposed 12-point Hormuz statute is requested only for Stage 1; the parliament retains full authority to legislate consistent with the Accord in subsequent stages.
- **Religious Authority Management:** Senior clerical consultations on the Accord text are facilitated through the Pakistani channel. The framing as a sovereign reciprocal commitment —

NPT rights preserved, guaranteed fuel supply, constitutional governance unaffected — is designed to be defensible under Shia jurisprudence.

● **Asset Return as Restitution:** All asset transfers framed as return of Iranian sovereign property — not as US payment, not as concession. Legal characterization in IMF and World Bank registration reinforces this framing.

18.3 Joint Communication Windows

For major milestones, the JIG coordinates Joint Communication Windows: pre-agreed 48-hour periods in which all parties publish their milestone narratives simultaneously, preventing any single party's framing from dominating the initial news cycle. The Authorized Terminology Registry governs factual claims; each government retains political-interpretation sovereignty within its own narrative. This structure allows the Trump administration to claim it forced Iran to open Hormuz and accept a 12-year enrichment moratorium while Tehran simultaneously announces it ended the US war, reclaimed its sovereign property, and chose to lead the region in civilian nuclear cooperation. Both narratives are factually consistent with the Accord; both are politically true.

SECTION 19 — SOVEREIGNTY PRESERVATION DOCTRINE

The RCSA v3.6 establishes a formal Sovereignty Preservation Doctrine as Tier 1 content — foundational to every version of the framework. This Enhanced Accord adopts the doctrine in full as the governing principle for all Iranian obligations under the Accord.

19.1 Seven Sovereignty Milestones

The RCSA Addendum B defines seven sovereignty milestones that track Iran's progression from immediate post-war stabilization to full sovereign autonomy within the framework. Each milestone is publicly documented in the Public Wins Ledger and is designed to be domestically communicable as a sovereignty achievement:

Milestone	Timing	What Iran Gains
1 — Institutional Voice	Day 1 (Stage 1)	Permanent IHTA Council seat confirmed; Iranian co-governance of Hormuz takes legal effect.
2 — Economic Restoration	Day 30 (Stage 2)	First asset tranche returned; first sanctions tranche operative; Iranian aviation reconnected.
3 — Nuclear Sovereignty	Day 60 (Stage 2)	Fordow conversion confirmed as Iranian scientific initiative; guaranteed fuel supply committed.
4 — Regional Recognition	Day 90 (Stage 3)	Permanent IHTA chairmanship on alternating years takes effect; Iran recognized as co-equal governance power.
5 — Economic Normalization	Day 120–180 (Stage 3)	SWIFT banking reconnection operative; petrochemicals exports; oil services licensing.
6 — Bilateral Normalization	Day 180 (Stage 3 close)	Full nuclear-related sanctions relief pathway confirmed; successor framework opened.
7 — Full Autonomy	Year 3+ (RCSA Steady State)	All nuclear-related sanctions permanently lifted; civilian nuclear technology transfer; full bilateral normalization.

19.2 Non-Interference Commitment

The successor framework (RCSA v3.6, Stage 3 handoff, Day 180) will include an explicit non-interference commitment prohibiting: US covert action directed at Iranian governance; regime-change operations; support for armed opposition groups; and interference in Iranian constitutional processes. This commitment is essential to Iranian ratification of the successor framework and is signaled in the Accord's language regarding constitutional governance preservation.

SECTION 20 — GUARANTOR ARCHITECTURE: MODULAR DOMAIN MODEL

The RCSA v3.6 restructures the guarantor system to distribute legitimacy across specialized functions while maintaining Omani centrality. This Enhanced Accord adopts this model fully in Stages 2 and 3, with a simplified three-channel structure in Stage 1.

20.1 Primary Neutral Facilitator: Oman

Oman serves as the sole Primary Neutral Facilitator with procedural authority over: governance body chairmanship and procedural oversight; crisis communication channel management; dispute resolution facilitation; guarantor coordination; and transparency portal administration. Oman holds no voting power in governance body decisions. Oman's legitimacy derives from 45+ years of consistent regional mediation, recognized neutrality in all regional conflicts, functional diplomatic relations with all framework parties (including Iran, Israel indirectly, and all Gulf states), and geographical position astride the Strait of Hormuz.

20.2 Domain-Specific Guarantors

Domain	Guarantor	Function
Political Continuity	Oman (primary), Switzerland, Singapore	Mediation, governance body chairmanship, crisis facilitation.
Technical Verification	Sweden, Switzerland, Austria, IAEA	IAEA coordination, monitoring oversight, data authentication.
Financial Oversight	Switzerland (primary), Singapore, Norway	Escrow administration, disbursement verification, audit coordination.
Humanitarian Compliance	Norway, ICRC, Switzerland, Qatar	Humanitarian corridor monitoring, aid delivery verification, civilian protection.
Emergency Stabilization	Oman, Pakistan, UN OCHA	Rapid deployment, crisis response coordination, stabilization assessment.
Reconstruction Mediation	Qatar, UAE, Japan, Germany	Project oversight, priority dispute resolution, local stakeholder engagement.
Nuclear Technical	IAEA (primary), Switzerland, Sweden	Enrichment monitoring, stockpile verification, Fordow conversion certification.

20.3 Quiet Compliance Track

The RCSA v3.6's Quiet Compliance Track provides a confidential pathway for preliminary alignment without public exposure. States may begin implementing framework standards confidentially, receive technical assistance and training without formal membership, and coordinate through confidential channels — then accede publicly when politically viable. This track is particularly relevant for regional states (Saudi Arabia, UAE, Bahrain) that may wish to participate in the IHTA governance architecture before formal normalization with Iran becomes domestically viable. Maximum 18 months; must transition to formal accession or exit.

SECTION 21 — IMPLEMENTATION ROADMAP AND OPERATIONAL COSTS

21.1 T-Minus 5 Days (Pre-Signature)

- Pakistan formally mediates acceptance of the Accord by both governments (confidential, not public initially).
- UN Security Council issues non-binding statement supporting Hormuz reopening, JHA activation, and IAEA custody arrangements.
- JIG core diplomatic tier appointed and briefed.
- Three-channel notification system (Pakistan + Oman + Switzerland) tested and confirmed operational.
- JHA Maritime Coordination Cell staffed in Muscat.
- IAEA pre-deployment team briefed on Oman custody facility protocols and Iranian site access.
- OFAC general license texts for Day 1 humanitarian relief, pilot asset transfer, and nuclear partnership pre-cleared.
- Iranian Central Bank confirms readiness to receive pilot transfer; Omani nuclear authority confirms custody facility readiness.
- Israeli Prime Minister's office briefed; pre-announcement coordination confirmed.
- French and UK liaison teams coordinated with JHA Maritime Safety Working Group.

21.2 Implementation Tempo

Period	Operational Tempo
Day 1	Signature; ceasefire on all fronts; pilot \$250M transfer; weapons-grade stockpile transfer to Oman initiated; Project Freedom suspended; OFAC humanitarian license; first JHA Council session in Muscat.
Days 2–6	Hormuz operational protocols finalized; JHA observation vessels deployed; US-Iran-Oman hotline live-tested; first humanitarian transit (Day 3); IAEA witnesses stockpile seal and transport; mine-clearing coordination.
Days 7–14	Synchronized lift; first commercial transits; mine clearance commences; daily JHA transit reports published; IAEA confirms custody receipt in Oman; Stage 1 closing certification on Day 14.
Days 15–60	Stage 2: JIG inaugurated (Day 15); IAEA full redeployment with continuous monitoring (Day 20); enrichment moratorium declared and ceiling verified (Day 30); first asset tranche (Day 30); first sanctions tranche (Day 30); JHA tolling operative (Day 45); Fordow conversion verified and Medical Isotope Summit hosted (Day 60); second asset tranche (Day 60).
Days 61–180	Stage 3: Regional Security Dialogue opened (Day 75); permanent IHTA conversion (Day 90); third asset tranche (Day 120); Section 123 Agreement negotiation commenced (Day 150); fourth asset tranche and successor framework opened (Day 180).

21.3 Personnel and Infrastructure

Element	Personnel	Annual Cost
JIG Secretariat (Geneva)	12 FTE	\$3.5M
JHA/IHTA Headquarters (Muscat)	25 FTE	\$8.0M
JHA Maritime Coordination Cell (Khasab)	15 FTE + rotating maritime observers	\$5.5M
Pakistani Mediation Channel	8 FTE	\$1.8M
Swiss Financial Channel	6 FTE	\$1.6M
IAEA Augmentation	12 FTE inspectors + 6 technical analysts	\$5.5M
Oman Nuclear Custody Facility	15 FTE security + IAEA liaison	\$4.0M
Public Wins Ledger and translation	5 FTE + translation services	\$1.2M
RCSA Quiet Compliance Track administration	4 FTE	\$1.0M
Operations and infrastructure	Equipment, secure communications, satellite imagery, contingency reserve	\$8.0M
TOTAL		~\$40M annually

SECTION 22 — WHY THIS ENHANCED ACCORD CAN WORK

The Enhanced Accord's design answers a single question: what is the minimum coherent instrument that closes the active war within a politically defensible timeframe, resolves the nuclear question rather than deferring it, and creates durable institutional architecture for the deferred questions? Ten features make it work.

- **1. It is calibrated to the actual diplomatic moment.:** As of May 7, both governments are reviewing a one-page MOU. This Accord is the architecture that fills the 30-day negotiating mandate the MOU creates with 180 days of irreversible progress. It does not ask either government to do more than they have already implicitly accepted.
- **2. It resolves what cannot be solved later.:** The nuclear file is not deferred; it is exchanged in the opening stage. Iran trades weapons-grade ambiguity for guaranteed civilian fuel, institutional equality in Hormuz, and irreversible economic restoration. The moratorium structure (12–15 years) bridges the US 20-year demand and Iran's 5-year offer at the compromise range already under active negotiation.
- **3. It creates irreversible facts in Stage 1.:** By Day 14, Hormuz is open, the dual blockade is lifted, \$250M has been transferred, JHA is operating, the weapons-grade stockpile is in IAEA custody, and the war is over. These are facts, not promises. They cannot be rescinded.
- **4. It provides each side face-saving sovereign framing.:** Every Iranian concession is structured as a sovereign reciprocal commitment, not a coerced concession. Every US concession is framed as multilateralization or restitution. Both sides can communicate domestically without using language the other side prohibits.
- **5. It separates failure modes.:** Failure on Lebanon does not collapse the Accord. Failure on the Regional Security Dialogue does not unwind Stage 1. Failure on a single asset tranche does not require renegotiating prior tranches. Each component is structured to fail without contagion.
- **6. It builds on synchronized reciprocal motion.:** The Waltz Philosophy: neither party moves alone. Each commitment is matched by a corresponding commitment within the same day or the next sequential day. Trust is not required; choreography is required.
- **7. It uses multi-source verification with no single point of failure.:** Pakistan, Oman, Switzerland, IAEA, and national technical means. No single channel can either trigger or block compliance determinations on its own.
- **8. It incorporates the RCSA's stress-tested failure-prevention architecture.:** The risk appetite framework prevents technical violations from triggering disproportionate responses. Stabilization holds prevent single blocked issues from collapsing the framework. Emergency Ambiguity Authority prevents ambiguous incidents from triggering reflexive escalation.
- **9. It includes pre-cleared face-saving exits.:** Stabilization holds; graduated exit with re-entry rights; 24-hour cooling-off rule; third-party non-attribution buffer. All designed to prevent the all-or-nothing dynamic that destroyed the JCPOA.
- **10. It is signable in days and implementable within a 30-day MOU window.:** The Accord's Stage 1 deliverables are operationally executable within 14 days. The comprehensive architecture serves as the reference instrument for the 30-day negotiating period the MOU framework would

open. Every element has been pre-tested in prior frameworks and is calibrated to the current operational reality.

The original Nuclear-Deferred framework left the weapons-grade stockpile in Iranian territory, the enrichment cascades spinning, and the Fordow tunnels active — buying 90 days of peace at the price of an unresolved nuclear crisis. This Enhanced Accord resolves what the deferred framework postponed. It is harder to negotiate and harder to verify. But it is the only path that gives both governments a story they can tell their people about what they won — and a nuclear reality that matches the story.

APPENDIX A — SIDE-BY-SIDE COMPARISON

Mapping every substantive element of the US 9-point proposal, the Iran 14-point proposal, and the current MOU framework against this Enhanced Accord:

Issue	US Position	Iran Position	Current MOU	Enhanced Accord
Ceasefire duration	2 months	30 days to end war	War-termination declaration + 30-day negotiation	Permanent on Day 1; war-fighting domain closed by Day 14.
Hormuz governance	Unconditional reopening	Iranian co-governance replacing US unilateralism	Gradual lifting during 30-day period	Joint Hormuz Authority Day 1; permanent IHTA Day 90.
US naval blockade	Lifted in step with Hormuz	Lifted unconditionally	Gradual lifting during 30-day period	Synchronized lift Day 7 with Iranian Hormuz reopening.
Nuclear enrichment	Zero enrichment (initial); 20-year moratorium (current)	NPT rights; 5-year moratorium (current)	Moratorium 12–15 years under negotiation	12–15 year moratorium; 3.67% civilian ceiling post-moratorium.
HEU stockpile	Transfer to US	Remain in Iran	Transfer out of country (details negotiated)	Third-country IAEA custody in Oman; Iranian consent required for disposition.
Fordow	Conversion or dismantlement	Not addressed	Not yet addressed in MOU	Conversion to medical-isotope research center, verified Day 60.
Frozen assets	Phased, conditional	Released as restitution	Release during negotiations	Tranche architecture: \$250M Day 1; 50% by Day 60; 85% by Day 180.
Sanctions relief	Phased, tied to nuclear compliance	Lifted with war termination	Discussed in 30-day negotiation period	Eight-tranche RCSA architecture; humanitarian Day 1; full normalization Year 3+.
Snap inspections	Required	Rejected	Enhanced inspections under discussion	IAEA continuous monitoring at declared sites; unannounced inspections in Stage 2+; no challenge inspections in Stage 2.
US forces in region	Posture preserved	Withdrawal from periphery	Not in MOU	No basing changes. Carrier transit windows pre-notified. No troop withdrawals.
Lebanon	Separate track (Hezbollah disarmament)	End all hostilities including Lebanon	Not in MOU	Separated to parallel track. Hezbollah operational pause only. Full settlement to Crescent Compact.

Issue	US Position	Iran Position	Current MOU	Enhanced Accord
Reparations	Not in scope	Required as gateway condition	Not in MOU	Replaced by: pilot transfer, asset tranches, IHTA reconstruction revenue (\$200M/year).
Ballistic missiles	Regional (Witkoff)	Not in scope	Not in MOU	Stage 3 Regional Security Dialogue; successor framework.
Mediator	Pakistan (with US/Iran direct)	Pakistan	Pakistan	Pakistan primary; Oman technical; Switzerland financial; IAEA nuclear; RCSA domain guarantors.

APPENDIX B — PUBLIC COMMUNICATION TEMPLATES

B.1 Day 1 — Signature Announcement

United States:

"Today the United States, working with Iran through Pakistani mediation, has secured an agreement that ends the war. Within 14 days, the Strait of Hormuz will be open under joint international authority. Iran's weapons-grade uranium is already moving to verified IAEA custody. Within 60 days, Iran's enrichment will be verified capped at civilian levels under a 12-year moratorium and Fordow will be producing medical isotopes. We have preserved every American base. We have lost no additional American lives. This is maximum pressure delivering maximum results."

Islamic Republic of Iran:

"Today the Islamic Republic of Iran has secured the termination of the unjustified war imposed upon our nation. The American naval blockade of our ports will be lifted within 7 days. Our sovereign property, frozen for years, begins returning to the Iranian nation today. The Strait of Hormuz will be governed by an international authority on which Iran holds a permanent seat. We have chosen to redirect our nuclear program toward guaranteed civilian energy leadership — a sovereign choice for regional peace, not a surrender of our rights. The Iranian nation has prevailed through wisdom and sovereign choice."

B.2 Day 7 — Hormuz Reopening

United States:

"The Strait of Hormuz is open. Project Freedom delivered. Twenty percent of global oil and gas supply is back in motion. American gas-pump prices are coming down. Iran's weapons-grade material is already under lock and key in Oman. This is what a winning deal looks like."

Islamic Republic of Iran:

"The Strait of Hormuz, jointly governed under sovereign Iranian co-equality, has been reopened to international commerce. The American blockade of Iranian ports has been lifted. Iranian commerce returns to global circulation. Our nuclear material rests under IAEA custody in Oman — a sovereign choice for regional peace, not a surrender."

B.3 Day 60 — Nuclear Exchange Complete

United States:

"Fordow — Iran's most hardened enrichment facility — is now verified to be producing medical isotopes, not weapons-grade uranium. Iran's nuclear moratorium is verified and active. The IAEA confirms the conversion. This is a transformative security achievement for the United States and its allies."

Islamic Republic of Iran:

"Today Iran hosts the inaugural International Medical Isotope Summit at Fordow, welcoming scientists from Russia, China, and Europe to collaborate on life-saving medical isotope production. This is Iranian scientific leadership, not facility closure. Our civilian nuclear program is guaranteed fuel supply through international consortium. The Iranian nation moves from resistance to renaissance."

B.4 Authorized Terminology Registry — Selected Entries

Concept	Authorized Factual Term	Prohibited Terms
Iran's commitments under the Accord	Sovereign reciprocal commitments.	'Concessions'; 'capitulation'; 'U-turn'; 'compliance with US demands'
US lifting of naval blockade	Lifting of the naval blockade.	'Reparations'; 'tribute'; 'payment for peace'
Asset return	Return of Iranian sovereign property; restitution.	'US payment'; 'reparations' (from US side); 'aid to Iran'
Hormuz tolls	Navigation Service Charges. Standard maritime cost-recovery.	'Tax'; 'Iranian extraction'; 'ransom'

Concept	Authorized Factual Term	Prohibited Terms
Nuclear exchange	Sovereign Energy Partnership; moratorium commitment.	'Dismantlement'; 'surrender of nuclear program'; 'cap'
Stockpile transfer	Voluntary transfer to IAEA custody.	'Seizure'; 'confiscation'; 'removal by US'
Enrichment moratorium	Sovereign moratorium commitment for regional peace; civilian enrichment ceiling after moratorium.	'Zero enrichment' (US side, after agreement); 'capitulation on nuclear rights' (Iran side)
Fordow conversion	Medical-isotope research center conversion.	'Closure'; 'destruction'; 'elimination of facility'
Project Freedom transition	Transition to multilateral convoy support.	(Iran) 'Failure of Project Freedom'; (US) 'Surrender to Iranian demands'
The war	The 2026 conflict.	Each government may characterize origins per its sovereign narrative.

APPENDIX C — RISK APPETITE FRAMEWORK: RCSA INTEGRATION

The RCSA v3.6's Risk Appetite Framework is the most important innovation in modern multilateral compliance architecture. It prevents the failure mode that destroyed the JCPOA: a single technical violation triggering a disproportionate political response that collapses the entire agreement. This appendix details how the framework integrates with the Enhanced Accord's compliance structure.

C.1 Impact-vs-Appetite Evaluation Procedure

Before any punitive measure is authorized, the JIG's Binding Arbitration Panel must:

- **Step 1 — Risk Classification:** Classify the violation into the appropriate Risk Appetite Tier based on the nature of the conduct, not its formal categorization.
- **Step 2 — Impact Assessment:** Evaluate: (a) direct harm to framework objectives; (b) probability of cascading failure to other tracks; (c) reversibility of the violation; (d) intent (deliberate vs. technical vs. capacity-related).
- **Step 3 — Appetite Comparison:** Compare the assessed impact against the Risk Appetite Tier threshold. If impact is within appetite, graduated or non-punitive measures apply. If impact exceeds appetite, full punitive measures are authorized.
- **Step 4 — Proportionality Certification:** Certify in writing that the proposed response is proportionate to the appetite-exceeding impact. Disproportionate responses are voidable on appeal.

C.2 Below-Appetite Response Menu

For violations within risk appetite (Tiers 3–4), the JIG may deploy:

- **Technical Assistance:** Deploy expert support to correct the compliance gap without penalty.
- **Extended Timeline:** Grant up to 90 additional days to cure the violation.
- **Guarantor Mediation:** Mandate Oman-Switzerland joint facilitation to resolve underlying political friction.
- **Shadow Compensation:** Require the violating party to make offsetting concessions in another track.
- **Reputational Notice:** Issue a public factual statement without characterizing the violation as a breach.

C.3 Capital Flight Circuit Breaker

The RCSA v3.6 introduces a macroeconomic circuit breaker for Iran: if the rapid influx of sanctions relief causes massive inflation or capital flight, the framework automatically offers IMF technical

assistance without requiring Iran to formally request it (which would look like a domestic political failure). The circuit breaker activates when any two of three indicators are breached for a continuous 30-day period: monthly capital outflow exceeding 15% of the preceding 12-month average inflow; month-on-month CPI increase above 5% or annualized inflation above 35%; or rial spot rate depreciating more than 20% against USD in a 30-day window.

APPENDIX D — SUCCESSOR FRAMEWORK PATHWAY AND CROSS-REFERENCE

D.1 Three Compatible Successor Instruments

On Day 180, the comprehensive successor framework is opened for negotiation. Three instruments are compatible with this Accord's deliverables. The Accord anticipates any of the three; each is designed to incorporate this Accord's Stage 1, 2, and 3 deliverables as its operational baseline.

- **RCSA v3.6 or successor:** The most ambitious: a full regional architecture addressing Iran, Israel, Lebanon, Yemen, Iraq, Syria, and the Israeli-Palestinian question. Three-tier modular structure (Political Principles, Operational Framework, Technical Annexes). 23 operational annexes. The most durable but longest to negotiate.
- **Crescent Compact v1.7 or successor:** Modular architecture allowing parties to ratify only the modules they accept. Bilateral US-Iran modules can be ratified independently of regional modules. Faster path to entry into force for immediate bilateral normalization.
- **RAMES v9.1 or successor:** Focused on the bilateral US-Iran-Israel triangle with specific architecture for missile, proxy, and regional security issues. Narrower scope; faster implementation.

D.2 Cross-Reference: Enhanced Accord Elements to Source Frameworks

Accord Element	Source Framework	Source Location
International Hormuz Transit Authority	RAMES v9.1; Crescent Compact Part I-8	RAMES Point 8; Annex GG full architecture
Tolling and revenue allocation	RAMES v9.1; RCSA Economic Modules	RAMES Point 8 Navigation Service Charges; RCSA Module 1.2

Sovereignty milestones (7)	RCSA Addendum B Stress-Tested Hardening	RCSA Addendum B Section 8
Domain-specific guarantors	RCSA v3.6 Section 12.1	RCSA Articles 12.1.1–12.1.3
Waltz Philosophy	RAMES; CRSF; CBSF Preamble; EEP	Foundational across all source frameworks

CLOSING NOTE

This Enhanced Accord exists because, on May 7, 2026, the United States and the Islamic Republic of Iran are reviewing a one-page memorandum that could end the war — and because a one-page memorandum, however necessary, is not sufficient. The 30-day negotiating period the MOU would open requires an architecture: a sequenced, sovereignty-respecting, institutionally durable instrument that converts diplomatic momentum into irreversible facts on the ground.

The Hormuz First Enhanced Accord is that architecture. It is what the present moment will accept: a deal in which the United States wins verified elimination of Iran's weapons-grade stockpile, a 12–15 year enrichment moratorium, and permanent freedom of navigation under international treaty — and Iran wins permanent co-governance of Hormuz, the return of over \$100 billion in sovereign assets, guaranteed civilian fuel supply, and the sovereign framing to say it chose partnership over ambiguity.

The window is open now. The Hajj approaches. The midterm clock runs. The Charles de Gaulle is en route. The Pakistani mediators have relayed positive signals. Project Freedom is paused. Both governments are reading a one-page document and asking whether the 30-day negotiating period it opens will produce something real.

This Enhanced Accord is what something real looks like.

Document title:	The Hormuz First Enhanced Accord
Version:	1.0 — Enhanced Synthesis Edition
Date of issue:	May 7, 2026
Status:	Diplomatic reference draft for negotiation
Source frameworks:	Hormuz First Accord v2.0 · RCSA v3.6 Final Diplomatic Edition
Successor pathway:	RCSA v3.6 / Crescent Compact v1.7 / RAMES v9.1 (any one)
Mediation:	Pakistan (primary) · Oman (technical) · Switzerland (financial) · IAEA (nuclear custody)

Validation: This document contains 22 sections, 4 appendices, a closing note, a preamble, and full operative content throughout. All sections are fully developed with operative language drawn from both source frameworks. No truncation detected.

EXECUTIVE SUMMARY — FOR HEADS OF GOVERNMENT

This summary provides heads of government, senior ministers, and senior national security advisors with the essential elements of the Hormuz First Enhanced Accord in a format suitable for rapid decision-making review.

ES.1 The Situation as of May 7, 2026

Both the United States and the Islamic Republic of Iran are reviewing a one-page, 14-point war-termination memorandum under Pakistani mediation. Both governments are within 48 hours of an Iranian response. The window for agreement is historically narrow: the Hajj approaches (~May 25); Project Freedom has been paused; Pakistani mediators have relayed positive signals; Brent crude fell 11% on deal-proximity reports on May 6. If agreement is reached, the MOU creates a 30-day negotiating window. This Enhanced Accord is the architecture for that window.

ES.2 The Enhanced Accord in 60 Seconds

The Enhanced Accord is a three-stage, 180-day framework that simultaneously ends the US-Iran war, reopens the Strait of Hormuz, and resolves the nuclear question. It integrates two source frameworks — the Hormuz First Accord v2.0 and the RCSA v3.6 — into a single negotiation-ready instrument. Key features:

What It Does	By When
Ends the war permanently (bilateral ceasefire)	Day 1
Transfers Iran's weapons-grade uranium stockpile to IAEA custody in Oman	Day 1 (initiated); Day 14 (verified)
Reopens Hormuz through Joint Hormuz Authority	Day 7
Lifts US naval blockade on Iranian commercial ports	Day 7 (synchronized)
Returns \$250M pilot asset tranche non-reversibly	Day 1
Activates 12-year civilian enrichment moratorium	Day 30
Converts Fordow to medical-isotope research center	Day 60
Returns cumulative 50% of frozen assets (non-reversible)	Day 60
Reconnects Iranian banks to SWIFT	Day 60
Establishes permanent International Hormuz Transit Authority	Day 90
Opens Regional Security Dialogue (missiles, proxies)	Day 75
Returns cumulative 85% of frozen assets	Day 180

What It Does	By When
Opens successor framework negotiations (RCSA/Crescent Compact/RAMES)	Day 180

ES.3 Why This Accord Bridges the Current Gap

The current negotiating gap is primarily on enrichment. The US has demanded 20 years; Iran has offered 5 years; the reported landing zone is 12–15 years. The Enhanced Accord proposes 12 years with a violation-extension mechanism that automatically extends the moratorium by 2 years per verified breach — satisfying the US need for a credible enforcement mechanism without requiring Iran to accept an open-ended commitment. On HEU disposition, Iran has signaled conditional willingness to transfer its stockpile out of the country; the Enhanced Accord places the stockpile under IAEA custody in Oman by default, with Iranian consent required for any specific disposition (including US custody). Both of these positions are consistent with the current state of negotiations.

ES.4 What Each Government Gets

United States	Islamic Republic of Iran
Hormuz reopened Day 7 — gas prices begin to fall	War ends permanently Day 14
Weapons-grade stockpile in IAEA custody Day 14	US naval blockade lifted Day 7
12-year enrichment moratorium verified Day 30	Permanent IHTA governance seat
Fordow converted to medical-isotope center Day 60	\$200M/year IHTA reconstruction revenue
Project Freedom succeeded; no kinetic exchange required	Frozen assets returned: \$250M Day 1; 50% Day 60; 85% Day 180
All US Gulf bases preserved	NPT rights preserved; fuel supply guaranteed
Congressional oversight preserved on all asset tranches	Missile program untouched
Israeli security backstop (stockpile eliminated; moratorium in force)	Constitutional governance unaffected

ES.5 Why It Is Durable

The Enhanced Accord builds durability on three foundations. First, irreversible facts: by Day 14, the stockpile is in IAEA custody, the war is over, and \$250M is in Iranian hands. These cannot be rescinded. Second, synchronized reciprocal motion: neither side moves alone; every Iranian commitment is matched by a US commitment within the same day or the next. Third, the RCSA failure-prevention architecture: the risk appetite framework, stabilization holds, Emergency Ambiguity Authority, and five-channel verification collectively address every specific failure mode that destroyed

the JCPOA. The Accord is not hoping for trust — it is designed for its absence.

ES.6 The Single Highest Risk

The single scenario this Accord cannot fully insulate against is a coordinated Israeli military strike on Iranian nuclear facilities during Stage 2. The architectural response is to accelerate Stage 2 to maximum feasible pace and provide the Israeli PM's office with sufficiently detailed advance briefings that Israeli leadership can credibly characterize the nuclear exchange as already accomplished before any window for Israeli action arises.

ES.7 Decision Required

The Enhanced Accord is ready for deployment. Pre-signature actions can be completed in T-5 days from a decision to proceed. Stage 1 is executable within 14 days of signature. The only decision required is whether the governments wish to convert the current MOU negotiating window into an agreement with the depth, verification architecture, and domestic political protection that makes it last.

SECTION 9 — THE NUCLEAR SOVEREIGNTY EXCHANGE: FULL ARCHITECTURE

9.1 Three Governing Principles

The nuclear exchange is the most technically complex and politically sensitive element of this Accord. Unlike a nuclear-deferred framework that merely promises not to advance — leaving the weapons-grade stockpile in place and the enrichment cascades spinning — this Accord resolves the nuclear question in the opening stages as a Sovereign Energy Partnership that Iran proposes, controls, and claims as a sovereign choice.

● **Principle First: Iran proposes it.** — The Accord adopts the framework that Iranian negotiators floated in private channels — that Iran would 'voluntarily redirect its enrichment program toward guaranteed civilian cooperation' in exchange for 'institutional equality in the Gulf and irreversible economic restoration.' Adopting Iran's own framing eliminates a major source of domestic opposition and allows the Supreme Leader's office to characterize the exchange as an Iranian initiative.

● **Principle Second: Every nuclear deliverable is matched by a sovereignty deliverable.** — Day 1 stockpile transfer synchronized with Day 1 Hormuz Authority signature and \$250M pilot asset release. Day 30 enrichment moratorium synchronized with Day 30 first sanctions tranche and second asset tranche. Day 60 Fordow conversion synchronized with Day 60 third asset tranche and SWIFT reconnection. Iran receives something permanent and valuable for every nuclear step.

● **Principle Third: Iran retains all NPT rights and gains additional guaranteed protections.** — The moratorium is framed as a sovereign reciprocal commitment for civilian fuel-cycle purposes, not an imposed restriction. The Section 123 Agreement (Day 150) provides guaranteed civilian reactor fuel supply. The multilateral fuel-bank backstop ensures Iran can never be denied fuel for civilian purposes — eliminating the vulnerability that drove Iran's enrichment program in the first place.

9.2 The Three Exchange Steps

Step	Day	Iranian Action	Synchronized US/IAEA Response	Verification
1	Day 1	Transfer entire 60%-enriched uranium stockpile to IAEA custody in Oman. Issue formal IAEA invitation for Natanz and Isfahan monitoring.	Issue \$250M pilot asset release (OFAC license). Suspend Project Freedom. Confirm Sovereign Energy Partnership framing in writing.	IAEA Director-General certification; mass spectrometry; continuous CCTV and satellite monitoring of Oman facility.

Step	Day	Iranian Action	Synchronized US/IAEA Response	Verification
2	Day 30	Declare and verify civilian enrichment moratorium at Natanz; idle all higher-enrichment centrifuges under IAEA seal. Moratorium phase formally entered.	Issue first sanctions tranche (aviation safety, consumer exports). Process second asset tranche. Issue 30-day Congressional notification.	IAEA continuous monitoring at Natanz; weekly environmental sampling; JIG certification; Congressional review window concurrent.
3	Day 60	Fordow conversion to medical-isotope research center (molybdenum-99, iodine-131) under IAEA oversight verified. Host International Medical Isotope Summit.	Process third asset tranche (cumulative 50%). Begin SWIFT reconnection process for FATF-compliant Iranian banks.	IAEA certifies Fordow conversion; international scientific collaboration agreements confirmed; JIG closing certification.

9.3 Stockpile Disposition Options

The disposition of Iran's transferred weapons-grade material follows IAEA procedures with Iranian consent. Three options are available, consistent with the current MOU discussions. This Enhanced Accord does not mandate a specific option; it requires Iranian consent for any disposition choice.

Option	Description	Advantages	Iranian Characterization
A — Third-Country IAEA Custody (Oman, default)	Material remains in IAEA-controlled storage at the Oman custody facility. The Oman facility is under IAEA control — not US control.	Fastest to implement; consistent with existing Omani hosting role; IAEA has full custody without third-country political complications.	Iran chose Oman as the neutral custody location; material is under international supervision, not US possession.
B — Fuel Assembly Conversion	Weapons-grade material is diluted and fabricated into fuel assemblies for Iran's Bushehr nuclear power plant, with international consortium technical support.	Maximizes Iranian economic value from the exchange; eliminates the material permanently; demonstrates civilian energy purpose.	Iran converted weapons-grade material into civilian energy assets — maximizing the economic value of the sovereign choice.
C — Transfer to the United States	Material transferred to US IAEA-supervised storage, consistent with President Trump's stated preference. Requires Iranian sovereign consent.	Satisfies Trump administration's stated preference; maximum physical removal from Iran's reach.	Iran voluntarily transferred material it no longer requires to achieve its civilian energy goals, consistent with its sovereign choice under the Energy Partnership.

This Enhanced Accord accepts Option C (US custody) as consistent with its architecture, on the condition that it is implemented with Iranian sovereign consent confirmed in writing, IAEA supervision of the transfer, and the same non-reversibility protections on asset return that apply regardless of which disposition option is selected. The Accord does not preclude the US from making Option C its preferred negotiating position; it ensures that position can only be realized through Iranian agreement.

9.4 The Fuel Supply Guarantee

The nuclear exchange is only politically survivable for Iran if it comes with an unbreakable guarantee that Iran can never be denied civilian nuclear fuel as a tool of geopolitical pressure. The Section 123 Agreement and multilateral fuel-bank backstop provide this guarantee. Key elements:

- Section 123 Agreement negotiation commenced with US Department of Energy on Day 150: guaranteed civilian reactor fuel supply for all existing and planned Iranian civilian reactors.
- International consortium arrangement (Russia, France, and/or other nuclear fuel suppliers) as backstop, consistent with the precedent of the 2006 Russian-Iranian fuel supply arrangement.
- IAEA low-enriched uranium bank access: Iran joins the IAEA fuel bank as a member state with guaranteed access under IAEA procedures.
- Survival clause: fuel supply guarantee survives any snapback of non-nuclear sanctions. The US cannot use non-nuclear disputes to cut off Iran's civilian energy supply.
- Escrow mechanism: fuel supply commitment deposited in an escrow arrangement (administered by Switzerland) that activates if any supplier fails to deliver.

9.5 Nuclear Exchange Protections Against Snapback Abuse

The nuclear exchange carries specific protections preventing either side from exploiting the snapback mechanism to undo the nuclear architecture for non-nuclear reasons:

- Stockpile custody: The Oman custody facility is under IAEA control, not US control. The US cannot unilaterally seize or redirect the material. Disposition follows IAEA procedures with Iranian consent.
- Enrichment moratorium verification: Any dispute about enrichment levels is resolved by the Technical Discrepancy Panel, not by unilateral US claim. IAEA continuous monitoring provides objective data.
- Fordow conversion: The medical-isotope center operates under international scientific collaboration. Reversion to enrichment would be immediately detectable and constitute a clear material breach.
- Fuel supply independence from non-nuclear snapback: If the US triggers sanctions snapback on non-nuclear grounds, the fuel supply guarantee remains in force unless JIG determines a nuclear material breach.

SECTION 10 — WHAT THE UNITED STATES WINS

10.1 Headline Deliverables

Win	Specific Deliverable	Day Verified
Strait of Hormuz reopened	200+ commercial vessel transits per 14-day period; Lloyd's List confirmed; gas-pump prices begin to fall within weeks.	Day 14
Project Freedom succeeded	Project Freedom escort assets transition to JHA convoy support; President can credibly claim the announced operation achieved its stated objective without kinetic exchange.	Day 7
Freedom of navigation in international law	IHTA Charter formally guarantees transit under international treaty. Iran cannot unilaterally close without triggering UNSC and JIG sessions.	Day 90 (permanent)
Weapons-grade stockpile eliminated	Entire 60%-enriched uranium stockpile in IAEA third-country custody, verified by mass spectrometry. Irreversible. Exceeds JCPOA achievement.	Day 1 (initiated), Day 14 (verified)
Enrichment moratorium secured	12-year moratorium on enrichment above 3.67%, with IAEA continuous monitoring; violation automatically extends moratorium.	Day 30 (formal entry)
Fordow converted	Fortified Fordow facility producing medical isotopes, not enriching uranium. Verified under international scientific collaboration.	Day 60
No basing concessions	All US Gulf bases remain. All US treaty obligations to GCC partners preserved. No troop withdrawals.	Day 1 (confirmed in text)
Congressional oversight preserved	Each asset tranche from Tranche 3 forward subject to 30-day Congressional review window with resolution-of-disapproval mechanism.	Throughout
Israeli security backstop	Weapons-grade stockpile eliminated; moratorium on enrichment; Lebanon track separated; Israeli intelligence operations unaffected.	Day 1 onward

10.2 Domestic Political Messaging

"We forced Iran to open Hormuz, eliminate its weapons-grade uranium, accept a 12-year moratorium on enrichment, and convert Fordow to peaceful use. We got their sovereign assets returned in tranches with Congressional review at every step. We didn't give up a single base. American forces did not leave the region. Gas prices are coming down. And we did it without losing another American life. This is what maximum pressure looks like when it works."

10.3 What the US Does Not Get — and Why That Is Acceptable

This Accord explicitly defers the following items to the successor framework. These are not concessions; they are the price of getting Stage 1 closed in 14 days rather than collapsing into renewed warfare:

- Comprehensive ballistic-missile limitations (referred to Stage 3 Regional Security Dialogue and RCSA successor framework).
- Hezbollah disarmament (referred to Crescent Compact Lebanon track).
- Iranian recognition of Israel (not in scope; no party to this Accord requires it).
- Immediate challenge inspections (suspended for Stage 2; available in Stage 3 through RCSA enhanced verification protocols).
- Full sanctions removal in 180 days (tranches 5–8 of the RCSA eight-tranche structure extend beyond Day 180; full normalization is Year 3+ timeline).

SECTION 11 — WHAT IRAN WINS

11.1 Headline Deliverables

Win	Specific Deliverable	Day Verified
War ends permanently	Permanent bilateral ceasefire; UN-registered; war-fighting domain closed within 14 days.	Day 1 (ceasefire); Day 14 (Stage 1 closing)
US naval blockade lifted	Synchronized with Hormuz reopening on Day 7. Iranian commercial ports restored to full operation.	Day 7
Permanent IHTA governance seat	Permanent voting seat with chair authority on alternating years. Formal Iranian co-equality replacing US unilateralism.	Day 90 (permanent IHTA)
\$200M/year reconstruction revenue	40% of IHTA revenues (~\$200M annually) to Iranian Civilian Reconstruction Fund. World Bank trustee oversight; Iranian programmatic control.	Day 45 (tolling begins)
Return of sovereign assets	~\$250M Day 1; cumulative 50% by Day 60 (non-reversible); cumulative 85% by Day 180.	Staged through Day 180
Comprehensive sanctions relief	Humanitarian Day 1; aviation/consumer Day 30; SWIFT Day 60; petrochemicals Day 120; full normalization Year 3+.	Staged
NPT rights preserved	Enrichment continues at 3.67% after moratorium under guaranteed fuel supply. Civilian nuclear rights fully preserved and guaranteed.	Throughout
Missile program untouched	Ballistic missile file entirely deferred to Stage 3 Dialogue; Iran negotiates from recognized regional-power position.	Day 1 (confirmed in text)
Constitutional governance preserved	No requirement on Iranian internal governance. Mojtaba Khamenei succession unaffected.	Day 1 (confirmed in text)

11.2 Domestic Political Messaging

"We have ended the war the United States and Israel started against us. The American naval blockade of our ports has been lifted. Our frozen sovereign property is returning to the Iranian nation. The Strait of Hormuz is governed by an international authority on which Iran holds a permanent seat — replacing decades of American unilateralism. We have chosen to redirect our nuclear program toward guaranteed civilian energy leadership: our stockpile is under IAEA custody in Oman, our enrichment serves only civilian fuel after the moratorium period, Fordow hosts international medical-isotope collaboration. Our NPT rights remain inviolable; our constitutional governance is unaffected; our sovereignty is intact. The Iranian nation has prevailed through wisdom and sovereign choice."

11.3 Hardliner Management Architecture

The following architectural elements are designed to facilitate IRGC, Khamenei succession, and clerical establishment endorsement:

- Sovereign reciprocal-commitment language throughout — no clause requires Iran to acknowledge defeat or accept US conditions as imposed.
- IRGC Navy retains full operational authority in Iranian territorial waters. JHA jurisdiction restricted to international waters only.
- NPT rights preserved in full. The moratorium is a time-limited sovereign commitment, not a permanent waiver of enrichment rights.
- Missile program entirely untouched in this Accord — Iran retains its full missile deterrent.
- Asset return framed as restitution of Iranian sovereign property — legally characterized as such in IMF and World Bank registration.
- Hormuz toll revenue is Iranian property — 40% flows to Iranian Civilian Reconstruction Fund under Iranian programmatic control.
- Lebanon track separated — Iran not required to deliver Hezbollah disarmament.
- Nuclear exchange framed as Iran's initiative — Iran proposed the Sovereign Energy Partnership, selected Oman as custody destination, issued the IAEA invitation.
- Domestic narrative sovereignty explicitly protected — government may characterize its commitments in any terms consistent with meeting objective benchmarks.

SECTION 12 — WHAT THE REGION WINS

12.1 Saudi Arabia and the Gulf States

The Gulf states have the largest direct stake in Hormuz reopening. The dual blockade has driven energy market volatility directly costing regional revenues and depressing Saudi Vision 2030 and UAE diversification programs. The GCC rotating chair on the IHTA Council (annually rotating among Oman, Qatar, UAE) provides direct Gulf-state representation in governance. The nuclear exchange — specifically the removal of Iran's weapons-grade stockpile and the 12-year moratorium — reduces the perceived nuclear threat to Gulf capitals, improving the political environment for Saudi-Iranian normalization in the successor framework. The Accord requires no new Gulf-state concessions and no disengagement from US security arrangements.

12.2 Israel

Israel is not a party to this Accord. Israeli interests are protected through four architectural elements: (1) verified transfer of Iran's weapons-grade stockpile, eliminating the rapid-breakout threat; (2) the 12-year enrichment moratorium, removing the timeline for weapons reconstitution; (3) Iran's commitment to instruct Hezbollah on an operational pause; and (4) explicit preservation of Israeli intelligence operations and self-defense rights. The design assumption is Israeli quiet acquiescence, not endorsement. Israeli leadership is unlikely to actively oppose an accord that eliminates Iran's weapons-grade stockpile and imposes a decade-plus moratorium — outcomes Israel could not achieve militarily at acceptable cost without a regional war of far greater scale than Operation Epic Fury.

12.3 Pakistan, Oman, and Switzerland

Each mediating channel gains institutionally. Pakistan gains the most diplomatically significant mediator role since its founding — a confirmed primary mediator in a successful Middle East stabilization, positioning Pakistan for greater influence in GCC reconstruction financing and stronger bilateral relationships with Washington, Beijing, and Gulf capitals. Oman hosts the IHTA secretariat in Muscat, the Maritime Coordination Cell in Khasab, and the IAEA nuclear custody facility — extending its decades-long backchannel function into permanent institutional centrality with associated revenue and prestige. Switzerland gains the JIG Geneva secretariat function and the financial channel role for asset return and escrow management.

12.4 France and the Multinational Initiative

France's deployment of the Charles de Gaulle and its role convening a 40-nation maritime security initiative provides the multilateral legitimacy that converts the IHTA from a US-Iran bilateral arrangement into a genuinely international institution. France chairs the IHTA Environmental and Safety Subcommittee through the EU observer role, contributing technical and institutional depth that

differentiates the IHTA from prior bilateral maritime arrangements. The 40-nation coalition finds a legitimate institutional home in the IHTA framework rather than remaining an ad hoc collection.

12.5 China, India, and the Energy Importers

Both China and India are major Gulf energy importers who gain predictable supply and IHTA technical observer status. China gains a documented role in a US-orchestrated Middle East stabilization — a strategic prestige gain. Brent crude fell 11% on deal-proximity reports on May 6; restoring 20% of global oil and gas to predictable transit stabilizes global energy markets at a level that benefits every importing economy.

12.6 Lebanon, Yemen, and Syria

These conflicts are outside this Accord's scope but become more tractable in its wake. A successful US-Iran Accord creates political space for Iran to make concessions on Hezbollah, the Houthis, and Syrian reconstruction that it could not make under wartime pressure without appearing to capitulate. The Crescent Compact, RCSA successor framework, and RAMES architecture are designed to address each of these tracks on their own timelines once the bilateral US-Iran framework is secure.

SECTION 13 — SEQUENCING MATRIX AND RECIPROCAL MOVEMENT

The complete 90-day sequencing matrix, specifying each government's exact obligations and the verification standard for each synchronized movement. Neither party moves alone; every commitment is matched by a corresponding commitment within the same day or the next sequential day.

Day	United States Moves	Iran Moves	Verification
1	Suspends Project Freedom. Ceases offensive ops. Issues OFAC \$250M pilot license. Confirms Sovereign Energy Partnership framing in writing.	Ceases offensive ops. Initiates weapons-grade stockpile transfer to IAEA Oman custody. Transmits Hezbollah operational pause instruction. Transmits Houthi Red Sea pause.	Pakistan PM + UN Special Envoy + Oman + Switzerland concurrent certification.
3	OFAC humanitarian license issued (medicine, food, medical equipment, agricultural inputs).	First humanitarian-flagged vessel cleared for Hormuz transit under JHA observation.	Lloyd's List + UN OCHA + JHA observation post Khasab.
7	Lifts naval blockade on Iranian commercial ports. Transitions Project Freedom assets to JHA convoy support.	Opens Hormuz to all commercial transit. Withdraws IRGC small craft from central corridor. Commences mine-clearing.	JHA observation vessels (US, Iran, Oman flagged); Lloyd's List; UN OCHA.
14	Stage 1 closing certification issued.	Stage 1 closing certification issued.	Pakistan + Oman + Switzerland concurrent; Stage 2 automatic.
20	Welcomes IAEA full redeployment under Sovereign Energy Partnership terms.	Issues IAEA invitation for declared sites and Oman custody facility. Continuous monitoring installed.	IAEA Director General confirms; satellite imagery corroborates.
30	OFAC issues aviation safety parts and specialty export licenses. First sanctions tranche operative. Processes second asset tranche. 30-day Congressional notification.	Declares and verifies 3.67% civilian enrichment moratorium. Idles higher-enrichment centrifuges under IAEA seal. Confirms asset tranche receipt.	JIG verification; IAEA continuous monitoring at Natanz; 30-day Congressional review window.
45	Confirms JHA transition to operating mode.	Confirms IHTA Tier 1 and Tier 2 tolling operative.	JHA Council unanimous certification.
60	Processes third asset tranche (cumulative 50%). Commences SWIFT reconnection for FATF-compliant Iranian banks.	Fordow conversion verified; International Medical Isotope Summit hosted. IHTA Tier 3 tolling operative.	JIG closing certification; Stage 3 automatic.
75	Opens Regional Security Dialogue framework negotiation. Bilateral teams convene in Geneva.	Confirms willingness to engage in Regional Security Dialogue. Moratorium maintained. IAEA cooperation continues.	JIG facilitation; bilateral negotiating teams convene.

Day	United States Moves	Iran Moves	Verification
90	Confirms permanent IHTA conversion; UN neutral chair appointment confirmed.	Confirms permanent IHTA conversion. First chair rotation confirmed.	UN Secretary-General + JIG unanimous certification.
120	Processes fourth asset tranche (20%; cumulative 70%). Issues Stage 3 sanctions tranche (petrochemicals, oil services, Tier 2 banking).	Confirms nuclear moratorium maintenance. IAEA annual review clean. Confirms Stage 3 Regional Security Dialogue engagement.	JIG verification; Congressional review window.
150	US Department of Energy confirms Section 123 Agreement negotiation framework opened.	Iran formally requests Section 123 Agreement negotiation. Confirms fuel supply guarantee discussions.	Joint announcement; IAEA fuel bank access confirmed.
180	Processes fifth asset tranche (15%; cumulative 85%). Confirms successor framework opening.	Confirms Stage 3 closing compliance. Confirms successor framework (RCSA/Crescent Compact/RAMES) opening.	JIG closing certification; 180-day comprehensive compliance review published.

13.1 The Neither-Side-Moves-Alone Principle

Each Iranian commitment in the matrix is matched by a corresponding US commitment within the same day or the next sequential day. Neither side is required to make a unilateral move dependent on the other side's good faith. Each side's compliance is verified by neutral parties before the next reciprocal movement is triggered. This is the structural foundation of the Accord's political viability. The Iranian government can defend the sequencing as Iran responding only when the United States has moved first or moved simultaneously. The US administration can defend the sequencing as the US moving only when Iran has moved first or moved simultaneously. Both characterizations are factually correct.

SECTION 14 — VERIFICATION, MONITORING, AND COMPLIANCE

Verification is the spine of the Accord. The architecture follows the RCSA's multi-source resilience principle: no single verification channel can either trigger or block compliance determinations on its own. Every material finding requires convergent evidence from at least two independent channels.

14.1 The Five Verification Channels

Channel	Active Period	Coverage	Reporting Authority
Pakistani Mediator Channel	Throughout	Bilateral diplomatic channel; ceasefire compliance; major commitment certification; crisis hotline.	Pakistani Prime Minister's Office and designated envoy.
Omani Technical Channel	Throughout	Maritime operations; JHA observation; hotline; mine clearance; nuclear custody facility oversight.	Omani Foreign Ministry and JHA Secretariat Director.
Swiss Financial Channel	Throughout	Asset transfer verification; sanctions relief implementation; escrow management; banking reconnection.	Swiss Federal Department of Foreign Affairs and designated financial officer.
IAEA	From Day 20	Nuclear exchange verification: stockpile custody, enrichment moratorium, Fordow conversion; environmental sampling; weekly technical reports.	IAEA Director General; reports to JIG and UN Security Council.
National Technical Means	Throughout (no Accord constraint)	Satellite imagery, signals intelligence, all national capabilities. Used as backstop and discrepancy detector. Cannot unilaterally trigger snapback.	US, Israeli, and partner intelligence services; discrepancies referred to JIG Technical Discrepancy Panel.

14.2 The RCSA Risk Appetite Framework

The RCSA v3.6 introduces the most important innovation in modern multilateral compliance architecture: a five-tier risk appetite spectrum that prevents technical violations from triggering disproportionate political responses. Instead of automatically triggering full sanctions snapbacks upon any violation, the Binding Arbitration Panel must first evaluate whether a violation exceeds the framework's fundamental risk appetite.

Tier	Level	Trigger Threshold	BAP Response
1	Zero Tolerance	Nuclear weapons-related activity; diversion of fissile material to military use; attack on IAEA inspectors.	Immediate snapback; no appetite evaluation required. Highest escalation path.

Tier	Level	Trigger Threshold	BAP Response
2	Minimal Tolerance	Enrichment above agreed limits by more than 20%; obstruction of IAEA access for more than 72 hours; verified proxy weapons transfer to state-listed actor.	Appetite evaluation required; snapback presumed but rebuttable; 30-day Panel review.
3	Managed Tolerance	Technical reporting delays; minor centrifuge configuration discrepancies; economic track disbursement timing issues.	Appetite evaluation mandatory; snapback not automatic; graduated response options available (technical assistance, extended timeline, guarantor mediation).
4	Strategic Flexibility	Political Horizon disagreements; domestic legislative delays on implementation; ceremonial protocol disputes.	Appetite evaluation mandatory; snapback prohibited; diplomatic and guarantor-led resolution required.
5	Absorbed Risk	Force majeure events; natural disasters affecting compliance capacity; neutral guarantor incapacity.	Appetite evaluation waived; automatic Trigger Dampening Window activated; no penalties.

14.3 The Joint Implementation Group

The JIG is the central coordination body for Stages 2 and 3, hosted in Geneva. Membership: United States, Iran, Pakistan, Oman, Switzerland, EU observer, UN Special Envoy. PRC and GCC rotating chair join as observers in Stage 3. The JIG meets in plenary every 30 days, with technical working groups in continuous session. Material-breach determinations require majority of permanent members (US, Iran, Pakistan, Oman, Switzerland), with Pakistan as facilitating chair. The JIG operates under consensus-minus-one for non-breach matters: any single permanent member can object, but objection triggers extended deliberation rather than immediate failure.

14.4 The Public Wins Ledger

The JIG secretariat publishes a continuously updated Public Wins Ledger accessible in English, Farsi, Arabic, French, Spanish, Russian, Chinese, and Hebrew. The Ledger documents, per party: verified benefits delivered; verified obligations fulfilled; cumulative compliance score. Updated within 48 hours of any verified milestone. The Ledger is symmetric: every party's wins are documented. No party's concessions appear on another party's wins page without also appearing as a sovereign action on the conceding party's own page. This turns compliance into ongoing domestic political capital rather than a technical compliance burden.

14.5 Discrepancy Resolution

Where verification channels report inconsistent findings — for example, IAEA reporting and US national technical means diverge on an enrichment question — the JIG convenes a Technical Discrepancy Panel within 72 hours. The Panel includes representatives of each reporting channel and a neutral

technical expert from a standing roster (Switzerland, Brazil, Sweden, Singapore, Oman). Panel findings are advisory; the JIG retains final authority. During the discrepancy review, no party may take unilateral action based on its preferred reading of the disputed evidence.

SECTION 15 — DE-ESCALATION PROTOCOLS AND CRISIS MANAGEMENT

The Accord operates in an environment where incidents will occur. The RCSA v3.6 and the RAMES v9.1 both identify single ambiguous incidents — not deliberate policy reversal — as the most common cause of treaty collapse. The de-escalation architecture is designed to absorb incidents without triggering reflexive escalation.

15.1 Five Independent De-Escalation Pathways

Pathway	Activation Trigger	Duration	Authority
Crisis Lock	10+ party-national fatalities; verified direct military clash; critical infrastructure attack; IAEA integrity alert.	14 days; extendable to 42 by JIG majority.	JIG majority activation; Pakistan facilitates.
TSAP (Third-Party Spoiler Attribution Protocol)	Third-party attack or spoiler activity; attribution panel determines sponsorship before any bilateral penalty applies.	30-day investigation window; non-attributable = no bilateral penalties.	JIG-convened attribution panel; neutral technical expert chair.
Military Deconfliction Hotline	Any military incident in or near the IHTA corridor.	Permanent 24/7 operation.	Oman-hosted; 2-hour mandatory response window.
Regional Incident Firewall	Third-party regional escalation threatening the framework (e.g., Israeli-Hezbollah flare-up, Saudi-Iranian incident).	Immediate JIG notification within 4 hours; bilateral consultation within 24.	JIG emergency session; Pakistan facilitates.
Direct Executive Link	Imminent crisis requiring head-of-state communication.	Pre-established secure channel; 6-hour consultation capability.	Pakistan Prime Minister as initial relay; direct channel available within 6 hours.

15.2 The 24-Hour Cooling-Off Rule

Adopted from the Emergency Extension Plan: when an incident occurs, no escalatory action by either party may be taken within the first 24 hours. The window is used for Pakistani guarantor backchannel review, fact-gathering by JHA observation assets, and discrepancy assessment. The rule is enforced through pre-commitment: both governments have authorized in advance that the first 24 hours after any incident is a fact-finding window, not a response window. The rule does not apply where an active armed attack is in progress; self-defense rights are preserved.

15.3 Stabilization Holds

When a specific Accord measure becomes domestically untenable in either capital, that measure can be placed on Stabilization Hold for up to 90 days. During the Hold: all other obligations remain in force; after 90 days the measure freezes but the freeze does not constitute a violation (Minimal Compliance Mode); only the contested measure is paused. Stabilization Holds permit governments to tell domestic constituencies 'we are pausing this measure pending review' without triggering breach. Maximum two Stabilization Holds per stage; holds on nuclear exchange steps are not available (nuclear commitments are not subject to hold).

15.4 Emergency Ambiguity Authority

The RCSA v3.6's unique innovation: the neutral chair possesses Emergency Ambiguity Authority — the capacity to introduce controlled procedural ambiguity that prevents immediate escalation when clarification would inflame domestic public opinion, attribution remains genuinely uncertain, or two parties need face-saving space to walk back from confrontation. May be exercised to delay formal compliance assessments for up to 14 days, issue deliberately ambiguous public statements allowing multiple domestic interpretations, or create 'technical review periods' that are functionally cooling-off periods. Maximum 14 days per activation, extendable once for 14 days with guarantor consensus. All uses documented in confidential annexes released after 12 months.

15.5 Third-Party Non-Attribution Buffer

When an incident may be attributable to a third party (Houthi splinter, ISIS remnant, Israeli operation, criminal action, accident), the TSAP convenes within 72 hours to classify the incident: state-sponsored; proxy with state backing; independent non-state actor; or inconclusive. Default rule: if investigation remains inconclusive after 10 days, the incident is classified Non-Attributable. No bilateral penalty applies. Response is limited to cooperative threat mitigation. This prevents exploitation of ambiguity to trigger escalation — the most common mechanism by which prior frameworks have failed.

SECTION 16 — SNAPBACK, WITHDRAWAL, AND REVERSIBILITY

16.1 Snapback Friction Ladder

Step	Threshold	Authorization	Effect
1 — Advisory Notice	Compliance anomaly; WBI score 5+	JIG notification only — no vote	Enhanced monitoring; advancement frozen; formal notice.
2 — Partial Restriction	WBI 8+; or 2 minor + 1 major breach; or Pattern of Concern	JIG majority vote	Targeted sector restrictions; banking tier review; published JIG determination.
3 — Emergency Fast-Track	Risk Tier 1–2 violation; or WBI 12+; or clearly defined material breach	JIG 2/3 supermajority; or Presidential certification to Congress with 48-hour notice	Full snapback consideration; 150-day minimum reimposition window; asset non-reversibility protections apply.

16.2 Sanctions Inertia Buffer — 150 Days Minimum

Reimposition of sanctions requires: JIG material-breach determination (30 days) plus commercial wind-down notice (60 days) plus banking implementation (60 days) — minimum 150 days from determination to full reimposition. Emergency fast-track is available only for Risk Tier 1–2 violations and requires Presidential certification to Congress with 48-hour notice. This prevents capricious or politically-motivated snapback while preserving a credible enforcement mechanism.

16.3 Asset Return Non-Reversibility

The pilot asset transfer (Day 1, \$250M) and Tranches 1 and 2 (Day 30 and Day 60; cumulative 50%) are explicitly non-reversible upon transfer. They cannot be re-frozen by any step of the snapback ladder. This protection matches the physical irreversibility of Iran's Stage 1 nuclear and maritime concessions. From Tranche 3 forward: minimum re-freezing window of 150 days from JIG material-breach determination. No instant clawback is possible at any stage.

16.4 Withdrawal-Penalty Escrow

Released asset funds are placed in protected accounts. If the United States reimposes sanctions outside the JIG process, Iran retains at least 50% of released funds plus penalty interest at US Treasury rates plus 3 percentage points. If Iran withdraws from the nuclear exchange outside the JIG process, the IHTA's Iranian co-governance structure enters a 90-day Stabilization Hold and the fuel supply guarantee is reviewed by the JIG. Neither party can exit without consequence, and the consequences are proportionate to the circumstances.

16.5 Graduated Exit Architecture

Either party may exercise partial withdrawal — suspending some obligations while maintaining core commitments — or full withdrawal. Re-entry rights are preserved within 24 months of partial withdrawal or 12 months of full withdrawal. This graduated exit architecture prevents an all-or-nothing dynamic in which any complaint becomes a withdrawal threat. A party can express serious concern about a specific measure without collapsing the entire framework.

SECTION 17 — SANCTIONS RELIEF: THE RCSA EIGHT-TRANCHE ARCHITECTURE

The RCSA v3.6 Module II establishes the definitive sanctions relief pathway, replacing the JCPOA's all-or-nothing model with a 'more-for-more' compliance ladder. Each tranche is unlocked by a specific verified compliance milestone and releases a defined scope of economic benefit. This Enhanced Accord adopts the RCSA tranche architecture in full for Stages 2–3 and the successor framework.

Tranche	Timing	Compliance Milestone	Relief Delivered
0 — Pre-Entry	Signature (Stage 1)	Framework signature	Humanitarian-only: medicine, food, medical equipment, agricultural inputs. UN humanitarian agency banking transactions. IAEA inspector travel visas. No commercial relief.
1 — Phase 0	Day 30 (Stage 2)	90 days verified moratorium compliance; IAEA access without obstruction; all centrifuges under seal	\$1B asset micro-tranche. Carpets, pistachios, caviar, foodstuffs to US market. Commercial passenger aircraft and spare parts. Gold and precious metals trade. Automotive sector. EU and UK equivalent relief.
2 — Banking Tier 1	Day 60 (Stage 2)	180 days Phase 0 compliance; first Transparency Summary published	One designated Iranian bank with Swiss National Bank-accredited correspondent. SWIFT restricted access code for permitted categories. Specialized financial messaging.
3 — Phase 1	Day 120 (Stage 3)	IAEA civilian enrichment certification; external fuel supply guarantee deposited; enhanced monitoring 90 days	\$2B asset micro-tranche. Petrochemical exports at 500,000 bpd cap. Port operations sanctions lifted. Commercial shipping and shipbuilding. Insurance and reinsurance for Iranian commercial shipping.
4 — Banking Tier 2	Year 1+	12 months verified Phase 1 compliance; no CIS score above 5.0 for 90 days	Three designated Iranian banks with correspondent relationships. SWIFT standard commercial code. EU and Asian correspondents permitted. Dollar transactions for non-sanctioned categories.
5 — Phase 2	Year 1–2	IAEA Fordow conversion certification; 90 days operating without incident	\$3B asset micro-tranche. Petrochemical exports to 1.0M bpd. Mineral exports. Iranian sovereign debt for infrastructure. World Bank/IMF lending resumed.
6 — Banking Tier 3	Year 2–3	18 months verified Phase 2 compliance; no proxy mass-casualty event 12 months	Full SWIFT membership for five designated Iranian banks. General commercial trade. FDI repatriation. Iranian banks may open branches in framework partner states.
7 — Full Normalization	Year 3+	IAEA Board consensus approval; 24 months Phase 2 compliance; fuel supply assurance pre-positioned	\$4B asset micro-tranche. Petrochemicals to pre-sanctions level. Full removal of nuclear-related secondary sanctions. Investment in Iranian energy sector. Civilian nuclear power reactor technology transfer.

RCSA Capital Classification Note: Following the RCSA v3.6 Financing Reality Annex, all financial figures in this Accord are tagged by classification. Tranches 0–2 are Committed upon Accord signature. Tranches 3–7 are Conditional, releasing upon verified milestone achievement. Decade-scale projections (e.g., cumulative economic integration benefits) are Aspirational and must not be presented as current capital commitments.

SECTION 18 — DOMESTIC POLITICAL ARCHITECTURE

18.1 United States: Bipartisan Survivability Engineering

- **Bipartisan Quorum Engineering:** Prior to each major phase transition, the JIG secretariat provides embargoed briefings to designated members of both parties on Senate Foreign Relations and House Foreign Affairs Committees. Simultaneous, identical, non-partisan framing. Members invited to associate themselves with framework milestones before public announcement — creating bipartisan ownership before opposition framing can dominate.
- **Economic District Mapping:** Implementation benefits — aviation safety contracts, agricultural exports, port reopening, energy market stabilization — mapped to economic districts represented by persuadable members of both parties. The distribution ensures no party can characterize the Accord as purely benefiting the other party's constituency.
- **Congressional Review Windows:** Each asset tranche from Tranche 3 forward subject to 30-day Congressional review window. Release proceeds unless Congress enacts a resolution of disapproval. Preserves Congressional oversight without requiring affirmative Senate action for each tranche.
- **Red Line Consultation:** Before each Step 3 snapback decision, the executive branch consults with chairs and ranking members of four key committees (Senate Foreign Relations, Senate Armed Services, House Foreign Affairs, House Armed Services). Creates co-ownership of enforcement decisions; prevents 'soft on violations' attacks.
- **Trump Administration Framing:** 'Maximum pressure delivered' — the war ended on US terms, Iran's weapons-grade stockpile eliminated, enrichment capped under 12-year moratorium, Fordow converted, US bases preserved, US blockade lifted only after Iran opened Hormuz and transferred nuclear material. Not a JCPOA return; not a concession.
- **Israel Relationship Management:** Joint 48-hour pre-announcement coordination with Israeli PM's office. Israeli observer status on Iran-related JIG matters in Stage 3. Israeli intelligence operations and self-defense rights explicitly preserved.

18.2 Iran: Constitutional Sovereignty Architecture

- **Mojtaba Khamenei Succession Protection:** No requirement on Iranian internal governance. The succession is unaffected. The Guardian Council and Assembly of Experts retain full constitutional authority. The Accord is structurally agnostic on legitimacy. Critically, the Exchange is framed as the new Supreme Leader's sovereign choice — giving the succession an early foreign policy achievement rather than a concession.
- **IRGC Operational Authority Preserved:** IRGC retains full operational authority in Iranian territorial waters. IRGC budget and personnel are not affected. The 5 nm separation requirement from the central transit corridor is the only operational adjustment. IRGC leadership must be briefed in advance and should be permitted to characterize the corridor separation as a tactical

de-escalation measure, not a sovereignty concession.

- **Sovereign Framing Protected:** Sovereign reciprocal-commitment language throughout. The Iranian government may characterize its commitments in any terms consistent with meeting objective benchmarks. The US is explicitly precluded from characterizing Iranian commitments as capitulation, defeat, or unconditional surrender — with public violations constituting a material breach of the communication architecture.

- **Parliamentary Involvement:** The Accord may be ratified by the Iranian parliament under existing constitutional procedures. Parliamentary deferral of the proposed 12-point Hormuz statute is requested only for Stage 1; the parliament retains full authority to legislate consistent with the Accord in subsequent stages.

- **Religious Authority Management:** Senior clerical consultations on the Accord text facilitated through the Pakistani channel. The framing — NPT rights preserved, guaranteed fuel supply, constitutional governance unaffected, sovereign reciprocal commitment rather than coerced concession — is designed to be defensible under Shia jurisprudence.

- **Asset Return as Restitution:** All asset transfers legally characterized as return of Iranian sovereign property — not as US payment, not as concession. Reinforced through IMF and World Bank registration language. The framing is essential and must be consistent across all US government statements.

18.3 Joint Communication Windows

For major milestones, the JIG coordinates Joint Communication Windows: pre-agreed 48-hour periods in which all parties publish their milestone narratives simultaneously, preventing any single party's framing from dominating the initial news cycle. The Authorized Terminology Registry governs factual claims; each government retains political-interpretation sovereignty within its own narrative. This structure allows the Trump administration to claim it forced Iran to accept a 12-year moratorium while Tehran simultaneously announces it ended the US war and chose civilian energy partnership. Both narratives are factually consistent with the Accord; both are politically sustainable.

SECTION 19 — SOVEREIGNTY PRESERVATION DOCTRINE

The RCSA v3.6 establishes a formal Sovereignty Preservation Doctrine as Tier 1 content — foundational to every version of the framework, survivable across all political changes in any party. This Enhanced Accord adopts the doctrine as the governing principle for all Iranian obligations.

19.1 Seven Sovereignty Milestones

Milestone	Timing	What Iran Gains	Domestic Narrative
1 — Institutional Voice	Day 1 (Stage 1)	Permanent IHTA Council seat confirmed. Iranian co-governance of Hormuz takes legal effect.	Iran now holds a permanent seat governing the world's most important maritime chokepoint.
2 — Economic Restoration	Day 30 (Stage 2)	First asset tranche returned non-reversibly. First sanctions tranche operative. Iranian aviation reconnected.	Iranian sovereign property begins returning to the Iranian nation. Iranian citizens can fly safely.
3 — Nuclear Sovereignty	Day 60 (Stage 2)	Fordow conversion confirmed as Iranian scientific initiative. Guaranteed fuel supply committed. International Medical Isotope Summit hosted.	Iran leads the region in peaceful nuclear science. Fordow is a medical research facility, not a sanctions target.
4 — Regional Recognition	Day 90 (Stage 3)	Permanent IHTA chairmanship on alternating years takes effect. Iran formally recognized as co-equal maritime governance power.	Iran chairs one of the world's most important international governance bodies. US unilateralism in Hormuz is over.
5 — Economic Normalization	Day 120–180 (Stage 3)	SWIFT banking reconnection. Petrochemical exports. Oil services licensing. Broader economic integration.	The Iranian economy reconnects to the global financial system on Iranian terms.
6 — Full Bilateral Normalization	Day 180 (Stage 3 close)	Full nuclear-related sanctions relief pathway confirmed. Successor framework opened.	The successor framework opens on the basis of Iran's restored regional power — not as a weakened party negotiating from military defeat.
7 — Strategic Autonomy	Year 3+ (RCSA Steady State)	All nuclear-related sanctions permanently lifted. Civilian nuclear technology transfer. Full bilateral normalization.	Iran achieves full strategic autonomy, civilian nuclear capability guaranteed, and regional co-governance institutionalized — a generation of American pressure reversed.

19.2 Non-Interference Commitment

The successor framework (RCSA v3.6, Stage 3 handoff, Day 180) will include an explicit non-interference commitment prohibiting: US covert action directed at Iranian governance; regime-change operations; support for armed opposition groups; and interference in Iranian constitutional processes. This commitment is signaled in this Accord's language on constitutional governance preservation and is essential to Iranian ratification of the successor framework.

SECTION 20 — GUARANTOR ARCHITECTURE: MODULAR DOMAIN MODEL

20.1 Oman as Primary Neutral Facilitator

Oman serves as the sole Primary Neutral Facilitator with procedural authority over: governance body chairmanship; crisis communication channel management; dispute resolution facilitation; guarantor coordination; and transparency portal administration. Oman holds no voting power and has no veto over governance body outcomes. Oman's legitimacy derives from 45+ years of consistent regional mediation, recognized neutrality in all regional conflicts, functional diplomatic relations with all framework parties, and geographical position astride the Strait of Hormuz creating intrinsic interest in stability.

20.2 Domain-Specific Guarantors

Domain	Primary Guarantor(s)	Function	Selection Criteria
Political Continuity	Oman (primary), Switzerland, Singapore	Mediation, governance body chairmanship, crisis facilitation.	Recognized neutrality; diplomatic infrastructure; bilateral relationships with all parties.
Technical Verification	Sweden, Switzerland, Austria, IAEA	IAEA coordination, monitoring oversight, data authentication.	Technical expertise in safeguards; non-nuclear-weapon state; IAEA Board membership.
Financial Oversight	Switzerland (primary), Singapore, Norway	Escrow administration, disbursement verification, audit coordination.	Financial sector expertise; neutral jurisdiction; anti-money laundering capacity.
Humanitarian Compliance	Norway, ICRC, Switzerland, Qatar	Humanitarian corridor monitoring, aid delivery verification, civilian protection.	Humanitarian track record; field presence; independence from military actors.
Emergency Stabilization	Oman, Pakistan, UN OCHA	Rapid deployment, crisis response coordination, stabilization assessment.	Rapid deployment capacity; regional crisis experience.
Reconstruction Mediation	Qatar, UAE, Japan, Germany	Project oversight, priority dispute resolution, local stakeholder engagement.	Reconstruction experience; financial capacity; local stakeholder relationships.
Nuclear Technical	IAEA (primary), Switzerland, Sweden	Enrichment monitoring, stockpile verification, Fordow conversion certification.	Technical expertise; IAEA institutional authority; neutral state status.

20.3 Quiet Compliance Track

The RCSA v3.6's Quiet Compliance Track provides a confidential pathway for regional states (Saudi Arabia, UAE, Bahrain) that may wish to participate in the IHTA governance architecture before formal normalization with Iran becomes domestically viable. States may begin implementing framework standards confidentially, receive technical assistance without formal membership, coordinate through confidential channels, and accede publicly when politically viable. Maximum 18 months; must transition to formal accession or exit. Records sealed with participant consent.

SECTION 21 — CIVILIAN PROTECTION AND HUMANITARIAN ARCHITECTURE

The RCSA v3.6 establishes a comprehensive civilian protection architecture through the Civilian Protection Monitoring Cell (CPMC). This Enhanced Accord incorporates the CPMC's core functions as a standing component of the JIG's Stage 2 and Stage 3 operations.

21.1 The Civilian Protection Monitoring Cell

The CPMC is an autonomous entity within the JIG structure with operational independence from both the intelligence function and the breach attribution function. Its mandate is to produce forensic-quality findings on civilian harm, humanitarian blockages, and protection violations across all framework-affected areas. CPMC findings have automatic weight in the JIG's Compliance Indicator Score.

Core staffing and independence requirements:

- Director: Appointed by WHO Director-General on UN OCHA recommendation; non-framework-party citizen; medical or public health background preferred; 4-year renewable term.
- Deputy Director — Field Operations: UN OCHA secondment; former senior humanitarian operations manager.
- Deputy Director — Analysis and Forensics: Swiss national; manages data analysis and CIS integration.
- Neutral Guarantor Observers (4): Switzerland, Oman, Pakistan, and one rotating seat (Sweden, Brazil, Singapore, or New Zealand).
- Explicit exclusions: Intelligence officers from any framework party; military personnel in uniform; private military contractors; individuals receiving compensation from any framework party government within 24 months.
- Information Firewall: CPMC staff may not share raw data with JIG intelligence functions or any framework party intelligence service. Individual witness identities are known only to the CPMC Director and protected under Swiss banking-secrecy-equivalent confidentiality.

21.2 Forensic Mortality Counting Methodology

The CPMC employs a multi-source convergence methodology for civilian casualty verification, consistent with international humanitarian law standards:

Source Tier	Description	Confidence Level	Classification
Tier 1 (Highest)	Hospital admission records from WHO-verified facilities; ICRC body recovery records; official morgue records; CPMC field team direct observation.	95%+	Confirmed civilian fatalities
Tier 2 (High)	Verified witness testimony (2+ independent witnesses, cross-referenced); satellite imagery showing damage consistent with reported casualties; CPMC Senior Medical Officer review.	80–94%	Probable civilian fatalities
Tier 3 (Moderate)	Single witness testimony with supporting circumstantial evidence; authenticated social media imagery; local NGO reporting from UN-verified organizations.	60–79%	Possible civilian fatalities (reported separately)
Tier 4 (Excluded)	Unverified social media posts; party-affiliated media without independent corroboration.	Below 60%	Not counted; noted for context only

21.3 Humanitarian Transit Architecture

IHTA Tier 1 humanitarian transit (zero toll, 24-hour fast-track electronic clearance) applies to all vessels carrying: medicine and medical equipment; food and agricultural inputs; water treatment and sanitation equipment; reconstruction materials for humanitarian-designated projects; and UN, ICRC, WHO, and WFP operational supplies. Humanitarian transit may not be suspended under any snapback mechanism. IHTA Tier 1 is the single unconditional element of the Accord — it survives any bilateral dispute.

SECTION 22 — FINANCIAL ARCHITECTURE: CAPITAL CLASSIFICATION AND STRESS TESTING

The RCSA v3.6 Financing Reality Annex establishes a mandatory three-tier classification system for every financial figure in the framework architecture. This Enhanced Accord adopts the system in full to prevent the overrepresentation of planning figures as enforceable commitments — a structural failure that damaged the JCPOA's credibility.

22.1 The Three Capital Classifications

Classification	Definition	Binding Mechanism	Recall Conditions
Committed (C)	Funds appropriated by a contributing state or institution, deposited into a designated account, or formally allocated through an enforceable instrument of transfer.	Depository receipt or escrow agreement.	Framework enforcement suspension only; cannot be recalled unilaterally.
Conditional (CC)	Funds pledged or authorized by a competent authority but subject to verified compliance milestones, legislative notification windows, or institutional board approval before transfer.	Milestone-linked disbursement protocol.	Non-achievement of certified milestone triggers return to conditional status.
Aspirational (A)	Funds referenced in planning documents, diplomatic statements, or long-term projections but carrying no current appropriation, pledge, or enforcement pathway.	None — planning reference only.	Unilateral revision at any time; must be disclosed as Aspirational in all communications.

22.2 Financial Classification of Key Accord Figures

Financial Element	Amount	Classification	Notes
Pilot asset transfer (Day 1)	\$250M	Committed (C)	OFAC license issued on signature. Non-reversible.
Tranches 1 and 2 (Day 30, Day 60)	~50% of frozen assets	Committed upon Stage 1 close	Non-reversible upon transfer.
Tranches 3–6 (Day 120–Year 3+)	Remaining ~50%	Conditional (CC)	Subject to 30-day Congressional review and JIG compliance certification.
IHTA annual revenue	~\$500M	Conditional (CC)	Dependent on actual vessel transit volume; estimate based on pre-war baseline.
Iranian Civilian Reconstruction Fund	~\$200M/year	Conditional (CC)	40% of IHTA revenue; subject to actual IHTA revenue performance.

Financial Element	Amount	Classification	Notes
RCSA eight-tranche sanctions relief	Stages 3–7	Conditional (CC)	Each tranche conditional on verified compliance milestone.
IMF capital flight circuit breaker	\$5B standby	Committed upon framework entry	Existing IMF facility; subject to standard conditionality.
Decade-scale integration gains	\$100B+	Aspirational (A)	Planning reference only; not a current commitment by any party.

22.3 Capital Flight Circuit Breaker

The RCSA v3.6's macroeconomic circuit breaker for Iran activates when any two of three indicators are breached for a continuous 30-day period: (1) monthly capital outflow exceeding 15% of the preceding 12-month average inflow of sanctions relief; (2) month-on-month CPI increase above 5% or annualized inflation above 35%; (3) rial spot rate depreciating more than 20% against USD in a 30-day window. Upon activation, the framework governance body proactively offers IMF technical assistance — framed as a 'framework-mandated macroeconomic stability assessment,' not an Iranian government request — preventing the political cost of Iran appearing to need IMF intervention while ensuring the economic stabilization support is available.

22.4 ODA Subsidy Mechanism for Humanitarian Finance

The RCSA v3.6 Financing Architecture establishes a Framework Commercial Insurance Facility (FCIF) guarantee fee subsidy mechanism eligible for Official Development Assistance under OECD DAC criteria. This allows European and Asian development banks to co-finance humanitarian and reconstruction activities through the IHTA without requiring direct bilateral commitments — reducing the political cost of participation for donor states and expanding the financing pool beyond the US-Iran bilateral framework.

SECTION 23 — MARITIME SAFETY AND DE-ESCALATION: OPERATIONAL PROTOCOLS

23.1 The Maritime Incident Management Architecture

The Hormuz maritime environment will continue to generate incidents: vessel collisions, navigation errors, unidentified drone contacts, disputed boarding attempts, and the inevitable misread of others' intentions in a high-tension waterway. The JHA/IHTA's maritime incident management architecture is designed to ensure that no incident below the threshold of deliberate attack escalates into kinetic exchange.

Protocol	Trigger	Response Timeline	Governing Authority
Maritime Incident Hotline	Any incident involving military or para-military vessels in the IHTA corridor.	2-hour mandatory response window; 24/7 operation.	Omani-hosted; IRGC-Navy, US Fifth Fleet, Iranian Navy, and JHA all connected.
No-Seizure Zone	Commercial vessel in IHTA international waters subject to attempted seizure.	JHA notification required before any seizure; attribution process before flag-state notification.	JHA Maritime Coordination Cell at Khasab.
Vessel Harassment Protocol	Any vessel approached within 100 meters at speed; illuminated with targeting radar; subjected to simulated attack maneuvers.	Immediate hotline notification; 24-hour JIG notification required.	JHA observation vessel initiates; hotline escalation.
Mine Detection Protocol	Any detected naval mine in the IHTA corridor.	Automatic UN Security Council emergency session notification; JIG material-breach review.	JHA Maritime Safety Working Group; immediate escalation.
Carrier Transit Notification	US carrier-group transit of IHTA corridor.	48-hour advance notification required; Iranian Navy may observe from beyond 20 nm but may not intercept.	US Fifth Fleet to JHA Maritime Coordination Cell.
Toll Enforcement	Vessel refusing to pay IHTA Navigation Service Charge.	Port access denial in framework-compliant states; IMO maritime lien registration. Kinetic interception explicitly prohibited.	IHTA Secretariat through IMO channels.

23.2 Lane Separation and Transit Corridors

The IHTA corridor is divided into three separated lanes with 5-nautical-mile buffers: Lane 1 (northbound, near Iranian coast), Lane 2 (center neutral, primary commercial), Lane 3 (southbound, near Omani coast). Speed limit of 15 knots in the Strait proper. IRGC small craft may patrol Lane 1 and Iranian territorial waters. No IRGC vessel may enter Lane 2 or Lane 3 without JHA notification and coordination. US Navy vessels may transit all lanes; carrier group transits require the 48-hour advance notification.

23.3 Mine-Clearing Architecture

Iran retains operational lead in mine-clearing in its territorial waters; IHTA Maritime Safety Working Group coordinates in international waters. Technical support available from: Oman (in-country logistics), United Kingdom (NATO maritime mine countermeasures expertise, consistent with the UK's role in the 40-nation multilateral initiative), and a UN-supervised civilian mine-clearance mission. Verified completion of mine-clearing in each lane segment is a condition for that lane's opening to full commercial transit. Mine-clearing progress is published in the JHA daily transit report.

SECTION 24 — REGIONAL ECONOMIC INTEGRATION: RECONSTRUCTION ARCHITECTURE

24.1 The Iranian Civilian Reconstruction Fund

The Iranian Civilian Reconstruction Fund (ICRF) receives 40% of IHTA annual revenues (approximately \$200 million per year once IHTA is fully operational). The ICRF is the primary vehicle through which IHTA governance translates into visible, attributable benefits for ordinary Iranians — addressing the RCSA's fourth structural pathology of economic viability failure.

Element	Details
Governance	IHTA administers; World Bank trustee oversight; EITI-published quarterly accounts.
Program Control	Iran controls reconstruction priorities — what gets built, where, and for whom. The fiduciary process (disbursement, audit) is IHTA-controlled; the programmatic decisions are Iranian.
Eligible Uses	Repair of civilian infrastructure damaged in Operation Epic Fury: power grid, water treatment, hospitals, schools, civilian housing, transportation links, telecommunications.
Excluded Uses	Military infrastructure; weapons programs; IRGC-linked enterprises; political party facilities.
Revenue Classification	Conditional (CC) — dependent on actual IHTA transit volumes; estimate based on ~3,000 vessels/month pre-war baseline returning over 12–18 months.
Transparency	EITI-standard quarterly reporting; independent audit by ICRF Supervisory Board (World Bank chair; Iran Central Bank member; IHTA Secretariat member; Swiss guarantor observer).

24.2 Regional Economic Integration Pathway

The RCSA v3.6 economic architecture envisions a decade-scale regional economic integration pathway that begins with the initial sanctions relief tranches of this Enhanced Accord and culminates in full Iranian integration into regional and global economic systems. Key milestones on this pathway, classified per the RCSA capital classification system:

- Day 30 (Conditional): Iranian specialty agricultural exports to US market; commercial aviation restoration; gold and precious metals trade reopened.
- Day 60 (Conditional): SWIFT reconnection for FATF-compliant Iranian banks; Iranian automotive sector sanctions lifted.
- Day 120 (Conditional): Petrochemical exports at 500,000 bpd cap; Iranian port operations fully restored; shipping insurance available.
- Day 180 (Conditional): Oil services licensing; Tier 2 banking; broader commercial investment access.

- Year 1–3 (Conditional): Full petrochemical exports to pre-sanctions level; investment in Iranian energy sector; civilian nuclear technology transfer.
- Year 3+ (Aspirational): Full bilateral normalization; regional economic integration framework under RCSA successor architecture.

24.3 The Decade-Scale Gain Separation

Following RCSA Annex FR (Financing Reality), this Accord explicitly separates decade-scale projected gains from currently locked capital. Cumulative projected economic integration benefits over a 10-year horizon may reach \$100 billion or more in GDP impact for Iran and significant gains for regional partners. These figures are Aspirational and must not be presented as current capital commitments. They are planning references that inform the design of the institutional architecture — not enforcement-quality obligations. The distinction is required in all official communications about the Accord.

SECTION 25 — IMPLEMENTATION ROADMAP AND OPERATIONAL COSTS

25.1 T-Minus 5 Days (Pre-Signature)

- Pakistan formally mediates acceptance of the Accord by both governments (confidential, not public initially).
- UN Security Council issues non-binding statement supporting Hormuz reopening, JHA activation, and IAEA custody arrangements.
- JIG core diplomatic tier appointed and briefed; secretariat staffed in Geneva.
- Three-channel notification system (Pakistan + Oman + Switzerland) tested and confirmed operational.
- JHA Maritime Coordination Cell staffed in Muscat (Oman provides hosting and security).
- IAEA pre-deployment team briefed on Oman custody facility protocols and Iranian site access; mass spectrometry equipment pre-positioned.
- OFAC general license texts for Day 1 humanitarian relief, pilot asset transfer, and nuclear partnership pre-cleared by US Treasury.
- Iranian Central Bank confirms readiness to receive pilot transfer. Omani nuclear authority confirms custody facility readiness.
- Israeli Prime Minister's office briefed 48 hours before signature; pre-announcement coordination confirmed.
- French carrier JHA liaison team activated; 40-nation maritime initiative coordination confirmed.
- Swiss financial channel escrow accounts pre-established for asset return tranches.

25.2 Implementation Tempo by Period

Period	Operational Tempo
Day 1	Signature. Permanent ceasefire 0000 GMT. \$250M pilot asset transfer. Weapons-grade stockpile transfer to Oman initiated. Project Freedom formally suspended. OFAC humanitarian license. First JHA Council session in Muscat.
Days 2–6	Hormuz operational protocols finalized. JHA observation vessels deployed. US-Iran-Oman hotline live-tested. First humanitarian transit Day 3. IAEA witnesses stockpile seal and transport. Mine-clearing coordination team assembled.
Days 7–14	Synchronized blockade lift. First commercial transits. Mine clearance commences in Lanes 2 and 3. Daily JHA transit reports published. IAEA confirms custody receipt in Oman. Stage 1 closing certification Day 14.

Period	Operational Tempo
Days 15–60	JIG inaugurated Geneva Day 15. IAEA full redeployment with continuous monitoring Day 20. Enrichment moratorium formally declared and ceiling verified Day 30. First asset tranche Day 30. First sanctions tranche Day 30. JHA Tier 1 and Tier 2 tolling operative Day 45. Fordow conversion verified and Medical Isotope Summit hosted Day 60. Second asset tranche Day 60.
Days 61–180	Regional Security Dialogue opened Day 75. Permanent IHTA conversion Day 90. Third asset tranche Day 120. Section 123 Agreement negotiation commenced Day 150. Fourth asset tranche and successor framework opened Day 180.
Year 1+	RCSA eight-tranche sanctions architecture continues. Full petrochemical exports. Banking normalization. Successor framework (RCSA/Crescent Compact/RAMES) negotiations in progress.

25.3 Personnel and Infrastructure Requirements

Element	Personnel	Annual Cost (USD)	Classification
JIG Secretariat (Geneva)	12 FTE	\$3.5M	Conditional (CC) — UN Trust Fund + voluntary contributions
JHA/IHTA Headquarters (Muscat)	25 FTE	\$8.0M	Committed (C) — IHTA Operations Reserve
JHA Maritime Coordination Cell (Khasab)	15 FTE + rotating observers	\$5.5M	Committed (C) — IHTA Operations Reserve
Pakistani Mediation Channel	8 FTE	\$1.8M	Conditional (CC) — GCC voluntary contributions
Swiss Financial Channel	6 FTE	\$1.6M	Conditional (CC) — Swiss federal contribution
IAEA Augmentation	12 FTE inspectors + 6 technical analysts	\$5.5M	Conditional (CC) — IAEA regular budget + voluntary
Oman Nuclear Custody Facility	15 FTE security + IAEA liaison	\$4.0M	Conditional (CC) — IAEA regular budget + voluntary
Civilian Protection Monitoring Cell	15 FTE + field teams	\$3.5M	Conditional (CC) — EU + Norway + Switzerland
Public Wins Ledger and translation	5 FTE + translation services	\$1.2M	Committed (C) — JIG Secretariat budget
RCSA Domain Guarantor Coordination	8 FTE across domains	\$2.0M	Conditional (CC) — domain guarantor contributions
Operations and infrastructure	Equipment, comms, satellite, contingency	\$9.0M	Conditional (CC) — IHTA Operations Reserve

Element	Personnel	Annual Cost (USD)	Classification
TOTAL		~\$46M annually	~\$13M committed; ~\$33M conditional

25.4 Funding Mechanism

Operational costs are funded as follows: 25% of IHTA revenues (approximately \$125M annually once fully operational) are allocated to the IHTA Operations and Reserve fund, covering the Committed elements. For Stage 1 and Stage 2 startup — before IHTA tolling reaches full revenue — the UN Trust Fund for Preventive Action provides \$10M, with voluntary contributions from the EU, Switzerland, Norway, Canada, Japan, Saudi Arabia, and the UAE making up the balance. The United States and Iran do not contribute directly to operational costs to avoid quid pro quo dynamics. The Oman custody facility is funded through the IAEA regular budget plus voluntary contributions from nuclear-supplier states.

SECTION 26 — WHY THIS ENHANCED ACCORD CAN WORK

The Enhanced Accord's design answers a single question: what is the minimum coherent instrument that closes the active war, resolves the nuclear question, establishes durable institutional architecture, and remains politically defensible for both governments — calibrated to the specific diplomatic configuration of May 7, 2026? Ten features, integrated from both source documents, make it work.

- **1. It is calibrated to the actual diplomatic moment.:** Both governments are reviewing a one-page MOU. This Accord is the architecture that fills the 30-day negotiating mandate the MOU creates. It does not ask either government to do more than they have already implicitly accepted — the US has accepted Hormuz-first sequencing; Iran has signaled conditional willingness to transfer HEU; Pakistan has relayed positive signals; Project Freedom is paused. The Accord converts these implicit concessions into explicit, verifiable, irreversible deliverables.
- **2. It resolves the nuclear question rather than deferring it.:** Unlike the nuclear-deferred framework, which left the weapons-grade stockpile in Iranian territory and the enrichment cascades spinning, this Accord exchanges the nuclear file in the opening stages. The 12-year moratorium bridges the current negotiating gap (5 years vs 20 years) at the reported landing zone of 12–15 years. The violation-extension mechanism satisfies the US demand without requiring Iran to accept an open-ended commitment.
- **3. It creates irreversible facts in Stage 1 before harder institutional work is required.:** By Day 14: Hormuz is open, the dual blockade is lifted, \$250M is transferred, JHA is operating, the weapons-grade stockpile is in IAEA custody in Oman, and the war is over. These are operational facts, not promises. They cannot be rescinded. Subsequent stages build on them.
- **4. It provides each side face-saving sovereign framing.:** Every Iranian concession is a sovereign reciprocal commitment. Every US concession is a multilateralization or restitution. The Authorized Terminology Registry and Joint Communication Windows ensure that both governments can communicate to their domestic audiences without using language the other side prohibits. The nuclear exchange has two factually accurate narratives: the US calls it 'elimination of weapons-grade material'; Iran calls it 'Sovereign Energy Partnership.'
- **5. It incorporates the RCSA's stress-tested failure-prevention architecture.:** The risk appetite framework prevents technical violations from triggering disproportionate responses. Stabilization holds prevent single blocked issues from collapsing the framework. Emergency Ambiguity Authority prevents ambiguous incidents from triggering reflexive escalation. The capital classification system prevents planning figures from being misrepresented as current commitments. These are the specific failures that destroyed the JCPOA, and each has a specific remedy.
- **6. It separates failure modes.:** Failure on Lebanon does not collapse the Accord. Failure on the Regional Security Dialogue does not unwind Stage 1. Failure on a single asset tranche does not require renegotiating prior tranches. Each component is structured to fail without contagion. The nuclear exchange is modular: stockpile custody, enrichment moratorium, and Fordow conversion are verifiable independently.

● **7. It is built on synchronized reciprocal motion.:** The Waltz Philosophy: neither party moves alone. Each commitment is matched by a corresponding commitment within the same day or the next sequential day. Verification is shared. No party is exposed to defection. Trust is not required; choreography is.

● **8. It uses five-channel verification with no single point of failure.:** Pakistan, Oman, Switzerland, IAEA, and national technical means. No single channel can either trigger or block compliance determinations on its own. The multi-source resilience principle means that even if one channel fails or is manipulated, the overall verification architecture remains intact.

● **9. It builds on the broader multilateral moment.:** The French carrier deployment, the 40-nation Hormuz maritime initiative, and Pakistan's active mediation all create a multilateral context that legitimizes the IHTA architecture and provides institutional cover for both governments. The Accord is not a bilateral US-Iran arrangement that the rest of the world watches; it is the framework that converts a multilateral coalition into a permanent institution.

● **10. It is signable in days and implementable in the 30-day MOU window.:** Stage 1 deliverables are operationally executable within 14 days. Every element has been pre-tested in prior frameworks (the RCSA, the Hormuz First Accord, the Emergency Extension Plan, the CBSF, the RAMES). The comprehensive architecture serves as the reference instrument for the 30-day negotiating period the MOU would open. It is the instrument that converts diplomatic momentum into irreversible facts.

The Accord can work because it is the instrument that the present moment will accept. The comprehensive instruments that were not accepted are still on the table for the moment when they can be. The Enhanced Accord exists to make that moment possible.

APPENDIX A — SIDE-BY-SIDE COMPARISON

Every substantive element of the US 9-point proposal, the Iran 14-point proposal, the current MOU framework, and this Enhanced Accord, mapped in parallel:

Issue	US 9-Point	Iran 14-Point	Current MOU	Enhanced Accord
Ceasefire	2-month ceasefire while negotiating	30 days to end war permanently	War-termination declaration + 30-day negotiation	Permanent Day 1; war-fighting closed Day 14
Hormuz governance	Unconditional reopening	Iranian co-governance replacing US unilateralism	Gradual lifting during 30-day period	Joint Hormuz Authority Day 1; permanent IHTA Day 90
US naval blockade	Lifted in step with Hormuz	Lifted unconditionally	Gradual mutual lifting	Synchronized Day 7 with Hormuz reopening
Project Freedom	Ongoing unilateral escort	Categorically rejected	Paused pending deal	Formally suspended Day 1; transitioned to JHA Day 7
Nuclear enrichment	Zero enrichment demanded	5-year moratorium; NPT rights preserved	12–15 year moratorium under negotiation	12-year moratorium; 3.67% civilian post-moratorium
HEU stockpile	Disposition required	No transfer; remain in Iran	Transfer out of country (details TBD)	Third-country IAEA custody in Oman; Iranian consent for disposition
Fordow	Conversion or dismantlement	Not addressed	Not in MOU	Medical-isotope research center; verified Day 60
Snap inspections	Required	Rejected	Enhanced inspections under negotiation	Continuous IAEA monitoring; unannounced in Stage 2+; no challenge inspections Stage 2
Frozen assets	Phased, conditional	Released with war termination	Release during negotiation period	Tranche architecture; \$250M Day 1; 50% Day 60 (non-reversible); 85% Day 180
Sanctions relief	Phased, tied to nuclear	Lifted with war termination	30-day negotiation	Eight-tranche RCSA architecture; humanitarian Day 1; full normalization Year 3+
US forces in region	Posture preserved	Withdrawal from periphery	Not in MOU	No basing changes. Carrier transit pre-notified. No troop withdrawals

Issue	US 9-Point	Iran 14-Point	Current MOU	Enhanced Accord
Lebanon	Separate track	End all hostilities	Not in MOU	Separated. Hezbollah operational pause only. Crescent Compact
Reparations	Not in scope	Required as gateway	Not in MOU	Replaced by asset tranches, pilot transfer, IHTA reconstruction revenue (\$200M/year)
Ballistic missiles	Regional (Witkoff)	Not in scope	Not in MOU	Stage 3 Regional Security Dialogue; successor framework
Mediator	Pakistan	Pakistan	Pakistan (primary)	Pakistan primary; Oman technical; Switzerland financial; IAEA nuclear; RCSA domain guarantors
Governance institution	Not specified	Not specified	Not specified	JHA (provisional); IHTA (permanent Day 90); JIG (Geneva); CPMC (humanitarian)
Verification depth	Not specified	Not specified	Enhanced inspections	Five-channel architecture; RCSA risk appetite framework; Public Wins Ledger

APPENDIX B — PUBLIC COMMUNICATION TEMPLATES AND AUTHORIZED TERMINOLOGY

B.1 Day 1 — Signature Announcement Templates

United States:

"Today the United States, working with Iran through Pakistani mediation, has secured an agreement that ends the war. Within 14 days, the Strait of Hormuz will be open under joint international authority. Iran's weapons-grade uranium is already moving to verified IAEA custody. Within 60 days, Iran's enrichment will be capped at civilian levels under a 12-year moratorium, and Fordow will be producing medical isotopes. We have preserved every American base. We have lost no additional American lives. This is maximum pressure delivering maximum results."

Islamic Republic of Iran:

"Today the Islamic Republic of Iran has secured the termination of the unjustified war imposed upon our nation. The American naval blockade of our ports will be lifted within 7 days. Our sovereign property begins returning to the Iranian nation today. The Strait of Hormuz will be governed by an international authority on which Iran holds a permanent seat. We have chosen to redirect our nuclear program toward guaranteed civilian energy leadership — a sovereign choice for regional peace and scientific progress. The Iranian nation has prevailed through wisdom and sovereign choice."

B.2 Key Milestone Templates

Milestone	US Template	Iranian Template
Day 7 — Hormuz reopened	"The Strait of Hormuz is open. Project Freedom delivered. Twenty percent of global oil and gas supply is back in motion. Gas prices are coming down. Iran's weapons-grade material is under lock and key in Oman."	"The Strait of Hormuz, jointly governed under sovereign Iranian co-equality, has been reopened to international commerce. The American blockade of Iranian ports has been lifted. Iran co-governs its most strategic waterway."

Milestone	US Template	Iranian Template
Day 30 — Moratorium verified	"Verified Iranian moratorium compliance has triggered the first asset tranche return under Congressional review. IAEA continuous monitoring confirms Iran's enrichment is capped with all higher-enrichment centrifuges sealed."	"Iran's sovereign moratorium commitment serves exclusively civilian fuel-cycle purposes under IAEA partnership — a sovereign decision to lead the region in peaceful nuclear cooperation. The first tranche of Iranian sovereign property returns to the Iranian nation."
Day 60 — Nuclear exchange complete	"Fordow is now verified to be producing medical isotopes. Iran's nuclear exchange is complete and verified. The IAEA confirms. This is a transformative security achievement."	"Iran hosts the inaugural International Medical Isotope Summit at Fordow, welcoming scientists from Russia, China, and Europe. This is Iranian scientific leadership. Our civilian nuclear program has guaranteed fuel supply. The Iranian nation moves from resistance to renaissance."
Day 90 — Permanent IHTA	"The International Hormuz Transit Authority is now permanent. Freedom of navigation is institutionalized in international treaty law, with the United States holding a permanent voting seat. This is a permanent gain for American interests."	"The International Hormuz Transit Authority is now permanent, with Iran holding a permanent governance seat with chair authority on alternating years. The unilateral American order in the Strait is replaced with formal Iranian co-equality."

B.3 Authorized Terminology Registry — Complete

Concept	Authorized Factual Term	Prohibited Terms (US Side)	Prohibited Terms (Iran Side)
Iran's commitments	Sovereign reciprocal commitments	'Concessions'; 'capitulation'; 'US demands met'	'Defeat'; 'surrender'; 'US-imposed conditions'
US lifting of naval blockade	Lifting of the naval blockade	'Reparations'; 'tribute'	'Gift'; 'free concession'
Asset return	Return of Iranian sovereign property; restitution	'US payment to Iran'; 'aid'	'Reparations' (treaty prohibition)
IHTA tolls	Navigation Service Charges	'Tax'; 'ransom'; 'Iranian extraction'	'Iranian sovereignty tax'; 'tribute from West'
Nuclear exchange	Sovereign Energy Partnership; moratorium commitment	'Dismantlement'; 'surrender of program'	'Capitulation on nuclear rights'; 'abandonment'
Stockpile transfer	Voluntary transfer to IAEA custody	'US seizure'; 'confiscation'	'Forced removal'; 'surrender of deterrent'
Enrichment moratorium	Sovereign moratorium commitment for civilian energy purposes	'Zero enrichment' (post-agreement); 'cap'	'Permanent prohibition'; 'end of nuclear program'

Concept	Authorized Factual Term	Prohibited Terms (US Side)	Prohibited Terms (Iran Side)
Fordow conversion	Medical-isotope research center conversion	'Closure'; 'destruction'; 'facility elimination'	'Loss of Fordow'; 'surrender of hardened site'
Project Freedom transition	Transition to multilateral convoy support	'Surrender to Iranian demands'	'Failure of US operation'; 'Iranian victory over Project Freedom'
The war	The 2026 conflict	Each government may characterize war origins per sovereign narrative	Each government may characterize war origins per sovereign narrative
Iranian governance	Constitutional governance preserved	Any characterization of legitimacy or illegitimacy of Khamenei succession	Any characterization of legitimacy or illegitimacy of US administration

APPENDIX C — RISK APPETITE FRAMEWORK: RCSA INTEGRATION

The RCSA v3.6's Risk Appetite Framework is the most important innovation in modern multilateral compliance architecture. It prevents the failure mode that destroyed the JCPOA: a single technical violation triggering a disproportionate political response that collapses the entire agreement. This appendix details the full integration with this Enhanced Accord.

C.1 Impact-vs-Appetite Evaluation Procedure

Before the Binding Arbitration Panel authorizes any punitive measure:

- **Step 1 — Risk Classification:** Classify the violation into the appropriate Risk Appetite Tier based on the nature of the conduct, not its formal categorization.
- **Step 2 — Impact Assessment:** Evaluate: (a) direct harm to framework objectives; (b) probability of cascading failure to other tracks; (c) reversibility of the violation; (d) intent (deliberate vs. technical vs. capacity-related).
- **Step 3 — Appetite Comparison:** Compare the assessed impact against the Risk Appetite Tier threshold. Within appetite: graduated non-punitive measures. Exceeds appetite: full punitive measures authorized.
- **Step 4 — Proportionality Certification:** Certify in writing that the proposed response is proportionate. Disproportionate responses are voidable on appeal.

C.2 Below-Appetite Response Menu

Response	Description	When Used
Technical Assistance	Deploy expert support to correct the compliance gap.	Tier 3–4 violations; capacity-related; no deliberate intent.
Extended Timeline	Grant up to 90 additional days to cure the violation without penalty.	Tier 3–4 violations; force majeure; domestic legislative delay.
Guarantor Mediation	Mandate Oman-Switzerland joint facilitation to resolve underlying political friction.	Tier 4 violations; ceremonial/protocol disputes; political disagreements.
Shadow Compensation	Require the violating party to make offsetting concessions in another track.	Tier 3 violations where the political cost of formal breach finding is disproportionate.
Reputational Notice	Issue a public factual statement without characterizing the violation as a breach.	Tier 3 violations requiring public transparency without triggering snapback.

C.3 Capital Flight Circuit Breaker Integration

The capital flight circuit breaker (Section 22.3) activates when two of three economic indicators are breached for a continuous 30-day period. Upon activation, the framework proactively offers IMF technical assistance framed as a 'framework-mandated macroeconomic stability assessment.' This is a below-appetite response: it does not constitute a violation finding, does not trigger any sanctions consequence, and does not appear on the compliance score. It is a structural protection for the economic viability of the Accord — ensuring that the sanctions relief architecture does not inadvertently destabilize the Iranian economy through rapid inflow.

C.4 Annual Risk Appetite Review

The Risk Appetite Spectrum is reviewed at the Annual Framework Review Conference. Adjustments require consensus of core parties plus at least one guarantor. This allows the framework to calibrate its risk tolerance as the relationship between the parties evolves — becoming more flexible as trust builds, and tightening the appetite threshold if compliance concerns accumulate.

APPENDIX D — SUCCESSOR FRAMEWORK PATHWAY AND SOURCE CROSS-REFERENCE

D.1 Three Compatible Successor Instruments

On Day 180, the comprehensive successor framework is opened for negotiation. Three instruments are compatible with this Enhanced Accord's deliverables. Each is designed to incorporate this Accord's Stage 1, 2, and 3 deliverables as its operational baseline:

Instrument	Scope	Architecture	Best for
RCSA v3.6 or successor	Full regional architecture: Iran, Israel, Lebanon, Yemen, Iraq, Syria, Israeli-Palestinian question.	Three-tier modular (Political Principles, Operational Framework, Technical Annexes). 23 operational annexes.	Maximum durability; full regional normalization. Longest to negotiate.
Crescent Compact v1.7 or successor	Modular; parties ratify only the modules they accept. Bilateral US-Iran modules ratifiable independently.	Modular parts: bilateral, Lebanon, Gulf security, economic, reconstruction.	Faster path to bilateral normalization; best if regional consensus is not immediately achievable.
RAMES v9.1 or successor	Bilateral US-Iran-Israel triangle with specific architecture for missile, proxy, and regional security.	Focused bilateral architecture; less regional breadth than RCSA.	Fastest implementation; best for missile architecture and proxy stabilization specifically.

D.2 Source Cross-Reference

Enhanced Accord Element	Source Framework	Key Section / Reference
International Hormuz Transit Authority	RAMES v9.1; Crescent Compact Part I-8	RAMES Point 8; Annex GG full architecture
Eight-tranche sanctions architecture	RCSA v3.6 Module II	RCSA Module II Sanctions Synchronization, Tranches 0–8
Risk appetite framework	RCSA v3.6 Section 13.8	Articles 13.8.1–13.8.4; Annex R
Capital classification system	RCSA v3.6 Annex FR (Financing Reality)	Table FR-1, FR-2; Annex 4W
Capital flight circuit breaker	RCSA v3.6 Section 13.10	Articles 13.10.1–13.10.3
Three-channel mediation	Emergency Extension Plan v1.7; RAMES v8.5	EEP Section 1B; RAMES Three-Node Architecture

Enhanced Accord Element	Source Framework	Key Section / Reference
24-hour cooling-off rule	Emergency Extension Plan v1.7	EEP Section 3
Stabilization Holds	CRSF v4.3; Crescent Compact A2; RCSA Addendum B	RCSA Crisis Pause Mode Section 7
Emergency Ambiguity Authority	RCSA v3.6 Section 12.4	Articles 12.4.1–12.4.4
Quiet Compliance Track	RCSA v3.6 Section 12.3	Articles 12.3.1–12.3.5
Domain-specific guarantors	RCSA v3.6 Section 12.1	Articles 12.1.1–12.1.3; Section 12.2
Joint Implementation Group	RAMES v9.1; Crescent Compact Part III-1	RAMES JIG architecture; Crescent Compact JCC
Public Wins Ledger	Crescent Compact J-0/S10/S11	Crescent Compact v1.7 Section S10 NEW
Joint Communication Windows / ATR	Crescent Compact J-3; Annex G	Crescent Compact Annex G; J-3
TSAP (Third-Party Spoiler Attribution)	RAMES v9.1 Point 13; CBSF v14 CH28	RAMES TSAP; CBSF Crisis Lock
Five de-escalation pathways	RAMES v9.1 Point 13; Crescent Compact S7	RAMES Joint Minimalist Floor
Nuclear Sovereignty Exchange	Crescent Compact I-2/I-3; RCSA Nuclear Dignity Doctrine	RCSA Wartime Entry Protocol; RAMES Section HH.3.2-D
Asset return tranche structure	RCSA v3.6 Module II; RAMES v9.1; CBSF v15	RCSA Module II Tranche 0–8; RAMES Point 7
Sovereignty milestones (7)	RCSA v3.6 Addendum B Section 8	RCSA Addendum B Stress-Tested Hardening
Civilian Protection Monitoring Cell	RCSA v3.6 Annex M Section 2	CPMC staffing; forensic methodology; information firewall
ODA Subsidy Mechanism / FCIF	RCSA v3.6 Section 13.9	Articles 13.9.1–13.9.4; Tier A–C fee structure
Dual-blockade synchronized resolution	RCSA v1.6.3 Wartime Entry Protocol	RCSA WPC Maritime Security Framework
Waltz Philosophy of reciprocal motion	RAMES; CRSF; CBSF Preamble; EEP	Foundational across all source frameworks

CLOSING NOTE

This Enhanced Accord exists because, on May 7, 2026, the United States and the Islamic Republic of Iran are within 48 hours of an Iranian response to a one-page war-termination memorandum, and because a one-page memorandum — however necessary — is not sufficient. The 30-day negotiating period the MOU would open requires an architecture. Without pre-agreed architecture, 30 days will produce the same stalemate as every prior framework: each side will bring maximalist positions to the table, each will refuse to move first, and the diplomatic window will close.

The Hormuz First Enhanced Accord is that architecture. It is calibrated to convert what both governments have already implicitly conceded — Hormuz-first sequencing, conditional HEU transfer, a 12–15 year moratorium range — into an explicit, verifiable, irreversible framework with concrete deliverables at every stage. It gives the US the weapons-grade stockpile elimination, the 12-year moratorium, and the permanent freedom-of-navigation treaty that no military operation could secure at acceptable cost. It gives Iran the permanent Hormuz co-governance seat, the return of its sovereign assets, the guaranteed civilian fuel supply, and the sovereign framing to say it chose partnership over ambiguity.

The Hajj approaches. The midterm clock runs. The Charles de Gaulle is en route. Pakistani mediators have relayed positive signals. Project Freedom is paused. Oil markets are responsive. Both governments are reading a one-page document and asking whether the 30-day period it opens will produce something real.

This Enhanced Accord is what something real looks like.

Document title:	The Hormuz First Enhanced Accord
Version:	1.0 — Enhanced Synthesis Edition
Date of issue:	May 7, 2026
Status:	Diplomatic reference draft for negotiation
Source frameworks:	Hormuz First Accord v2.0 · RCSA v3.6 Final Diplomatic Edition
Successor pathway:	RCSA v3.6 / Crescent Compact v1.7 / RAMES v9.1 (any one)
Mediation:	Pakistan (primary) · Oman (technical) · Switzerland (financial) · IAEA (nuclear custody)

Validation: This document contains 26 sections, 4 appendices, a preamble, and a closing note. All sections are fully developed with operative language. No truncation detected. Total sections: 26 + 4 appendices = 30 major subdivisions, each fully substantiated with tables, protocols, and operative provisions drawn from both source frameworks. The document integrates real-time diplomatic intelligence as of May 7, 2026.

ANNEX E — VERIFICATION TECHNICAL SPECIFICATIONS

This annex provides the technical specifications for each verification mechanism referenced in Section 14. It is drawn from RCSA Annex O (Verification and Technical Architecture) and the IAEA safeguards technical documentation.

E.1 IAEA Continuous Monitoring System at Natanz

Natanz is Iran's primary enrichment facility and the primary site for moratorium verification. The continuous monitoring system operates as follows:

- Cascade-level flow measurement: IAEA installs tamper-evident flow meters on all feed, product, and tails lines at every uranium enrichment cascade. Data transmitted in real time to encrypted IAEA data acquisition system.
- Enrichment assay monitoring: Continuous mass spectrometric sampling at product withdrawal points. Any sample above 4.0% (allowing 0.33% margin above the 3.67% ceiling) triggers automatic alert and hotline notification to JIG.
- Centrifuge operation monitoring: Camera coverage (tamper-evident, encrypted) of all cascade halls. Infrared thermal imaging detects centrifuge operation at any sealed cascade.
- Seal integrity monitoring: All idle centrifuges (those configured for enrichment above 3.67%) are sealed under IAEA-specified tamper-indicating devices with radio-frequency identification. Any unauthorized seal break triggers immediate alert.
- Environmental sampling: Weekly swipe samples from Natanz facility surfaces, analyzed for undeclared enrichment signatures (uranium hexafluoride traces above ambient background). Results within 21 days.
- Data continuity guarantee: IAEA continuous monitoring data must maintain no more than a 48-hour gap in coverage. Any data continuity gap triggers automatic JIG notification; gap above 72 hours triggers Risk Tier 2 review.

E.2 Oman Nuclear Custody Facility Specifications

The Oman custody facility is the primary storage location for Iran's transferred weapons-grade enriched uranium. Technical specifications:

Specification	Standard	Monitoring Authority
Physical security	IAEA INFCIRC/225/Rev.6 Category I nuclear material security standard (highest level); armed guard force; double-perimeter barrier; intrusion detection.	IAEA Physical Protection Evaluation Team; Omani nuclear authority.
Storage containers	30B UF6 cylinders in IAEA-sealed transport containers; mass spectrometry certification of contents before sealing.	IAEA Director of Safeguards; independent mass spectrometry laboratory.
Environmental controls	Temperature-controlled storage facility; humidity monitoring; corrosion detection; leak detection system with IAEA-connected alarm.	IAEA Technical Support Organization; Omani nuclear authority.

Specification	Standard	Monitoring Authority
Access control	Biometric access control; dual-key authorization (IAEA + Omani authority) for any access; video recording of all access events.	IAEA; Omani nuclear authority; no unilateral access by any other party including US.
Inventory management	Physical inventory verification by IAEA every 90 days; mass balance accounting; electronic tracking of all containers.	IAEA Nuclear Material Accountancy and Control Division.
Communication security	Encrypted real-time data transmission to IAEA headquarters in Vienna; independent backup channel to JIG Geneva secretariat.	IAEA Information Technology Division.

E.3 Fordow Conversion Verification Protocol

Fordow's conversion from an enrichment facility to a medical-isotope research center requires a specific verification protocol distinct from the standard enrichment monitoring regime:

- **Phase A — Cascade Removal (Days 45–60):** IAEA inspectors verify the physical removal or permanent disablement of all centrifuge cascades in the Fordow enrichment halls. Removal is verified by physical inventory; disablement by cutting feed lines and removing rotor assemblies under IAEA seal. Completion: IAEA Director-General certification.
- **Phase B — Facility Conversion (Days 60–90):** Installation of medical-isotope production equipment (molybdenum-99/technetium-99m generator production systems; iodine-131 production capability). IAEA verifies that installed equipment is consistent with declared medical-isotope production purpose and inconsistent with any enrichment function.
- **Phase C — International Collaboration Confirmation (Day 90):** Written agreements with at least two international scientific partners (Russia, China, EU member state, or US DOE national laboratory) for technical collaboration, isotope supply arrangement, and quality standards compliance. IAEA receives copies; JIG verifies.
- **Phase D — Ongoing Monitoring (Year 1+):** Annual IAEA inspection of Fordow to verify continued medical-isotope production and absence of any enrichment function. Environmental sampling at all production areas. Any detection of UF₆ or enriched uranium above trace background levels triggers immediate material-breach review.

E.4 National Technical Means Integration

National technical means (NTM) operate as a backstop verification channel. The Accord places no constraint on NTM collection activities. Discrepancies between NTM findings and IAEA reporting are handled through the Technical Discrepancy Panel process (Section 14.5). Key NTM integration rules:

- NTM findings cannot unilaterally trigger snapback. Any NTM-based compliance concern must be referred to the JIG Technical Discrepancy Panel.

- IAEA findings are presumptively authoritative in nuclear matters. NTM findings inconsistent with IAEA reporting trigger a Panel review, not automatic US assertion of breach.
- Satellite imagery from commercial providers (DigitalGlobe, Planet, Airbus) is available to all JIG members, providing a multilateral verification backstop independent of US national intelligence.
- Signal intelligence concerning enrichment operations, if shared with the JIG, must be shared with all permanent JIG members simultaneously — no selective disclosure to create unilateral advantage.

ANNEX F — MATERIAL BREACH DEFINITIONS AND GRADUATED RESPONSE TABLE

This annex establishes the exhaustive list of actions that constitute material breach at each Risk Tier level, the corresponding graduated response, and the JIG voting threshold required for each response level. The annex is binding on the JIG's Binding Arbitration Panel.

F.1 Risk Tier 1 Material Breach — Zero Tolerance

The following actions constitute Risk Tier 1 material breach, triggering automatic snapback without risk appetite evaluation:

Breach Category	Specific Trigger	JIG Vote Required	Effect
Nuclear weapons activity	Diversion of any fissile material from IAEA custody; weaponization research at declared or undeclared site; nuclear device test or subcritical experiment.	Emergency session within 24 hours; simple majority for determination	Immediate full sanctions snapback; IHTA operations suspended pending review; emergency UNSC notification.
IAEA inspector safety	Physical attack on, detention of, or credible threat against IAEA inspector in performance of duties.	Emergency session within 24 hours; simple majority	Suspension of all IAEA activities until security restored; immediate JIG emergency session; US self-defense rights preserved.
Enrichment above moratorium threshold	Enrichment above 3.67% verified by IAEA at any declared or undeclared facility during moratorium period.	Emergency session within 48 hours; simple majority	Immediate two-year moratorium extension; full sanctions review; Congressional notification.
Undeclared nuclear facility	Discovery of undeclared nuclear facility with enrichment capability through national technical means, IAEA challenge inspection (Stage 3+), or third-party intelligence.	Emergency session within 72 hours; 2/3 supermajority (due to evidentiary complexity)	Moratorium extension 3 years; sanctions re-imposition proceedings; UNSC notification.

F.2 Risk Tier 2 Material Breach — Minimal Tolerance

Breach Category	Specific Trigger	JIG Vote	Effect
IAEA access obstruction	Denial or delay of IAEA inspector access to a declared site for more than 72 hours without force majeure justification.	JIG majority within 7 days	Advancement frozen; formal notice; 30-day cure period before partial restrictions.

Breach Category	Specific Trigger	JIG Vote	Effect
Enrichment discrepancy	IAEA environmental sampling reveals enrichment product or traces above 4.0% (above ceiling plus margin) at declared facility.	JIG majority within 14 days (Discrepancy Panel first)	Cure period 30 days; if unresolved, partial restrictions and moratorium extension review.
Verified proxy weapons transfer	Iranian-supplied weapons used in a confirmed mass-casualty attack on civilian shipping in the IHTA corridor, verified by CPMC and TSAP.	JIG 2/3 supermajority	Stabilization Hold on Stage 3 advancement; Iranian Civilian Reconstruction Fund disbursement paused pending JIG determination.
Houthi Red Sea material breach	Confirmed Houthi attack using Iranian-supplied weapons on commercial shipping after Iranian operational pause commitment.	JIG majority	Iranian Red Sea pause commitment reviewed; JIG diplomatic consultation; TSAP attribution investigation initiated.

F.3 Risk Tier 3 Managed Tolerance — Below Appetite Response Menu

Compliance Issue	Typical Response	JIG Action
Technical reporting delay (up to 7 days)	Technical assistance offer; no penalty	JIG note; monitoring enhanced
Minor centrifuge configuration discrepancy	IAEA clarification request; 14-day response period	Technical Discrepancy Panel convened
Asset tranche processing delay (up to 14 days)	Swiss channel clarification; no penalty	JIG note; US Treasury OFAC contacted
IHTA tolling revenue discrepancy (<5%)	World Bank trustee audit; reconciliation	JIG note; ICRF supervisory board review
Communication protocol violation (single instance)	Reputational notice via Public Wins Ledger	JIG factual correction; Authorized Terminology Registry reminder

F.4 US Material Breach Definitions

The breach architecture applies symmetrically. The following US actions constitute material breach at the specified Risk Tier levels:

US Action	Risk Tier	Effect
Reimposition of sanctions outside JIG process (unilateral)	Tier 2	Withdrawal-penalty escrow activated; Iran entitled to retain 50% released funds plus penalty interest; JIG emergency session.

US Action	Risk Tier	Effect
Seizure or unilateral redirection of Oman custody facility material	Tier 1	Immediate framework suspension; IHTA operations suspended; UNSC notification; Iran retains all non-reversible asset tranches.
Attack on Iranian civilian nuclear facility during Accord operation	Tier 1	Framework suspension; Iran's moratorium commitment suspended pending JIG review; emergency UNSC session.
Public characterization of Iranian commitments as 'capitulation' or 'defeat' by senior official	Tier 4 (Strategic Flexibility)	JIG Communication Cell issues factual correction; reputational notice; no sanctions consequence.
New sanctions designations against Iranian individuals/entities without JIG notification	Tier 3	JIG notification; 30-day cure; if pattern established, Tier 2 review.

ANNEX G — NEGOTIATING HISTORY AND DIPLOMATIC RECORD

This annex documents the negotiating history from April 2025 through May 7, 2026 that informs this Enhanced Accord. It serves as the reference record for mediators, negotiators, and successor framework architects. All information is drawn from public sources as of May 7, 2026.

G.1 Timeline of Key Events

Date	Event	Significance for Enhanced Accord
April 12, 2025	First round of US-Iran nuclear talks in Oman. Witkoff and Araghchi lead respective teams. Both sides describe talks as constructive.	Established Pakistan and Oman as the key mediation channels. Confirmed that diplomacy was possible in principle.
April 19, 2025	Second round in Rome; third round in Muscat one week later.	Built the indirect-talks infrastructure through Pakistani and Omani channels.
May 11, 2025	Fourth round in Oman; high-level only, no technical negotiators. Iran proposes joint nuclear-enrichment project with Arab states and US investment. US envoy Witkoff denies this was discussed.	Revealed the gap between Iranian 'civilian partnership' framing and US 'zero enrichment' demand — the precise gap this Accord's Sovereign Energy Partnership is designed to bridge.
May 12, 2025	US imposes new sanctions targeting Iranian nuclear research with possible military applications; followed by sanctions on Chinese and Iranian entities supporting Iran's missile program.	Demonstrated the sanctions-as-pressure dynamic that the Enhanced Accord replaces with a synchronized relief architecture.
May 23, 2025	Fifth round in Rome ends without breakthrough. Significant differences remain on enrichment dismantlement vs. limitation.	Confirmed that 'zero enrichment' was unachievable; the US began the multi-month shift toward moratorium framing.
October 2025	UK, Germany, and France trigger snapback sanctions against Iran under the 2015 JCPOA.	Escalated pressure; contributed to the conditions under which Israel/US launched military action in February 2026.
February 28, 2026	US and Israel launch Operation Epic Fury. Strikes on Iranian nuclear, military, and leadership infrastructure. Supreme Leader Khamenei killed.	Created the wartime context; established the Mojtaba Khamenei succession; transformed the negotiating environment from deterrence to war termination.
March 1, 2026	Iran effectively closes Strait of Hormuz. Monthly transits fall from ~3,000 to 154.	The central economic crisis driving diplomatic urgency. Gas prices begin rising in US.

Date	Event	Significance for Enhanced Accord
April 7–8, 2026	Ceasefire mediated by Pakistan. Technically holds for approximately one month despite ongoing incidents.	Established Pakistan as the primary mediator; created the diplomatic window the Enhanced Accord is designed to fill.
April 13, 2026	US imposes naval blockade on Iranian commercial ports.	The dual-blockade configuration that Stage 1 resolves through synchronized lift.
May 3, 2026	Iran's Foreign Ministry confirms receipt of US written response. 'Ball is in America's court.'	The immediate diplomatic context for this document.
May 4, 2026	Project Freedom US Navy escort operation begins.	The operational trigger that imposes urgency on the diplomatic window.
May 5, 2026	Secretary Rubio declares Operation Epic Fury 'concluded.' Shifts US objective to MOU framework.	The most significant US posture shift since war began; accepts Iran's Hormuz-first sequencing.
May 6, 2026	Trump pauses Project Freedom citing Pakistani mediators' positive signals and 'great progress' toward deal. Iran expected to respond within 48 hours. Brent crude falls 11% on deal-proximity reports.	The immediate context for this document. The Enhanced Accord is designed for this precise diplomatic window.
May 7, 2026	This Enhanced Accord prepared and issued.	Reference instrument for the 30-day negotiating period the MOU framework would open.

G.2 The Convergence of Positions Over 13 Months

The 13-month negotiating history reveals a clear convergence trajectory that this Enhanced Accord is designed to complete. Key convergence movements:

Issue	US April 2025 Position	US May 2026 Position	Iran April 2025 Position	Iran May 2026 Position	Enhanced Accord Landing Zone
Enrichment	Zero enrichment; dismantle all facilities	20-year moratorium (shifted to 12–15 in MOU discussions)	NPT rights; no restrictions	5-year moratorium; 3.67% post-moratorium	12-year moratorium; 3.67% civilian post-moratorium
HEU stockpile	Transfer to US required	Transfer out of country (US preferred destination)	No transfer; remain in Iran	Conditional willingness to transfer	Third-country IAEA custody (Oman); Iranian consent for disposition

Issue	US April 2025 Position	US May 2026 Position	Iran April 2025 Position	Iran May 2026 Position	Enhanced Accord Landing Zone
Hormuz sequencing	Nuclear first, then Hormuz	Hormuz and blockade simultaneous with nuclear (MOU accepted Iran sequencing)	Hormuz and blockade first; nuclear later	Hormuz and blockade first (maintained)	Hormuz reset Stage 1; nuclear exchange Stage 2; synchronized on Day 1 for stockpile transfer
Sanctions sequencing	Tied to nuclear compliance; phased	Part of 30-day negotiation	Lifted with war termination	Released during negotiation period	Eight-tranche architecture; humanitarian Day 1; full normalization Year 3+

G.3 Lessons from Prior Framework Failures

This Enhanced Accord incorporates specific lessons from each prior failure in the negotiating history:

- **Lesson:** Zero enrichment is unachievable **Source:** Repeated US demand from April 2025 through at least January 2026; Iran's categorical rejection confirmed in every round **Application:** Replaced with time-limited moratorium architecture; 3.67% civilian ceiling post-moratorium respects NPT rights.
- **Lesson:** Iran will not transfer HEU to the US as an imposed condition **Source:** Iran's foreign ministry categorical statement: 'uranium will under no circumstances be transferred anywhere' **Application:** Transfer reframed as Iranian sovereign choice under IAEA custody; disposition (including US as Option C) requires Iranian consent.
- **Lesson:** Snap inspections as framed are unacceptable to Iran **Source:** Iranian consistent rejection of 'snap inspections' language throughout 2025–26 **Application:** Reframed as enhanced declared-site monitoring and unannounced (not 'challenge') inspections under Sovereign Energy Partnership; Iran issues IAEA invitation.
- **Lesson:** Monolithic frameworks collapse under the weight of the most contested element **Source:** 15-point March 2026 proposal; 10-point April 2026 proposal; 9-point/14-point exchange **Application:** Modular three-stage architecture; each stage closes independently; failure of Stage 3 does not unwind Stages 1–2.
- **Lesson:** Both sides require domestically communicable wins on the same day **Source:** Trump's domestic pressure (gas prices, midterms); Khamenei succession consolidation requirements **Application:** Synchronized reciprocal motion; Waltz Philosophy; Joint Communication Windows; Public Wins Ledger.

ANNEX H — GLOSSARY OF KEY TERMS AND ABBREVIATIONS

This glossary defines key terms, abbreviations, and institutional names used throughout this Enhanced Accord. All definitions are consistent with their usage in the source frameworks.

Term / Abbreviation	Definition
ATR (Authorized Terminology Registry)	The registry of factual terms governing how specific Accord concepts may be described in official communications. Prohibits characterizations that would prejudice the domestic political framing of either government.
BAP (Binding Arbitration Panel)	The JIG sub-body responsible for formal compliance determinations and sanctions consequences. Operates under the RCSA Risk Appetite Framework. Decisions are binding on all parties subject to the JIG dispute resolution process.
CBSF (Comprehensive Bilateral Stability Framework)	A source framework for the US-Iran bilateral stability architecture; provides the asset return tranche structure and snapback architecture adopted in this Enhanced Accord.
CIS (Compliance Indicator Score)	The RCSA v3.6's numerical measure of each party's overall compliance performance, updated quarterly. CIS below 3.0 indicates full compliance; 3.0–5.0 managed tolerance; above 5.0 triggers graduated response.
CPMC (Civilian Protection Monitoring Cell)	The autonomous forensic monitoring unit within the JIG structure responsible for civilian harm documentation, humanitarian blockage reporting, and protection violation verification.
Crescent Compact	A modular regional stability architecture, compatible with this Enhanced Accord as a successor framework. Allows parties to ratify individual modules without ratifying the whole.
Emergency Ambiguity Authority	The RCSA v3.6 innovation allowing the neutral chair to introduce controlled procedural ambiguity to prevent escalation from ambiguous incidents.
FCIF (Framework Commercial Insurance Facility)	The RCSA v3.6 insurance backstop for commercial investment in framework-covered areas, eligible for ODA subsidization.
HEU (Highly Enriched Uranium)	Uranium enriched to 20% or above. Iran's weapons-grade stockpile consists primarily of 60%-enriched uranium. The Enhanced Accord requires transfer of all HEU to IAEA third-country custody on Day 1.
ICRF (Iranian Civilian Reconstruction Fund)	The fund receiving 40% of IHTA annual revenues (~\$200M/year) for reconstruction of civilian infrastructure damaged in Operation Epic Fury.
IHTA (International Hormuz Transit Authority)	The permanent multilateral institution governing transit through the Strait of Hormuz, established on Day 90 of the Enhanced Accord. Replaces the provisional Joint Hormuz Authority.
IMIRC (International Medical Isotope Research Center)	The designation for the converted Fordow facility as a medical-isotope research and production center, consistent with the RCSA v3.6 Fordow conversion architecture.
JHA (Joint Hormuz Authority)	The provisional maritime governance body established on Day 1 and operational in provisional mode through Day 90, when it converts to the permanent IHTA.

Term / Abbreviation	Definition
JIG (Joint Implementation Group)	The central coordination body for Stages 2 and 3, hosted in Geneva. Membership: US, Iran, Pakistan, Oman, Switzerland, EU observer, UN Special Envoy.
MOU (Memorandum of Understanding)	The one-page, 14-point war-termination document under review as of May 7, 2026. The Enhanced Accord is designed to serve as the reference architecture for the 30-day negotiating period the MOU would open.
NTM (National Technical Means)	Satellite imagery, signals intelligence, and other national intelligence capabilities. May operate without Accord constraint; cannot unilaterally trigger compliance determinations.
NPT (Non-Proliferation Treaty)	The Treaty on the Non-Proliferation of Nuclear Weapons, to which Iran is a party. The Enhanced Accord explicitly preserves all of Iran's NPT rights.
OFAC (Office of Foreign Assets Control)	The US Treasury agency responsible for administering sanctions programs. Issues general licenses authorizing specific transactions.
Operation Epic Fury	The US-Israeli military campaign launched February 28, 2026, against Iranian nuclear, military, and leadership infrastructure.
Project Freedom	The US Navy operation (launched May 4, 2026; paused May 6, 2026) to escort commercial vessels through the Strait of Hormuz.
RAMES	The US-Iran-Israel regional security framework; a source framework for the missile, proxy, and regional security architecture of the Enhanced Accord's Stage 3 and successor framework.
RCSA v3.6 (Regional Cooperation and Stability Architecture)	The comprehensive three-tier modular framework providing the governance, verification, economic, and sovereignty architecture integrated into this Enhanced Accord.
Risk Appetite Framework	The RCSA v3.6 five-tier system for evaluating whether a compliance violation exceeds the framework's fundamental risk tolerance before triggering punitive responses.
Section 123 Agreement	A bilateral agreement under Section 123 of the US Atomic Energy Act governing civilian nuclear cooperation, including fuel supply guarantees for Iranian civilian reactors.
Sovereign Energy Partnership	The Enhanced Accord's framing of the nuclear exchange as a voluntary Iranian initiative to redirect its enrichment program toward guaranteed civilian energy cooperation.
SWIFT	The Society for Worldwide Interbank Financial Telecommunication; the global banking messaging network from which Iranian banks are currently disconnected. SWIFT reconnection for FATF-compliant Iranian banks is a key Stage 2 economic deliverable.
TSAP (Third-Party Spoiler Attribution Protocol)	The five-pathway de-escalation mechanism for classifying incidents potentially attributable to third-party actors (Houthi splinters, ISIS remnants, Israeli operations) before any bilateral penalty applies.
Waltz Philosophy	The synchronized reciprocal motion principle foundational to all source frameworks: each commitment by one party matched by a corresponding commitment by the other; neither party moves alone.

Term / Abbreviation	Definition
WBI (Weighted Breach Index)	The RCSA v3.6 numerical scoring system for compliance breaches, used by the BAP to determine which snapback ladder step is triggered. Minor breach = 2 points; major breach = 5 points; cumulative scoring.

ANNEX I — NEGOTIATING GUIDANCE FOR MEDIATORS

This annex provides practical guidance for Pakistan as primary mediator and for Oman and Switzerland as technical and financial channel mediators. It is drawn from the RCSA v3.6's Shadow Negotiation and Backchannel Protocols (Annex U) and the Emergency Extension Plan's mediation architecture.

I.1 Pakistan's Primary Mediator Function

Pakistan's role as primary mediator gives it unique responsibilities and unique leverage. The following guidance applies to Pakistan's management of the mediation:

I.1.1 The Asymmetric Information Problem

Each government will share information with Pakistan that it will not share directly with the other side. Pakistan's leverage and credibility both depend on managing this asymmetric information flow correctly. Key principles:

- Pakistan does not share confidential information from one party with the other without the confiding party's explicit consent. Violation of this principle destroys the mediation channel.
- Pakistan may use information from one side to formulate questions or test positions with the other, without disclosing the source. This is the core of shuttle diplomacy.
- Pakistan should not represent to either party that the other has agreed to something it has not. Overstating agreement to create momentum is a short-term tactic that produces medium-term collapse.
- Pakistan is permitted to characterize the general direction of movement ('both sides are moving toward a 12-15 year moratorium') without disclosing specific positions.
- Pakistan's public statements should be consistently optimistic without being specific. Specific optimism creates hostage effects; general optimism creates momentum.

I.1.2 Managing the Internal Iranian Division

The most significant challenge Pakistan faces is the genuine internal division within the Iranian system between moderates who want a deal and hardliners who believe continued confrontation produces better terms. Guidance:

- Pakistan should direct communications through the Iranian foreign ministry channel (moderate-controlled) while simultaneously ensuring the Mojtaba Khamenei succession and the IRGC senior leadership receive parallel briefings through their preferred channels.
- Pakistan should frame the Enhanced Accord's elements to the hardliner audience in terms of strategic wins: permanent IHTA seat (US unilateralism ended), missile program untouched, asset return as restitution, constitutional governance preserved.
- Pakistan should frame the Enhanced Accord's elements to the moderate audience in terms of economic restoration: sanctions relief timeline, SWIFT reconnection, IHTA reconstruction revenue, Section 123 fuel supply guarantee.

- Pakistan should not attempt to resolve the internal Iranian division — it should present the Accord in terms that both factions can accept. The Accord is designed for this: the hardliner wins and the moderate wins are the same deliverables, framed differently.
- Pakistan should advise both parties that the Hajj constraint (~May 25) creates a natural window for a deal that benefits all Muslim-majority parties, and that missing this window extends the confrontation into a period of higher escalation risk.

I.1.3 Managing the US Domestic Clock

The Trump administration faces its own domestic pressure: gas prices, midterms, and the challenge of characterizing any deal as a win. Pakistan's guidance:

- Pakistan should present each US concession (accepting Hormuz-first sequencing, accepting moratorium rather than zero enrichment) as a Pakistani recommendation that serves US interests — providing cover for the administration to accept the concession without appearing to capitulate.
- Pakistan should maintain strict confidentiality on the specific moratorium length being negotiated until both sides have agreed. Premature disclosure creates domestic hostage effects on both sides.
- Pakistan should coordinate with Oman and Switzerland to ensure that the first public signal of deal proximity (which should be released through Pakistani channels) occurs at a time that gives the Trump administration the maximum domestic political benefit.

I.2 Oman's Technical Channel Function

Oman's role as technical channel mediator focuses on maritime and nuclear custody matters. Oman has specific responsibilities in three areas:

- **JHA Maritime Coordination Cell (Khasab):** Oman staffs and hosts the JHA Maritime Coordination Cell that manages the practical mechanics of Hormuz reopening — transit lane protocols, mine-clearing coordination, observation vessel deployment, hotline operation. This is Oman's most operationally demanding function and requires pre-positioning of personnel and communications infrastructure before signature.
- **IAEA Nuclear Custody Facility:** Oman hosts the custody facility for Iran's transferred weapons-grade uranium. This requires advance coordination with the IAEA, establishment of Category I nuclear material security measures, and agreement with Iran that Oman (rather than the US or a European state) is the custody location. Oman should frame its hosting role as consistent with its decades-long function as a neutral technical intermediary.
- **Emergency Ambiguity Authority Support:** When the neutral chair exercises Emergency Ambiguity Authority, Oman provides the logistical and communication support for the ambiguous period — hosting confidential consultations, managing the 'technical review period' framing in public communications, and maintaining secure channels for both parties to walk back from confrontation without public acknowledgment.

I.3 Switzerland's Financial Channel Function

Switzerland's role as financial channel mediator focuses on asset return mechanics, escrow management, and sanctions relief implementation. Key functions:

- Escrow account establishment: Swiss-sovereign jurisdiction escrow accounts for each asset tranche, pre-established before signature with both Iranian Central Bank and US Treasury OFAC as authorized parties.
- Asset transfer verification: Swiss financial channel verifies that each asset tranche transfer is complete, correctly characterized as 'Iranian sovereign property restitution' in IMF and World Bank registration, and reported to the JIG within 48 hours.
- OFAC coordination: Switzerland coordinates with US Treasury OFAC on general license issuance, ensuring that each sanctions relief tranche is activated simultaneously with its corresponding compliance milestone certification.
- Withdrawal-penalty escrow: Switzerland administers the withdrawal-penalty escrow mechanism. If the US triggers sanctions snapback outside the JIG process, Switzerland independently certifies the triggering event and activates the 50% retention plus penalty interest mechanism.
- Capital classification registry: Switzerland maintains the capital classification registry (Committed/Conditional/Aspirational) and publishes quarterly updates to ensure transparency on the actual status of all financial commitments.

I.4 Backchannel Architecture — RCSA Annex U Integration

The RCSA v3.6 Annex U (Shadow Negotiation and Backchannel Protocols) identifies four categories of backchannel that should be maintained during the Enhanced Accord's implementation period, distinct from the formal mediation channels:

Backchannel Type	Participants	Purpose	Confidentiality Level
Nuclear technical track	IAEA technical staff + Iranian Atomic Energy Organization technical staff + US DOE technical representatives	Resolve technical IAEA-Iran discrepancies before they reach JIG level; agree Fordow conversion technical specifications; coordinate Section 123 Agreement technical details.	Strictly confidential; no public disclosure without JIG authorization.
Military deconfliction track	US CENTCOM senior officer + IRGC senior officer + Omani military liaison	Prevent maritime incidents from escalating; coordinate mine-clearing operations; manage carrier transit notifications.	Operational confidentiality; incidents may be publicly acknowledged but deconfliction discussions are not disclosed.
Economic normalization track	US Treasury OFAC + Iranian Central Bank + Swiss financial channel	Accelerate technical preparation for sanctions relief tranches; resolve OFAC licensing questions before they create delays; manage SWIFT reconnection technical steps.	Confidential; outcomes disclosed when sanctions tranche activates.

Backchannel Type	Participants	Purpose	Confidentiality Level
Domestic political track	Pakistani intelligence + Iranian national security council contacts + US NSC contacts	Monitor hardliner positioning in both capitals; alert mediators to domestic political threats to framework stability; identify Stabilization Hold candidates before formal requests are needed.	Strictly confidential; existence of track not publicly acknowledged.

ANNEX J — SUCCESSOR FRAMEWORK TRANSITION PROTOCOL

This annex specifies the transition protocol from this Enhanced Accord to the successor framework (RCSA v3.6, Crescent Compact v1.7, or RAMES v9.1) opened for negotiation on Day 180. It is drawn from RCSA Annex V (Legacy Provisions and Transition from Prior Framework Versions) and the RCSA Addendum W (Grand Strategic End-State Implementation Roadmap).

J.1 The Day 180 Handoff

On Day 180, the successor framework is formally opened for negotiation. The handoff from the Enhanced Accord to the successor framework is designed to be seamless — not a replacement but an extension. The Enhanced Accord remains in force until explicitly superseded by the successor framework's entry into force. During the negotiating period for the successor framework (which may take 12–36 months), the Enhanced Accord provides the operational baseline.

J.2 What the Successor Framework Inherits

The successor framework inherits the following as its operational baseline:

Inherited Element	Status at Day 180	Successor Framework Treatment
Permanent IHTA	Fully operational; permanent charter in force	Successor framework ratifies and expands IHTA charter or incorporates by reference.
Nuclear moratorium	Year 1 of 12-year moratorium; continuous IAEA monitoring active	Successor framework maintains moratorium; negotiates transition to steady-state civilian ceiling at moratorium end.
Asset return	Cumulative 85% returned (Tranches Pilot through 4)	Successor framework completes RCSA Tranches 5–8; addresses residual claims.
Sanctions relief	RCSA Tranches 0–3 operative	Successor framework activates RCSA Tranches 4–8 on successor framework compliance milestones.
JIG	Operational in Geneva; expanded with PRC and GCC observer	Successor framework JIG converts to successor framework governance body.
Regional Security Dialogue	Opened Day 75; 90-day preliminary discussions completed	Successor framework formalizes as binding regional architecture with specific missile confidence-building measures.

Inherited Element	Status at Day 180	Successor Framework Treatment
Lebanon parallel track	Hezbollah operational pause in effect; Crescent Compact Lebanon track operating in parallel	Successor framework integrates Lebanon track or maintains parallel architecture.

J.3 Successor Framework Selection Criteria

The choice among RCSA v3.6, Crescent Compact v1.7, and RAMES v9.1 depends on the political conditions prevailing at Day 180. Guidance for mediators:

If conditions at Day 180 are...	Recommended Successor Framework	Rationale
Both governments are satisfied with Accord performance; regional states (Saudi Arabia, UAE) seeking formal engagement; Israeli hardliners have not blocked progress	RCSA v3.6 (full architecture)	Maximum durability; full regional integration; builds on the established JIG and IHTA institutions with full modular architecture. Best long-term outcome.
Both governments satisfied but regional consensus not achievable; Lebanon track stalled; Israel-Gulf normalization moving slowly	Crescent Compact v1.7 (bilateral modules first)	Allows US-Iran bilateral normalization to proceed independently of regional package. Lebanon, Gulf, and wider regional modules ratified as political conditions permit.
Both governments satisfied but missile file has become urgent (Iranian missile test or regional incident creates pressure)	RAMES v9.1 (focused bilateral security)	Addresses the US-Iran-Israel security triangle directly; provides fastest path to missile confidence-building measures and proxy operational monitoring.
Either government is in political difficulty; domestic hardliners have strengthened; compliance has been strained	Extended Enhanced Accord (not a new framework)	Maintain the Enhanced Accord's operational baseline; defer successor framework selection; use Stabilization Hold architecture to manage contested measures; wait for political conditions to improve.

J.4 The Grand Strategic End-State Vision

The RCSA v3.6 Addendum W articulates the Grand Strategic End-State that the successor framework is designed to achieve. This End-State is aspirational (classified Aspirational per the capital classification system) but serves as the north star for institutional design decisions. Key elements:

- A Middle East in which Iran is a recognized co-equal regional power operating within a multilateral governance architecture, not against it — trading strategic ambiguity for strategic partnership.

- A Strait of Hormuz governed by international treaty with permanent US and Iranian co-governance, generating stable revenue for regional reconstruction and maritime safety.
- An Iranian civilian nuclear program with guaranteed fuel supply, operating under full IAEA safeguards, with no enrichment above 3.67% and no weapons-grade material.
- A regional security architecture (through RCSA, Crescent Compact, or RAMES) that provides confidence-building measures for ballistic missiles, proxy operational constraints, and crisis management mechanisms across all active conflict theaters.
- A US-Iran bilateral relationship normalized to the point of consular relations, commercial banking access, and civilian nuclear cooperation — not necessarily full diplomatic normalization, but functional working relations.
- A Lebanon in which the Hezbollah political-military organization has been integrated into a legitimate governance structure, the Israeli-Lebanese border is stabilized, and UNIFIL operates with an effective mandate.

None of these end-state elements is achievable in 180 days. All of them are achievable in 10 years if the Enhanced Accord's first 180 days succeed. The Accord's value is not in what it achieves by Day 180 — it is in what it makes possible in the decade that follows.

ANNEX K — PRE-SIGNATURE CHECKLIST AND OPERATIONAL GUIDE

This annex provides the complete pre-signature implementation checklist and a detailed day-by-day operational guide for Stage 1. It is designed for operational use by implementing agencies and mediation teams.

K.1 Pre-Signature Implementation Checklist — T-5 to T-1

The following actions must be completed before signature. Each is assigned a responsible party and a verification standard:

T-minus	Action Required	Responsible Party	Verification Standard
T-5 days	Pakistan formally confirms both governments' acceptance of Accord text (confidential).	Pakistani Prime Minister's Office	Written confirmation from both foreign ministries to Pakistani PM's Office.
T-5 days	UN Security Council statement supporting Hormuz reopening, JHA activation, and IAEA custody arrangements drafted and circulated to P5.	UN Secretary-General's office	P5 confirmation of no objection; statement issued T-3.
T-5 days	JIG core diplomatic tier appointed by both governments; Geneva secretariat staffed.	US State Department + Iranian Foreign Ministry	Personnel list exchanged through Pakistani channel; travel to Geneva confirmed.
T-5 days	Three-channel notification system tested and confirmed operational: encrypted communications Pakistan-Oman-Switzerland.	Omani Foreign Ministry (technical lead)	Test message sent and confirmed received by all three channels simultaneously.
T-5 days	JHA Maritime Coordination Cell staffed in Muscat; Oman provides hosting and physical security.	Omani Ministry of Foreign Affairs	Staff roster confirmed; secure communications established; Khasab observation post manned.
T-4 days	IAEA pre-deployment team briefed on Oman custody facility protocols and Iranian site access; mass spectrometry equipment pre-positioned in Oman.	IAEA Director General	IAEA team manifest confirmed; equipment manifest confirmed; Oman custody facility security certification issued.
T-4 days	OFAC general license texts for Day 1 humanitarian relief, pilot asset transfer, and nuclear partnership pre-cleared by US Treasury; ready for immediate issuance on signature.	US Treasury Department (OFAC)	License texts confirmed by OFAC Director; presidential authorization pre-staged.

T-minus	Action Required	Responsible Party	Verification Standard
T-4 days	Iranian Central Bank confirms readiness to receive pilot \$250M transfer; account details confirmed through Swiss channel.	Iranian Central Bank + Swiss financial channel	Swiss confirmation of account establishment; OFAC confirmation of authorized transfer pathway.
T-4 days	Omani nuclear authority confirms custody facility physical readiness; Category I security measures certified.	Omani nuclear authority + IAEA Physical Protection team	IAEA Physical Protection Evaluation Team on-site confirmation.
T-3 days	Israeli Prime Minister's office briefed by US administration; pre-announcement coordination confirmed; 48-hour advance notice for Day 1 public announcement agreed.	US National Security Council	Israeli PM office written confirmation of coordination agreement.
T-3 days	French carrier JHA liaison team activated; 40-nation maritime initiative coordination confirmed for Day 7 multilateral convoy support.	French Ministry of Armed Forces + US CENTCOM	French liaison officer manifest; coordination protocols confirmed.
T-3 days	Swiss financial channel escrow accounts pre-established for all asset return tranches; World Bank trustee ICRF account pre-established.	Swiss Federal Department of Foreign Affairs + World Bank	Account establishment confirmations; dual-key authorization confirmed.
T-2 days	Iran's IRGC senior leadership briefed on JHA corridor separation (5 nm separation requirement from central transit corridor); IRGC acknowledgment received.	Iranian Foreign Ministry + IRGC liaison through Pakistani channel	IRGC acknowledgment received through Pakistani channel; operational orders issued to IRGC-Navy.
T-2 days	Houthi leadership channel confirmed operational for Day 1 Iranian transmission of Red Sea operational pause instruction.	Iranian Foreign Ministry + Iranian IRGC liaison channel to Houthis	Channel operational confirmation through Pakistani mediator.
T-2 days	Lloyd's List and UN OCHA maritime monitoring systems confirmed for real-time Hormuz transit tracking beginning Day 3.	UN OCHA + Lloyd's List + JHA Maritime Coordination Cell	System integration test; Day 3 first transit monitoring protocol confirmed.
T-1 day	Draft public statements for Day 1 (US and Iranian) reviewed against Authorized Terminology Registry; Joint Communication Window T+0 pre-agreed.	JIG Communication Cell (staffed T-2)	Both statements reviewed; no ATR violations; simultaneous release protocol agreed.
T-1 day	Pakistani Prime Minister briefed on full Day 1 operational sequence; emergency contact protocols confirmed for first 24 hours.	Pakistani PM's Office	PM personal confirmation of full briefing; emergency contact list confirmed.
T-0 (Signature)	All the above confirmed green. Signature proceeds.	All parties	Pakistani PM's Office certification that all pre-conditions are met.

K.2 Day-by-Day Operational Guide: Days 1–14 (Stage 1)

Hour-by-hour and day-by-day operational guide for Stage 1:

Day / Time	Action	Who Acts	Verification Output
Day 1, 0000 GMT	Permanent ceasefire enters into force on all US-Iran bilateral fronts.	CENTCOM (US), IRGC (Iran)	CENTCOM public operational report; IRGC public statement; Pakistani guarantor certification within 6 hours.
Day 1, 0600 GMT	Accord signature by designated representatives; transmitted via Pakistan with Oman and Switzerland as concurrent witnesses.	US Secretary of State (or designated) + Iranian Foreign Minister (or designated) + Pakistani PM's office relay	Pakistani PM's office certification; UN Secretary-General notification; simultaneous published statements.
Day 1, 0800 GMT	IAEA inspectors begin stockpile transfer process: sealing, weighing, and transport documentation of Iran's 60%-enriched uranium.	IAEA + Iranian Atomic Energy Organization (AEOI)	IAEA seal documentation; mass spectrometry certification; transport manifest.
Day 1, 0800 GMT	OFAC issues general license for pilot \$250M asset transfer; transfer initiated.	US Treasury OFAC + Iranian Central Bank + Swiss channel	OFAC license published; Iranian Central Bank confirms transfer initiation; Swiss channel confirms transfer in progress.
Day 1, 0900 GMT	OFAC issues general license for humanitarian trade (medicine, food, medical equipment, agricultural inputs).	US Treasury OFAC	License published on OFAC website; Iranian banks notified through Swiss channel.
Day 1, 1000 GMT	Project Freedom formally suspended. US naval assets remain in position; assigned JHA convoy support missions from Day 7.	US CENTCOM	CENTCOM public operational order; JHA Maritime Coordination Cell notified.
Day 1, 1200 GMT	First JHA Council session in Muscat. Provisional authority confirmed. Day 3 and Day 7 operational protocols reviewed.	JHA founding members (US, Iran, GCC rotating chair, UN neutral chair)	JHA Council minutes published; Day 7 synchronized lift protocol confirmed.
Day 1, 1600 GMT	Iran transmits Hezbollah operational pause instruction through Iranian channel.	Iranian Foreign Ministry + Hezbollah liaison channel	Hezbollah operational pause confirmed through Lebanese Armed Forces observation; Pakistani mediator notified.
Day 1, 1800 GMT	Iran transmits Houthi Red Sea operational pause instruction.	IRGC liaison to Houthi channel	Houthi confirmation received through Pakistani channel within 24 hours.
Day 1 (24h)	Pakistani PM's office certifies Day 1 ceasefire compliance; pilot asset transfer confirmed by Iranian Central Bank.	Pakistani PM's office + Swiss channel	Written certification issued; transmitted to UN Secretary-General.
Day 2	JHA observation vessels deployed to Khasab and Bandar Abbas. US-Iran-Oman hotline live-tested with all three channels.	JHA Maritime Coordination Cell + Omani Navy + Iranian Navy + US Fifth Fleet	Hotline test log confirmed; vessel deployment confirmed by Lloyd's List.

Day / Time	Action	Who Acts	Verification Output
Day 3	First humanitarian-flagged vessel transits Strait of Hormuz under JHA observation. Zero fee, no inspection delay.	JHA Maritime Coordination Cell + Iranian transit authority + UN OCHA	Lloyd's List vessel tracking confirmation; UN OCHA confirmation; JHA observation post Khasab confirmation. JHA issues first transit report.
Days 4–6	Mine-clearing coordination: JHA Maritime Safety Working Group assesses Lane 2 and Lane 3 mine situation; Iranian-led clearing in Lane 1 territorial waters commences.	JHA Maritime Safety Working Group + Iranian Navy + UK mine countermeasures technical team	Daily JHA mine-clearing progress report; Lane status reports published.
Day 7, 0000 GMT	Synchronized lifting of dual blockade. Iran removes all Hormuz restrictions on commercial transit; US lifts naval blockade on Iranian commercial ports. Simultaneous declarations.	Iranian Navy/IRGC + US Fifth Fleet + Pakistani guarantor relay + Oman technical channel	JHA observation vessels confirm; Lloyd's List confirms; UN OCHA confirms; guarantor naval observers confirm. Both declarations issued simultaneously.
Day 7, 2400 GMT	Project Freedom assets formally re-tasked as JHA convoy support vessels under JHA Maritime Safety Fund.	US CENTCOM + JHA Council	CENTCOM operational re-assignment order; JHA Council confirmation.
Days 8–13	Commercial transit resumes at scale. Daily JHA transit report published. Mine-clearing continues in Lane 2. IAEA confirms stockpile transport to Oman custody facility.	JHA Maritime Coordination Cell + IAEA + Lloyd's List	Daily JHA transit reports; IAEA transport confirmation; Lloyd's List transit tracking.
Day 14	Stage 1 closing certification. Pakistan, Oman, and Switzerland jointly certify all closing conditions. Stage 2 automatic activation.	Pakistan + Oman + Switzerland guarantor certification + JIG	Joint certification document; transition to Stage 2 automatic; JIG inaugural session confirmed for Day 15.

K.3 Contingency Protocols for Stage 1 Failures

Pre-agreed responses for the most likely Stage 1 failure scenarios:

Scenario	Immediate Response	Escalation Path if Unresolved	Default Rule
Iran opens Hormuz Day 7 but US does not simultaneously lift blockade	JHA emergency session within 24 hours. Pakistani guarantor engages US through backchannel. 72-hour implementation window (per synchronized lift mechanism).	If US lift not verified within 72 hours, Iranian Hormuz lift commitment suspended. Matter referred to JIG. Default: maintain both blockades.	Neither side gains unilateral advantage from the other's non-compliance.

Scenario	Immediate Response	Escalation Path if Unresolved	Default Rule
US lifts blockade Day 7 but Iran does not fully open Hormuz	JHA emergency session within 24 hours. Pakistani guarantor engages Iran through backchannel. 72-hour implementation window.	If Iranian Hormuz opening not verified within 72 hours, US blockade lift suspended. Matter referred to JIG.	Same default: maintain both blockades until synchronization achieved.
IAEA confirms partial but not complete stockpile transfer by Day 14	Pakistani guarantor requests remediation plan from Iranian AEOI. JIG Technical Working Group convenes. Stage 1 extended 7 days by joint guarantor concurrence.	If partial transfer only, Stage 1 extension is available once (7 days). Nuclear exchange Step 2 timelines adjust accordingly.	Stage 1 does not close until IAEA certifies complete weapons-grade stockpile custody transfer.
Maritime incident in IHTA corridor during Days 1–14	24-hour cooling-off rule activates. Military Deconfliction Hotline engaged. TSAP convenes within 72 hours to classify incident.	If incident is classified Non-Attributable after 10 days, no bilateral penalty. If attributed to one party, Risk Tier determination triggers appropriate response.	Ceasefire is not automatically terminated by a single incident. The 24-hour cooling-off rule is mandatory.
Third-party spoiler attack (e.g., Houthi attack on commercial vessel during Stage 1)	TSAP convenes immediately. Regional Incident Firewall activated. 4-hour JIG notification.	If Iranian responsibility not verified within 30 days, classified Non-Attributable. No bilateral penalty. Cooperative threat mitigation response.	Iran's Houthi pause commitment covers instruction transmitted Day 1; Iran is not guaranteeing Houthi compliance. Isolated attacks without Iranian authorization do not constitute Iranian material breach.

K.4 Stage 1 Success Metrics Dashboard

The JIG secretariat publishes a real-time Stage 1 Success Metrics Dashboard accessible to all parties and publicly available in English, Farsi, and Arabic. The dashboard tracks:

Metric	Target	Data Source	Update Frequency
Hormuz daily vessel transits	200+ in first 14-day period	Lloyd's List + JHA observation vessels	Daily
IAEA stockpile custody percentage	100% by Day 14	IAEA Director General reporting	Upon each transfer event
Ceasefire compliance (bilateral)	Zero direct fire incidents	Pakistani guarantor + CENTCOM + IRGC reports	Daily
Pilot asset transfer status	Confirmed complete by Day 1 +24h	Swiss channel + Iranian Central Bank + OFAC	Upon confirmation
Mine clearance progress (Lane 2 and 3)	Lane 2 cleared by Day 14; Lane 3 cleared by Day 30	JHA Maritime Safety Working Group	Every 48 hours
Humanitarian transit (Tier 1)	Zero refusals; zero delay >24h	UN OCHA + JHA observation post Khasab	Per vessel
Houthi Red Sea pause compliance	Zero confirmed Houthi attacks on commercial shipping using Iranian weapons	JHA Red Sea monitoring station + JIG TSAP	Daily
US blockade lift verification	Confirmed Day 7 +24h	Lloyd's List Iranian port traffic + Omani naval observers	Upon lift declaration

ANNEX L — STRESS TEST SCENARIOS AND FRAMEWORK RESILIENCE ASSESSMENT

The RCSA v3.6 Annex J (Contingency Protocols, Degradation, and Deadlock Procedures) and Annex R (Financing Architecture, Stress Tests, and Resilience) require that every framework version be stress-tested against its most likely failure scenarios before deployment. This annex documents the stress test results for the Enhanced Accord and the architectural responses to each identified vulnerability.

L.1 Political Stress Tests

Stress Test Scenario	Probability (May 2026)	Framework Response	Residual Risk
Iranian hardliner faction blocks parliamentary ratification of the Accord	Moderate-High. Iranian parliament speaker has publicly mocked deal reports. IRGC hardliner faction is active.	The Enhanced Accord does not require parliamentary ratification to be operationally effective. Executive authority (foreign ministry + AEOI + IRGC command) can implement Stage 1 without parliamentary vote. Parliamentary ratification is desirable but not a prerequisite.	Low-Moderate. If parliament actively blocks implementation, IRGC would need to override — possible under national security framing but politically costly. Stabilization Hold available for specific measures parliament contests.
Trump administration faces Congressional resolution of disapproval on an asset tranche	Moderate. Congressional Republicans may oppose 'paying Iran.' Democrats may oppose if deal is framed as abandoning nonproliferation.	Each tranche from Tranche 3 forward is subject to 30-day Congressional review. Resolution of disapproval requires both chambers and cannot be vetoed. Bipartisan Quorum Engineering and Economic District Mapping reduce likelihood.	Low-Moderate. Even if one tranche is blocked, subsequent tranches can proceed once political situation resolves. Non-reversibility of Tranches 1-2 means Iran retains the first 50% regardless.

Stress Test Scenario	Probability (May 2026)	Framework Response	Residual Risk
Mojtaba Khamenei succession faces internal coup or political crisis	Low-Moderate. Succession is not fully consolidated; IRGC retains significant political autonomy.	The Accord places no requirement on Iranian internal governance. If the succession is destabilized, the Accord's sovereign-commitment framing transfers to whatever authority emerges — the IHTA seat, the asset tranches, and the fuel supply guarantee are Iranian sovereign entitlements, not personal gifts to the Khamenei succession.	Moderate. Extreme political instability in Tehran could suspend Iranian compliance. Stabilization Hold architecture available; Crisis Lock available if direct military clash threatens.
Israeli military action against Iran during Stage 2 or 3	Low-Moderate. Israel has publicly expressed concern about potential US concessions; Netanyahu has met with Trump administration officials to 'better understand the latest developments.'	Israeli action against Iran during the Accord's operation would likely trigger Crisis Lock (if party-national fatalities) or Regional Incident Firewall. The Accord explicitly preserves Israeli self-defense rights but does not protect Israeli offensive operations from diplomatic consequences. TSAP would attribute the action.	High if Israeli action occurs. An Israeli strike on Iranian nuclear or military infrastructure during Stage 2 nuclear exchange could collapse the Accord entirely. The Accord's design assumption is Israeli quiet acquiescence; active Israeli sabotage is the single highest-risk scenario.
US Presidential election (November 2026) produces new administration hostile to the Accord	Low. The Accord is designed to be completed before election-cycle hardening; Stages 1-2 should be verified complete by November 2026 midterms.	The RCSA withdrawal-penalty escrow, 150-day inertia buffer on sanctions reimposition, and non-reversibility of Tranches 1-2 all create significant switching costs for any incoming administration. The IHTA permanent charter and IAEA continuous monitoring create irreversible facts that any administration would have to affirmatively undo.	Low-Moderate. If Stage 3 is incomplete at the midterms, hardliner pressure could slow Tranches 4+. The non-reversible architecture of Stages 1-2 provides the core protection.

L.2 Operational Stress Tests

Stress Test Scenario	Probability	Framework Response	Residual Risk
IAEA mass spectrometry reveals Iran retained a small undeclared HEU cache	Low-Moderate. Iran may retain a small undeclared stockpile as insurance.	IAEA report triggers JIG Technical Discrepancy Panel. If verified, this is a Risk Tier 1 violation — immediate snapback consideration, moratorium extension. The Discrepancy Panel process (72 hours, up to 14 days to resolve) provides a de-escalation buffer before automatic consequences.	High consequences if confirmed. The entire architecture of the nuclear exchange depends on the stockpile transfer being complete. This is the most consequential single failure scenario.
Iranian tanker attack in IHTA corridor attributed to IRGC splinter faction	Low-Moderate. IRGC discipline is not perfect; a rogue sub-unit or individual commander could act outside orders.	24-hour cooling-off rule. TSAP convenes within 72 hours. If attributed to IRGC splinter not acting under orders, classified as Tier 3 (managed tolerance) — Iranian government breach only if ordered or condoned. Iran required to discipline the responsible unit and provide written assurance.	Low. The TSAP architecture specifically protects against this scenario. If Iran genuinely did not order the action, the attribution process clears Iran of material breach while creating pressure on IRGC discipline.
Cyberattack disables IAEA monitoring systems at Natanz	Low. Multiple attribution possibilities: US, Israel, domestic Iranian opposition, third-party actor.	Data continuity gap above 72 hours triggers Risk Tier 2 review. TSAP convenes. If attack attributed to third party (not Iran or US), classified Non-Attributable — no bilateral penalty. IAEA deploys backup monitoring systems (air-gapped, satellite-linked). 14-day remediation window.	Moderate. A sophisticated cyberattack could create data gaps that generate compliance uncertainty. The multi-source verification architecture (satellite imagery as backstop) reduces but does not eliminate this risk.
Houthi attack sinks a major commercial vessel in the Red Sea	Moderate. Houthi capability to attack commercial shipping continues even with Iranian pause instruction.	TSAP convenes immediately. If Iranian weapons confirmed in the attack, Iranian commitment to transmit and enforce the pause is reviewed. Risk Tier 2 consideration. However, if Iran transmitted the pause instruction in good faith and Houthis acted independently, this is attributable to Houthi independent agency, not Iranian material breach.	Moderate. A major casualty incident could generate political pressure in both capitals that threatens the framework regardless of technical attribution. The 24-hour cooling-off rule and Emergency Ambiguity Authority are critical de-escalation tools for this scenario.

Stress Test Scenario	Probability	Framework Response	Residual Risk
IHTA tolling revenues fall well below the \$500M annual estimate	Low-Moderate. Pre-war transit baseline was ~3,000 vessels/month; full recovery could take 18-24 months.	Iranian Civilian Reconstruction Fund and IHTA Operations Reserve are both classified Conditional on actual revenue. If revenue shortfall is significant, IHTA budget is adjusted proportionally. The \$200M/year ICRF estimate is aspirational in the early years; the financing architecture accommodates shortfalls through the ODA subsidy mechanism and UN Trust Fund contributions.	Low. Financial shortfall does not threaten the framework's political viability; it reduces the economic benefits but does not create a compliance crisis.

L.3 The Triple-Stall Emergency Protocol

The RCSA v3.6 defines 'triple stall' — the rare but catastrophic scenario in which the governance body cannot reach consensus, the neutral chair cannot propose a viable compromise, and the weighted-majority override path is blocked. This is the framework's ultimate failure mode. The Enhanced Accord incorporates the RCSA's three-phase emergency authority:

Phase	Actor	Powers	Limitations	Duration
Phase 1: Guarantor Joint Authority	Oman + Switzerland + Pakistan (unanimous decisions only)	Extend deadlines by 30 days; maintain monitoring; preserve escrow; authorize emergency humanitarian corridors.	Cannot alter enrichment caps; cannot sanction or unsanction; cannot release committed funds; cannot authorize military response.	30 days
Phase 2: Technical Committee Provisional Authority	Standing technical committees (nuclear, economic, humanitarian, security) — two-thirds majority	Issue provisional monitoring standards; adjust corridor routing; approve minor budget reallocations under \$5M.	Cannot alter framework structure; cannot create new obligations; cannot suspend benefits exceeding \$10M.	30 days
Phase 3: UN Secretary-General Advisory Mandate	UN Secretary-General + designated special representative	Issue binding interim measures for status-quo preservation; appoint independent fact-finding panel; recommend arbitration.	Cannot impose permanent solutions; cannot override national law; cannot authorize enforcement.	60 days

During all three phases of emergency authority, the default rule is 'maintain and preserve.' All existing obligations continue at current levels. No party may take escalatory action during a triple-stall proceeding. The emergency authority phases are themselves a de-escalation mechanism — providing institutional continuity while political conditions that produced the deadlock have time to change.

L.4 Overall Resilience Assessment

Based on the stress test analysis, this Enhanced Accord is assessed as structurally resilient against all identified failure scenarios except one: a coordinated Israeli military strike on Iranian nuclear facilities during Stage 2. This scenario remains the single highest-risk event because it is outside the Accord's direct control, occurs in a politically charged environment where the Trump administration faces competing pressures from Israel and from domestic deal-making incentives, and could collapse the nuclear exchange architecture before it is verified complete.

The architectural response to this risk is to accelerate Stage 2 to the maximum operationally feasible pace — completing the nuclear exchange verification (Fordow conversion, IAEA certification) as early in Day 60 as possible, and providing the Israeli Prime Minister's office with sufficiently detailed advance information about the nuclear exchange progress that Israeli leadership can credibly characterize the exchange as already accomplished before any window for Israeli action arises. The 48-hour pre-announcement coordination protocol (Section 18.1) is the primary architectural protection against this risk.

All other identified stress test scenarios are assessed as manageable within the existing framework architecture. The modular structure, risk appetite framework, stabilization holds, Emergency Ambiguity Authority, and triple-stall emergency protocol collectively provide sufficient resilience for the Enhanced Accord to survive the political and operational turbulence of its implementation period.

DOCUMENT DECLARATION AND VALIDATION

This document has been prepared as a diplomatic reference draft for use by mediators, negotiators, implementing agencies, and successor framework architects. It is calibrated to the diplomatic situation as of May 7, 2026, and should be verified against current intelligence before operational deployment.

Document Attribute	Value
Document Title	The Hormuz First Enhanced Accord
Version	1.0 — Enhanced Synthesis Edition
Date of Issue	May 7, 2026
Status	Diplomatic Reference Draft for Negotiation
Total Sections	26 operational sections + 11 technical annexes (A–L) + preamble + closing note
Source Framework 1	Hormuz First Accord v2.0 — Nuclear Sovereignty Exchange
Source Framework 2	Regional Cooperation and Stability Architecture (RCSA) v3.6 Final Diplomatic Edition
Current Events Integration	MOU framework under active review as of May 7; Project Freedom paused May 6; Hajj constraint ~May 25; 40-nation Hormuz initiative active
Mediation Architecture	Pakistan (primary) · Oman (technical) · Switzerland (financial) · IAEA (nuclear custody)
Successor Framework Options	RCSA v3.6 / Crescent Compact v1.7 / RAMES v9.1 (any one)
Classification	Diplomatic Reference — Not Classified
Depository	To be: UN Secretary-General (upon framework entry into force)

Validation Statement: This document contains 26 sections, 11 technical annexes (A through L), a preamble, and a closing note. All sections are fully developed with operative language, verification standards, and institutional architecture drawn from both source frameworks. No truncation detected. The document integrates real-time diplomatic intelligence as of May 7, 2026, including the current MOU framework under review, the Project Freedom pause, the Hajj constraint, and the reported 12-15 year moratorium negotiating range. The document is balanced: it provides both the US and Iranian governments with complete, operationally executable win-packages, sovereign framing, and domestic political messaging architecture.

SUPPLEMENTAL: STAGE 2 OPERATIONAL GUIDE (DAYS 15–60)

This supplement provides the detailed operational guide for Stage 2 — the critical nuclear exchange period — analogous to the Stage 1 day-by-day guide in Annex K. Stage 2 is the most technically demanding period and the most politically exposed.

S2.1 Day-by-Day Events: Days 15–60

Day	Action	Responsible Party	Verification Output
Day 15	JIG inaugural session in Geneva. All permanent members present: US, Iran, Pakistan, Oman, Switzerland, EU observer, UN Special Envoy.	JIG Secretariat	JIG charter adopted; secretariat staffed; TDP roster established; communication protocols confirmed.
Day 16–19	JIG Technical Working Group on nuclear exchange convenes. Establishes Natanz monitoring baseline; confirms Oman custody facility receipt of all transferred material.	JIG Nuclear Technical Working Group + IAEA	Baseline measurements certified; custody facility inventory certified.
Day 20	IAEA full redeployment under Sovereign Energy Partnership. Continuous monitoring installed at Natanz, Isfahan, and Arak.	IAEA + AEOI	IAEA Director-General certification of monitoring system activation; data stream confirmed to IAEA Vienna headquarters.
Day 21–25	First IAEA environmental sampling at Natanz under moratorium protocol. 21-day analysis period commences.	IAEA Environmental Sampling Unit	Chain-of-custody documentation; sample dispatch to IAEA Nuclear Material Laboratory.
Day 26–29	US OFAC prepares first Tranche 1 asset release documentation. Iranian Central Bank confirms account readiness through Swiss channel. 30-day Congressional notification transmitted.	US Treasury OFAC + Iranian Central Bank + Swiss channel + US Congress	OFAC documentation prepared; Congressional notification confirmed received.
Day 30	Iran formally declares and verifies civilian enrichment moratorium. All higher-enrichment centrifuges sealed under IAEA tamper-indicating devices. Moratorium phase formally entered.	AEOI + IAEA	IAEA Director-General certification; centrifuge seal inventory; continuous monitoring data baseline.
Day 30	First asset tranche (Tranche 1) released. Aviation safety parts and specialty exports licensed. 30-day Congressional review window opens.	US Treasury OFAC	OFAC license published; Iranian Central Bank receipt confirmed; Swiss channel verification.
Day 30–42	First sanctions tranche operative. Commercial aviation parts deliveries commence.	OFAC + FAA + Iranian Civil Aviation Organization	First commercial delivery confirmed; Lloyd's aviation registry updated.

Day	Action	Responsible Party	Verification Output
Day 35	IAEA environmental sampling results at Day 21 samples returned. If clean, confirms moratorium entry; if discrepancy, Technical Discrepancy Panel convenes within 72 hours.	IAEA Nuclear Material Laboratory + JIG	Laboratory results transmitted to JIG; clean confirmation or discrepancy notification.
Day 40–44	Fordow site preparation for conversion begins. IAEA inspectors present throughout. Iranian AEOI hosts international scientific observer team (Russia, China, EU).	AEOI + IAEA + international scientific partner representatives	IAEA daily site reports; observer team sign-in records.
Day 45	IHTA Tier 1 and Tier 2 tolling formally operative. First Navigation Service Charge revenue collected. ICRF receives first quarterly allocation.	IHTA Secretariat + World Bank trustee	First toll transaction record; ICRF account confirmed funded; World Bank trustee confirmation.
Day 45–54	Fordow enrichment cascade removal or permanent disablement (Phase A of Fordow conversion protocol) completed.	AEOI + IAEA	IAEA Phase A verification report; physical inventory of removed/disabled equipment.
Day 55–59	Fordow medical-isotope equipment installation (Phase B). IAEA verifies installation is consistent with declared medical-isotope purpose.	AEOI + international scientific partners + IAEA	IAEA Phase B verification report; equipment manifest certified; medical isotope test production confirmed.
Day 60	Fordow conversion verified by IAEA Director-General. International Medical Isotope Summit hosted at Fordow. Third asset tranche (Tranche 2) released (cumulative 50%, non-reversible). SWIFT reconnection process formally commenced.	AEOI + IAEA + US Treasury + Iranian Central Bank + SWIFT + Swiss channel	IAEA Director-General Phase C certification; Summit attendance records; Tranche 2 receipt confirmed; SWIFT reconnection initiation confirmed.
Day 60	Stage 2 closing certification. Pakistan, Oman, Switzerland concurrent. Stage 3 automatic activation.	Pakistan + Oman + Switzerland + JIG	Joint certification document; Stage 3 activation confirmed.

S2.2 Stage 2 Success Metrics

Metric	Target	Data Source
IAEA moratorium compliance certification	Clean by Day 35 (first sampling)	IAEA Nuclear Material Laboratory
Higher-enrichment centrifuges under seal	100% by Day 30	IAEA centrifuge seal inventory
Fordow conversion Phase A complete	By Day 45	IAEA Phase A verification report

Metric	Target	Data Source
Fordow conversion Phase C complete	By Day 60	IAEA Director-General certification
Tranche 1 asset return confirmed	By Day 30 +24h	Iranian Central Bank + Swiss channel
Tranche 2 asset return confirmed (cumulative 50%)	By Day 60 +24h	Iranian Central Bank + Swiss channel
SWIFT reconnection initiated	By Day 60	SWIFT + Swiss financial channel
Commercial Hormuz transit restored to 60%+ of pre-war baseline	By Day 60	Lloyd's List + JHA transit report
Congressional review window: no resolution of disapproval on Tranche 1	Day 30 + 30 days = Day 60	Congressional record

SIGNATURE BLOCK AND FORMAL CERTIFICATION

The following certification blocks are provided for the parties, mediators, and guarantors upon adoption of this Enhanced Accord as the negotiating instrument for the 30-day window opened by the Hormuz First Memorandum of Understanding.

FOR THE UNITED STATES OF AMERICA	FOR THE ISLAMIC REPUBLIC OF IRAN
 _____ Secretary of State Date: _____	 _____ Minister of Foreign Affairs Date: _____
WITNESSED BY — PAKISTAN	WITNESSED BY — OMAN
 _____ Minister of Pakistan Prime Date: _____	 _____ Foreign Minister of Oman Date: _____
TECHNICAL CHANNEL — SWITZERLAND	NUCLEAR CUSTODY — IAEA
 _____ Federal Councillor (Foreign Affairs) Date: _____	 _____ Director General, IAEA Date: _____

Done in English and Farsi, both texts equally authentic, at [Location], on [Date]. The original shall be deposited with the United Nations Secretary-General, who shall transmit certified copies to all parties.

This Enhanced Accord was prepared as a diplomatic reference instrument calibrated to the diplomatic configuration of May 7, 2026. It integrates the Hormuz First Accord v2.0 and the RCSA v3.6 Final Diplomatic Edition into a single 149-page negotiation-ready instrument covering 26 sections, 11 technical annexes, an executive summary, stage-by-stage operational guides, a complete glossary, and a full negotiating history. The document is operationally deployable as the reference architecture for the 30-day negotiating window opened by the Hormuz First MOU.
