1. Executive Summary

Purpose

The **Adaptive De-Escalation Architecture (ADEA)** is a comprehensive, modular diplomatic framework designed to transform the fragile U.S.-Iran ceasefire of 8 April 2026 into a durable, comprehensive peace agreement. It directly addresses all fifteen critical issues identified as structural blockers to a finalized deal, providing concrete, negotiable solutions that balance President Trump's public demands of 17 May 2026 with Iran's sovereign red lines under the guidance of Supreme Leader Mojtaba Khamenei.

The current negotiation environment is extraordinarily compressed. President Trump has publicly stated that Iran has **"two or three days"** to reach an agreement or face renewed kinetic attacks. On 17 May, the White House issued five hard preconditions: (1) physical transfer of Iran's ~400 kg highly enriched uranium stockpile to the United States; (2) retention of only one operational Iranian nuclear facility; (3) linking all negotiations to cessation of hostilities across all fronts; (4) withholding at least 25 percent of frozen Iranian assets; and (5) rejection of any Iranian claim to war reparations. Simultaneously, Iran has established the **Persian Gulf Strait Authority (PGSA)**, asserting sovereign control over the Strait of Hormuz transit corridor, and maintains that its enriched uranium must remain on Iranian soil under IAEA custody.

ADEA threads this needle through fifteen self-contained but interoperable modules, each providing a specific structural fix to a defined problem. Rather than forcing either party to abandon its core demands, each module constructs a **third-way mechanism** that reframes the dispute in terms both sides can claim as victory. For President Trump, ADEA delivers the substantive outcomes he has demanded: full HEU accountability, facility consolidation, linkage to regional stability, performance-gated financial release, and economic partnership in place of reparations liability. For Iran, ADEA preserves sovereign dignity: HEU remains on Iranian territory under inviolable IAEA seal, enrichment suspension is time-limited and reversible, infrastructure is converted rather than destroyed, and the PGSA is integrated into a multilateral governance framework rather than unilaterally dismantled.

The architecture is designed for immediate implementation. Every module includes a **Day 1 trigger**, a **30-day verification pathway**, and a **political packaging strategy** that allows both leaders to sell the agreement domestically. The document draws comprehensively from the six bilateral frameworks previously developed: The Reciprocal Opening Window v1.1 (Custody Exchange, Safe Passage, Sanctuary Protocol), the Framework for Reciprocal Stabilization v3.2 (Cascading Releases, Sanctuary Cities, Black-Box Telemetry), the Hormuz-First Enhanced Accord v2.4 (Gulf Safety Net, Multilateral Fund, Safe Passage), CBSF v16.2 (Multi-Phased Implementation, Revenue-Positive Arrangements), the Stability-First Enhanced Accord v5.7 (Legalistic Architecture, Escrow for Peace), and The Final Steps Accord (Perimeter Shielding, Joint Facility), as well as the CRESCENT COMPACT v1.1 regional stabilization protocol.

2. Strategic Context: The Current Landscape

2.1 The Five Trump Preconditions (17 May 2026)

On 17 May 2026, President Trump publicly outlined five conditions that the Iranian regime must accept to resume and conclude deal negotiations, as reported by Fars News Agency and subsequently confirmed by multiple international outlets. These preconditions represent the most concrete articulation of the U.S. negotiating position since the Islamabad talks collapsed on 12 April, and they form the immediate political boundaries within which any diplomatic solution must operate. Understanding each precondition in detail is essential to crafting solutions that can actually secure White House approval.

Table 1 The Five Trump Preconditions — Structural Analysis

Precondition	Trump Demand	Iran Position	Gap
Uranium Transfer	400 kg HEU physically delivered to U.S.	HEU must remain on Iranian soil	Sovereignty vs. physical removal
Facility Consolidation	Only one Iranian nuclear facility operational	Multiple facilities are sovereign right	One vs. multiple operational sites
Hostility Linkage	Cessation of hostilities on all fronts tied to deal	Hostility cessation is precondition, not outcome	Sequencing and causality
Asset Retention	At least 25% of frozen assets withheld	Full release of all frozen assets	Partial vs. complete unfreezing
Reparations Rejection	U.S. will pay zero war damages	Formal demand for war reparations	Liability acknowledgment vs. denial

The uranium transfer precondition presents the most acute sovereignty concern for Tehran. Supreme Leader Mojtaba Khamenei has reportedly issued a strict directive that the highly enriched uranium must remain on Iranian soil to prevent future breakout vulnerability — a position rooted in the historical trauma of the 2015 JCPOA, where Iran dismantled much of its program only to face the unilateral U.S. withdrawal in 2018. Any solution must therefore provide Trump with full physical accountability of the HEU while ensuring it never leaves Iranian territory. The Consolidated Custody Protocol in Module 1 achieves this by placing the HEU under permanent, unbreachable IAEA physical seal inside a single declared

Iranian facility, with real-time U.S. technical monitoring access — functionally equivalent to physical transfer from a nonproliferation standpoint, while respecting Iranian sovereignty.

2.2 Iran's Core Red Lines

Tehran's negotiating position, articulated through the National Security Council and the office of the Supreme Leader, rests on five immovable pillars. First, the right to enrich uranium on Iranian soil — while the level and quantity are negotiable, the underlying right is not. Second, the HEU stockpile must remain physically within Iran's borders. Third, all secondary sanctions must be lifted as part of any comprehensive agreement, not as a reward for compliance after the fact. Fourth, the Strait of Hormuz falls under Iranian sovereign authority, and any transit regime must formally recognize this principle. Fifth, Iran will not accept limitations on its ballistic missile program as part of the nuclear file, though defensive deployment parameters may be discussed separately.

These red lines are not arbitrary negotiating positions. They reflect the institutional consensus of the Islamic Republic's security architecture, including the Islamic Revolutionary Guard Corps, the regular armed forces, and the clerical establishment. Any agreement that crosses them will face internal sabotage from Iranian hardliners, who already view the negotiation track with deep suspicion following the assassination of former Supreme Leader Ali Khamenei during Operation Epic Fury in February 2026. The new Supreme Leader, Mojtaba Khamenei, inherits a regime whose unity has been tested by war, leadership transition, and economic collapse. He needs a deal, but cannot afford to be seen as surrendering.

2.3 The PGSA Factor

The **Persian Gulf Strait Authority (PGSA)**, established by Iran on 5 May 2026, fundamentally alters the maritime governance equation. The PGSA asserts Iranian sovereign authority over the entire Strait of Hormuz transit corridor, implementing a de facto military checkpoint and vessel vetting system enforced by the IRGC Navy. This unilateral institutionalization of Strait control represents both an obstacle and, paradoxically, an opportunity. The obstacle is obvious: the United States, the United Kingdom, and the European Union have all categorically rejected any Iranian claim to regulate transit through an international waterway, with President Trump explicitly stating, "We don't want tolls." The opportunity lies in the fact that the PGSA provides Iran with a institutional framework that can be multilateralized rather than dismantled.

ADEA's maritime modules (4, 5, and 6) treat the PGSA not as a rogue entity to be destroyed, but as a bilateral platform to be reformed. The authority's existing infrastructure — its checkpoint protocols, its communications networks, its coordination with Omani counterparts — can be rebranded and integrated into a Joint Maritime Governance Framework (JMGF) that includes U.S. and international representatives. This approach gives Iran the institutional continuity it needs to claim domestic victory, while giving the United States the transparent, rules-based transit system it demands. The PGSA's headquarters in Bandar Abbas becomes the physical seat of the JMGF, its personnel retain their positions under new operating procedures, and its fee-collection apparatus is redirected into a multilateral maintenance fund rather than Iranian state revenue. This is the critical conceptual move that unlocks the maritime deadlock: not dismantling the PGSA, but upgrading it.

3. ADEA Architecture Overview

The Adaptive De-Escalation Architecture is organized into four operational parts, corresponding to the four arenas of dispute identified in the issues analysis. Each part contains multiple self-contained modules. Every module follows a standardized internal structure: an **Issue Statement** that defines the problem in the exact language used by both parties; a **Solution Mechanism** that describes the specific structural fix proposed; **Trump Deliverables** that identify what President Trump can claim as a win; **Iran Deliverables** that identify what Supreme Leader Khamenei can claim as a win; a **Day 1 Trigger** that describes the specific action taken immediately upon signature; and a **Verification Pathway** that describes how compliance is confirmed over the 30-day window.

Table 2 ADEA Module Matrix

Part	Module	Core Issue	Solution Family
I	1	HEU Stockpile Disposition	Consolidated Custody Protocol
I	2	Enrichment Cap and Moratorium	Graduated Enrichment Suspension
I	3	Centrifuges and Underground Sites	Dual-Use Infrastructure Conversion
II	4	Strait Vetting System	Joint Maritime Governance Framework
II	5	Transit Security Fees	Multilateral Maritime Maintenance Fund
II	6	U.S. Naval Blockade	Synchronized Reciprocal Withdrawal
III	7	Sanctions Relief Sequencing	Milestone-Triggered Cascading Release
III	8	Frozen Assets	Joint Sovereign Custody Escrow
III	9	SWIFT Reconnection	Phased Virtual Reintegration
III	10	War Reparations	Regional Stability Reconstruction Credits
IV	11	30-Day Negotiation Window	Letter of Intent with Auto-Escalation Brake
IV	12	Institutional Mediation	Distributed Guarantor Matrix
IV	13	Human-in-the-Loop Governance	Procedural Step-Back Protocol
IV	14	Drone and Missile Reconstitution	Deployment Freeze with Industrial Grandfathering

The fifteen modules are designed to be implemented as an integrated package, but each contains internal safeguards allowing for **procedural step-backs** if implementation encounters political resistance. This modular resilience is critical because the Iranian regime is not monolithic: hardline factions within the IRGC, the Guardian Council, and the Basij may attempt to derail specific provisions even after the Supreme Leader approves the overall framework. Similarly, domestic U.S. political opposition, congressional war powers resolutions, and allied pressure (particularly from Israel and Saudi Arabia) could destabilize American implementation. Each module's Human-in-the-Loop governance element (detailed in Module 13) creates a buffer between technical compliance disputes and catastrophic collapse back to total war.

Headline Win for President Trump

ADEA delivers on all five of Trump's 17 May preconditions through mechanisms that achieve his stated objectives without requiring Iran to publicly capitulate. The HEU is consolidated to a single U.S.-monitored facility under IAEA seal (precondition 1). Only one Iranian facility remains operationally active for any fissile material work (precondition 2). All nuclear progress is explicitly linked to regional stability outcomes (precondition 3). Financial release is performance-gated with 25 percent held in reserve (precondition 4). And all economic support is framed as investment, not reparations (precondition 5). Trump can truthfully tell the American people that Iran met his conditions.

Headline Win for Supreme Leader Khamenei

ADEA preserves every Iranian red line through mechanisms that achieve Tehran's objectives without requiring the United States to publicly reverse its demands. The HEU never leaves Iranian soil. Enrichment is suspended, not surrendered. Nuclear infrastructure is converted to civilian medical and research use, not destroyed. The PGSA is upgraded into a multilateral body with Iranian co-chairmanship, not dismantled. Secondary sanctions are lifted in binding tranches, not promised for future delivery. Frozen assets are moved to neutral escrow, not seized by American courts. And Iran receives substantial economic reconstruction support without acknowledging any war liability. Khamenei can truthfully tell the Iranian people that sovereignty was defended.

4. Part I: The Nuclear Deadlock — Modules 1-3

Module 1: HEU Stockpile Disposition and Physical Control

The Issue

President Trump demands the complete physical recovery and removal of Iran's roughly 900-pound (400 kg) highly enriched uranium (HEU) stockpile to the United States. Supreme Leader Mojtaba Khamenei has issued a strict directive that the HEU must remain on Iranian soil to protect against future breakout vulnerability. This is the single most contentious material issue in the negotiation.

The ADEA Solution: The Consolidated Custody Protocol (CCP)

The Consolidated Custody Protocol resolves the HEU impasse by achieving **functional equivalence** to physical transfer while preserving Iranian territorial sovereignty. The entire 400 kg stockpile of uranium enriched to 60 percent purity is moved to a single, declared facility at the Isfahan Nuclear Technology Center — specifically, the underground storage complex that has been the subject of extensive IAEA and U.S. intelligence attention since Operation Midnight Hammer in June 2025. Once consolidated at Isfahan, the HEU is placed under a **tripartite physical custody arrangement** involving Iran, the IAEA, and the United States (represented technically, not politically, through the IAEA's existing American deputy director framework).

The physical security of the stockpile is ensured through a **multi-layered containment architecture**. The HEU is stored in tamper-evident containers equipped with continuous radiation monitoring, GPS-independent location verification, and seismic disturbance sensors. These containers are sealed with cryptographic locks whose key shares are distributed among the IAEA Director General, the rotating chair of the IAEA Board of Governors (currently a U.S.-aligned Western state), and the Iranian Atomic Energy Organization. No single party can unilaterally access the material. The facility itself is secured by a combined guard force: Iranian perimeter security (outer ring), IAEA technical monitors (inner ring), and a neutral third-country security contingent from Oman or Qatar (facility access control). This three-ring architecture, adapted from the Framework for Reciprocal Stabilization's "Escrow for Peace" concept, ensures that the HEU cannot be moved, reprocessed, or accessed without simultaneous cooperation from all three parties.

For President Trump, the Consolidated Custody Protocol delivers the core outcome he demanded: **physical control over Iran's HEU**. The United States, through its IAEA representation, holds a physical key share. American technical personnel have real-time monitoring access via encrypted telemetry. Any attempt to move or process the material triggers an immediate, automatic alert to Washington. The stockpile is consolidated from its current dispersed locations (Isfahan underground facility, residual material at Natanz, and possible material at Fordow and Pickaxe Mountain) to a single known, monitored location — eliminating the risk of hidden breakout stocks. From a nonproliferation perspective, this achieves the same security outcome as physical transfer to the U.S., because the material is under effective international control and cannot be weaponized without detection.

For Iran, the Protocol preserves the absolute red line of territorial sovereignty. The HEU never crosses an Iranian border. It remains on Iranian soil, in an Iranian facility, guarded by Iranian forces on the perimeter. The Supreme Leader can tell his domestic audience, truthfully, that Iran did not surrender its nuclear material to the United States. The IAEA's role provides political cover: Iran is not bowing to American demands, but fulfilling its obligations to the international nonproliferation regime. The Omani/Qatari security contingent provides an Islamic-face guarantee that assuages nationalist and religious opposition. And the cryptographic key distribution ensures that Iran retains a formal veto over any access to its material — a procedural equality that symbolizes sovereign equality.

Trump Carrot — What the President Gets

- **Complete HEU accountability:** Every gram of Iran's 400 kg stockpile is located, sealed, and monitored.
- **Effective U.S. control:** American technical personnel hold a physical key share and receive real-time telemetry.
- **No hidden stocks:** Consolidation to one facility eliminates the risk of dispersed breakout material.
- **Transfer-equivalent security:** The material is as secure as if it were in Oak Ridge — more secure, in some respects, because it's immobilized rather than transported.
- **Media headline:** "Trump Secures Full Control of Iranian Nuclear Material — Without Firing a Shot."

Implementation Mechanics

Day 1 Trigger: Iran submits a complete declaration of all HEU holdings to the IAEA, including locations, quantities, and enrichment levels. The IAEA dispatches a rapid verification team to confirm the declaration.

Day 3-7: HEU is transported from all declared locations to the Isfahan consolidated storage facility under IAEA seal and international observation. U.S. technical monitors accompany the transport as IAEA guests.

Day 7-14: Tamper-evident containers are installed, cryptographic seals are applied, and the three-ring security architecture is operationalized. Continuous telemetry goes live to IAEA headquarters in Vienna and to a dedicated U.S. monitoring station.

Day 14-30: Black-box telemetry verification confirms no unauthorized access attempts. IAEA issues a compliance certificate triggering the first sanctions relief tranche under Module 7.

Module 2: The Enrichment Cap and Moratorium Timeline

The Issue

The United States is pushing for an absolute "zero enrichment" baseline or a strict 20-year moratorium on all Iranian enrichment activity. Iran has countered with a maximum 12-year suspension window and insists on retaining the underlying right to enrich. This temporal disconnect — 20 years versus 12 years — has deadlocked the core nuclear bargain.

The ADEA Solution: The Graduated Enrichment Suspension (GES)

The Graduated Enrichment Suspension resolves the timeline dispute through a **sliding-scale architecture** that couples suspension duration to verification performance. Rather than fixing a single number in years, GES establishes a baseline 12-year enrichment moratorium that automatically extends to 15 years upon completion of specific IAEA verification milestones. This directly bridges the U.S. 20-year demand and Iran's 12-year ceiling: the effective duration is 12 years guaranteed with a 3-year extension pathway — functionally a 15-year arrangement that Tehran can market as 12 and Washington can market as 15.

The GES framework contains four distinct enrichment tiers, each with defined parameters. **Tier 1 (Months 1-36):** Total suspension of all enrichment activity. No uranium hexafluoride is fed into centrifuges. All enrichment cascades are placed in cold standby under IAEA seal. This is the deep freeze period that provides the United States with immediate, verifiable confidence. **Tier 2 (Months 37-84):** Limited enrichment permitted to 3.67 percent purity (the JCPOA baseline) at a single declared facility, with a stockpile cap of 300 kg. This restores Iran's civilian nuclear program in a heavily constrained form. **Tier 3 (Months 85-144):** Enrichment permitted to 5 percent purity with a 500 kg stockpile cap, suitable for civilian power reactor fuel. **Tier 4 (Months 145-180, conditional):** If the 3-year extension milestones are met, enrichment permitted to 5 percent with a 1,000 kg stockpile cap and expanded civilian facility operations.

The critical innovation is the **milestone-linked auto-extension mechanism**. The baseline 12-year moratorium extends to 15 years only if three cumulative conditions are satisfied: (1) the IAEA confirms Iran has not conducted any undeclared enrichment activity for 36 consecutive months; (2) the Joint Sovereign Custody Protocol (Module 8) maintains full integrity with no escrow disputes; and (3) the Joint Maritime Governance Framework (Module 4) operates without major incidents for 24 consecutive months. If any condition is breached, the timeline does not auto-extend — but it also does not collapse. The agreement remains in force at the 12-year baseline, and a diplomatic review is triggered. This protects Iran from having its timeline extended by technical disputes or bad-fifth allegations, while giving the United States a credible pathway to the longer duration it seeks.

For Trump, the GES delivers a **12-year hard freeze** followed by tightly constrained enrichment well below weapons-relevant levels. The auto-extension provides a diplomatic carrot to incentivize Iranian compliance rather than a coercive stick that Tehran would reject. The 3.67 percent cap in Tier 2 represents a 90 percent reduction in enrichment capability from the current 60 percent level — a historic constraint that no previous agreement has achieved. For Iran, GES preserves the **inalienable right to enrich** recognized under the NPT, embeds that right in a binding international agreement, and provides a clear, time-bound pathway back to civilian enrichment. The sliding scale allows Iran to claim that it negotiated a 12-year arrangement (the baseline), while the United States can claim it achieved up to 15 years (the extended pathway) — both are factually correct.

Political Packaging

President Trump announces: "We have achieved a 15-year moratorium on Iranian enrichment, with an ironclad 12-year total freeze. Iran will not enrich a single atom for 12

years. After that, they are capped at levels far below anything dangerous. This is the strongest nuclear deal in history." Supreme Leader Khamenei announces: "We have preserved Iran's sovereign right to peaceful nuclear energy. The suspension is 12 years, not 20. Enrichment resumes after that at a level suitable for civilian power. The enemies of Iran failed to strip us of our scientific achievements." Both statements are true.

Module 3: Advanced Centrifuge Hardening and Underground Sites

The Issue

President Trump has threatened to permanently "knock out" five deeply buried underground storage and manufacturing sites — including Fordow, Natanz, Isfahan, and two additional clandestine facilities — if a deal is not struck. Iran demands the preservation of its nuclear infrastructure, which represents decades of scientific investment and national pride. The physical status of these facilities has been further complicated by damage sustained during Operation Epic Fury (February 2026) and the subsequent conflict, creating a complex reconstruction dynamic.

The ADEA Solution: Dual-Use Infrastructure Conversion (DUIC)

The Dual-Use Infrastructure Conversion program resolves the facility dispute by transforming Iran's hardened underground sites from nuclear weapons-relevant infrastructure into **globally certified civilian nuclear research and medical isotope production centers**. Rather than destroying the facilities (an Iranian red line) or leaving them operational for potential weapons use (an American red line), DUIC converts them to purposes that are transparently civilian, economically valuable, and politically defensible for both sides.

The five primary facilities are addressed through a tiered conversion plan. **Fordow (near Qom):** Converted into the **Regional Medical Isotope Production Center (RMIPC)**. Fordow's deeply buried location makes it ideal for producing medical isotopes that require shielding from cosmic radiation — a genuine civilian application that leverages the facility's physical characteristics. Under the DUIC plan, Fordow's centrifuges are replaced with medical isotope separation equipment, and the facility operates under continuous IAEA monitoring with real-time black-box telemetry. The medical isotopes produced (molybdenum-99, iodine-131, xenon-133) are distributed to hospitals across the Middle East, generating humanitarian goodwill and economic revenue. **Natanz:** Converted into the **Iranian Nuclear Research and Training Campus**, hosting IAEA-certified training

programs for nuclear scientists from across the developing world. The above-ground buildings house classrooms and laboratories; the underground halls are adapted for low-enrichment experiments and materials science research under full international supervision. **Isfahan (underground facility):** Becomes the consolidated HEU storage site under the Consolidated Custody Protocol (Module 1), with above-ground facilities converted to nuclear safeguards training for IAEA inspectors. **Pickaxe Mountain:** Converted to a **Seismological and Geothermal Research Station**, leveraging its deep tunnels for geophysical research with no fissile material present. **Undeclared Site #5 (location classified):** Verified dismantlement of all nuclear equipment under IAEA supervision, with the facility either sealed or repurposed for conventional industrial use.

For President Trump, DUIC achieves his core objective: **Iran's underground nuclear complex is permanently neutralized as a weapons threat.** Fordow produces cancer medicine, not fissile material. Natanz trains students, not weapons scientists. The five sites that Trump threatened to "knock out" are instead "knocked into" civilian service — a far more durable outcome than bombing, which would leave rubble that could be excavated and rebuilt. The black-box telemetry system provides continuous, tamper-proof verification that no enrichment activity is occurring. Any attempt to revert facilities to weapons use would be detected within hours, not months. For Iran, DUIC preserves the physical infrastructure — the buildings, the tunnels, the scientific equipment — and redirects it to prestigious civilian applications. Iranian engineers remain employed. Iranian science continues. And Iran becomes a regional hub for medical isotope production and nuclear training, converting a sanctions-starved pariah program into a revenue-generating, internationally respected enterprise.

Trump Carrot — Facility Outcome

- Five underground sites converted or consolidated — none remain weapons-capable.
- Fordow produces cancer medicine, not bomb fuel — a global humanitarian showcase.
- Continuous black-box telemetry means any Iranian cheating is detected within hours.
- No American troops needed to enforce — the IAEA and technology do the work.
- Headline: "Trump Converts Iran's Nuclear Bunkers into Cancer Hospitals."

Implementation Timeline

Days 1-30: IAEA technical assessment teams visit all five facilities, verify current damage status, and develop facility-specific conversion plans.

Months 2-6: Equipment conversion begins at Fordow (medical isotope installation) and Natanz (research campus setup). Centrifuge removal and disablement under IAEA seal at all facilities.

Months 6-12: Fordow RMIPC begins limited medical isotope production under IAEA certification. Natanz training campus enrolls first international students. Black-box telemetry fully operational at all sites.

Month 12: IAEA certifies all five facilities as fully converted or consolidated. Second sanctions relief tranche released.

5. Part II: Maritime Governance and Sovereignty — Modules 4-6

Module 4: The Strait of Hormuz Vetting System vs. Freedom of Navigation

The Issue

The Islamic Revolutionary Guard Corps (IRGC) Navy has established a rigid de facto transit system, enforcing military checkpoints and vessel vetting under the newly declared Persian Gulf Strait Authority (PGSA). The United States fiercely rejects any unilateral Iranian restrictions on international waters. CENTCOM has conducted naval operations to "clear" the Strait, including mine countermeasures and armed escorts, resulting in direct military clashes with IRGC forces on 4-7 May 2026. The PGSA represents Iran's institutionalization of what it considers sovereign maritime authority; the U.S. considers it an illegal blockade of an international waterway.

The ADEA Solution: The Joint Maritime Governance Framework (JMGF)

The Joint Maritime Governance Framework resolves the Hormuz sovereignty dispute by **multilateralizing the PGSA without dismantling it**. This is the critical conceptual breakthrough that unlocks the entire maritime module. The JMGF converts Iran's unilateral Persian Gulf Strait Authority into a formal, treaty-based international body with Iranian co-chairmanship, embedding the existing PGSA infrastructure — its Bandar Abbas headquarters, its communications networks, its checkpoint protocols, its personnel — into a cooperative framework that includes the United States, Oman, Qatar, and rotating international participants.

The JMGF is structured as a six-party governing council: **Iran** (co-chair, permanent seat); **Oman** (co-chair, permanent seat); **United States** (permanent seat); **Qatar** (permanent seat); **Rotating Member** (two-year term, drawn from IMO Council members); and **IAEA Maritime Office** (technical observer with reporting authority). This composition ensures that Iran retains formal institutional parity (co-chairmanship with Oman) and a permanent voice in all decisions, while the United States gains a formal seat at the table and the ability to block unacceptable decisions through a supermajority voting mechanism.

The operational architecture of the JMGF replaces the PGSA's unilateral military checkpoints with **Joint Transit Coordination Centers (JTCCs)** at three locations: Bandar Abbas (Iranian side, leveraging the existing PGSA headquarters), Khasab (Omani side), and a floating coordination platform in international waters at the midpoint of the Strait. Each JTCC is staffed by personnel from all six JMGF members, wearing unified JMGF uniforms and operating under a common rules of engagement manual. The JTCCs do not stop, board, or search vessels. Their function is purely coordinative: they monitor AIS transponder data, coordinate naval patrol schedules, respond to distress calls, and manage the transit scheduling system described in Module 5.

Vessel vetting is transformed from a **political screening mechanism** into a **safety certification process**. Under the PGSA's current system, Iran unilaterally decides which vessels may transit based on nationality, cargo, and perceived political alignment — this is the "vetting" that the United States rejects. Under JMGF, all commercial vessels receive a **Universal Transit Certificate (UTC)** issued by the JMGF Secretariat in Muscat (physically separate from Iranian territory, to address U.S. concerns about Iranian data control). The UTC certifies three things only: that the vessel's registration and insurance are valid, that its cargo manifest does not include prohibited materials (weapons of mass destruction, sanctioned goods per UN Security Council resolutions), and that its AIS transponder is functional. The UTC does not discriminate based on flag state ownership, cargo type (oil, LNG, containers, bulk goods), or port of origin. Israeli-flagged vessels receive the same UTC as any other vessel, provided they meet the three neutral criteria.

Naval patrols in the Strait corridor are reorganized under the **Coordinated Patrol Architecture**. Rather than U.S./CENTCOM and Iranian naval forces operating independently in the same waterway — the configuration that produced the 4-7 May clashes — patrol sectors are formally assigned. Iranian naval forces patrol the northern half of the Strait corridor (Iranian territorial waters extending to the median line). Omani and Qatari forces patrol the southern half. A joint rapid-response task force, composed of units from all JMGF members and commanded on a rotating six-month basis, is stationed at the floating coordination platform for emergency intervention (piracy, collision, pollution incident, terrorism). U.S. naval forces operate as JMGF participants, not unilateral enforcers — a legal nuance that dramatically reduces the risk of Iranian-American direct confrontation while preserving American naval presence.

For President Trump, the JMGF eliminates the Iranian unilateral vetting system he has condemned. Vessel passage is determined by neutral criteria, not Iranian political preferences. U.S. naval forces operate under a formal multinational mandate rather than a unilateral blockade-breaking posture, reducing risk to American sailors. The United States

holds a permanent seat and veto-equivalent power through the supermajority voting rule. And the linkage to regional stability is explicit: the JMGF's success is a condition for broader agreement implementation, giving the United States ongoing leverage. For Iran, the JMGF preserves the PGSA as an institutional entity — upgraded, not abolished. Iran retains co-chairmanship of the governing body. Iranian personnel continue to operate the Bandar Abbas coordination center. And the principle of Iranian sovereign involvement in Strait governance is formally recognized in the founding treaty, a diplomatic achievement that no previous Iranian government has secured from the United States.

Implementation Mechanics

Day 1: Both parties sign the JMGF founding charter. Iran issues a decree rebranding the PGSA as the "PGSA-JMGF Joint Secretariat." The United States issues a parallel decree recognizing the JMGF as the legitimate transit authority for the Strait of Hormuz.

Day 3-7: Joint technical teams establish the three JTCCs. U.S. and Iranian naval commanders exchange direct communication hotlines. The Coordinated Patrol Architecture enters provisional operation.

Day 7-14: The Universal Transit Certificate system goes live. The JMGF Secretariat in Muscat begins issuing UTCs to all registered vessels. Commercial shipping resumes under the new framework.

Day 14-30: Full operational verification. Independent maritime monitors (Lloyd's List, BIMCO observers) confirm unrestricted transit. Third-party tanker traffic data confirms commercial volumes returning to pre-war levels.

Module 5: Transit "Security Fees" and Maritime Funding

The Issue

Iran and Oman are actively negotiating a permanent toll/fee system for commercial traffic traversing the Strait to fund regional security. President Trump explicitly rejected this at the White House, stating, "We don't want tolls." Iran views transit fees as legitimate compensation for providing security services in its territorial waters and as a sovereign revenue stream. The United States views any Iranian toll on international shipping as piracy under international law.

The ADEA Solution: The Multilateral Maritime Maintenance Fund (MMMF)

The Multilateral Maritime Maintenance Fund resolves the toll dispute by **restructuring unilateral Iranian fees into a transparent, internationally governed maintenance pool** that funds waterway safety services rather than Iranian state revenue. The MMMF is the economic engine of the Joint Maritime Governance Framework, providing the financial resources to operate the JTCCs, maintain navigational aids, fund the joint rapid-response task force, and compensate member states for their patrol costs — without transferring money to the Iranian government as toll revenue.

The MMMF operates through a simple, transparent mechanism. All commercial vessels transiting the Strait of Hormuz pay a **Strait Maintenance Contribution (SMC)** of 0.15 percent of cargo value, assessed and collected by the JMGF Secretariat in Muscat (not by Iranian authorities). The SMC is not a toll paid to Iran; it is a fee paid to an international body for specific, enumerated services: navigational safety (buoys, lights, channel maintenance), maritime security (joint patrols, piracy response), environmental protection (pollution monitoring, spill response), and administrative overhead (JMGF operations, UTC issuance, telemetry systems). The fee is comparable to the Suez Canal transit fee structure (0.2-0.5 percent of cargo value), but at the low end of that range to minimize commercial resistance.

The MMMF's revenue is distributed through a binding formula enshrined in the JMGF charter: **40 percent** funds joint operational costs (patrol fuel, maintenance, communications, rapid-response task force); **25 percent** is allocated to member states as cost-recovery for patrol contributions, distributed proportionally to days of patrol provided; **20 percent** funds a Maritime Safety Investment Pool for regional port infrastructure, search-and-rescue capability, and environmental protection; and **15 percent** covers JMGF Secretariat administrative costs. Iranian cost-recovery payments are calculated based on actual patrol days provided by Iranian naval forces — a performance-based metric that avoids the appearance of Iranian toll revenue while still compensating Iran for its legitimate security contributions.

For President Trump, the MMMF eliminates Iranian tolls as a sovereign revenue stream. No money flows directly to the Iranian government. The fee is collected by a neutral secretariat in Muscat. The fee rate (0.15 percent) is modest and commercially reasonable. And the United States receives cost-recovery payments for American naval patrol contributions, making the arrangement revenue-positive for the U.S. Treasury rather than a subsidy to Iran. Trump can truthfully state that he prevented Iran from imposing tolls on American shipping, and that the United States is being paid for its security contributions rather than

paying for Iranian cooperation. For Iran, the MMMF preserves the principle that transit through the Strait carries a cost-recovery obligation — a principle that Iran has never before secured from the United States. Iranian patrol contributions are recognized and compensated. Iran receives proportional representation on the fund's investment decisions through its JMGF co-chairmanship. And the long-term revenue stream, while indirect, is substantial: Iranian naval patrol cost-recovery at current deployment levels would generate approximately \$180-220 million annually, plus Iran's share of infrastructure investments in its ports.

Trump Carrot — Fee Structure Victory

- **No Iranian tolls:** The United States blocked Iran's unilateral fee system.
- **U.S. gets paid:** American naval patrols receive cost-recovery payments from the MMMF.
- **Transparent governance:** Fee collection and distribution are publicly auditable.
- **Commercial protection:** Low fee rate (0.15%) minimizes impact on U.S. energy prices.
- **Headline:** "Trump Ends Iranian Tolls, Secures U.S. Patrol Payments."

Module 6: Lifting the U.S. Naval Blockade

The Issue

CENTCOM continues to enforce a crippling naval blockade on Iranian ports, intercepting commercial vessels and tankers. On 6 May 2026, CENTCOM forces disabled an Iranian-flagged oil tanker in the Gulf of Oman. Iran considers this blockade a direct violation of the ceasefire spirit and a continuation of economic warfare by military means. The United States views the blockade as legitimate enforcement of sanctions and a pressure tool to compel Iranian nuclear concessions.

The ADEA Solution: Synchronized Reciprocal Withdrawal (SRW)

The Synchronized Reciprocal Withdrawal resolves the blockade dispute by making U.S. naval blockade suspension **directly contingent on verified Iranian maritime compliance**, with a precisely defined, non-negotiable sequencing that eliminates ambiguity and mutual suspicion. Rather than asking either side to act first on trust alone, SRW creates

a mechanical linkage: every verified Iranian withdrawal action triggers an automatic, proportionate American withdrawal action.

The SRW sequence operates on a **seven-day cycle**. **Day 1:** Iran withdraws all IRGC fast-attack craft (FAC) and missile boats from the Strait transit corridor to designated anchorage points inside Iranian territorial waters, verified by JMGF aerial surveillance. **Day 2:** Upon verification of IRGC withdrawal, U.S. Navy intercept operations outside the Strait corridor are suspended. Vessels heading to/from Iranian ports are not boarded or diverted. **Day 3:** Iran opens the Strait to all UTC-cleared commercial traffic, removing the de facto transit ban that has been in place since February 2026. **Day 4:** Upon confirmation of open transit (verified by third-party shipping data), the United States suspends all aerial surveillance and reconnaissance over Iranian territorial waters, confining military flights to international airspace. **Day 5:** Iran transfers operational control of the PGSA checkpoint infrastructure to the JMGF Joint Secretariat, completing the transition from unilateral to multilateral governance. **Day 6:** The United States withdraws the two carrier strike groups currently stationed in the Gulf of Oman to a holding position 200 nautical miles from the Strait mouth, reducing immediate strike capability while preserving rapid response. **Day 7:** Both parties jointly declare the Strait fully open and the blockade lifted. The JMGF assumes full operational authority.

This synchronized sequence is binding and automatic. Each step is verified by the JMGF technical monitoring team (including U.S. and Iranian observers plus neutral third-country personnel) before the next step triggers. If Iran fails to complete a step, the sequence pauses at that point — the United States does not proceed with its corresponding step, but it also does not reverse completed steps. The sequence is ratcheted forward, not subject to rollback over individual disputes. This protects both sides from being exploited for unilateral concessions while ensuring that genuine compliance produces genuine rewards.

For President Trump, SRW ensures that **Iran moves first and the United States verifies before responding**. American concessions are unlocked by Iranian actions, not promised in advance. The seven-day sequence is fast enough to produce visible results within Trump's compressed timeline, while the mechanical linkage prevents Iranian foot-dragging. The carrier withdrawal on Day 6 is a significant American military concession — but it only occurs after Iran has fully opened the Strait, meaning Trump can claim that he forced Iran to back down before reducing U.S. military posture. For Iran, SRW provides a clear, predictable pathway to blockade relief. Every Iranian step produces a visible American response within 24 hours. The sequence is symmetrical — both sides withdraw, both sides reduce — which supports Iran's narrative of a negotiated compromise rather than a dictated

surrender. And the Day 7 joint declaration means the blockade is not "lifted by Trump" but "lifted by mutual agreement," a crucial semantic distinction for Iranian domestic politics.

6. Part III: Economic Normalization and Guarantees — Modules 7-10

Module 7: Chronological Sequencing of Sanctions Relief

The Issue

Iran demands an immediate, blanket lifting of all secondary sanctions as the price of any nuclear agreement. The United States refuses to yield its primary economic leverage before total nuclear compliance is achieved. This sequencing dispute — who moves first, and how fast — has deadlocked every negotiation since 2018.

The ADEA Solution: Milestone-Triggered Cascading Release (MTCR)

The Milestone-Triggered Cascading Release resolves the sequencing dispute by **breaking sanctions relief into discrete, rapidly delivered tranches that are mechanically linked to specific, verifiable Iranian actions**. Rather than the all-or-nothing approach that has failed in every previous negotiation, MTCR delivers meaningful sanctions relief within days of signature, but conditions full normalization on a phased compliance pathway. This gives Iran the early economic relief it needs to halt currency collapse and rolling blackouts, while giving the United States the performance-gated structure it needs to maintain leverage.

MTCR operates through a **15-day micro-cycle system** with four tranches:

Table 3 MTCR Sanctions Relief Tranches

Tranche	Timing	Relief Content	Triggering Milestone
Tranche 1	Day 3	Humanitarian exemptions: food, medicine, medical equipment; agricultural inputs; civilian aviation safety parts	HEU declaration submitted; CCP implementation begun
Tranche 2	Day 7	Release of \$5B in frozen assets to Joint Sovereign Custody Escrow (Module 8); lifting of sanctions on Iranian petroleum sales to existing customers (China, India, Turkey)	HEU consolidated at Isfahan under IAEA seal; GES Tier 1 declared active

Tranche 3	Day 15	General License for non-sanctioned commercial trade; SWIFT virtual reconnection (Module 9); lifting of secondary sanctions on petrochemical exports	JMGF operational; Strait open to commercial traffic; DUIC conversion plans approved by IAEA
Tranche 4	Day 30	Full lifting of all secondary sanctions (oil, banking, shipping, insurance); release of remaining frozen assets from escrow to Iranian control; General License for foreign investment in Iran	All prior milestones sustained; no material breaches detected; IAEA issues comprehensive compliance certificate

The critical design feature of MTCR is its **irreversibility mechanism**. Each tranche, once triggered, cannot be reimposed for technical or minor compliance disputes. The only ground for reimposition is a "material breach" — defined in the agreement as: resumption of enrichment above agreed levels, removal of IAEA seals, attack on U.S. or allied forces, or material support for terrorist organizations resulting in casualties. Technical disagreements, procedural delays, or political rhetoric do not constitute material breach and do not trigger snapback. This irreversibility gives Iran the confidence to make early concessions (knowing that relief, once delivered, is secure) while preserving meaningful U.S. leverage over the most important tranches.

For Trump, MTCR delivers **performance-gated relief** — Iran must act before receiving each tranche. The 25 percent asset withholding that Trump demanded on 17 May is embedded in the escrow structure: 25 percent of all frozen assets remain in the Joint Sovereign Custody Escrow until Month 12, serving as a performance reserve that can be released early for exceptional compliance or retained in the event of disputes. The micro-cycle pace produces visible results every few days, allowing Trump to claim continuous progress. For Iran, MTCR delivers **immediate, tangible economic relief** — humanitarian trade opens within 72 hours, petroleum sales resume within a week, and the banking system reconnects within two weeks. The cascading structure means that Iran does not have to wait for full American trust to receive meaningful benefits; each step produces immediate returns.

Module 8: Liquidating and Shielding Frozen Assets

The Issue

Iran is demanding the immediate unfreezing of its sovereign assets worldwide — estimated at \$80-120 billion across multiple jurisdictions — to halt its current currency collapse and rolling blackouts. The United States requires ironclad performance reserves and fears that released funds will be diverted to military programs or proxy groups. Additionally, American court judgments against Iran (particularly the Peterson case and other terrorism-related judgments totaling over \$50 billion) create a legal risk that released assets could be seized by U.S. creditors.

The ADEA Solution: Joint Sovereign Custody Escrow (JSCE)

The Joint Sovereign Custody Escrow resolves the asset dispute by **moving frozen funds to a neutral jurisdiction under a tripartite control structure that protects the funds from both American judicial seizure and Iranian unilateral diversion**. The JSCE is the financial cornerstone of ADEA, modeled on the Framework for Reciprocal Stabilization's "Escrow for Peace" concept and refined with additional legal protections drawn from the Stability-First Enhanced Accord v5.7.

The JSCE operates as follows. All frozen Iranian assets — held in banks across China, Japan, South Korea, India, Iraq, Oman, and European jurisdictions — are transferred to a dedicated escrow account at the **Central Bank of Oman**, which serves as the escrow agent due to its neutrality, strong legal protections, and established role as a bilateral financial intermediary. The escrow account is governed by a **Tripartite Custody Agreement** among Iran (as beneficial owner), the United States (as sanctions releaser), and Oman (as escrow agent). Funds are released from escrow according to the MTCR schedule (Module 7), with each tranche requiring digital authorization from two of the three parties.

The critical legal protection is the **Sovereign Immunity Shield Protocol**. Under this protocol, all assets transferred to the JSCE are designated as "diplomatic escrow funds" protected by the escrow agent's sovereign immunity and by a UN Security Council resolution recognizing their protected status. This designation prevents seizure by American courts (or any other courts) under terrorism judgments, because escrow funds held by a neutral sovereign for diplomatic purposes are immune from attachment under the Foreign Sovereign Immunities Act and customary international law. The UN Security

Council resolution — which ADEA anticipates will be sponsored by China and Russia and supported by the United States as part of the package — provides an additional, politically powerful shield against creditor attachment.

Within the JSCE, funds are allocated to three sub-accounts: **Account A (75%)**: Released to Iranian government control per the MTCR schedule, for use in civilian economic reconstruction, infrastructure, and normal government operations. **Account B (25%)**: Held as a performance reserve until Month 12, released upon IAEA certification of sustained compliance, or retained in escrow if material breach occurs. This is the direct answer to Trump's 17 May precondition that at least 25% of assets be withheld. **Account C (Humanitarian)**: Immediately available for food, medicine, and agricultural imports, not subject to the two-of-three authorization requirement — these funds flow directly to approved vendors.

For Trump, the JSCE delivers exactly what he demanded: **25 percent of Iranian assets held in reserve**, unavailable to Iran until performance is verified. The assets are not "released" to Iran in a lump sum; they are "transferred to neutral custody" and released in controlled tranches. The Sovereign Immunity Shield Protocol protects the funds from American court seizure — a concession to Iran, but one that serves U.S. interests by preventing the assets from being tied up in litigation for decades rather than being used to stabilize Iran's economy and reduce regional instability. For Iran, the JSCE delivers what it needs: **immediate access to humanitarian funds**, a clear schedule for full release, and protection from the existential threat of American court seizure that has hung over every previous negotiation. The Central Bank of Oman is a friendly Islamic-country institution, not an American-controlled bank. And the 75/25 split gives Iran access to the vast majority of its own money within 30 days.

Trump Carrot — Asset Control

- **25% performance reserve held**: Exactly as Trump demanded on 17 May.
- **Two-of-three authorization**: U.S. holds a veto over fund releases.
- **No unilateral Iranian access**: Funds are in neutral custody, not Tehran's hands.
- **Litigation-proof**: UN resolution prevents decades of American court battles.
- **Headline**: "Trump Holds \$20B Hostage: Iran Gets Paid Only for Performance."

Module 9: SWIFT Reconnection and Banking Isolation

The Issue

Iran's total disconnection from the SWIFT interbank messaging system since 2018 has paralyzed its commercial sector. Iranian banks cannot process international payments, issue letters of credit, or receive remittances. This has created a cash-only economy for international trade, driving up transaction costs by 15-25 percent and making Iran dependent on opaque, high-risk payment channels through third-country banks. Reconnection to SWIFT is Iran's most urgent economic demand after sanctions relief itself.

The ADEA Solution: Phased Virtual Reintegration (PVR)

The Phased Virtual Reintegration resolves the SWIFT dispute by **creating a graduated, risk-managed pathway for Iranian banks to reconnect to the global financial system without granting immediate, unrestricted access**. PVR recognizes that full, instantaneous SWIFT reconnection would be politically impossible in Washington and risky from a compliance perspective, while maintaining Iran's total isolation is economically destabilizing and diplomatically counterproductive. The solution is a three-tier reintegration model that expands Iranian banking access as compliance milestones are sustained.

Tier 1 — Virtual Consolidation Window (Days 1-30): Rather than immediately reconnecting all Iranian banks to SWIFT, ADEA establishes a **single, designated Iranian "consolidation bank"** — the Bank of Oman-Iran Reconstruction Bank (a new entity jointly capitalized by the Central Bank of Oman and the Central Bank of Iran, with minority stakes from Qatar and Pakistan) — which receives limited SWIFT connectivity for a defined set of permitted transactions: humanitarian imports (food, medicine, medical equipment), petroleum sales to pre-approved customers (China, India, Turkey, Japan), and agricultural inputs. All transactions are pre-cleared by a compliance monitor (Deloitte or PwC, contracted to the JMGF) and screened against sanctions lists in real time. This "one-bank, limited-scope" model gives Iran functional SWIFT access for its most urgent trade within days, while keeping the vast majority of Iranian banks off SWIFT until compliance is verified.

Tier 2 — Graduated Institutional Reconnection (Months 2-12): Upon IAEA certification of sustained compliance at Month 3, a second tranche of Iranian banks — starting with privately owned banks with no IRGC ownership — receive SWIFT connectivity for general commercial trade. The compliance monitor continues to screen all transactions, and any bank found processing sanctioned transactions is immediately disconnected. By Month 6, if compliance remains clean, a third tranche (including smaller state-owned banks) is connected. By Month 12, all Iranian banks except those specifically designated for terrorism or proliferation involvement (a list agreed by both parties) are fully reconnected.

Tier 3 — Full Normalization (Month 12+): Upon the Month 12 comprehensive review, all remaining Iranian banks receive standard SWIFT connectivity. The compliance monitor transitions from a mandatory gatekeeper to an advisory auditor. Iranian banks are subject to the same SWIFT compliance standards as all other member banks — no special restrictions, but also no special exemptions.

For Trump, PVR ensures that **Iranian banks do not receive instant, unrestricted SWIFT access**. The phased model gives the United States multiple veto points: the compliance monitor can block individual transactions, the U.S. representative on the JMGF financial committee can freeze reconnection of subsequent tranches, and the terrorism-designated bank exclusion list permanently keeps problematic institutions isolated. The consolidation bank model means that U.S. intelligence and compliance personnel have visibility into virtually all Iranian international banking activity during the critical early months. For Iran, PVR delivers **functional SWIFT connectivity within days, not years**. The consolidation bank can process humanitarian and petroleum transactions immediately — the two trade categories that matter most for Iran's economic survival. The graduated timeline is predictable and binding, not subject to American political whims. And the Tier 3 full normalization endpoint gives Iranian banks a clear incentive to maintain clean compliance.

Module 10: War Reparations vs. Economic Reconstruction Credits

The Issue

Tehran formally requested U.S.-funded war reparations for infrastructure damage sustained since February 2026, including damage to nuclear facilities, military bases, civilian infrastructure, and economic losses from the blockade. The Trump administration flatly rejected the concept of reparations, viewing such payments as an admission of wrongdoing and a political impossibility with Congress and the American public. This impasse threatens to derail an otherwise achievable agreement over a framing issue.

The ADEA Solution: Regional Stability Reconstruction Credits (RSRC)

The Regional Stability Reconstruction Credits resolve the reparations dispute through a **pure reframing that preserves both sides' political requirements**. The substance — substantial American financial support for Iranian economic reconstruction — is preserved. The label — "reparations" versus "investment" — is replaced with a third term that both sides can accept. RSRC reframes the financial flow not as compensation for damage caused by U.S. military action (an American political impossibility) but as **American investment in regional stability that happens to fund reconstruction in Iran** (an Iranian economic necessity and an American strategic interest).

The RSRC mechanism operates through a **dedicated reconstruction investment fund** capitalized by the United States (\$5 billion initial contribution), the European Union (\$2 billion), Japan (\$1 billion), and South Korea (\$1 billion), for a total capitalization of \$9 billion. The fund is administered by the **Asian Development Bank** — a neutral multilateral institution headquartered in Manila — which issues reconstruction credits to Iranian entities for specific, enumerated civilian projects: power grid restoration, water treatment facilities, hospital reconstruction, port modernization, telecommunications infrastructure, and agricultural processing plants. Credits are not cash transfers to the Iranian government; they are project-specific financing disbursed directly to contractors and suppliers, with ADB oversight ensuring that funds are used for their designated civilian purposes.

The political framing is the critical innovation. The United States does not "pay reparations to Iran." The United States "contributes to the Regional Stability Fund to prevent state collapse and refugee flows that would threaten American allies." The fund's charter

explicitly states that its purpose is "regional stability through economic resilience," not "compensation for military action." This language allows Trump to tell Congress and the American people that he secured economic partnership, not reparations. Simultaneously, Iran receives \$9 billion in reconstruction financing that directly addresses war damage, channeled through projects that rebuild the exact infrastructure that was destroyed. Khamenei can tell the Iranian people that the "enemy was forced to pay for the damage it caused" — because functionally, that is what occurs, regardless of the legal label.

The RSRC includes a **proportional damage targeting provision**: the first \$3 billion in credits are allocated to provinces and facilities that suffered the heaviest damage during the conflict (Bushehr, Isfahan, Khuzestan, Tehran's southern industrial zones). This ensures that the reconstruction funding flows to the communities that experienced the war most directly, producing visible, tangible evidence of "American money rebuilding what American bombs destroyed" — a powerful political message in Iran, even if the legal framing avoids the word "reparations."

Trump Carrot — No Reparations, Real Investment

- **Zero reparations liability:** The United States does not acknowledge any legal obligation.
- **Regional stability framing:** The investment prevents Iranian state collapse and refugee crises.
- **Multilateral burden-sharing:** The EU, Japan, and Korea contribute 55% of the fund — not solely U.S. taxpayer money.
- **Project-specific controls:** Funds go directly to contractors, not Iranian government accounts.
- **Headline:** "Trump Brokers \$9B Regional Investment — Zero Reparations to Iran."

7. Part IV: Treaty Durability and Regional Architecture — Modules 11-15

Module 11: The 30-Day Negotiation Window and De-escalation Timeline

The Issue

The current ceasefire is highly fragile, with both sides trading sharp threats of resuming devastating kinetic attacks. President Trump has stated he will only give diplomacy "a few days" or "one shot," and on 20 May 2026 publicly warned that Iran has "two or three days" to reach a deal before renewed strikes commence. Iran's leadership, meanwhile, has threatened to expand the war beyond the Middle East if attacks resume. The temporary ceasefire of 8 April, extended indefinitely by Trump through Pakistani mediation, lacks structural resilience and could collapse from a single incident.

The ADEA Solution: The Letter of Intent with Auto-Escalation Brake (LI-AEB)

The LI-AEB resolves the timeline fragility by **transforming the unstable temporary halt into a binding 30-day negotiation timeline locked in via a mutual Letter of Intent, equipped with an automatic escalation brake that prevents either side from launching major attacks without a 72-hour cooling-off period.** This architecture addresses Trump's demand for speed while creating structural barriers to the rapid return to total war that both sides have threatened.

The **Letter of Intent** is a short, legally binding document (maximum two pages) signed by President Trump and Supreme Leader Khamenei (or their personally authorized representatives) on Day 1. It states four commitments: (1) Both parties commit to negotiate in good faith toward a Comprehensive Settlement Agreement over a 30-day period. (2) Neither party will initiate major kinetic military operations against the other during this 30-day period. (3) Both parties will implement the ADEA modules as agreed in the sequencing described in the Implementation Roadmap. (4) If either party believes the other has committed a material breach, it will issue a formal Breach Notification and observe a 72-hour Cooling-Off Period before any military response. The LI is registered with the UN

Secretary-General and publicly released, creating international political commitment that raises the domestic cost of unilateral abandonment.

The **Auto-Escalation Brake** is the critical safety mechanism. If either party issues a Breach Notification, the following sequence is automatically triggered: **Hour 0-6:** Breach Notification delivered to the other party, the JMGF Secretariat, and the UN Secretary-General. **Hour 6-24:** Emergency consultation among the Distributed Guarantor Matrix (Module 12) — Pakistan, Oman, Qatar, China, Russia — to verify the alleged breach and propose de-escalation measures. **Hour 24-72:** Mandatory cooling-off period. No major military operations permitted. Guarantor states engage in intensive shuttle diplomacy. **Hour 72+:** If the guarantors unanimously confirm a material breach and the breaching party refuses correction within 48 hours, the non-breaching party is released from its commitment and may resume military operations. If the guarantors do not unanimously confirm a breach, or if the breaching party corrects the violation within 48 hours, the 30-day period continues.

This architecture gives Trump the speed he demands — a 30-day binding timeline with visible progress every few days. It also gives him an exit ramp: if Iran materially breaches, the United States can strike within 72 hours with international legal cover from the guarantor verification process. For Iran, the LI-AEB provides protection against Trump's impulsive threats: the 72-hour cooling-off period means that even if Trump tweets an attack order at 3 AM, American military planners must observe the formal procedure, giving Iranian forces warning time and guarantor states intervention time. The mutual nature of the commitment — Iran is also bound not to attack — supports Iran's narrative of equal-status diplomacy rather than dictated terms.

Trump Carrot — Binding Timeline, Verified Exit

- **30-day hard deadline:** Iran must perform or face military consequences.
- **72-hour attack pathway:** If Iran cheats, verified breach triggers rapid U.S. response authority.
- **International legal cover:** Guarantor verification provides legitimacy for any necessary military action.
- **Speed:** Visible progress every 3-7 days, fitting Trump's political cycle.
- **Headline:** "Trump Gives Iran 30 Days — With a 72-Hour Trigger If They Cheat."

Module 12: Institutional Mediation and Guarantee Frameworks

The Issue

A profound trust deficit exists between Washington and Tehran. Neither country believes the other will honor a signed document. The United States points to Iran's history of concealing nuclear facilities (Natanz, Fordow, Arak) and its support for proxy groups that attack American personnel. Iran points to the U.S. unilateral withdrawal from the JCPOA in 2018 despite IAEA confirmation of Iranian compliance, the assassination of General Qasem Soleimani in 2020, and the assassination of former Supreme Leader Ali Khamenei in February 2026. Both sides need external guarantees that the other will perform — but neither trusts any single mediator to be neutral.

The ADEA Solution: The Distributed Guarantor Matrix (DGM)

The Distributed Guarantor Matrix resolves the trust deficit by **distributing guarantee functions across multiple mediators with different interests, preventing any single guarantor from controlling the process or biasing it toward either party**. Rather than relying on one mediator (Pakistan, which has its own interests; Oman, which is pro-Iranian; or the United States, which is a party to the conflict), DGM creates a multi-polar guarantee architecture where consensus among diverse guarantors is required for major decisions, ensuring that no single country's interests dominate.

The DGM comprises five tiers of guarantor, each with specific functions:

Table 4 Distributed Guarantor Matrix Structure

Tier	Members	Function	Decision Rule
Tier 1: Regional Mediators	Pakistan, Oman, Qatar	Day-to-day diplomatic facilitation, breach verification, shuttle diplomacy	Unanimous consensus required for breach confirmation
Tier 2: Global Powers	China, Russia	Political guarantees, UN Security Council action, economic backstopping	Either can block UNSC action; both must agree for positive guarantees

Tier 3: Economic Stakeholders	EU, Japan, South Korea, India	Sanctions implementation, investment commitments, trade facilitation	Majority vote for economic measures
Tier 4: Technical Verifiers	IAEA, UNMOVIC successor	Technical compliance verification, data collection, site inspections	Independent technical judgment; political override requires DGM consensus
Tier 5: Parliamentary Track	U.S. Congress, Iranian Majlis observers	Domestic ratification support, legislative implementation, transparency	Each parliament acts independently; coordination through joint committee

The DGM's critical innovation is the **breach verification protocol**. If either party alleges a material breach, the allegation is assessed by all five tiers in sequence. Tier 4 (IAEA) conducts the technical assessment first — did the alleged breach actually occur? Tier 1 (regional mediators) assesses intent and context — was the breach deliberate, or a technical misunderstanding? Tier 2 (global powers) assesses geopolitical implications — would confirming the breach destabilize the broader agreement? Only if all three assessment tiers reach affirmative conclusions is a breach formally confirmed and the auto-escalation brake (Module 11) activated. This multi-layered verification prevents either side from manufacturing a breach pretext to abandon the agreement, while ensuring that genuine breaches are caught and addressed.

For Trump, the DGM provides **multilateral legitimacy** for any necessary military action: if Iran breaches and the DGM confirms it, the United States is not acting unilaterally but enforcing a multilateral agreement. The inclusion of China and Russia as guarantors means that those powers have a vested interest in Iranian compliance — they cannot blame the United States for a collapse that their own representatives verified. For Iran, the DGM provides **protection against American unilateralism**: the United States cannot declare a breach and attack without going through a multi-tier verification process that includes Iranian-friendly states (Pakistan, Oman, Qatar, Russia). The DGM effectively creates a diplomatic speed bump that prevents impulsive military escalation by either side.

Module 13: Internal Regime Fractures and Human-in-the-Loop Governance

The Issue

Top U.S. officials have highlighted intense ideological fractures within Tehran's leadership regarding potential nuclear compromises. These internal rifts mean that automated deal triggers — where technical compliance breaches automatically produce sanctions or military consequences — could easily be derailed by political hardliners who oppose the deal and may deliberately create minor infractions to sabotage it. Similarly, American hardliners in Congress or the national security bureaucracy might exploit minor Iranian violations to demand total collapse. Purely automated compliance architectures are politically fragile in environments where internal actors may benefit from deal failure.

The ADEA Solution: The Procedural Step-Back Protocol (PSBP)

The Procedural Step-Back Protocol resolves the governance fragility by **inserting human political judgment into the compliance response chain, allowing leaders to exercise strategic discretion rather than being bound to catastrophic automated escalations**. The PSBP does not eliminate consequences for material breaches — it preserves them. What it eliminates is the automaticity of response to ambiguous or minor violations, creating space for political leaders to de-escalate technical disputes before they become existential crises.

The PSBP operates through a **three-tier dispute classification system**:

Class A — Technical Discrepancy: Minor issues that do not affect the substance of compliance: reporting delays of less than 48 hours, minor telemetry gaps due to equipment malfunction, procedural deviations corrected within 72 hours. Class A discrepancies trigger automatic technical consultation between IAEA monitors and Iranian technical staff. No political consequences. No sanctions implications. The issue is logged and resolved at the working level.

Class B — Procedural Non-Compliance: Issues that indicate potential compliance problems but do not constitute material breach: failure to meet a milestone deadline by more than 7 days, restriction of IAEA inspector access (later restored), movement of

declared equipment without pre-notification. Class B non-compliance triggers the **Step-Back Procedure**: both parties must send senior officials (Deputy Foreign Minister level or equivalent) to meet within 72 hours, either in Oman or by secure video. The meeting's purpose is not to assign blame but to identify the political obstacle and develop a corrective plan. If the corrective plan is agreed and implemented within 14 days, the non-compliance is formally resolved with no consequences. If the plan is not agreed or not implemented, the Class B escalates to Class C.

Class C — Material Breach: Actions that fundamentally undermine the agreement: resumption of enrichment above agreed levels, removal of IAEA seals, attack on U.S. or allied forces, material support for terrorism resulting in casualties, closure of the Strait to international shipping. Class C breaches trigger the full Auto-Escalation Brake (Module 11): Breach Notification, 72-hour cooling-off, guarantor verification, and potential release from commitment. Material breach is the only category that can lead to military response or sanctions snapback.

The critical feature of PSBP is the **Strategic Discretion Window**. Even when a Class C material breach is technically confirmed, both the U.S. President and the Iranian Supreme Leader retain a 48-hour window to issue a **Political Step-Back Order** — a formal declaration that, despite the technical breach, they choose to continue negotiations rather than escalate to military confrontation. The Step-Back Order does not erase the breach; it pauses consequences to allow political resolution. Each side may issue a maximum of two Step-Back Orders per year, preventing abuse while preserving genuine emergency de-escalation capacity. This mechanism directly addresses the concern that hardline factions in either capital might trigger a war neither leader wants.

For Trump, the PSBP provides **escalation control without escalation weakness**. The automatic Class C pathway ensures that Iran faces military consequences for genuine cheating. The Step-Back Order ensures that Trump — and only Trump — decides whether America goes to war, not a technical monitoring system and not bureaucratic hardliners. Trump can tell voters that he holds the trigger, not some UN bureaucrat. For Iran, the PSBP provides **protection against American technical entrapment**: a minor Iranian reporting delay cannot be exploited by American hawks as a pretext for war, because it falls into Class A or Class B with political resolution pathways. The Supreme Leader retains ultimate authority over Iranian escalation decisions, preserving regime stability.

Module 14: Drone and Missile Program Reconstitution

The Issue

Intelligence reports indicate Iran is rapidly using the ceasefire window to reconstitute its drone and missile industrial base, which suffered significant damage during Operation Epic Fury and subsequent strikes. The United States wants strict limitations on Iran's missile program, which it views as the delivery system for any future nuclear weapon and as a threat to regional allies (Israel, Saudi Arabia, UAE). Iran has previously declared its missile program "not up for negotiation," viewing it as a sovereign defensive capability essential for deterrence against American and Israeli military superiority.

The ADEA Solution: Deployment Freeze with Industrial Grandfathering (DFIG)

The Deployment Freeze with Industrial Grandfathering resolves the missile dispute through a **deliberate sequencing strategy that defers heavy ballistic limitations to a later, mature dialogue stage while implementing an immediate, verifiable pause on offensive deployment and cross-border transfers**. DFIG recognizes that attempting to resolve the missile file simultaneously with the nuclear file creates an agreement so complex that it will collapse under its own weight. Instead, DFIG creates a confidence-building pause that stabilizes the immediate threat while preserving the diplomatic track for later comprehensive resolution.

DFIG has two components. The **Deployment Freeze** is an immediate, binding commitment: Iran freezes all deployment of medium-range ballistic missiles (MRBMs, defined as 1,000-3,000 km range) to launch sites targeting U.S. military bases, Israel, Saudi Arabia, and the UAE. missiles currently deployed to such sites are moved to designated storage facilities under IAEA/JMGF satellite monitoring. Short-range missiles (under 1,000 km) for territorial defense remain fully unrestricted. New MRBM production is paused for 12 months. Cross-border transfers of drones and missiles to non-state actors (the Houthis, militias in Iraq, Hezbollah) are suspended under the same 12-month pause. In exchange, the United States freezes all offensive military operations targeting Iranian missile production facilities for the same 12-month period.

The **Industrial Grandfathering** component protects Iran's long-term industrial base: existing missile production facilities are not destroyed, not converted, and not placed under

IAEA seal. They continue to operate at maintenance levels, producing replacement parts for existing inventories and conducting research and development on defensive missile systems (anti-aircraft, anti-ship, short-range precision strike). This preserves Iran's scientific workforce, its industrial capacity, and its deterrent posture against conventional attack — addressing the core Iranian concern that missile limitations would leave Iran defenseless against American military superiority. The grandfathering is time-limited to 12 months, after which a dedicated missile dialogue is convened to negotiate long-term parameters.

For Trump, the DFIG delivers an **immediate, verifiable cessation of the most threatening Iranian missile activities**: no MRBM deployments to sites targeting Israel and American bases, no drone deliveries to militias that attack U.S. personnel, no new production for 12 months. The satellite monitoring of storage facilities provides visible, real-time verification that Iran is not cheating. And the 12-month timeline creates a diplomatic window for the comprehensive missile agreement that the United States ultimately seeks. For Iran, the DFIG preserves **full sovereignty over its missile program in principle** — no permanent limits are accepted. The production freeze is just that, a freeze, not dismantlement. The industrial base remains intact. And the deferral of heavy ballistic limitations to a later dialogue means that Iran negotiates those limits from a position of strength, after economic recovery and diplomatic normalization, not from a position of wartime weakness.

Trump Carrot — Missile Pause, Verified

- **No Iranian MRBMs targeting Israel or U.S. bases:** Immediate threat reduction.
- **No drone deliveries to militias:** Reduced attacks on American personnel.
- **Satellite-verified storage:** Real-time confirmation of Iranian compliance.
- **12-month pathway to comprehensive limits:** Diplomatic track preserved.
- **Headline:** "Trump Freezes Iran's Missile Threat — Without Destroying a Single Factory."

Module 15: Systemic Agrifood Shocks and Global Stabilization

The Issue

The prolonged closure of the Strait of Hormuz has choked off a third of the world's fertilizer supply — particularly ammonia and urea shipments from Qatar, Saudi Arabia, and the UAE to Asian, African, and European agricultural markets. The UN Food and Agriculture Organization has warned of a systemic global agrifood crisis if the Strait does not reopen within weeks, predicting food price spikes of 30-50 percent in import-dependent developing countries and potential famine conditions in the Horn of Africa and South Asia. This humanitarian dimension is politically explosive: a global food crisis triggered by the Iran war would generate massive anti-American sentiment in the Global South and destabilize allied governments from Egypt to Indonesia.

The ADEA Solution: Humanitarian Supply Line Firewall (HSLF)

The Humanitarian Supply Line Firewall resolves the agrifood crisis by **separating global humanitarian supply lines from the underlying political dispute, granting immediate safe passage to agricultural shipping regardless of the broader treaty timeline**. HSLF operates on a simple principle: food and fertilizer are not bargaining chips. Even if the comprehensive political settlement fails, the world cannot afford a famine triggered by diplomatic deadlock.

HSLF creates a dedicated **Humanitarian Transit Corridor (HTC)** within the Strait of Hormuz, physically separated from general commercial traffic and operating under a simplified, pre-cleared protocol. Vessels carrying FAO-certified humanitarian cargoes — defined as food grains (wheat, rice, corn, soybeans), fertilizers (urea, ammonia, phosphate), and agricultural inputs (seeds, pesticides, irrigation equipment) — receive a **Humanitarian Transit Certificate (HTC)** from the FAO Liaison Office in Dubai, not from the JMFG or any Iranian authority. The HTC certifies only cargo type and humanitarian destination; it does not assess political factors. HTC-carrying vessels transit the Strait under JMFG naval escort (mixed Iranian-Omani-American patrol) with priority routing, guaranteed passage within 24 hours of arrival at the corridor entry point, and exemption from all SMC fees (Module 5).

The HSLF includes an **emergency stock release mechanism**. Qatar, Saudi Arabia, and the UAE — which have accumulated significant fertilizer stockpiles during the export halt —

immediately release 2 million metric tons of urea and ammonia to FAO-coordinated distribution for sub-Saharan Africa and South Asia. This release is financed by a \$500 million emergency facility at the Islamic Development Bank, capitalized by Saudi Arabia (\$200 million), the UAE (\$150 million), and the United States (\$150 million). The emergency release provides a 60-day buffer while regular fertilizer shipments resume through the HTC.

For Trump, the HSLF neutralizes a major political liability: **the United States cannot be blamed for a global food crisis**. By sponsoring the humanitarian corridor and contributing to the emergency facility, Trump positions himself as a humanitarian leader, not a sanctions enforcer indifferent to famine. The HSLF also generates goodwill from critically important Global South countries — India, Indonesia, Egypt, Nigeria, Brazil — that would otherwise blame American Iran policy for their food price spikes. For Iran, the HSLF provides **diplomatic protection from humanitarian criticism**: Iran cannot be accused of blocking food shipments to starving populations, because the humanitarian corridor operates under JMGF (not solely Iranian) authority and with Iranian naval participation. The HSLF also creates an immediate, visible benefit of cooperation that builds public support for the broader agreement in both countries.

Trump Carrot — Humanitarian Leadership

- **Prevents global food crisis:** Famine in Africa and Asia would be a political catastrophe.
- **U.S. leads emergency response:** American contribution generates Global South goodwill.
- **Iran cannot weaponize food:** Humanitarian corridor operates independently of political disputes.
- **Moral high ground:** Trump positioned as deal-maker who prevented famine.
- **Headline:** "Trump Opens Humanitarian Corridor, Prevents Global Famine."

8. Implementation Roadmap

The ADEA modules are designed for synchronized implementation over a 30-day timeline, with specific triggers, milestones, and verification points. This section provides the master schedule that integrates all fifteen modules into a coherent operational sequence.

Table 5 ADEA 30-Day Master Implementation Schedule

Day	Nuclear (Modules 1-3)	Maritime (Modules 4-6)	Economic (Modules 7-10)	Durability (Modules 11-15)
1	HEU declaration submitted to IAEA	JMGF charter signed; PGSA rebranded	MTCR Tranche 1 authorized	Letter of Intent signed; 30-day clock starts
2	IAEA rapid verification team deploys	JTCCs established at Bandar Abbas, Khasab	Humanitarian trade licenses issued	DGM operational; guarantor consultations begin
3	HEU consolidation transport begins	Coordinated Patrol Architecture provisional	Tranche 1 active: food, medicine imports resume	HSLF Humanitarian Transit Corridor opens
7	HEU consolidated at Isfahan; IAEA seal applied	IRGC FAC withdrawal to territorial waters verified	Tranche 2: \$5B to JSCE; petroleum sales resume	First guarantor verification report issued
10	Centrifuge disablement begins at Fordow, Natanz	U.S. intercept operations suspended	SWIFT Tier 1: consolidation bank connected	Class A/B dispute log established
14	CCP cryptographic seals active; telemetry live	Universal Transit Certificate system operational	JSCE Account A releases first \$3B to Iran	Midpoint guarantor summit in Muscat
15	GES Tier 1 certified active by IAEA	Strait commercial transit resumes	Tranche 3: SWIFT expanded; petrochemical exports	Emergency fertilizer release distributed
20	DUIC conversion plans approved by IAEA	Coordinated Patrol Architecture fully operational	RSRC first project credits approved	Deployment Freeze verified by satellite

25	Fordow medical isotope installation begins	Joint rapid-response task force operational	JSCE Account A releases second \$3B	Class B Step-Back procedures tested
30	IAEA comprehensive compliance certificate	JMGF assumes full operational authority	Tranche 4: full secondary sanctions lifted	30-day review summit; pathway to CSA agreed

The 30-day schedule is aggressive but achievable. It compresses into one month what previous agreements took years to negotiate, reflecting the political reality that President Trump will not tolerate a prolonged process and that Iran's economy cannot survive additional months of blockade. The schedule is also realistic: every action on Day X is triggered by a verified action on Day X-1, creating mechanical forward momentum that does not require trust or good faith — only verification.

After Day 30, ADEA transitions into the **Comprehensive Settlement Agreement (CSA)** negotiation phase. The 30-day period produces a "Framework Agreement" that locks in all ADEA modules as binding commitments. The CSA, negotiated over the subsequent 6-12 months, transforms the framework into a permanent treaty with full legal status, ratification procedures, and long-term institutional structures. This two-phase approach — 30-day framework, 12-month comprehensive treaty — gives Trump his quick win while building the durable architecture that prevents the next crisis.

9. Headline Wins: The Political Packaging

ADEA is designed to produce political victories for both leaders that can be communicated to domestic audiences in simple, powerful terms. This section provides the messaging framework that each side can use to claim success — all of which are factually grounded in the agreement's provisions.

President Trump's Wins

1. Full HEU Control Without Invasion

Every gram of Iran's 400 kg highly enriched uranium stockpile is consolidated to a single facility, sealed with cryptographic locks, monitored by American technical personnel in real time, and rendered unusable for weapons. The United States achieved complete material accountability without a ground invasion that would have cost thousands of American lives.

2. One Facility, Not Five

Iran's nuclear complex is reduced from five operational facilities to one. Fordow makes cancer medicine. Natanz trains students. Isfahan stores sealed material. The underground bunkers that threatened Israel and American bases are permanently converted to civilian use. This is the facility consolidation Trump demanded.

3. 12-Year Total Enrichment Freeze

Iran will not enrich a single atom of uranium for 12 years. Not to 3 percent, not to 1 percent — zero enrichment for 12 years. After that, enrichment is capped at levels far below weapons-grade. This is the longest, deepest enrichment freeze in history.

4. Strait Open, No Iranian Tolls

Iran's unilateral toll system is dead. The PGSA is replaced by a U.S.-participating international authority. American naval patrols are paid for their contributions. Israeli ships sail freely. Iranian fast-attack boats are withdrawn. The Strait belongs to the world, not to Tehran.

5. \$20 Billion Performance Hostage

Twenty-five percent of Iran's frozen assets — approximately \$20 billion — remain in neutral escrow as a performance reserve. Iran gets paid only for verified compliance. If Iran cheats, America holds the money. This is the leverage Trump demanded.

6. Zero Reparations

The United States pays not one dollar in reparations to Iran. American reconstruction contributions are framed as regional stability investment, administered by a multilateral development bank, with project-specific controls that prevent Iranian government diversion. This is partnership, not capitulation.

7. Missiles Frozen, Drones Grounded

Iran's medium-range ballistic missiles are withdrawn from launch sites targeting Israel and American bases and placed in monitored storage. Drone deliveries to militias that kill Americans are suspended. This is an immediate, verifiable threat reduction that saves American lives.

8. Global Famine Prevented

President Trump opened a humanitarian corridor through the Strait of Hormuz, preventing a global food crisis that would have killed hundreds of thousands in Africa and Asia. American leadership averted famine while negotiating peace.

Supreme Leader Khamenei's Wins

1. HEU Never Leaves Iranian Soil

Iran's highly enriched uranium remains on Iranian territory, in an Iranian facility, guarded by Iranian forces. The IAEA provides technical monitoring, but Iran holds a key share and retains sovereign control. The enemies of Iran demanded surrender of our nuclear material; they failed.

2. Enrichment Right Preserved

Iran's right to enrich uranium is formally recognized in an international agreement. The suspension is temporary — 12 years, not 20. Enrichment resumes thereafter at civilian levels. No previous Iranian government has secured international recognition of this right from the United States.

3. Infrastructure Converted, Not Destroyed

Fordow, Natanz, Isfahan — Iran's nuclear facilities are not bombed, not demolished, but upgraded into medical isotope centers, research campuses, and training institutes. Iranian scientists remain employed. Iranian engineering prowess is showcased to the world. This is victory, not surrender.

4. PGSA Upgraded, Not Abolished

The Persian Gulf Strait Authority is not dismantled; it is elevated into an international body with Iranian co-chairmanship. Iran's role in governing the Strait is formally recognized by the United States for the first time in history. Iranian personnel continue to operate from Bandar Abbas. This is sovereignty defended.

5. Sanctions Lifted in Binding Tranches

All secondary sanctions are lifted within 30 days, in a binding schedule that cannot be reversed for political reasons. Iran's oil, banking, shipping, and petrochemical sectors reconnect to the global economy. This is not a promise; it is a contractual obligation.

6. Frozen Assets Secured from American Courts

Iran's sovereign assets are moved to a neutral Islamic-country escrow, protected by UN Security Council resolution from American court seizure. Seventy-five percent of our money returns to Iranian control. The nightmare of Peterson and other judgments is ended.

7. \$9 Billion in Reconstruction Financing

The enemies of Iran are financing the rebuilding of Bushehr, Isfahan, and Khuzestan through a \$9 billion regional investment fund. American, European, Japanese, and Korean money will reconstruct what American bombs destroyed. This is justice without the name.

8. Missile Program Intact

Iran's missile production facilities are not destroyed, not sealed, not inspected. They continue to operate at maintenance levels, preserving our deterrent capability. The deployment pause is temporary — 12 months — and our industrial base remains ready to defend the nation.

The Shared Victory

Beyond the competing domestic narratives, ADEA produces one shared victory that both leaders can claim: **war was avoided and peace was secured through diplomacy**. For Trump, this validates his self-image as the ultimate deal-maker — the president who achieved what Obama could not, through strength and negotiation rather than endless war. For Khamenei, this validates his claim that the Islamic Republic can stand up to American pressure, defend its red lines, and emerge with dignity intact. Both men need this deal. ADEA gives each of them the political architecture to say yes.

10. Appendix: Cross-Reference Matrix

This appendix maps each ADEA module to its conceptual origins in the six bilateral frameworks that preceded it, and to the specific Trump precondition or Iranian red line that it addresses.

Table 6 Module-to-Framework Cross-Reference

ADEA Module	Primary Source Framework	Secondary Sources	Trump Precondition Addressed	Iranian Red Line Protected
Module 1 (CCP)	Reciprocal Opening Window v1.1 (Custody Exchange)	FRS v3.2 (Escrow for Peace), Stability-First v5.7	#1: HEU transfer to U.S.	HEU remains on Iranian soil
Module 2 (GES)	CBSF v16.2 (Multi-Phased Implementation)	FRS v3.2 (Cascading Releases)	#2: One operational facility	Right to enrich preserved
Module 3 (DUIC)	Framework for Reciprocal Stabilization v3.2 (Sanctuary Protocol)	The Final Steps Accord (Joint Facility)	#2: Facility consolidation	Infrastructure preserved
Module 4 (JMGE)	Hormuz-First v2.4 (Safe Passage)	CRESCENT COMPACT v1.1	#3: Hostility linkage	Sovereign role in Strait governance
Module 5 (MMMF)	Hormuz-First v2.4 (Multilateral Fund)	CBSF v16.2 (Revenue-Positive)	#3: No unilateral restrictions	Compensation for security services
Module 6 (SRW)	Reciprocal Opening Window v1.1 (Synchronized Drawdown)	Stability-First v5.7	#3: Cessation of hostilities	Reciprocal, not unilateral, withdrawal
Module 7 (MTCR)	CBSF v16.2 (Cascading Releases)	FRS v3.2 (Reciprocal Opening)	#4: 25% asset withholding	Binding, not discretionary, relief
Module 8 (JSCE)	Framework for Reciprocal Stabilization v3.2 (Escrow for Peace)	Stability-First v5.7 (Legalistic Architecture)	#4: Performance reserve	Protection from U.S. court seizure

Module 9 (PVR)	Stability-First v5.7 (Phased Reintegration)	CBSF v16.2	Banking oversight	Functional connectivity within days
Module 10 (RSRC)	CRESCENT COMPACT v1.1 (Regional Investment)	Hormuz-First v2.4 (Gulf Safety Net)	#5: No reparations	Substantial reconstruction financing
Module 11 (LI-AEB)	Reciprocal Opening Window v1.1 (Letter of Intent)	Stability-First v5.7	Speed of agreement	Protection from impulsive attack
Module 12 (DGM)	The Final Steps Accord (Guarantor Framework)	CRESCENT COMPACT v1.1	Multilateral legitimacy	Protection from unilateral U.S. action
Module 13 (PSBP)	Framework for Reciprocal Stabilization v3.2 (Human-in-the-Loop)	CBSF v16.2 (Step-Back Protocol)	Escalation control	Protection from technical entrapment
Module 14 (DFIG)	Hormuz-First v2.4 (Deployment Freeze)	The Final Steps Accord	Missile threat reduction	Missile sovereignty preserved
Module 15 (HSLF)	CRESCENT COMPACT v1.1 (Humanitarian Corridor)	Hormuz-First v2.4	Global stability	Humanitarian protection from political disputes

Table 7 Abbreviations and Defined Terms

Abbreviation	Full Term	Definition
ADEA	Adaptive De-Escalation Architecture	This comprehensive framework document
CCP	Consolidated Custody Protocol	Module 1 HEU containment mechanism
GES	Graduated Enrichment Suspension	Module 2 sliding-scale enrichment moratorium
DUIC	Dual-Use Infrastructure Conversion	Module 3 facility repurposing program
JMGF	Joint Maritime Governance Framework	Module 4 multilateral Strait authority
MMMF	Multilateral Maritime Maintenance Fund	Module 5 transparent fee system
SRW	Synchronized Reciprocal Withdrawal	Module 6 blockade lifting sequence

MTCR	Milestone-Triggered Cascading Release	Module 7 sanctions relief sequencing
JSCE	Joint Sovereign Custody Escrow	Module 8 frozen assets mechanism
PVR	Phased Virtual Reintegration	Module 9 SWIFT reconnection model
RSRC	Regional Stability Reconstruction Credits	Module 10 reconstruction financing
LI-AEB	Letter of Intent with Auto-Escalation Brake	Module 11 timeline and safety mechanism
DGM	Distributed Guarantor Matrix	Module 12 multi-polar guarantee system
PSBP	Procedural Step-Back Protocol	Module 13 human-in-the-loop governance
DFIG	Deployment Freeze with Industrial Grandfathering	Module 14 missile confidence-building
HSLF	Humanitarian Supply Line Firewall	Module 15 agrifood emergency mechanism
PGSA	Persian Gulf Strait Authority	Iranian unilateral Strait authority, integrated into JMGF
HEU	Highly Enriched Uranium	Uranium enriched to 60% purity in Iran's stockpile
IAEA	International Atomic Energy Agency	UN nuclear watchdog and technical verification body
JTCC	Joint Transit Coordination Center	Operational node of the JMGF
UTC	Universal Transit Certificate	JMGF vessel transit authorization
HTC	Humanitarian Transit Certificate	FAO emergency cargo authorization
SMC	Strait Maintenance Contribution	MMMF transit fee (0.15% of cargo value)
CSA	Comprehensive Settlement Agreement	Permanent treaty to follow the 30-day framework

End of Document

Adaptive De-Escalation Architecture (ADEA) — 22 May 2026

This document is a diplomatic draft for negotiation purposes.
