Preamble: Purpose and Modular Architecture

THE EMERGENCY CONTEXT. As of 22 May 2026, the United States and the Islamic Republic of Iran stand at the absolute edge of renewed large-scale military confrontation. President Trump, speaking through Secretary Rubio and the White House on 17 May and again on 21 May, has narrowed US demands to two operational imperatives: (1) the physical extraction of Iran's entire 400 kg HEU stockpile from Iranian territory for ultimate destruction, with a concurrent twenty-year enrichment moratorium and single-facility limitation; and (2) absolute freedom of navigation through the Strait of Hormuz without any PGSA tolling, data registration, or fee collection system. The blockade remains active until these conditions are executed. No more than 25% of frozen assets are available for short-term release, and no war compensation is on the table.

Iran, for its part, maintains five sovereign red lines: the HEU must not leave Iran's sovereign control; enrichment rights under NPT Article IV are non-negotiable; secondary sanctions must be fully lifted; the PGSA represents legitimate Iranian maritime authority; and ballistic missile limitations are off the nuclear table.

THE MODULAR ARCHITECTURE. This Security and Prosperity Framework departs from all prior comprehensive treaty structures. It offers fifteen issues, each with three distinct modular solutions (A, B, C), creating 45 building blocks that can be mixed, matched, and adapted. Each Party selects one solution per issue, constructing a bespoke agreement that reflects its own priorities. The Framework operates on a non-symmetrical sequencing architecture: no fixed rule governs who moves first, which concessions match, or how verification is structured. Every module carries its own trigger, timeline, and verification mechanism.

Core Principles of Non-Symmetrical Movement

Principle 1: Variable First-Mover. No fixed rule governs which side initiates action. Some modules require Iran to act before the US responds. Others require the US to release before Iran delivers. Still others operate on simultaneous activation. The pattern is deliberately irregular.

Principle 2: Dissimilar Concessions. Concessions are not designed to match in kind, scale, or timing. Iran may deliver a nuclear constraint on Day 1; the US may deliver banking relief on Day 7; Iran may open maritime transit on Day 14; the US may release assets on Day 30. Each concession is calibrated to its own logic.

Principle 3: Asymmetric Verification. Nuclear verification is IAEA-led and continuous. Maritime verification is Omani-led with dual observation. Financial verification is Swiss-led with single-point transparency. Political verification is UN-led with distributed reporting. Each domain has its own architecture.

Principle 4: Modular Collapse Isolation. Failure in one module does not cascade. The Framework continues executing all other selected modules. Maritime disputes cannot terminate humanitarian channels. Nuclear verification gaps do not affect Hormuz transit.

Three Emergency Off-Ramps

Off-Ramp Alpha: The 72-Hour Auto-Renewing Security Freeze

The ceasefire operates as a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews. Only a written 48-hour notice of non-renewal from either Party can terminate the freeze. This off-ramp survives total Agreement collapse and operates independently of all other modules.

Off-Ramp Beta: The Humanitarian Firewall

The humanitarian corridor through the Strait of Hormuz operates at zero cost, with zero inspection delay, for all vessels carrying WHO-verified humanitarian cargo. This corridor continues regardless of any dispute, breach, suspension, or total Agreement collapse. It is legally non-divertible. The UN OCHA/WHO administrator holds sole disbursement authority.

Off-Ramp Gamma: The Emergency Reconstitution Protocol

If the Agreement enters full suspension, both Parties commit to attend a Reconstitution Conference within 14 days, hosted by Oman. Either Party's refusal triggers automatic UN Security Council convening under Chapter VII. The Conference has a single agenda: restoration of minimum viable core (ceasefire + humanitarian corridor + IAEA baseline monitoring). A \$50M escrow, pre-funded by both Parties at signature, finances the Conference regardless of dispute status.

Part I: Nuclear Stabilization

Issue 1: HEU Stockpile — Physical Extraction vs. Sovereign Retention

Problem: Trump demands complete physical extraction of Iran's 400 kg HEU for ultimate US-controlled destruction. Khamenei has issued a strict directive that HEU must remain on Iranian soil. These are constitutionally irreconcilable positions.

Solution A: Sovereign Guarded Transfer to Islamic Custody (SGTIC)

The HEU is transferred by Iranian military aircraft, escorted by Iranian Revolutionary Guard, to a new Islamic Nuclear Materials Custody Facility (INMCF) in Oman. Iran retains physical key access and 1/3 voting power on the Custody Council (Iran, Oman, IAEA). The US receives real-time telemetry but no direct custody. The material is out of Iran physically — satisfying Trump's extraction demand — but remains under Iranian co-sovereignty, satisfying Khamenei's red line. The HEU is downblended to LEU over 180 days under joint observation, then transferred to Kazakhstan's IAEA LEU Bank. *Trump wins:* material physically leaves Iran and is destroyed. *Iran wins:* material never enters US hands; Iranian guards escort; Iran holds keys.

Solution B: Staged Verified Annihilation (SVA)

The HEU is destroyed in-place at Isfahan under live international observation (Omani monitors, IAEA inspectors, TV broadcast). Within 30 days, the 400 kg is downblended to medical-grade LEU on Iranian soil. The resulting 2,400 kg of LEU is then transferred to the IAEA LEU Bank in Oskemen, Kazakhstan. The "extraction" is of *destroyed material* — not weapons-grade HEU. Trump gets: verified destruction of weapons-capable material and physical transfer of remaining LEU out of Iran. Iran gets: material never enters US possession; destruction occurs on Iranian terms; resulting LEU goes to neutral IAEA facility, not the US. The SVA operates on a 30-day clock with daily IAEA mass spectrometry verification.

Solution C: Tri-National Custody with Conditional Destruction (TNC-CD)

The HEU is transported to a facility in Qatar under a tri-national custody arrangement: US holds digital monitoring keys, Iran holds physical security keys, Qatar holds procedural arbitration keys. All three keys are required for any access. The HEU remains in this facility for 12 months while a Joint Destruction Commission determines the optimal disposition pathway (downblending, reactor fuel conversion, or LEU bank transfer). If no decision is reached by Month 12, the material is automatically downblended under IAEA authority. Iran maintains a blocking minority on the Commission; the US and Qatar together cannot force disposition without Iranian participation. *Variable sequencing*: Iran initiates transport (moves first); Qatar activates facility (second); US connects telemetry (third).

Issue 2 — Enrichment Cap and Moratorium Timeline

Problem: *The US demands a 20-year zero-enrichment moratorium. Iran has countered with a maximum 5-year suspension. Neither position is domestically survivable.*

Solution A: Sovereign Energy Guarantee with 20-Year Suspension (SEG-20)

Iran accepts a 20-year moratorium on enrichment above 3.67%, with all enrichment infrastructure placed under IAEA seal. In exchange, the US and an international consortium (Russia, China, France) provide a legally binding, irrevocable guarantee of Iran's entire civilian nuclear fuel supply for Bushehr and any future reactors for the full 20-year period. The guarantee is backed by a \$10 billion fuel supply escrow at the IAEA. If the consortium ever fails to deliver, the moratorium automatically reduces to 10 years and Iran may resume enrichment to 3.67% immediately. *Non-symmetrical feature*: Iran accepts the 20-year timeline but gains an insurance policy the US cannot revoke without triggering Iran's early release.

Solution B: Tiered Variable Duration (TVD-10-20)

A two-tier structure: **Years 1–10**: Total enrichment suspension. Zero enrichment above 3.67%; all advanced centrifuges sealed; only Natanz operates at 3.67% with 300 kg cap after Year 5. **Years 11–20**: Iran may enrich to 3.67% at Natanz only, with 500 kg cap, all other sites mothballed. The transition from Tier 1 to Tier 2 requires only IAEA clean certification — not US political approval. Material breach in Years 1–10 triggers 2-year extension per event. Clean compliance beyond Year 8 triggers early Tier 2 review at Iran's request. Trump markets Years 1–10 as a total freeze; Iran markets Years 11–20 as restored enrichment rights. Both statements are true.

Solution C: Performance-Linked Auto-Extension (PLAE)

Baseline moratorium of 8 years, auto-extending by 2 years per year of IAEA-certified clean compliance, capping at 20 years. If Iran maintains clean compliance for all 12 extension years, the full 20-year window is achieved. If a material breach occurs, extension pauses but does not collapse — the Agreement remains at the currently achieved duration. A Joint Implementation Group (IAEA + Oman + Switzerland) determines compliance, not the US alone. Iran can achieve full 20-year duration through behavior, but is not locked into it through a single signature. This converts the timeline dispute from a political decision into a technical one, removing both leaders from the blame equation.

Issue 3 — Underground Sites: Destruction vs. Preservation

Problem: *Trump has threatened to "knock out" five underground sites (Fordow, Natanz, Isfahan, and two classified). Iran demands preservation as sovereign infrastructure.*

Solution A: Dual-Track Conversion (DTC)

Fordow + Natanz: Convert to civilian medical isotope production centers under Technical Custody Consortium management (Swiss, Austrian, Omani engineers). Iranian personnel serve as co-pilots. Revenue: Iran 40%, TCC 35%, Global Health Fund 25%. US gets quarterly inspections. **Isfahan + 2 classified sites:** Mothball status under continuous IAEA remote feeds. Centrifuge rotors removed, sealed, stored in UN-monitored facility within Iran. Infrastructure remains intact. Iranian technicians perform removal. Sites may be restored to low-enrichment civilian fuel production only if successor framework is not reached by Year 15, subject to 30-day IAEA notification. Non-symmetrical: Iran accepts conversion at 2 sites; US accepts mothballing at 3. Different tracks, different timelines, different verification intensities.

Solution B: International Medical Isotope Hub (IMI)

All five sites are converted into components of a Regional Medical Isotope Production Network. Fordow becomes the primary production center for molybdenum-99 and iodine-131. Natanz becomes a nuclear research and training campus. Isfahan becomes consolidated HEU storage (pre-destruction) plus safeguards training. The two classified sites become geophysical research stations with no fissile material. The IMI operates under an International Scientific Advisory Board with Iranian co-chair authority. Iranian scientists lead major research programs. Annual revenue of ~\$300M is shared: Iran 45%, operational consortium 40%, global health fund 15%. This transforms Iran's nuclear complex from a military liability into a revenue-generating scientific asset.

Solution C: Sealed Preservation with Black-Box Telemetry (SP-BBT)

All five sites remain physically intact but are sealed under a multi-layered containment architecture. Centrifuges are placed in "warm idle" — climate-controlled, maintained, not dismantled — under IAEA seal. Black-box sensors continuously record operational parameters (temperature, pressure, electromagnetic signatures) and transmit encrypted data to IAEA nodes in Vienna and Geneva. Any anomaly triggers automatic alert within 15 minutes. Sensors cannot be disabled without triggering Tier 2 breach. Every 90 days, IAEA inspectors conduct seal integrity verification. The "preservation" satisfies Iran's infrastructure demands; the "sealed telemetry" satisfies US verification requirements. A light blockchain log (Swiss and Omani nodes only) creates immutable verification history. Year 15 review determines whether conversion or continued preservation is optimal.

Part II: Maritime Governance & the PGSA

Issue 4 — Strait Vetting vs. Freedom of Navigation

Problem: The IRGC Navy enforces *de facto* transit controls under the PGSA. The US fiercely rejects any unilateral Iranian restrictions on international waters, and Rubio has stated PGSA tolling makes a deal "unfeasible."

Solution A: Joint Hormuz Transit Authority with PGSA Integration (JHTA-PGSA)

The PGSA is formally integrated into a Joint Hormuz Transit Authority as Iran's designated operational implementation body for transit coordination within Iranian territorial waters. The PGSA retains its Iranian statutory authority but exercises it under JHTA Council oversight. All PGSA transit permits bear dual branding: PGSA-Iran and JHTA-Authorized. The JHTA Council has 6 seats: Iran (co-chair, alternating), US (co-chair, alternating), Oman (Secretariat host), GCC rotating member, EU observer, China observer. Routine decisions require 3 affirmative votes from permanent members. Joint Transit Coordination Cells at Bandar Abbas (PGSA HQ), Khasab (Oman), and a floating platform at the Strait midpoint. JTCCs do not stop, board, or search vessels — purely coordinative. Vessels receive a Universal Transit Certificate from the JHTA Secretariat in Muscat, certifying valid registration and functional AIS. *Non-symmetrical:* Iran gives up unilateral PGSA authority but gains permanent co-chairmanship and dual branding.

Solution B: Maritime Safety Coordinator Model (MSCM)

The PGSA is rebranded as a "Persian Gulf Maritime Safety Coordination Office" — a safety and information body, not a tolling or regulatory authority. Its functions are limited to: (1) publishing daily navigational safety bulletins; (2) coordinating emergency search-and-rescue; (3) operating a 24/7 maritime distress hotline; (4) sharing weather and traffic data. The PGSA has *no authority* to issue transit permits, levy fees, or deny passage. Transit rights are governed exclusively by UNCLOS Article 37 (transit passage) and JHTA safety protocols. All vessel vetting is conducted by the JHTA Secretariat in Muscat against neutral criteria (IMO registration, insurance, AIS functionality). Israeli-flagged vessels receive the same UTC as any other. *Iran wins*: PGSA retains institutional existence, personnel, and Bandar Abbas HQ. *US wins*: PGSA cannot restrict, tax, or deny transit to any vessel.

Solution C: Cooperative Information Exchange (CIE)

No joint authority replaces the PGSA. Instead, a Cooperative Information Exchange protocol requires Iran and the US to share AIS transponder data, patrol schedules, and distress response plans through the Omani Maritime Coordination Cell in Muscat. Both navies operate independently but with full transparency. The PGSA continues to issue advisory notices (non-binding) to vessels transiting Iranian territorial waters. The US 5th Fleet issues parallel Notices to Mariners for international waters. Vessels may reference either or both. No permits are required. No fees are collected. The two systems operate in parallel, competing for vessel compliance through service quality rather than authority. If one system fails (technical outage, political dispute), the other maintains coverage. This is the most sovereignty-preserving model: neither side surrenders unilateral authority.

Issue 5 — Transit Fees vs. No-Tolls Demand

Problem: Iran and Oman negotiate a permanent toll system. Trump declared: "We don't want tolls." Rubio stated tolling makes a deal "unfeasible." Reports indicate vessels have paid up to \$2M per transit.

Solution A: Multilateral Maritime Maintenance Fund (MMMF)

No tolls are paid to Iran. A Strait Maintenance Contribution of 0.15% of cargo value is collected by the JHTA Secretariat in Muscat — not by Iranian authorities. Revenue (~\$500M at capacity) is distributed: 35% Iranian Civilian Reconstruction Fund (managed through PGSA oversight), 35% International Maritime Safety Fund (joint patrol, mine clearance, navigation aids), 20% JHTA Operations, 10% US Naval Cost-Recovery payments to the US Treasury. Tier 1 (humanitarian): zero fee, 24-hour fast-track. Tier 2 (standard commercial): \$0.15/ton. Tier 3 (energy): \$0.25/ton or \$35,000 flat per VLCC. JHTA Council member vessels exempt. *Trump wins*: no Iranian tolls; US patrols get paid. *Iran wins*: 35% revenue share through PGSA oversight; institutionalized revenue stream.

Solution B: Voluntary Risk-Mitigation Contribution (VRMC)

No mandatory tolls exist. Instead, a voluntary contribution system: vessels that pay a Risk-Mitigation Contribution receive insurance premium discounts (via Lloyd's of London partnership), fast-track transit processing, and priority distress response. Non-contributors transit freely without penalty, benefits, or delay. The VRMC is administered by Lloyd's of London and the Omani Sovereign Wealth Fund, not by Iran. A \$20 billion reinsurance backstop (US DFC \$10B + Lloyd's \$5B + Oman \$5B) activates upon JHTA certification of 200 authorized transits, rendering the corridor commercially navigable. Revenue funds the International Maritime Safety Fund exclusively — no Iranian state revenue. *Non-symmetrical*: Iran gets no direct toll revenue but benefits from safer shipping lanes; US gets commercial incentive alignment without coercion.

Solution C: Port Services Fee Architecture (PSFA)

No transit tolls are levied. Iran instead charges for specific, legitimate coastal state services under UNCLOS: pilotage, tug assistance, emergency response, weather routing, and marine pollution prevention. These are standard, internationally recognized services rendered by Iran to vessels *choosing* to use them. Services are voluntary and competitively priced against regional alternatives. Revenue flows directly to the Iranian Ports and Maritime Organization (a civilian entity), not the IRGC or PGSA. This model decouples Strait transit rights from Iranian revenue while allowing Iran to monetize its legitimate maritime services. The US accepts this because fees are for services rendered, not passage rights; Iran accepts it because it retains a revenue stream. A published fee schedule (quarterly review by independent maritime economists) ensures transparency.

Issue 6 — Lifting the US Naval Blockade

Problem: CENTCOM enforces a crippling naval blockade. Iran considers it a ceasefire violation and precondition for Hormuz opening. Washington maintains blockades as leverage until HEU extraction and open-access Strait rules are executed.

Solution A: Conditional Graduated Reduction (CGR)

The blockade reduces in five phases, each triggered by verified Iranian compliance milestones: **Phase 1 (Day 1):** Iran freezes enrichment above 60%. US exempts humanitarian and agricultural vessels from blockade. **Phase 2 (Day 7):** Iran opens Hormuz to JHTA-authorized humanitarian transit at zero cost. US reduces blockade intensity by 50% for non-military cargo. **Phase 3 (Day 14):** Iran consolidates HEU under chosen custody solution. US suspends aerial surveillance over Iranian waters. **Phase 4 (Day 21):** Iran transfers PGSA checkpoint control to JHTA. US withdraws carriers to 200nm. **Phase 5 (Day 30):** Full blockade lift, JHTA assumes authority. *Non-symmetrical:* Iran moves first at every phase. US responds after verification. Completed steps are ratcheted forward, not reversed.

Solution B: HEU-Linked Blockade Architecture (HEU-LBA)

Blockade lifting is mechanically linked to HEU extraction progress, not general compliance. The blockade remains in full force until IAEA confirms HEU is under custody under the selected Solution A/B/C from Issue 1. Once custody is confirmed, the blockade lifts 75% immediately, with the remaining 25% lift tied to the HEU physically departing Iranian territory (or being certified as downblended, depending on Issue 1 selection). During the custody-to-extraction window (Days 1–30), humanitarian and agricultural vessels are exempted. Full petroleum and commercial blockade remains until extraction milestone. This gives Trump direct linkage between his core demand (HEU out) and the blockade lift. It gives Iran a clear, predictable pathway: complete the custody protocol, and the blockade begins dissolving.

Solution C: Reciprocal Economic Port Access (REPA)

The US lifts the blockade in exchange for Iran granting US-flagged and US-linked vessels priority transit status through Hormuz (priority processing, guaranteed 24-hour transit window, dedicated coordination channel). Both sides gain visible economic benefits: Iran's ports reopen to global commerce immediately; US vessels receive commercially valuable transit guarantees. The arrangement is revenue-positive: US shipping companies pay standard JHTA fees (not Iranian tolls) for priority service, generating revenue for the International Maritime Safety Fund. Iran gains port revenue and customs duties. The linkage is economic, not political: both sides are better off with open trade than with blockade. Blockade lifts on Day 3 of Agreement signature; priority access for US vessels activates simultaneously. If Iran denies priority access, blockade reactivates automatically.

Part III: Economic Normalization

Issue 7 — Sanctions Relief Sequencing

Problem: Iran demands immediate blanket lifting of all secondary sanctions. The US refuses to yield leverage before compliance. Trump has limited short-term release to no more than 25% of frozen assets.

Solution A: Asymmetric Tranche Architecture (ATA)

Relief delivered in deliberately unequal tranches: **Pilot (Day 1):** \$250M humanitarian (medicine, food, aviation safety) — irreversible. **Tranche 1 (Day 7):** \$5B to escrow; civilian aircraft parts; agricultural goods — irreversible. **Tranche 2 (Day 30):** Petroleum sales authorized; \$15B escrow release — irreversible. **Tranche 3 (Day 90):** Petrochemical exports; metals trade — 30-day hold only. **Tranche 4 (Day 180):** Automotive, textiles, general commercial license — 30-day hold. **Tranche 5 (Day 365):** Full secondary sanctions lift; SWIFT normalization — material breach only. **Tranche 6 (Year 2–3):** Remaining frozen assets — successor framework. *Non-symmetrical:* Early tranches are large and irreversible (Iran benefits fast); late tranches are conditional (US retains leverage).

Solution B: Swap-Window Sanctions Model (SWSM)

Every 15 days, a "swap window" opens. Iran delivers a verified physical milestone (centrifuge sealed, HEU moved, site opened to inspectors). The US delivers a matched sanctions relief micro-package (specific sector license, specific bank authorized, specific export category cleared). The swap is not negotiated each cycle — both sides pre-commit to a published menu of 12 milestones and 12 relief packages at signature. Milestone 1 triggers Relief 1 automatically. No renegotiation required. If Iran delivers Milestone 7 but the US delays Relief 7 beyond 48 hours, Oman's escrow fund automatically releases a \$500M bridge payment to Iran, recouped from the US later. *This creates automaticity that removes human political judgment from each step.*

Solution C: Indexed Sanctions Relief (ISR)

Sanctions relief is indexed to a Compliance Index (CI) calculated monthly by the Joint Secretariat. The CI comprises 10 objective indicators (IAEA seal integrity, enrichment levels, site access, Hormuz transit openness, etc.), each scored 0–10. Maximum CI = 100. At CI 20: humanitarian licenses. CI 40: petroleum exports. CI 60: banking reconnection. CI 80: SWIFT Phase 2. CI 100: full normalization. This removes both Trump and Khamenei from monthly relief decisions. The CI is published publicly, transparent, and non-negotiable month-to-month. Both sides know exactly what score unlocks what relief. Spoilers cannot derail the process because scoring is automated against published criteria. If CI drops, relief correspondingly rolls back one tier (not total collapse).

Issue 8 — Frozen Assets Shielding & Liquidation

Problem: Iran demands unfreezing ~\$100B in frozen assets to halt currency collapse. US requires performance reserves. American court judgments threaten seizure.

Solution A: Dual-Tier Sovereign Immunity Escrow (DSIE)

Assets transferred to Central Bank of Oman, designated "diplomatic escrow funds" protected by sovereign immunity and a UNSC resolution. **Tier A (55% — \$55B):** Released to Iranian civilian control per tranche schedule. Administered by World Bank with Iranian programmatic input. Eligible for civilian infrastructure, healthcare, education, environmental remediation. Auto-exclusion for IRGC-linked entities. **Tier B (45% — \$45B):** Held until Year 2. Released only upon IAEA sustained compliance certification. If material breach occurs, Reserve converts to "Regional Stability Fund" administered by Oman for Gulf reconstruction — including projects inside Iran via UN agencies. Iran never receives direct control of Reserve but benefits regardless. The Sovereign Immunity Shield protects from US court seizure. *Trump:* 45% held. *Iran:* \$55B flows within 180 days.

Solution B: Structured Liquidation with Counterparty Protection (SLCP)

Frozen assets are liquidated in tranches against specific, pre-negotiated Iranian commitments. Each tranche release requires: (1) IAEA verification of milestone; (2) Joint Secretariat approval; (3) counterparty bank guarantee from Oman's central bank. Iranian funds can only be used for purchases from a pre-approved "Green Corridor" list of vendors and commodities (medicine, food, agricultural equipment, civilian aviation parts, renewable energy technology). Iranian banks receiving funds must be independently audited quarterly by Deloitte or PwC. Any diversion to IRGC, military, or non-civilian purposes triggers immediate freeze of the next three tranches. The counterparty protection ensures US-sourced goods and services flow to Iran, creating American commercial beneficiaries who become domestic lobbies for continued engagement.

Solution C: Islamic Development Bank Credit-Line Conversion (IDB-CLC)

Frozen assets are converted into a revolving credit line at the Islamic Development Bank, with Oman as the operational node. Iran draws against the credit line for approved civilian imports. The IDB processes all transactions, screens all recipients, and reports monthly to the Joint Secretariat. This model has three advantages: (1) frozen assets never become liquid cash in Iranian hands — they are always intermediated through the IDB; (2) the IDB's Shariah-compliant framework is domestically acceptable in Iran; (3) the credit line is denominated in a basket of currencies (40% euro, 30% yuan, 20% riyal, 10% rupee), insulating Iran from dollar dependency while avoiding direct US banking system exposure. Maximum 25% (\$25B) available in Year 1; remainder released in 10% annual increments contingent on compliance.

Issue 9 — SWIFT Reconnection

Problem: *Iran's total SWIFT disconnection paralyzes its commercial sector. US demands verified non-diversion before full reconnection.*

Solution A: Consolidation-Bank Gateway (CBG)

A single designated "consolidation bank" — the Oman-Iran Reconstruction Bank — receives limited SWIFT connectivity for defined categories: humanitarian imports, petroleum sales to pre-approved customers, agricultural inputs. All transactions are pre-cleared by a compliance monitor (Deloitte/PwC) and screened against sanctions lists in real time. Graduated expansion: Month 3 — second tranche of clean-record private banks. Month 6 — state-owned banks. Month 12 — all banks except terrorism-designated institutions. If IAEA identifies Tier 2 compliance concern, SWIFT holds for 14 days; unresolved, rolls back exactly one tier. Tier 1 technical disputes do not trigger the fuse. Iran accepts SWIFT as a privilege, not a right, with transparent rollback rules.

Solution B: Regional Clearing House (RCH)

Instead of direct SWIFT reconnection, Iran connects to a new Regional Clearing House established in Muscat under Omani central bank supervision. The RCH clears Iranian trade with Asia, Africa, and Europe through correspondent relationships with Omani, Qatari, and Turkish banks. US banks are not involved. European banks can connect to the RCH voluntarily. The RCH operates on its own messaging standard (interoperable with SWIFT but independent). This gives Iran functional banking connectivity without touching the US-controlled SWIFT infrastructure. Over time (18–36 months), if compliance is sustained, the RCH can be bridged to SWIFT through Omani and Qatari correspondent banks. This is a sovereignty-preserving model for Iran and a politically defensible model for the US.

Solution C: Digital Currency Trade Corridor (DCTC)

Iran's trade is cleared through a central bank digital currency (CBDC) corridor operated by Oman's central bank. The digital rial is minted against verified Iranian petroleum exports and can be used to purchase goods from a whitelist of international vendors. Settlement is instant, transparent, and recorded on a permissioned blockchain managed by the Bank for International Settlements and Oman's central bank. US regulators receive read-only access. This bypasses SWIFT entirely while providing complete transaction transparency. The DCTC is particularly suited to Iranian petroleum sales to China, India, and Turkey — buyers who already have CBDC pilot programs. By Year 3, if compliance is sustained, the DCTC can be bridged to SWIFT through Oman.

Issue 10 — War Reparations vs. Reconstruction Credits

Problem: *Iran demands US-funded war reparations for infrastructure damage since February. Trump flatly rejects reparations. Neither side can politically accept the other's framing.*

Solution A: No-Fault Regional Stability Investment (NFRSI)

The International Gulf Reconstruction Fund (IGRF) is established under sovereign immunity in Oman, managed by the World Bank. Funding sources: \$30B from Iranian frozen assets (Iran's own money), plus voluntary contributions from Gulf states, the EU, and development banks. The US contribution is technical assistance (USACE engineering, USAID programming, NRC nuclear safety expertise) and development finance guarantees — not direct cash. The label is "Regional Stability Reconstruction Credits," not reparations, not aid, but investment in regional stability that happens to rebuild Iranian infrastructure. Both leaders can claim victory: Trump did not pay reparations; Khamenei secured \$30B in reconstruction for Iran. The IGRF operates through UN implementing agencies to avoid direct US-Iran financial flows.

Solution B: Joint Infrastructure Partnership (JIP)

Iran and the US establish a Joint Infrastructure Partnership as a commercial entity registered in Dubai International Financial Centre. The JIP is a for-profit reconstruction company: Iran contributes land, labor, and 40% capital; international investors (including US pension funds via UAE sovereign wealth intermediaries) contribute 60% capital. The JIP rebuilds Iranian civilian infrastructure (ports, power grids, water treatment) as commercial projects with equity returns. US investors earn returns on Iranian reconstruction without any government payment. Iran receives rebuilt infrastructure without US reparations. The arrangement is a commercial partnership, not a diplomatic concession. All contracts are enforceable under English law in DIFC courts. Both sides can market it as a business deal, not a political compromise.

Solution C: Environmental Remediation Credit (ERC)

The US does not pay reparations for military damage. Instead, it commits to funding environmental remediation of the Persian Gulf ecosystem through a standalone Environmental Trust administered by UNEP. The Trust addresses oil spills, depleted uranium contamination, marine habitat destruction, and air quality — damage caused by both sides during the conflict. Iran receives substantial environmental cleanup (valued at \$8–12B) without any US admission of liability. The US funds ecological recovery in a region where it has strategic interests, without acknowledging causation. This converts the reparations dispute into an environmental cooperation framework. Marine scientists, not politicians, administer the Trust. Iran benefits from cleaner coastlines and fisheries; the US benefits from regional stability and reduced environmental migration.

Part IV: Treaty Durability & Regional Architecture

Issue 11 — The Negotiation Timeline

Problem: *The ceasefire is highly fragile. Trump says he will give diplomacy only "a few days" or "one shot." The 30-day window has collapsed repeatedly because both sides treat it as an ultimatum.*

Solution A: Variable-Step Open Timeline (VSOT-180)

An open 180-day timeline with variable-length steps: some 3 days, others 30. Steps are not synchronized between domains — nuclear steps move on their own clock, maritime steps on theirs, economic steps on theirs. Each domain's timeline advances or pauses independently based on domain-specific verification. If nuclear verification hits a snag, maritime and economic modules continue executing. There is no single "deadline" that kills the entire Framework. Step 1: Days 1–3 (freeze enrichment). Step 2: Days 4–14 (HEU custody). Step 3: Days 15–30 (JHTA operational). Step 4: Days 31–60 (petroleum exports). Step 5: Days 61–90 (SWIFT Phase 1). Step 6: Days 91–180 (successor framework). *Non-symmetrical:* each step has its own duration, trigger, and verification standard.

Solution B: Perpetual Auto-Renewal Protocol (PARP)

The Framework has no fixed end date. It auto-renews every 90 days unless either Party issues a 30-day non-renewal notice. Each 90-day cycle has its own micro-agenda (e.g., Cycle 1: ceasefire + humanitarian; Cycle 2: HEU custody + blockade reduction; Cycle 3: sanctions relief + SWIFT; etc.). If a cycle fails, the Framework reverts to the last successfully completed cycle and attempts the failed cycle again with modified terms. There is no "failure" state — only reverting to a known-good configuration and retrying. This removes the catastrophic pressure of a hard deadline. Both leaders can tell domestic audiences: "We did not sign a permanent deal; we signed a 90-day review mechanism."

Solution C: Rolling 14-Day Sprint Model (R14SM)

The entire Framework is broken into 14-day sprints. At the end of each sprint, the Joint Secretariat publishes a Sprint Report: what was delivered, what was not, what adjustments are needed. Both Parties approve the next sprint's scope or invoke the Step-Back Protocol. Sprints create momentum through visible deliverables every two weeks. The short cycle prevents either side from stalling for months while claiming progress. If three consecutive sprints fail to produce deliverables, the Emergency Reconstitution Protocol (Off-Ramp Gamma) auto-activates. This model borrows from agile project management: continuous delivery, continuous review, continuous adaptation. Each sprint has a named objective ("Sprint Alpha: HEU Freeze," "Sprint Bravo: Hormuz Open," etc.), creating media-visible milestones.

Issue 12 — Guarantor Architecture

Problem: *Neither side believes the other will honor a signed document. The trust deficit is structural and cannot be bridged by goodwill alone.*

Solution A: Distributed Guarantor Matrix (DGM)

Different domains have different guarantors — no single referee. **Nuclear:** IAEA (Vienna) primary, Switzerland backup. **Maritime:** Oman (Muscat) primary, Pakistan backup. **Financial:** Switzerland (Geneva) primary, Qatar backup. **Political:** UN Under-Secretary-General primary, EU High Representative backup. No single guarantor's incapacity suspends Framework operations. The Joint Secretariat comprises two senior officers from each Party, one neutral chair rotating among Oman/Switzerland/Pakistan, one IAEA liaison, one UN observer. Decisions require consensus of the two Party officers plus the neutral chair. *Non-symmetrical:* different guarantors for different domains with different powers and different backups.

Solution B: Mutual Hostage Guarantees (MHG)

Each Party deposits a "hostage asset" at signature that is forfeited to the other upon material breach. **US hostage:** \$5 billion in a Swiss escrow, released to Iran if the US unilaterally reimposes sanctions without Joint Secretariat cause finding. **Iranian hostage:** 50% of its HEU stockpile (already under IAEA seal), transferred to the IAEA LEU Bank if Iran unilaterally restarts enrichment above 3.67% without Joint Secretariat authorization. Both hostages are released only upon Framework completion or mutual consent. The mutual hostage structure creates self-enforcing compliance: neither side wants to lose its deposit. The escrow is managed by Switzerland under a pre-agreed algorithm — no political judgment required.

Solution C: International Arbitration Tribunal (IAT)

A dedicated US-Iran Arbitration Tribunal is established at The Hague under the Permanent Court of Arbitration. The Tribunal has jurisdiction over all disputes arising from the Framework. Composed of 5 arbitrators: each Party appoints one; the three neutral arbitrators are appointed by the UN Secretary-General (one), the IAEA Director-General (one), and the Omani Foreign Minister (one). Tribunal decisions are final and binding. A \$2 billion enforcement fund is established at signature: \$1B from US frozen asset releases, \$1B from Iranian petroleum pre-sales. The fund pays compensation to the prevailing party in any arbitration. The Tribunal operates under expedited procedures: decisions within 120 days. This provides a neutral, rules-based enforcement mechanism that neither side controls.

Issue 13 — Internal Regime Fractures & Human-in-the-Loop Governance

Problem: *Intense ideological fractures within Tehran's leadership mean automated deal triggers can be derailed by political hardliners. US officials have highlighted these rifts as a core risk.*

Solution A: Procedural Step-Back Protocol (PSBP)

Any Party may invoke a 14-day "cooling period" for any provision without triggering breach status. During cooling: ceasefire auto-renewal continues; humanitarian operations continue; IAEA monitoring continues; all other modules continue executing. A Party may invoke cooling up to three times per year without explanation. This prevents hardline spoilers from weaponizing technical disputes into crises. The PSBP is the ultimate spoiler-management tool: it allows either leader to pause without collapsing. The 14-day window is long enough to manage internal politics but short enough to prevent indefinite stalling.

Solution B: Dual-Channel Governance (DCG)

Two parallel governance channels: the **Technical Channel** (IAEA, Swiss Financial Cell, Omani Maritime) handles verification, compliance scoring, and routine operations — fully automated, no political intervention. The **Political Channel** (foreign ministers, National Security Council equivalents) handles strategic decisions, dispute resolution, and escalation management. Technical disputes never reach the Political Channel unless both Parties agree. Political disputes never affect Technical Channel operations. This separation insulates technical progress from political turbulence. Hardliners can fight in the Political Channel while the Technical Channel continues delivering results.

Solution C: Internal Coalition Management Fund (ICMF)

A \$2 billion "Coalition Stabilization Fund" is established to help Iranian moderates manage internal political costs of compliance. The Fund provides targeted economic benefits to Iranian constituencies most affected by nuclear compromise: enrichment facility workers receive retraining grants; hardline provincial governors receive infrastructure projects; IRGC-affiliated pensioners receive enhanced benefits. All disbursements are routed through the World Bank to avoid direct US-Iran cash flows. The Fund does not bribe Iranian officials — it helps the Iranian government manage the domestic politics of peace. The US contributes \$500M (technical assistance equivalent); Gulf states contribute \$1B; Iran contributes \$500M from frozen asset releases. The Fund operates transparently, audited by Ernst & Young.

Issue 14 — Drone & Missile Program Reconstitution

Problem: Intelligence indicates Iran is rapidly reconstituting drone and missile capabilities during the ceasefire. US wants strict limitations; Iran has declared these programs non-negotiable on the nuclear table.

Solution A: Deployment Pause with Industrial Grandfathering (DPIG)

Iran commits not to deploy drones or missiles against US or allied interests during the 180-day period. Iran does not commit to halting production or research — this is a *deployment pause*, not an industrial freeze. In exchange, the US refrains from targeting Iranian drone or missile manufacturing facilities. Verification: satellite thermal imaging monitors known launch sites, not factories. Any detected deployment preparation triggers a 48-hour consultation, not automatic breach. This distinction — deployment vs. production — creates a workable firewall. Iran preserves its sovereign industrial base; the US gains force protection assurance. After 180 days, a separate dialogue track on missile limitations opens, but it is not linked to the nuclear Framework.

Solution B: Range-Cap Protocol (RCP)

Iran agrees to cap missile range at 2,000 km for 24 months. Missiles above this range are mothballed (not destroyed) under IAEA-style seal. Iranian production of sub-2,000 km missiles continues unrestricted. This cap covers missiles capable of reaching Europe but preserves Iran's regional deterrence against immediate threats. Verification: mobile IAEA-like teams conduct random inspections of missile storage and production facilities. Sealed missiles are tagged with GPS-enabled tamper sensors. In exchange, the US commits to not deploying additional missile defense systems in the Gulf during the 24-month period. The Range Cap is the missile equivalent of the enrichment moratorium: a limitation, not a surrender, with defined verification.

Solution C: Transfer Transparency Regime (TTR)

Iran does not limit production, range, or research. Instead, Iran commits to full transparency on all transfers: any drone or missile export to any third party requires 14-day advance notification to the Joint Secretariat. The Secretariat maintains a public Transfer Registry. Any unregistered transfer is treated as a Tier 2 breach. This addresses the US concern about Iranian proliferation to proxies (Houthis, Hezbollah, militias) without constraining Iran's sovereign defense programs. The TTR is modeled on the Missile Technology Control Regime but is bilateral, not multilateral. Iran gains: full production freedom. US gains: early warning on all transfers. The TTR applies only to cross-border transfers; domestic deployment and testing are not regulated.

Issue 15 — Agrifood Crisis & Humanitarian Supply Lines

Problem: Strait closure has choked off one-third of global fertilizer supply. The UN warns of systemic agrifood crisis. Iran faces severe food insecurity, rolling blackouts, and currency collapse.

Solution A: Immediate Agricultural Release Valve (IARV)

Within 48 hours of signature, the US issues OFAC general licenses for: wheat, rice, fertilizer, and agricultural machinery exports to Iran; Iranian petrochemical exports (fertilizer feedstock); and LPG exports for Iranian food processing and cold chain. Simultaneously, an Oil Export Price Floor Guarantee activates: if Brent crude falls below \$65/barrel during the first 90 days of Iranian oil exports, the escrow supplements the difference up to \$15/barrel. The Floor is funded by a 2% levy on JHTA tolls during the guarantee period, deducted pro-rata from Iran's share. Iran receives immediate agricultural relief before delivering nuclear milestones beyond the initial 72-hour freeze. US accepts this sequencing because agricultural relief is politically defensible as humanitarian.

Solution B: Global Fertilizer Corridor (GFC)

A dedicated "Green Lane" through Hormuz is established exclusively for fertilizer, grain, and agricultural input vessels. The GFC operates under WHO/FAO joint administration, completely insulated from the broader political Framework. Vessels in the GFC transit Hormuz at zero cost, zero inspection, with 6-hour guaranteed processing. The GFC is funded by a \$1 billion international consortium (US \$300M, EU \$300M, China \$200M, India \$200M) administered by the FAO. Iran receives port fees and handling revenue for GFC vessels. This creates an immediate, visible global benefit from the Agreement: lower fertilizer prices worldwide. Farmers in Iowa, Punjab, and Sao Paulo all benefit, creating domestic constituencies for Framework survival in multiple countries.

Solution C: Iranian Food Security Compact (IFSC)

A bilateral US-Iran Food Security Compact addresses Iran's immediate humanitarian needs through a structured, 12-month program. Month 1–3: Emergency food and medicine shipments (US-funded, UN-delivered, \$500M). Month 4–6: Agricultural machinery and fertilizer (US-export licenses, Iranian payment via escrow). Month 7–9: Cold chain infrastructure and grain silos (joint US-Iranian technical cooperation). Month 10–12: Irrigation modernization and drought-resistant seed program. The Compact is managed by the FAO and USAID, not by diplomats. Technical teams, not politicians, make day-to-day decisions. The Compact is explicitly humanitarian and commercial, not political. It creates American agricultural exporters as stakeholders in Iran's stability while addressing Iran's most urgent domestic need.

Annex A: Economic Incentive Matrix

The following matrix summarizes what each side gains under the Framework, organized by stakeholder priority:

Table 1: What the United States Gains

Priority	Deliverable	Timeline	Political Value
HEU Extraction	400 kg physically removed or destroyed; real-time telemetry	Day 30–60	Historic non-proliferation victory
20-Year Moratorium	Zero enrichment above 3.67% for 20 years (or auto-extending 8–20)	Day 1	Deeper freeze than JCPOA ever achieved
Single Facility	Natanz only operational; all others converted or mothballed	Day 30	Breakout capability eliminated
No PGSA Tolls	Transit rights governed by UNCLOS; no Iranian tolling authority	Day 7	Freedom of navigation preserved
Naval Cost Recovery	10% of MMMF revenue flows to US Treasury for patrol costs	Day 30	Deal is revenue-positive for US
Asset Reserve	45–75% of frozen assets held until Year 2+ compliance	Year 2	Performance leverage preserved
No Reparations	US pays zero war compensation; all support is commercial/technical	Immediate	No admission of liability
Drone Pause	Deployment pause for 180 days; thermal monitoring active	Day 1	Force protection window

Table 2: What Iran Gains

Priority	Deliverable	Timeline	Political Value
Sovereignty Preserved	HEU never enters US hands; Iranian guards escort; Iran holds keys	Day 30–60	Khamenei's red line respected
NPT Rights	3.67% enrichment resumes Year 10–11; full rights by Year 16–20	Year 10+	Enrichment not surrendered, only suspended
PGSA Recognized	PGSA integrated as JHTA operational body; co-chairmanship	Day 14	Institutional victory
Revenue Stream	35% MMMF share; port service fees; medical isotope revenue	Day 30+	~\$500M+ annual institutional revenue
Blockade Lifted	CENTCOM blockade dissolved; ports reopened; trade resumes	Day 7–30	Economic suffocation ends
Assets Released	\$20–55B in frozen assets within 180 days; protected from seizure	Day 7–180	Currency stabilization
SWIFT Reconnected	Limited SWIFT within 30 days; full normalization by Year 1	Day 30–365	Banking isolation ends
Agricultural Relief	Food and fertilizer on Day 2; oil price floor for 90 days	Day 2	Immediate domestic stabilization
Reconstruction	\$8–30B in reconstruction credits (no-fault framing)	Month 3–12	Infrastructure rebuilt without US liability

Annex B: Non-Symmetrical Implementation Schedule

Table 3: Variable-Sequence Day-by-Day Timeline

Day	Iranian Action	US Action	Module
1	Freeze enrichment >60%; activate HEU tri-lock	\$250M humanitarian; freeze new sanctions	Issues 1, 2, 7
2	WHO humanitarian vessel transit at zero cost	OFAC general license for ag exports to Iran	Issues 4, 15
3	IRGC craft withdraw to 5nm anchorage	Exempt humanitarian vessels from blockade	Issues 6, 14
7	HEU custody protocol complete; JHTA cells active	Release \$5B to escrow; aircraft parts license	Issues 1, 4, 7
14	PGSA checkpoint control to JHTA; dual-branding	Reduce blockade 50%; suspend aerial surveillance	Issues 4, 6
30	30-day clean compliance; mothballing underway	Authorize petroleum; release \$15B; SWIFT Phase 1	Issues 2, 7, 9
45	Full Hormuz open to JHTA traffic	Carrier withdrawal to 200nm; agricultural machinery OK	Issues 4, 6
60	Centrifuge rotors sealed; LEU bank transfer begins	Tranche 3 release; petrochemical exports authorized	Issues 1, 2, 7
90	Comprehensive successor framework talks begin	SWIFT Phase 2; automotive/textile licenses	Issues 7, 9, 11
180	Sustained compliance review	Full secondary sanctions review	Issues 7, 11

Annex C: Domestic Narrative Guidance

Each Party requires a domestically defensible narrative. The following characterizations are factually accurate:

For the Trump Administration

- **"Weapons-grade uranium physically removed from Iran."** Under all three HEU solutions, the material either leaves Iran or is destroyed in-place. Extraction is verified, irreversible, and US-monitored.
- **"Twenty-year enrichment freeze — deeper than JCPOA."** All three moratorium solutions achieve at least 20 years of constraint through different mechanisms.
- **"No tolls to Iran. No Iranian restrictions on Hormuz."** Under Solutions 4B and 4C, PGSA has no authority to levy fees or deny transit.
- **"Blockade stays until Iran delivers."** Under Solutions 6A and 6B, blockade lifts only after verified HEU custody and Strait opening.
- **"No reparations paid. We didn't write a check."** All three reparation solutions are no-fault, investment-based, or commercial partnership.
- **"Our patrols get paid."** Under Solution 5A, 10% of maritime revenue flows to the US Treasury.
- **"Most assets still frozen."** 45–75% remain in escrow until Year 2+ compliance is certified.

For the Islamic Republic of Iran

- **"Sovereignty preserved. The HEU never entered American hands."** Under all three solutions, material is either destroyed on Iranian soil, held in Islamic/Omani custody, or co-managed with Iranian key access.
- **"Enrichment rights intact. The moratorium is suspension, not surrender."** Under Solutions 2B and 2C, enrichment to 3.67% resumes in Year 10–11 with automatic triggers.
- **"PGSA recognized globally as co-chair of the Strait authority."** Under Solution 4A, PGSA is the operational implementation body with permanent co-chairmanship.

- **"The blockade is lifted."** Under all three blockade solutions, full blockade dissolution occurs within 30 days.
- **"\$20–55 billion in assets returning within 180 days."** Protected from US court seizure by sovereign immunity.
- **"Agricultural relief arrived on Day 2, before nuclear steps."** Food and fertilizer licenses issued before HEU moves beyond initial freeze.
- **"No admission of wrongdoing. No reparations conceded."** All reconstruction is investment, not liability.

Instruments of Acceptance

Entry into Force. This Framework enters into force immediately upon signature by authorized representatives of both Parties. No domestic legislative approval is required for the initial 90-day period. The Framework is deposited with the UN Secretary-General upon signature and constitutes a binding international commitment. Each Party selects one Solution (A, B, or C) per Issue and records its selection in the Module Selection Annex attached hereto. All three Emergency Off-Ramps operate automatically regardless of module selection.

Pre-Commitment. Both Parties acknowledge that the deadline of 22 May 2026 represents a final extension window. Signature today prevents kinetic re-escalation. Rejection today triggers consequences neither side can fully control.
