EXECUTIVE SUMMARY

The Ten Hardening Measures
Modular Selection Matrix

PART I: NUCLEAR STABILIZATION (HARDENED)

Issue 1: HEU — IDKEC / PEI / ILMD
Issue 2: Enrichment Moratorium — SEG-20 / TVD-10-20 / PLAE
Issue 3: Underground Sites — DTC / IMIH / SP-BBT
Telemetry-Locked De-Capitation Guarantee

PART II: MARITIME GOVERNANCE (HARDENED)

Issue 4: Strait Vetting — JHTA-PGSA / MSCM / CIE
Issue 5: Abolish Tolls, Establish Shared Safety Levies
Issue 6: Blockade Lifting — CGR / HEU-LBA / REPA

PART III: ECONOMIC NORMALIZATION (HARDENED)

Issue 7: Sanctions Relief — HTT-ATA / SWSM / ISR
Issue 8: Frozen Assets — DSIE / SLCP / IDB-CLC
Issue 9: SWIFT — CBG / RCH / DCTC
Issue 10: No-Fault Infrastructure Credits

PART IV: TREATY DURABILITY (HARDENED)

Issue 11: Hourly Telemetry Timeline
Issue 12: Guarantor Architecture
Issue 13: Regime Fracture Governance
Issue 14: Drone & Missile Pause
Issue 15: HSLF & Agrifood Valve

Executive Summary: The Ten Hardening Measures

THE HARDENING RATIONALE. SPF-2026-v1.0 established a modular architecture with three solutions per issue. However, direct technical review against the White House demands of 17 and 21 May 2026 identified ten structural vulnerabilities that could cause either Party to reject the Framework at the signature table. This v2.0 revision applies ten precision hardening measures to close those gaps.

Hardening Measure 1: Immediate Dual-Key Extraterritorial Custody (IDKEC)

Gap: Co-sovereign HEU custody in Oman still allowed US veto over access, risking Iranian rejection.

Fix: HEU physically flown out of Iran within 72 hours to a fortified facility in Oman. Physical keys held exclusively by Oman-IAEA joint command. Iran holds a legal "veto key" over security logs, preventing covert transfer to third states. Legal title atoms in international escrow.

Hardening Measure 2: Physical Escrow Intermediary (PEI) for Transshipment

Gap: Khamenei's directive that material cannot leave Iran created a constitutional blocker.

Fix: Swiss-administered transshipment escrow at a neutral port. Material physically crosses Iranian border on Day 5 (Trump demand met). Transport vessel legally barred from clearing international waters until Day 10, when blockade reduction triggers are verified by Pakistan and Oman. If US defaults, material is returned under international escort.

Hardening Measure 3: In-Line Mobile Dilution (ILMD) Protocol

Gap: Downblending HEU inside Isfahan left raw material on Iranian soil during processing.

Fix: HEU loaded onto Swiss/Kazakhstan-provided mobile processing vehicles/ships at the border. Material exits sovereign Iranian control immediately. Downblending to LEU happens inside mobile units on a 96-hour accelerated timeline, followed by immediate destruction or removal of remaining compounds.

Hardening Measure 4: Abolish Tolls, Establish Shared Safety Levies (ATSSL)

Gap: Rubio declared any tolling system makes a deal "unfeasible."

Fix: All unilateral PGSA commercial transit tolls and registration fees are permanently abolished. Replaced by a Multilateral Strait Environmental and Safety Levy collected by a joint Omani-Iranian maritime board, denominated in non-dollar, sanctions-exempt currencies. Rubio can declare unilateral tolls killed; Iran retains bureaucratic role.

Hardening Measure 5: Telemetry-Locked De-Capitation Guarantee (TLDG)

Gap: Iranian hardliners view HEU surrender as an invitation for post-handover strikes.

Fix: The moment HEU clears Iranian airspace, an automated telemetry firewall (Switzerland + Pakistan) locks in a 200nm military exclusion zone for US carrier groups and strike aircraft. Violation during the 90-day interim causes instant reversion of escrowed assets to Tehran.

Hardening Measure 6: No-Fault Infrastructure Credits (NFIC)

Gap: Iran demands reparations; Washington rejects liability entirely.

Fix: All liability language eradicated from Part III. Replaced by Strategic Regional Infrastructure Stabilization Credits — international commercial investment pools funded by third-party energy buyers, routed through Omani/Qatari escrow, protected from US court seizure by executive order.

Hardening Measure 7: Hourly Telemetry Triggers (HTT)

Gap: 15-day windows allowed political/media sabotage before steps completed.

Fix: Acute phases broken into synchronized hourly milestones (Hour 00: IAEA seals; Hour 02: sanctions waivers; Hour 06: HEU transport boards; Hour 08: first tranche clears). Zero room for political second-guessing.

Hardening Measure 8: Humanitarian Supply Line Firewall (HSLF) on Day 1

Gap: Iran refused nuclear rollbacks while under active naval blockade.

Fix: Hardcoded Day 1 Carve-Out: US shifts blockade posture to allow verified, continuous UN/Jordan-managed agricultural corridor, activating prior to HEU transport flights. Humanitarian pipeline is fully separated from political negotiations.

Hardening Measure 9: Modular Selection Matrix (MSM) in Executive Preamble

Gap: Grand-bargain indivisibility risked total stall on any single issue.

Fix: Explicit A-B-C Selection Clause in the executive summary. Parties sign master stabilization agreement immediately, while working groups independently select Options A/B/C per module. Disagreement on SWIFT cannot freeze maritime protocols.

Hardening Measure 10: Binding Domestic Narrative Article

Gap: Preamble text is non-binding, allowing public rhetoric to violate deal spirit.

Fix: Domestic Narrative Guidance elevated to a legally binding Article. Both parties formally commit to limiting public pronouncements to pre-vetted, non-provocative formulas. Legally suppresses political grandstanding that could shatter the peace.

The Modular Selection Matrix

ARTICLE MSM: MODULE SELECTION PROTOCOL. This Framework is not an indivisible grand bargain. It is a master stabilization container with fifteen independently selectable modules. Each Party records its selection of Solution A, B, or C for each Issue in the Module Selection Annex. The master agreement binds both Parties to peace and to the execution of all selected modules. No single module disagreement prevents signature or entry into force.

Table 1: Module Selection Matrix (Blank Template)

Issue	Description	US Selects	Iran Selects
1	HEU Stockpile Disposition	A / B / C	A / B / C
2	Enrichment Moratorium Timeline	A / B / C	A / B / C
3	Underground Site Conversion	A / B / C	A / B / C
4	Strait Vetting vs. Freedom of Navigation	A / B / C	A / B / C
5	Transit Fees vs. No-Tolls	A / B / C	A / B / C
6	Naval Blockade Lifting	A / B / C	A / B / C
7	Sanctions Relief Sequencing	A / B / C	A / B / C
8	Frozen Assets Shielding	A / B / C	A / B / C
9	SWIFT Reconnection	A / B / C	A / B / C
10	Infrastructure Credits (No-Fault)	A / B / C	A / B / C
11	Negotiation Timeline	A / B / C	A / B / C
12	Guarantor Architecture	A / B / C	A / B / C
13	Regime Fracture Governance	A / B / C	A / B / C
14	Drone & Missile Pause	A / B / C	A / B / C
15	Agrifood Crisis Valve	A / B / C	A / B / C

Part I: Nuclear Stabilization (Hardened)

Issue 1: HEU Stockpile Disposition — Three Hardened Solutions

Problem: Trump demands complete physical extraction of Iran's 400 kg HEU for destruction. Khamenei has issued a strict directive that HEU must remain under Iranian sovereign control. These are constitutionally irreconcilable without structural innovation.

Solution A (Hardened): Immediate Dual-Key Extraterritorial Custody (IDKEC)

The HEU is physically flown out of Iran within 72 hours of signature by Iranian military C-130 aircraft, escorted by Iranian Revolutionary Guard, to the Islamic Nuclear Materials Custody Facility (INMCF) at Duqm, Oman — a facility constructed to NATO-standard hardening specifications.

Physical Key Architecture: Physical access keys are held *exclusively* by a joint command of Oman and the IAEA. The US receives real-time telemetry and 24-hour advance notice of any access request, but holds no physical key. Iran holds no physical key, but retains a legal "veto key" over the facility's security logs — any unauthorized access pattern triggers automatic Iranian diplomatic protest and Joint Secretariat emergency session.

Legal Title: Legal title to the atoms remains in an international escrow administered by the Swiss Bank for International Settlements. The escrow agreement specifies that material disposition (downblending, reactor fuel conversion, or LEU bank transfer) requires approval by two of three escrow principals (US, Iran, IAEA). No single party can unilaterally redirect the material.

Disposition Timeline: Downblending to LEU commences within 30 days under joint observation, completed within 180 days. Resulting LEU is transferred to Kazakhstan's IAEA LEU Bank at Oskemen. *Trump wins:* material physically leaves Iran within 72 hours and is destroyed. *Iran wins:* material never enters US hands; Iranian guards escort the transport; Iran holds legal veto over disposition.

Solution B (Hardened): In-Line Mobile Dilution (ILMD) Protocol

The HEU is loaded onto specialized, high-security mobile processing vehicles provided by Switzerland and Kazakhstan, positioned at Shahid Rajaei Port, Bandar Abbas. The material physically exits sovereign Iranian control immediately upon loading. The vehicles are sealed by IAEA under real-time telemetry before departure from Iranian customs jurisdiction.

Mobile Processing: Chemical downblending to medical-grade LEU occurs inside these mobile units on a highly accelerated 96-hour timeline, under continuous IAEA mass spectrometry and Omani observer presence. The processing occurs either on board a neutral-flagged vessel in international waters or at the Duqm processing facility. The HEU is never stationary outside controlled environments.

Physical Escrow Intermediary (PEI): A Swiss-administered transshipment escrow protocol governs the entire movement. The transport vessel is legally barred from clearing designated waypoints until Day 10, when US naval blockade reduction triggers are telemetry-verified by Pakistan and Oman. If the US defaults on its blockade reduction commitments, the material is returned to Iranian custody under international escort via the PEI protocol. This guarantees Iran against post-surrender abandonment.

Disposition: The resulting 2,400 kg of LEU is transferred to the IAEA LEU Bank in Oskemen within 14 days of processing completion. All processing waste is dispositioned under IAEA radioactive materials protocols. *Trump wins:* verified destruction of weapons-capable material, physically removed from Iran. *Iran wins:* destruction occurs on Iranian-escorted mobile units under Iranian observation; PEI guarantees return if US defaults.

Solution C (Hardened): Tri-National Custody with Conditional Destruction (TNC-CD)

The HEU is transported to the Al Udeed Nuclear Security Facility in Qatar under a tri-national custody arrangement: US holds digital monitoring keys, Iran holds physical security keys, Qatar holds procedural arbitration keys. All three keys are required for any access. The facility operates under Qatari sovereign jurisdiction with extraterritorial legal status for the custody zone.

Joint Destruction Commission: The HEU remains for 12 months while a Joint Destruction Commission (US, Iran, IAEA, Qatar) determines the optimal disposition pathway. Iran maintains a blocking minority: the US and Qatar together cannot force disposition without Iranian participation. If no decision is reached by Month 12, the material is automatically downblended under IAEA authority.

PEI Overlay: The Physical Escrow Intermediary protocol applies: Qatar serves as the escrow node. Material may not be moved from the facility without 72-hour advance notification to all three key-holders and the Joint Secretariat. If US military action resumes during the escrow period, the PEI protocol triggers automatic material transfer to Oman under IAEA exclusive custody.

Variable sequencing: Iran initiates transport (moves first); Qatar activates facility (second); US connects telemetry (third). Non-symmetrical: each party activates a different system at a different time.

ARTICLE TLDG: Telemetry-Locked De-Capitation Guarantee

Binding Status: This Article is non-derogable and applies regardless of which Solutions are selected for Issues 1–3.

Trigger: The moment HEU material clears Iranian airspace under any selected Solution, the Telemetry-Locked De-Capitation Guarantee auto-activates.

Military Exclusion Zone: An automated telemetry firewall managed by Switzerland (primary) and Pakistan (backup) locks in a 200-nautical-mile military exclusion zone for all US carrier groups, strike aircraft, and offensive military platforms. The zone is defined by GPS coordinates and monitored by a dedicated satellite constellation (Swiss-operated, US-and-Iran-read access).

Violation Consequences: If a US radar signature, transponder, or thermal signature violates this zone during the 90-day interim period, the following consequences activate automatically within 4 hours:

1. Legal custody of all internationally escrowed Iranian assets reverts to Tehran immediately;
2. The enrichment moratorium is suspended, and Iran may resume enrichment to 3.67% without penalty;
3. The Joint Secretariat convenes an emergency session within 24 hours;
4. The violation is reported to the UN Security Council as a breach of the Framework's non-derogable security guarantee.

Verification: The telemetry firewall is maintained by the Swiss Federal Office for Civil Protection, with backup monitoring by Pakistan's Strategic Plans Division. Data is transmitted in real time to Joint Secretariat nodes in Geneva and Muscat, with both US and Iranian read access. The firewall cannot be disabled by either party without triggering the violation protocol.

Termination: The TLDG expires automatically at the end of the 90-day interim period, or upon IAEA certification that all HEU has been downblended and transferred to the LEU Bank, whichever occurs first.

Issue 2: Enrichment Cap and Moratorium Timeline

Problem: US demands 20-year zero-enrichment moratorium. Iran counters with maximum 5-year suspension. Neither position is domestically survivable.

Solution A: Sovereign Energy Guarantee with 20-Year Suspension (SEG-20)

Iran accepts a 20-year moratorium on enrichment above 3.67%, with all enrichment infrastructure placed under IAEA seal. In exchange, the US, Russia, China, and France provide a legally binding, irrevocable guarantee of Iran's entire civilian nuclear fuel supply for Bushehr and all future reactors for the full 20-year period. The guarantee is backed by a \$10 billion fuel supply escrow at the IAEA. If the consortium fails to deliver for 90 consecutive days, the moratorium automatically reduces to 10 years and Iran may resume enrichment to 3.67% immediately. This is an insurance policy the US cannot revoke without triggering Iran's early release.

Solution B: Tiered Variable Duration (TVD-10-20)

Years 1–10: Total enrichment suspension. Zero enrichment above 3.67%; all advanced centrifuges sealed; only Natanz operates at 3.67% with 300 kg cap after Year 5. **Years 11–20:** Iran may enrich to 3.67% at Natanz only, with 500 kg cap, all other sites mothballed. The transition from Tier 1 to Tier 2 requires only IAEA clean certification — not US political approval. Material breach in Years 1–10 triggers 2-year extension per event. Clean compliance beyond Year 8 triggers early Tier 2 review at Iran's request. Trump markets Years 1–10 as a total freeze; Iran markets Years 11–20 as restored enrichment rights. Both statements are factually accurate.

Solution C: Performance-Linked Auto-Extension (PLAE)

Baseline moratorium of 8 years, auto-extending by 2 years per year of IAEA-certified clean compliance, capping at 20 years. If Iran maintains clean compliance for all 12 extension years, the full 20-year window is achieved. If a material breach occurs, extension pauses but does not collapse — the Agreement remains at the currently achieved duration. A Joint Implementation Group (IAEA + Oman + Switzerland) determines compliance, not the US alone. Iran can achieve full 20-year duration through verified behavior, but is not locked into it through a single signature. This converts the timeline dispute from a political decision into a technical one.

Issue 3: Underground Sites — Destruction vs. Preservation

***Problem:** Trump has threatened to "knock out" five underground sites (Fordow, Natanz, Isfahan, and two classified). Iran demands preservation as sovereign infrastructure.*

Solution A: Dual-Track Conversion (DTC)

Fordow + Natanz: Convert to civilian medical isotope production centers under Technical Custody Consortium management (Swiss, Austrian, Omani engineers). Iranian personnel serve as co-pilots. Revenue: Iran 40%, TCC 35%, Global Health Fund 25%. US gets quarterly inspections. **Isfahan + 2 classified sites:** Mothball status under continuous IAEA remote feeds. Centrifuge rotors removed, sealed, stored in UN-monitored facility within Iran. Infrastructure remains intact. Iranian technicians perform removal. Sites may be restored to low-enrichment civilian fuel production only if successor framework is not reached by Year 15, subject to 30-day IAEA notification. Non-symmetrical: different tracks, different timelines, different verification intensities.

Solution B: International Medical Isotope Hub (IMIH)

All five sites become components of a Regional Medical Isotope Production Network. Fordow: primary production center for molybdenum-99 and iodine-131. Natanz: nuclear research and training campus. Isfahan: consolidated HEU storage (pre-destruction) plus safeguards training. The two classified sites: geophysical research stations with no fissile material. Iranian scientists lead major research programs. Annual revenue of ~\$300M shared: Iran 45%, operational consortium 40%, global health fund 15%. This transforms Iran's nuclear complex from a military liability into a revenue-generating scientific asset with Iranian intellectual leadership.

Solution C: Sealed Preservation with Black-Box Telemetry (SP-BBT)

All five sites remain physically intact but sealed under multi-layered containment. Centrifuges placed in "warm idle" — climate-controlled, maintained, not dismantled — under IAEA seal. Black-box sensors continuously record operational parameters and transmit encrypted data to IAEA nodes in Vienna and Geneva. Any anomaly triggers automatic alert within 15 minutes. Sensors cannot be disabled without triggering Tier 2 breach. Every 90 days, IAEA inspectors conduct seal integrity verification. A light blockchain log (Swiss and Omani nodes only) creates immutable verification history. Year 15 review determines conversion or continued preservation. "Preservation" satisfies Iran's infrastructure demands; "sealed telemetry" satisfies US verification requirements.

Part II: Maritime Governance & the PGSA (Hardened)

Issue 4: Strait Vetting vs. Freedom of Navigation

Problem: *IRGC Navy enforces de facto transit controls under the PGSA. Rubio has stated PGSA tolling makes a deal "unfeasible."*

Solution A: Joint Hormuz Transit Authority with PGSA Integration (JHTA-PGSA)

The PGSA is formally integrated into a Joint Hormuz Transit Authority as Iran's designated operational implementation body for transit coordination within Iranian territorial waters. The PGSA retains its Iranian statutory authority but exercises it under JHTA Council oversight. All PGSA transit permits bear dual branding: PGSA-Iran and JHTA-Authorized. The JHTA Council has 6 seats: Iran (co-chair, alternating), US (co-chair, alternating), Oman (Secretariat host), GCC rotating member, EU observer, China observer. Routine decisions require 3 affirmative votes from permanent members. Joint Transit Coordination Cells at Bandar Abbas (PGSA HQ), Khasab (Oman), and a floating platform at the Strait midpoint. JTCCs do not stop, board, or search vessels — purely coordinative. Vessels receive a Universal Transit Certificate from the JHTA Secretariat in Muscat.

Solution B: Maritime Safety Coordinator Model (MSCM)

The PGSA is rebranded as a "Persian Gulf Maritime Safety Coordination Office" — a safety and information body, not a tolling or regulatory authority. Its functions are limited to: publishing daily navigational safety bulletins; coordinating emergency search-and-rescue; operating a 24/7 maritime distress hotline; sharing weather and traffic data. The PGSA has *no authority* to issue transit permits, levy fees, or deny passage. Transit rights governed exclusively by UNCLOS Article 37 and JHTA safety protocols. All vessel vetting conducted by the JHTA Secretariat in Muscat against neutral criteria. Israeli-flagged vessels receive the same UTC as any other vessel. *Iran wins:* PGSA retains institutional existence and Bandar Abbas HQ. *US wins:* PGSA cannot restrict, tax, or deny transit.

Solution C: Cooperative Information Exchange (CIE)

No joint authority replaces the PGSA. A Cooperative Information Exchange protocol requires Iran and the US to share AIS transponder data, patrol schedules, and distress response plans through the Omani Maritime Coordination Cell in Muscat. Both navies operate independently but with full transparency. The PGSA continues to issue advisory notices (non-binding) to vessels transiting Iranian territorial waters. The US 5th Fleet issues parallel Notices to Mariners for international waters. Vessels may reference either or both. No permits required. No fees collected. The two systems operate in parallel, competing for vessel compliance through service quality rather than authority. The most sovereignty-preserving model: neither side surrenders unilateral authority.

Issue 5 (Hardened): Abolish Tolls, Establish Shared Safety Levies (ATSSL)

Problem: Iran and Oman negotiate a permanent toll system. Trump declared: "We don't want tolls." Rubio stated tolling makes a deal "unfeasible." Reports indicate vessels have paid up to \$2M per transit in Chinese yuan.

ARTICLE ATSSL: PERMANENT TOLL ABOLITION AND SAFETY LEVY ESTABLISHMENT. All unilateral commercial transit "tolls," fees, and financial registration requirements levied by the PGSA or any Iranian state entity are permanently abolished under this Framework. No vessel shall be required to pay any fee, toll, or charge to any Iranian entity as a condition of transit through the Strait of Hormuz.

Solution A: Multilateral Strait Environmental and Safety Levy (MSESL)

The PGSA toll is replaced by a Multilateral Strait Environmental and Safety Levy collected not by Iran, but by the Joint Omani-Iranian Maritime Board operating under JHTA authority. The Levy is denominated exclusively in non-dollar, sanctions-exempt currencies (primarily Omani rial and euro) to avoid US sanctions exposure. Funds are pooled in the International Maritime Safety Fund at the Central Bank of Oman. Revenue allocation: 35% to Iranian Civilian Reconstruction (managed through PGSA oversight as a budgetary line, not a toll), 35% to joint patrol/mine clearance/navigation aids, 20% to JHTA Operations, 10% to US Naval Cost-Recovery payments to the US Treasury. *Rubio wins:* unilateral PGSA tolls are dead. *Iran wins:* 35% revenue share through institutionalized board membership; PGSA retains a role in fund allocation oversight.

Solution B: Voluntary Risk-Mitigation Contribution (VRMC)

No mandatory levy exists. A voluntary contribution system: vessels that pay a Risk-Mitigation Contribution receive insurance premium discounts via Lloyd's of London partnership, fast-track transit processing, and priority distress response. Non-contributors transit freely without penalty, benefits, or delay. The VRMC is administered by Lloyd's and the Omani Sovereign Wealth Fund — not by Iran. A \$20 billion reinsurance backstop (US DFC \$10B + Lloyd's \$5B + Oman \$5B) activates upon JHTA certification of 200 authorized transits. Revenue funds the International Maritime Safety Fund exclusively — no Iranian state revenue. This is a fully market-based solution with no government tolling.

Solution C: Port Services Fee Architecture (PSFA)

No transit tolls are levied. Iran charges only for specific, legitimate coastal state services under UNCLOS: pilotage, tug assistance, emergency response, weather routing, and marine pollution prevention. These are standard, internationally recognized services rendered to vessels *choosing* to use them. Services are voluntary and competitively priced. Revenue flows to the Iranian Ports and Maritime Organization (civilian entity), not the IRGC or PGSA. This decouples Strait transit rights from Iranian revenue while allowing Iran to monetize legitimate maritime services. A published fee schedule, reviewed quarterly by independent maritime economists, ensures full transparency.

Issue 6: Lifting the US Naval Blockade

Problem: CENTCOM enforces a crippling naval blockade. Iran considers it a ceasefire violation. Washington maintains blockades as leverage until HEU extraction and open-access Strait rules are executed.

Solution A: Conditional Graduated Reduction (CGR)

The blockade reduces in five phases, each triggered by verified Iranian compliance: **Phase 1 (Day 1):** Iran freezes enrichment above 60%. US exempts humanitarian and agricultural vessels from blockade. **Phase 2 (Day 7):** Iran opens Hormuz to JHTA-authorized humanitarian transit at zero cost. US reduces blockade intensity by 50% for non-military cargo. **Phase 3 (Day 14):** Iran consolidates HEU under chosen custody solution. US suspends aerial surveillance over Iranian waters. **Phase 4 (Day 21):** Iran transfers PGSA checkpoint control to JHTA. US withdraws carriers to 200nm. **Phase 5 (Day 30):** Full blockade lift, JHTA assumes authority. *Non-symmetrical:* Iran moves first at every phase. US responds after verification. Completed steps are ratcheted forward, not reversed.

Solution B: HEU-Linked Blockade Architecture (HEU-LBA)

Blockade lifting is mechanically linked to HEU extraction progress. The blockade remains in full force until IAEA confirms HEU is under custody under the selected Solution A/B/C from Issue 1. Once custody is confirmed, the blockade lifts 75% immediately, with the remaining 25% lift tied to the HEU physically departing Iranian territory (or being certified as downblended). During the custody-to-extraction window (Days 1–30), humanitarian and agricultural vessels are exempted. Full petroleum and commercial blockade remains until extraction milestone. This gives Trump direct linkage between his core demand (HEU out) and the blockade lift. It gives Iran a clear, predictable pathway: complete the custody protocol, and the blockade begins dissolving.

Solution C: Reciprocal Economic Port Access (REPA)

The US lifts the blockade in exchange for Iran granting US-flagged and US-linked vessels priority transit status through Hormuz (priority processing, guaranteed 24-hour transit window, dedicated coordination channel). Both sides gain visible economic benefits: Iran's ports reopen to global commerce immediately; US vessels receive commercially valuable transit guarantees. The arrangement is revenue-positive: US shipping companies pay standard JHTA fees (not Iranian tolls) for priority service, generating revenue for the International Maritime Safety Fund. Iran gains port revenue and customs duties. Blockade lifts on Day 3; priority access for US vessels activates simultaneously. If Iran denies priority access, blockade reactivates automatically.

Part III: Economic Normalization (Hardened)

Issue 7 (Hardened): Sanctions Relief — Hourly Telemetry Triggers

Problem: Iran demands immediate blanket lifting of all secondary sanctions. The US refuses to yield leverage before compliance. 15-day windows allow political/media sabotage.

ARTICLE HTT: HOURLY TELEMETRY TRIGGER ARCHITECTURE. For the acute phase (Days 1–14) of the Security and Prosperity Framework, all implementation milestones are broken into synchronized hourly triggers. Each trigger is telemetry-verified by the Joint Secretariat before the next trigger activates. This leaves zero room for political second-guessing.

Solution A (Hardened): Hourly Telemetry Trigger — Asymmetric Tranche Architecture (HTT-ATA)

Relief delivered in deliberately unequal tranches with hourly verification gates: **Pilot (Hour 02, Day 1):** \$250M humanitarian (medicine, food, aviation safety) — irreversible, triggered by IAEA seal confirmation on Fordow cascades. **Tranche 1 (Hour 08, Day 7):** \$5B to escrow; civilian aircraft parts; agricultural goods — triggered by HEU under IDKEC/ILMD/TNC custody and OLEM freeze confirmation. **Tranche 2 (Hour 12, Day 30):** Petroleum sales authorized; \$15B escrow release — triggered by 30 days clean compliance. **Tranche 3 (Day 90):** Petrochemical exports; metals trade — 30-day hold only. **Tranche 4 (Day 180):** Automotive, textiles, general commercial license. **Tranche 5 (Day 365):** Full secondary sanctions lift; SWIFT normalization. *Non-symmetrical:* Early tranches are large and irreversible (Iran benefits fast); late tranches are conditional (US retains leverage).

Solution B: Swap-Window Sanctions Model (SWSM)

Every 15 days, a "swap window" opens. Iran delivers a verified physical milestone (centrifuge sealed, HEU moved, site opened). The US delivers a matched sanctions relief micro-package (specific sector license, specific bank authorized, specific export category cleared). Both sides pre-commit to a published menu of 12 milestones and 12 relief packages at signature. Milestone 1 triggers Relief 1 automatically. If Iran delivers Milestone 7 but the US delays Relief 7 beyond 48 hours, Oman's escrow fund automatically releases a \$500M bridge payment to Iran, recouped from the US later. This creates automaticity that removes human political judgment from each step.

Solution C: Indexed Sanctions Relief (ISR)

Sanctions relief is indexed to a Compliance Index (CI) calculated monthly by the Joint Secretariat. The CI comprises 10 objective indicators (IAEA seal integrity, enrichment levels, site access, Hormuz transit openness, etc.), each scored 0–10. Maximum CI = 100. At CI 20: humanitarian licenses. CI 40: petroleum exports. CI 60: banking reconnection. CI 80: SWIFT Phase 2. CI 100: full normalization. Both sides know exactly what score unlocks what relief. Spoilers cannot derail the process because scoring is automated against published criteria. If CI drops, relief rolls back one tier (not total collapse).

Issue 8: Frozen Assets Shielding & Liquidation

Problem: Iran demands unfreezing ~\$100B in frozen assets to halt currency collapse. US requires performance reserves. American court judgments threaten seizure.

Solution A: Dual-Tier Sovereign Immunity Escrow (DSIE)

Assets transferred to Central Bank of Oman, designated "diplomatic escrow funds" protected by sovereign immunity and a UNSC resolution. **Tier A (55% — \$55B):** Released to Iranian civilian control per tranche schedule. Administered by World Bank with Iranian programmatic input. Eligible for civilian infrastructure, healthcare, education, environmental remediation. Auto-exclusion for IRGC-linked entities. **Tier B (45% — \$45B):** Held until Year 2. Released only upon IAEA sustained compliance certification. If material breach occurs, Reserve converts to "Regional Stability Fund" administered by Oman for Gulf reconstruction — including projects inside Iran via UN agencies. Iran never receives direct control of Reserve but benefits regardless. The Sovereign Immunity Shield protects from US court seizure. *Trump:* 45% held. *Iran:* \$55B flows within 180 days.

Solution B: Structured Liquidation with Counterparty Protection (SLCP)

Frozen assets liquidated in tranches against specific, pre-negotiated Iranian commitments. Each tranche release requires: (1) IAEA verification of milestone; (2) Joint Secretariat approval; (3) counterparty bank guarantee from Oman's central bank. Iranian funds can only be used for purchases from a pre-approved "Green Corridor" list (medicine, food, agricultural equipment, civilian aviation parts, renewable energy). Iranian banks independently audited quarterly by Deloitte or PwC. Any diversion to IRGC or military triggers immediate freeze of the next three tranches. Counterparty protection ensures US-sourced goods flow to Iran, creating American commercial beneficiaries who become domestic lobbies for continued engagement.

Solution C: Islamic Development Bank Credit-Line Conversion (IDB-CLC)

Frozen assets converted into a revolving credit line at the Islamic Development Bank, with Oman as operational node. Iran draws against the credit line for approved civilian imports. The IDB processes all transactions, screens all recipients, reports monthly to the Joint Secretariat. Three advantages: (1) frozen assets never become liquid cash in Iranian hands — always intermediated through IDB; (2) IDB's Shariah-compliant framework is domestically acceptable in Iran; (3) credit line denominated in a basket of currencies (40% euro, 30% yuan, 20% riyal, 10% rupee), insulating Iran from dollar dependency while avoiding direct US banking exposure. Maximum 25% (\$25B) available in Year 1; remainder in 10% annual increments contingent on compliance.

Issue 9: SWIFT Reconnection

Problem: *Iran's total SWIFT disconnection paralyzes its commercial sector. US demands verified non-diversion before full reconnection.*

Solution A: Consolidation-Bank Gateway (CBG)

A single designated "consolidation bank" — the Oman-Iran Reconstruction Bank — receives limited SWIFT connectivity for defined categories: humanitarian imports, petroleum sales to pre-approved customers, agricultural inputs. All transactions pre-cleared by a compliance monitor (Deloitte/PwC) and screened against sanctions lists in real time. Graduated expansion: Month 3 — second tranche of clean-record private banks. Month 6 — state-owned banks. Month 12 — all banks except terrorism-designated institutions. If IAEA identifies Tier 2 compliance concern, SWIFT holds for 14 days; unresolved, rolls back exactly one tier. Tier 1 technical disputes do not trigger the fuse.

Solution B: Regional Clearing House (RCH)

Instead of direct SWIFT reconnection, Iran connects to a new Regional Clearing House in Muscat under Omani central bank supervision. The RCH clears Iranian trade with Asia, Africa, and Europe through correspondent relationships with Omani, Qatari, and Turkish banks. US banks are not involved. European banks connect voluntarily. The RCH operates on its own messaging standard (interoperable with SWIFT but independent). This gives Iran functional banking connectivity without touching US-controlled SWIFT infrastructure. Over time (18–36 months), if compliance is sustained, the RCH can be bridged to SWIFT through Omani and Qatari correspondent banks.

Solution C: Digital Currency Trade Corridor (DCTC)

Iran's trade cleared through a central bank digital currency (CBDC) corridor operated by Oman's central bank. The digital rial is minted against verified Iranian petroleum exports and can be used to purchase goods from a whitelist of international vendors. Settlement is instant, transparent, and recorded on a permissioned blockchain managed by the Bank for International Settlements and Oman's central bank. US regulators receive read-only access. This bypasses SWIFT entirely while providing complete transaction transparency. By Year 3, if compliance is sustained, the DCTC can be bridged to SWIFT through Oman.

Issue 10 (Hardened): No-Fault Infrastructure Credits

***Problem:** Iran demands US-funded war reparations for infrastructure damage since February. Trump flatly rejects reparations. Neither side can politically accept the other's framing.*

ARTICLE NFIC: LIABILITY EXCLUSION AND INFRASTRUCTURE CREDIT FRAMEWORK. All references to liability, reparations, damages, war compensation, or fault are permanently excluded from this Framework and from all associated implementing documents. No Party admits wrongdoing, causation, or legal responsibility for any act or event preceding the entry into force of this Agreement.

Solution A: Strategic Regional Infrastructure Stabilization Credits (SRISC)

The International Gulf Reconstruction Fund (IGRF) is established under sovereign immunity in Oman, managed by the World Bank. Funding: \$30B from Iranian frozen assets (Iran's own money) released through the DSIE mechanism, plus voluntary contributions from Gulf states, the EU, and development banks. The US contribution is technical assistance (USACE engineering, USAID programming, NRC nuclear safety expertise) and development finance guarantees — not direct cash. Credits are funded by third-party buyers of Iranian energy, routed through Omani/Qatari escrow networks, and protected from US domestic court seizures by explicit executive orders. The label is "Regional Infrastructure Stabilization Credits," not reparations, not aid, but international commercial investment in regional stability. Both leaders can claim victory: Trump did not pay reparations; Khamenei secured \$30B in reconstruction for Iran.

Solution B: Joint Infrastructure Partnership (JIP)

Iran and the US establish a Joint Infrastructure Partnership as a for-profit commercial entity registered in Dubai International Financial Centre. Iran contributes land, labor, and 40% capital; international investors (including US pension funds via UAE sovereign wealth intermediaries) contribute 60% capital. The JIP rebuilds Iranian civilian infrastructure (ports, power grids, water treatment) as commercial projects with equity returns. US investors earn returns on Iranian reconstruction without any government payment. Iran receives rebuilt infrastructure without US reparations. The arrangement is a commercial partnership, not a diplomatic concession. All contracts enforceable under English law in DIFC courts.

Solution C: Environmental Remediation Credit (ERC)

The US does not pay reparations for military damage. Instead, it commits to funding environmental remediation of the Persian Gulf ecosystem through a standalone Environmental Trust administered by UNEP. The Trust addresses oil spills, depleted uranium contamination, marine habitat destruction, and air quality — damage caused by both sides during the conflict. Iran receives substantial environmental cleanup (valued at \$8–12B) without any US admission of liability. The US funds ecological recovery in a region where it has strategic interests, without acknowledging causation. Marine scientists, not politicians, administer the Trust. Iran benefits from cleaner coastlines and fisheries; the US benefits from regional stability and reduced environmental migration pressure.

Part IV: Treaty Durability & Regional Architecture (Hardened)

Issue 11 (Hardened): Hourly Telemetry Timeline

Problem: The ceasefire is highly fragile. Trump says he will give diplomacy only "a few days." 30-day windows have collapsed because both sides treat them as ultimatums.

Solution A (Hardened): Hourly Telemetry Trigger Protocol (HTT-180)

An open 180-day timeline with variable-length steps and synchronized hourly milestones for the acute phase (Days 1–14). Each milestone is telemetry-verified by the Joint Secretariat before the next trigger activates. Steps are not synchronized between domains — nuclear steps move on their own clock, maritime steps on theirs, economic steps on theirs. Each domain's timeline advances or pauses independently. There is no single "deadline" that kills the entire Framework. Step 1: Days 1–3 (freeze enrichment). Step 2: Days 4–14 (HEU custody). Step 3: Days 15–30 (JHTA operational). Step 4: Days 31–60 (petroleum exports). Step 5: Days 61–90 (SWIFT Phase 1). Step 6: Days 91–180 (successor framework). *Non-symmetrical:* each step has its own duration, trigger, and verification standard.

Solution B: Perpetual Auto-Renewal Protocol (PARP)

The Framework has no fixed end date. It auto-renews every 90 days unless either Party issues a 30-day non-renewal notice. Each 90-day cycle has its own micro-agenda (Cycle 1: ceasefire + humanitarian; Cycle 2: HEU custody + blockade reduction; Cycle 3: sanctions relief + SWIFT). If a cycle fails, the Framework reverts to the last successfully completed cycle and retries with modified terms. There is no "failure" state — only reverting to a known-good configuration and retrying. Both leaders can tell domestic audiences: "We did not sign a permanent deal; we signed a 90-day review mechanism."

Solution C: Rolling 14-Day Sprint Model (R14SM)

The entire Framework is broken into 14-day sprints. At the end of each sprint, the Joint Secretariat publishes a Sprint Report: what was delivered, what was not, what adjustments are needed. Both Parties approve the next sprint's scope or invoke the Step-Back Protocol. Sprints create momentum through visible deliverables every two weeks. If three consecutive sprints fail to produce deliverables, the Emergency Reconstitution Protocol (Off-Ramp Gamma) auto-activates. Each sprint has a named objective ("Sprint Alpha: HEU Freeze," "Sprint Bravo: Hormuz Open," etc.), creating media-visible milestones.

Issue 12: Guarantor Architecture

Problem: *Neither side believes the other will honor a signed document. The trust deficit is structural.*

Solution A: Distributed Guarantor Matrix (DGM)

Different domains have different guarantors — no single referee. **Nuclear:** IAEA (Vienna) primary, Switzerland backup. **Maritime:** Oman (Muscat) primary, Pakistan backup. **Financial:** Switzerland (Geneva) primary, Qatar backup. **Political:** UN Under-Secretary-General primary, EU High Representative backup. No single guarantor's incapacity suspends Framework operations. The Joint Secretariat comprises two senior officers from each Party, one neutral chair rotating among Oman/Switzerland/Pakistan, one IAEA liaison, one UN observer. Decisions require consensus of the two Party officers plus the neutral chair.

Solution B: Mutual Hostage Guarantees (MHG)

Each Party deposits a "hostage asset" at signature that is forfeited to the other upon material breach. **US hostage:** \$5 billion in a Swiss escrow, released to Iran if the US unilaterally reimposes sanctions without Joint Secretariat cause finding. **Iranian hostage:** 50% of its HEU stockpile (already under IAEA seal), transferred to the IAEA LEU Bank if Iran unilaterally restarts enrichment above 3.67% without Joint Secretariat authorization. Both hostages are released only upon Framework completion or mutual consent. The escrow is managed by Switzerland under a pre-agreed algorithm — no political judgment required.

Solution C: International Arbitration Tribunal (IAT)

A dedicated US-Iran Arbitration Tribunal is established at The Hague under the Permanent Court of Arbitration. Composed of 5 arbitrators: each Party appoints one; three neutral arbitrators appointed by the UN Secretary-General (one), the IAEA Director-General (one), and the Omani Foreign Minister (one). Tribunal decisions are final and binding. A \$2 billion enforcement fund is established at signature: \$1B from US frozen asset releases, \$1B from Iranian petroleum pre-sales. The fund pays compensation to the prevailing party. The Tribunal operates under expedited procedures: decisions within 120 days.

Issue 13: Regime Fracture Governance

Problem: *Intense ideological fractures within Tehran's leadership mean automated triggers can be derailed by hardliners. US officials have highlighted these rifts as a core risk.*

Solution A: Procedural Step-Back Protocol (PSBP)

Any Party may invoke a 14-day "cooling period" for any provision without triggering breach status. During cooling: ceasefire auto-renewal continues; humanitarian operations continue; IAEA monitoring continues; all other modules continue executing. A Party may invoke cooling up to three times per year without explanation. This prevents hardline spoilers from weaponizing technical disputes into crises. The 14-day window is long enough to manage internal politics but short enough to prevent indefinite stalling.

Solution B: Dual-Channel Governance (DCG)

Two parallel governance channels: the **Technical Channel** (IAEA, Swiss Financial Cell, Omani Maritime) handles verification, compliance scoring, and routine operations — fully automated, no political intervention. The **Political Channel** (foreign ministers, National Security Council equivalents) handles strategic decisions, dispute resolution, and escalation management. Technical disputes never reach the Political Channel unless both Parties agree. Political disputes never affect Technical Channel operations. Hardliners can fight in the Political Channel while the Technical Channel continues delivering results.

Solution C: Internal Coalition Management Fund (ICMF)

A \$2 billion "Coalition Stabilization Fund" helps Iranian moderates manage internal political costs of compliance. The Fund provides targeted economic benefits to Iranian constituencies most affected by nuclear compromise: enrichment facility workers receive retraining grants; hardline provincial governors receive infrastructure projects; IRGC-affiliated pensioners receive enhanced benefits. All disbursements routed through the World Bank to avoid direct US-Iran cash flows. The US contributes \$500M (technical assistance equivalent); Gulf states contribute \$1B; Iran contributes \$500M from frozen asset releases. The Fund operates transparently, audited by Ernst & Young.

Issue 14: Drone & Missile Program Reconstitution

Problem: Intelligence indicates Iran is rapidly reconstituting drone and missile capabilities during the ceasefire. US wants strict limitations; Iran declares these programs non-negotiable on the nuclear table.

Solution A: Deployment Pause with Industrial Grandfathering (DPIG)

Iran commits not to deploy drones or missiles against US or allied interests during the 180-day period. Iran does not commit to halting production or research — this is a *deployment pause*, not an industrial freeze. In exchange, the US refrains from targeting Iranian drone or missile manufacturing facilities. Verification: satellite thermal imaging monitors known launch sites, not factories. Any detected deployment preparation triggers a 48-hour consultation, not automatic breach. This distinction — deployment vs. production — creates a workable firewall. Iran preserves its sovereign industrial base; the US gains force protection assurance.

Solution B: Range-Cap Protocol (RCP)

Iran agrees to cap missile range at 2,000 km for 24 months. Missiles above this range are mothballed (not destroyed) under IAEA-style seal. Iranian production of sub-2,000 km missiles continues unrestricted. This cap covers missiles capable of reaching Europe but preserves Iran's regional deterrence. Verification: mobile IAEA-like teams conduct random inspections. Sealed missiles tagged with GPS-enabled tamper sensors. In exchange, the US commits to not deploying additional missile defense systems in the Gulf during the 24-month period.

Solution C: Transfer Transparency Regime (TTR)

Iran does not limit production, range, or research. Instead, Iran commits to full transparency on all transfers: any drone or missile export to any third party requires 14-day advance notification to the Joint Secretariat. The Secretariat maintains a public Transfer Registry. Any unregistered transfer is treated as a Tier 2 breach. This addresses the US concern about Iranian proliferation to proxies without constraining Iran's sovereign defense programs. The TTR applies only to cross-border transfers; domestic deployment and testing are not regulated.

Issue 15 (Hardened): Humanitarian Supply Line Firewall & Agrifood Valve

Problem: Strait closure has choked off one-third of global fertilizer supply. Iran faces severe food insecurity, rolling blackouts, and currency collapse. Iran's leadership refuses nuclear rollbacks while under active naval blockade, viewing it as negotiating under starvation.

Solution A (Hardened): Humanitarian Supply Line Firewall (HSLF) + Immediate Agricultural Release

ARTICLE HSLF: HUMANITARIAN SUPPLY LINE FIREWALL. The humanitarian and agrifood pipeline is fully separated from the broader sanctions and nuclear negotiations. This is a non-derogable, Day 1 Carve-Out. Within 12 hours of signature, the US shifts its naval blockade posture specifically to allow a verified, continuous corridor for agricultural machinery, fertilizers, and grain shipments managed by the UN World Food Programme and the Jordanian Hashemite Charity Organisation. The HSLF operates through Aqaba (Jordan) and Bandar Abbas (Iran) ports under UN flag protection. Vessels in the HSLF transit the Strait of Hormuz at zero cost, zero inspection, with 4-hour guaranteed processing. Simultaneously, the US issues OFAC general licenses for: wheat, rice, fertilizer, and agricultural machinery exports to Iran; Iranian petrochemical exports (fertilizer feedstock); and LPG exports for Iranian food processing. An Oil Export Price Floor Guarantee activates: if Brent crude falls below \$65/barrel during the first 90 days of Iranian oil exports, the escrow supplements the difference up to \$15/barrel. The Floor is funded by a 2% levy on JHTA safety levies during the guarantee period. Iran receives immediate agricultural relief *before* delivering nuclear milestones beyond the initial 72-hour freeze.

Solution B: Global Fertilizer Corridor (GFC)

A dedicated "Green Lane" through Hormuz exclusively for fertilizer, grain, and agricultural input vessels. The GFC operates under WHO/FAO joint administration, completely insulated from the broader political Framework. Vessels transit Hormuz at zero cost, zero inspection, with 6-hour guaranteed processing. Funded by a \$1 billion international consortium (US \$300M, EU \$300M, China \$200M, India \$200M) administered by the FAO. Iran receives port fees and handling revenue for GFC vessels. Creates an immediate, visible global benefit: lower fertilizer prices worldwide. Farmers in Iowa, Punjab, and Sao Paulo all benefit, creating domestic constituencies for Framework survival in multiple countries.

Solution C: Iranian Food Security Compact (IFSC)

A bilateral US-Iran Food Security Compact addressing Iran's immediate humanitarian needs through a structured 12-month program. Month 1–3: Emergency food and medicine shipments (US-funded, UN-delivered, \$500M). Month 4–6: Agricultural machinery and fertilizer (US-export licenses, Iranian payment via escrow). Month 7–9: Cold chain infrastructure and grain silos (joint US-Iranian technical cooperation). Month 10–12: Irrigation modernization and drought-resistant seed program. Managed by the FAO and USAID, not by diplomats. Technical teams make day-to-day decisions. Creates American agricultural exporters as stakeholders in Iran's stability.

Binding Domestic Narrative Article

ARTICLE BDN: BINDING DOMESTIC NARRATIVE COMMITMENTS

Legal Status: This Article is binding and enforceable under the Framework's dispute resolution mechanisms. Violation constitutes a Tier 1 breach subject to Step-Back Protocol invocation.

ARTICLE BDN.1: Both Parties formally commit to limiting their public pronouncements, official statements, state-media characterizations, and diplomatic communications regarding this Framework to the pre-vetted, non-provocative formulas outlined in this Annex. Neither Party shall make public statements that contradict, undermine, or disparage the other's selected modules or the Framework's core architecture.

ARTICLE BDN.2 — US Authorized Formulas: The United States may publicly characterize the Framework as achieving: (a) "the total physical elimination of the near-weapons-grade threat from Iranian territory"; (b) "a twenty-year enrichment freeze deeper than any prior agreement"; (c) "freedom of navigation without tolls to Iran"; (d) "blockade maintained until verified compliance"; (e) "no reparations paid by the United States"; (f) "performance-based asset release with majority held in reserve." The US shall not publicly characterize the Framework as: (i) a surrender by Iran; (ii) unconditional US concession; (iii) permanent Iranian disarmament.

ARTICLE BDN.3 — Iranian Authorized Formulas: The Islamic Republic of Iran may publicly characterize the Framework as achieving: (a) "total preservation of NPT enrichment rights with guaranteed resumption"; (b) "the HEU never entered American hands"; (c) "the illegal blockade terminated"; (d) "PGSA recognized as co-chair of the Strait authority"; (e) "sovereign assets returning with protection from seizure"; (f) "humanitarian relief delivered before political concessions." Iran shall not publicly characterize the Framework as: (i) capitulation to US demands; (ii) abandonment of the nuclear program; (iii) acceptance of foreign domination.

ARTICLE BDN.4 — Enforcement: The Joint Secretariat monitors public statements by both Parties against these formulas. A formal finding of narrative violation by either Party triggers the Step-Back Protocol (14-day cooling period). Three narrative violations in any 90-day period triggers Joint Secretariat emergency session and potential Compliance Index adjustment. Neither Party's authorized formulas may be challenged by the other as factually incorrect, as each formula is designed to be simultaneously true from its issuer's perspective.

ARTICLE BDN.5 — Surviving Collapse: The Binding Domestic Narrative Article survives total Framework suspension for 180 days. Even if all other modules are frozen, both Parties remain bound to refrain from inflammatory public rhetoric that could preclude future re-engagement.

Annex A: Economic Incentive Matrix

Table 2: What the United States Gains

Priority	Deliverable	Timeline	Political Value
HEU Extraction	400 kg physically removed or destroyed within 72 hours; real-time telemetry	Day 3–5	Historic non-proliferation victory
20-Year Moratorium	Zero enrichment above 3.67% for 20 years (or auto-extending 8–20)	Day 1	Deeper freeze than JCPOA ever achieved
Single Facility	Natanz only operational; all others converted or mothballed	Day 30	Breakout capability eliminated
No PGSA Tolls	Unilateral tolls permanently abolished; no Iranian fee authority	Day 7	Rubio can declare tolls killed
Naval Cost Recovery	10% of MMMF revenue flows to US Treasury for patrol costs	Day 30	Deal is revenue-positive for US
Asset Reserve	45–75% of frozen assets held until Year 2+ compliance	Year 2	Performance leverage preserved
No Reparations	US pays zero war compensation; all support is commercial/technical	Immediate	No admission of liability
Drone Pause	Deployment pause for 180 days; thermal monitoring active	Day 1	Force protection window
TLDG Security	200nm exclusion zone; automated telemetry firewall	Day 5	Iranian hardliners deterred from cheating

Table 3: What Iran Gains

Priority	Deliverable	Timeline	Political Value
Sovereignty Preserved	HEU never enters US hands; Iranian guards escort; Iran holds legal veto	Day 3–5	Khamenei's red line respected
NPT Rights	3.67% enrichment resumes Year 10–11; full rights by Year 16–20	Year 10+	Enrichment not surrendered, only suspended
PEI Guarantee	Material returned if US defaults on blockade reduction	Day 5–10	Insurance against post-surrender abandonment
PGSA Recognized	PGSA integrated as JHTA operational body; co-chairmanship	Day 14	Institutional victory
Blockade Lifted	CENTCOM blockade dissolved; ports reopened; trade resumes	Day 7–30	Economic suffocation ends
Assets Released	\$20–55B in frozen assets within 180 days; protected from seizure	Day 7–180	Currency stabilization
HSLF on Day 1	Humanitarian corridor opens before HEU transport; food on Day 2	Day 1	No negotiation under starvation
Reconstruction	\$8–30B in infrastructure credits (no-fault framing)	Month 3–12	Infrastructure rebuilt without US liability
Binding Narrative	US legally constrained from inflammatory rhetoric	Day 1	Political face preserved

Annex B: Hourly Telemetry Trigger Schedule (Acute Phase)

ARTICLE HTT.SCHED: HOUR-BY-HOUR IMPLEMENTATION PROTOCOL. The following schedule governs the acute phase (Days 1–3). Each trigger is telemetry-verified by the Joint Secretariat before the next trigger activates. No trigger may be skipped or accelerated without unanimous Joint Secretariat approval.

Table 4: Day 1: The Security Freeze and HSLF Activation

Hour	Iranian Action	US Action	Verification
H00	Freeze all enrichment above 60%; IAEA seals placed on Fordow cascades	Telemetry link activated; Swiss/Pakistani monitoring online	IAEA seal confirmation + telemetry handshake
H02	Confirm cascade shutdown; OLEM freeze verification transmitted	\$250M humanitarian tranche released to Swiss escrow; OFAC ag export licenses issued	Swiss Cell confirms credit clearance
H04	IRGC fast-attack craft withdraw to 5nm anchorage; AIS transponders activated	Blockade posture shifted: HSLF corridor authorized; UN/Jordanian flagged vessels exempted	Omani naval observers confirm; Lloyd's List AIS
H06	HEU transport aircraft boards at Isfahan; Iranian Guard escort confirmed	Suspend new sanctions designations; freeze OFAC enforcement actions	Pakistani satellite confirmation of aircraft movement
H08	First HSLF vessel (UN-flagged grain carrier) cleared through Hormuz at zero cost	Release \$5B to Oman escrow; civilian aircraft parts general license	WHO transit logs + Omani port authority
H12	HEU aircraft clears Iranian airspace; TLDG auto-activates	200nm military exclusion zone confirmed; carrier strike groups acknowledge	Swiss telemetry firewall confirms lock; Pakistani backup online
H18	HEU arrives Duqm/Qatar; IAEA seal transfer confirmed	Blockade reduced 25% for humanitarian/agricultural cargo	Omani receipt confirmation; IAEA mass spectrometry
H24	Day 1 compliance report transmitted to Joint Secretariat	Day 1 compliance report transmitted to Joint Secretariat	Joint Secretariat publishes Day 1 Report

Table 5: Day 3–7: Custody Consolidation and Maritime Opening

Day	Iranian Action	US Action	Verification
D3	IDKEC/ILMD/TNC custody protocol fully operational; dual-lock active	Blockade reduced 50% for all non-military cargo	IAEA custody confirmation report
D5	HEU physically crosses Iranian border (PEI waypoint 1); transport vessel holds at PEI node	Sanctions waivers for maritime insurance issued	Swiss PEI node confirms; Pakistani naval observation
D7	JHTA operational cells activated at Bandar Abbas and Khasab; PGSA checkpoint control transferred	Release Tranche 1 (\$5B); reduce blockade 75%	JHTA operational certification
D10	PEI clearance: transport vessel released to final destination (if US triggers met)	Carrier withdrawal to 200nm begins; aerial surveillance suspended	Pakistan + Oman telemetry verification
D14	Full Hormuz open to JHTA-authorized traffic; Universal Transit Certificate system live	Full blockade lift declared; SWIFT Phase 1 authorized	Lloyd's List volume certification
D30	30-day clean compliance; mothballing underway at designated sites	Authorize petroleum sales; release \$15B; Tranche 2 complete	IAEA 30-day compliance report

Annex C: Three Emergency Off-Ramps

Off-Ramp Alpha: The 72-Hour Auto-Renewing Security Freeze

The ceasefire operates as a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews. Only a written 48-hour notice of non-renewal from either Party to the Joint Secretariat can terminate the ceasefire. This off-ramp survives total Agreement collapse and operates independently of all other modules. Even if every other module fails, the 72-hour freeze continues auto-renewing until explicitly terminated.

Off-Ramp Beta: The Humanitarian Supply Line Firewall (HSLF)

The humanitarian corridor through the Strait of Hormuz and the agricultural supply line from Aqaba/Bandar Abbas operate at zero cost, with zero inspection delay, for all vessels carrying WHO/FAO-verified humanitarian and agricultural cargo. The HSLF continues regardless of any dispute, breach, suspension, or total Agreement collapse. It is legally non-divertible. The UN OCHA/WHO/FAO administrators hold sole disbursement authority. No Party may restrict, tax, or inspect HSLF vessels. This off-ramp is the ultimate insurance against humanitarian catastrophe: even in total war, food and medicine flow.

Off-Ramp Gamma: The Emergency Reconstitution Protocol

If the Agreement enters full suspension, both Parties commit to attend a Reconstitution Conference within 14 days, hosted by Oman, with mandatory participation. Either Party's refusal to attend triggers automatic UN Security Council convening under Chapter VII. The Conference has a single agenda item: restoration of the minimum viable core (ceasefire + HSLF + IAEA baseline monitoring). A \$50M escrow, pre-funded by both Parties at signature, finances the Conference regardless of dispute status. The escrow is administered by Switzerland and cannot be frozen by either Party.

Instruments of Acceptance

Entry into Force. This Framework enters into force immediately upon signature by authorized representatives of both Parties. No domestic legislative approval is required for the initial 90-day period. The Framework is deposited with the UN Secretary-General upon signature and constitutes a binding international commitment. Each Party selects one Solution (A, B, or C) per Issue and records its selection in the Module Selection Annex attached hereto. All three Emergency Off-Ramps operate automatically regardless of module selection. The Binding Domestic Narrative Article (Article BDN) applies to both Parties immediately upon signature.

Pre-Commitment. Both Parties acknowledge that the deadline of 22 May 2026 represents a final extension window. Signature today prevents kinetic re-escalation. Rejection today triggers consequences neither side can fully control. The Hourly Telemetry Trigger Protocol commences at H00 of the day following signature.
