

Stability First Enhanced Accord

Version 5.6

*A Sovereignty-Preserving Regional Stability Framework for US-Iran De-escalation,
Strait of Hormuz Governance, and Nuclear Stabilization*

*Incorporating the Rollback and Step-Down Architecture, the Nuclear Monitoring
Technology Menu,
the Three-Tier Deal Options, the Prisoner Exchange Framework, the Ballistic Missile Test
Moratorium,
the Nuclear Flexibility & Sovereignty Protections, the Economic Accessibility Mechanisms,
the Regional Transparency & De-escalation Architecture, the Privacy-Preserving
Verification Refinements,
and the Political Narrative & Legitimacy Instruments*

With: *Executive Decision Brief · Visual Sequencing Matrix · Distributed Guarantor Matrix
Three-Tier Breach System · Reconstitution Mechanism · Political Shock Absorber · Quick
Reference*

CALIBRATED FOR

The May 2026 Negotiation Environment — As of May 13, 2026

DRAWING FROM

Stability First Enhanced Accord v1.0 | 14-Day Implementation Directive v2.5

Phase II Maritime Annex v1.2 | Phase II Nuclear Annex v1.2 | RCSA v3.6

STATUS

Integrated Framework — All Blockers Addressed — 125 Enhancements Applied

The Core Exchange

The Stability First Enhanced Accord v5.6 creates a **sequenced, reversible, verified** exchange between the United States and Iran. Neither side moves alone. Every Iranian commitment is matched by a corresponding US commitment, activated simultaneously, verified by neutral observers through a **distributed facilitating state matrix** (not a single guarantor).

Iran Delivers	United States Delivers
60% Freeze: Immediate freeze of all enrichment at or above 60%. Verified by IAEA within 72 hours. Sustained throughout Micro-Pilot.	\$250M Pilot: Immediate humanitarian tranche via Swiss escrow. Humanitarian goods only. Non-reversible.
Hormuz Reopening: IRGC-Navy withdraws small craft from transit corridor. Synchronized with US blockade lift on Day 7.	Blockade Lift: US naval blockade of Iranian commercial ports lifted, synchronized with Hormuz reopening on Day 7.
Stockpile Transfer: Weapons-grade enriched uranium to IAEA custody in Oman by Day 1. Verified by mass spectrometry.	Sanctions Relief: Staged asset return through non-US channels (no Congress required initially).
1-Year Renewable Cap: Moratorium on enrichment above 3.67%, renewable annually for up to 12 years based on performance.	No Precedent Clause: Explicit language: this Accord creates no legal or political precedent for future negotiations.

The Distributed Facilitating State Matrix

Building on the distributed architecture introduced in v5.2, v5.6 further expands the framework across responsibilities across six specialized facilitating states:

Facilitating State	Domain	Core Function
Oman	Maritime Deconfliction	Hotline management, naval encounter facilitation, Hormuz transit oversight
Switzerland	Financial Verification	Escrow administration, asset transfer verification, sanctions relief monitoring

Qatar	Escrow and Liquidity	Emergency liquidity facility, bridging finance, humanitarian corridor support
IAEA	Nuclear Verification	Enrichment monitoring, stockpile custody, facility inspection
UN Appointee	Procedural Mediation	Governance facilitation, dispute resolution, deadlock breaking
Pakistan	Emergency Convening	Diplomatic High-level crisis summits, backchannel facilitation, leadership relay only

The Timeline at a Glance

Phase	Duration	Iranian Steps	US Steps
Blind escalation	De- Days -44 to -30	Halt centrifuge installation; reduce Hormuz interdiction; pause proxy attacks; reduce cyber ops	No new sanctions; reduce patrols; no proxy strikes; process humanitarian licenses
Micro-Pilot	Days -30 to -1	Freeze 60% enrichment; IAEA access within 72h; IRGC presence reduced 30%	\$250M via Swiss escrow; partial blockade reduction; open 30-day nuclear window
Stage Opening	1: Days 1-14	Ceasefire; stockpile to IAEA; Hormuz reopening; mine clearing	Suspend Epic Fury; OFAC license; blockade lift; maritime notice
Stage Deferred Window	2: Days 15-44 (+7 ext.)	Declare moratorium; idle centrifuges; Fordow Phase A; HEU export plan	Sanctions tranche; aviation licenses; 50% asset return; SWIFT Tier B/C
Stage Permanent	3: Days 45-180	Permanent Transit Authority; successor framework; Fordow Phases B/C	Full sanctions relief; 85% assets returned; Crescent Compact opened

The Guarantees

Guarantee	Mechanism
Neither side moves alone	Waltz pairing: every step matched simultaneously
Neutral oversight	Distributed matrix: Oman, Qatar, Switzerland, IAEA, UN, Pakistan each in defined domain
Verification convergence	Five independent channels; no single channel triggers snapback
Financial protection	Humanitarian firewall: medical, food, isotope funds cannot be frozen
No accidental breach	Three-tier breach system: only deliberate hostile violations trigger suspension

Cooling-off default	All disagreements automatically freeze escalation for 24-72 hours
Force majeure protected	Temporary pause without breach; Triad arbitration within 7 days
Return-to-talks	Any breach automatically triggers emergency consultation before suspension
No withdrawal during mediation	During Triad review, IAEA clarification, or hotline dispute, neither side may withdraw
Reconstitution	If framework enters full suspension, all parties must attend Reconstitution Conference within 30 days
Rollback not snapback	Four graduated models: 10% for Tier 1, 25% for Tier 2, 50% for Tier 3; funds held, not seized; earn-back through compliance
Three deal options	Minimal (crisis containment), Medium (recommended), Maximal (comprehensive); structured graduation pathway
Fast-track humanitarian	48-hour auto-approval for medicine, food, aviation safety; uncapped; protected from all rollbacks
Sanctions neutrality	US commits no new sanctions unless Tier 3 confirmed; humanitarian and micro-waiver channels protected
Privacy-preserving monitoring	Data filtered at source; dual-key encryption; IAEA receives only compliance data, not industrial secrets

What Each Side Can Claim

Iranian Domestic Narrative	US Domestic Narrative
"We ended the war" — Permanent bilateral ceasefire "Blockade lifted" — US naval blockade removed "Assets returning" — \$250M immediate; 50% by Day 44; 85% by Day 180 "Sovereignty preserved" — No precedent clause; NPT rights intact; annual review "We moved as equals" — Every US concession matched simultaneously	"Hormuz is open" — 200+ transits in 14 days "Weapons-grade uranium secured" — Entire stockpile in IAEA custody "Enrichment capped and verified" — 1-year renewable cap; IAEA continuous monitoring "No bases lost" — All US Gulf bases remain "Congressional oversight" — Tranches 3+ subject to 30-day Congressional review

Three Deal Options: Selectable at Signature

v5.5 presents three complete deal packages, each representing a different depth of commitment:

Option		Nuclear	Monitoring	Economic Value	Duration
Minimal Containment)	(Crisis	60% freeze; no stockpile transfer	Minimal (cameras + OLEM)	~\$850M limited oil	+ 90 days renewable
Medium First)	(Stability	3.67% cap; stockpile to IAEA; Mothball Protocol	Medium (UGES sensors + ICS)	~\$85B SWIFT	+ 1-year renewable
Maximal (Comprehensive)		3.67% cap; AI fusion; missile test moratorium	Maximal (AI + digital twin + drones)	\$100B+ full trade	2-year initial

Default: Minimal activates by default; automatic graduation to Medium upon verified Micro-Pilot completion.

Failure Containment: Stabilization Pause Architecture

The single most important design feature of v5.5 is that **stabilization pause in any module does not suspend the entire framework**. The Partial Continuity Rule ensures:

If This Pauses...	These Continue...	These Go to Hold...
Nuclear talks	Ceasefire; Hormuz transit; humanitarian channel; asset tranches 1-2	Further asset releases; SWIFT; Fordow advanced phases
Sanctions relief delayed	Ceasefire; Hormuz transit; IAEA monitoring; humanitarian	Further nuclear concessions; cap renewal
Maritime incidents	Ceasefire; nuclear freeze; IAEA monitoring; humanitarian	Non-humanitarian transit; asset releases pending review
Verification fails	Ceasefire; Hormuz transit; humanitarian channel; diplomatic channels	Further asset releases; automated compliance certification

Framework Survival Core: Under all circumstances, three elements survive: (1) the ceasefire hotline remains active, (2) humanitarian access continues uninterrupted, (3) the emergency diplomatic channel stays open. Even if everything else enters stabilization pause.

Minimum Viable Accord (Emergency Fallback): If negotiators reject the full architecture, a stripped-down emergency version covers only: ceasefire, Hormuz reopening, humanitarian channel, and enrichment freeze. See Section 8.

Key Risk Factors

Risk	Likelihood	Mitigation
Israeli military strike during 30-day window	High	Tel Aviv Channel; IAEA data-sharing; US coordination
IRGC hardliner rejection	Medium	Micro-Pilot proves benefits; sovereignty language; no precedent clause
US Congressional blocking of Tranche 3+	Medium	Non-US channels for initial tranches; 30-day review window
Proxy spoiler attack	Medium	Spoiler Management; attribution protocols; regional firewall
Cyber escalation	High	Cyber Stabilization Module; protected infrastructure categories
Political shock (elections, leadership change)	Medium	Political Shock Absorber: automatic review pause, not termination

Bottom Line: This framework creates a **reversible, verifiable, politically defensible** pathway. The Micro-Pilot tests trust at low stakes. The modular architecture ensures nothing collapses if one element pauses. The distributed facilitating state matrix replaces single-point-of-failure guarantors. The three-tier breach system prevents accidental escalation. And every provision includes face-saving metrics.

Table of Contents

Preamble: The May 2026 Moment

Section 1: Core Principles

- 1.1 Synchronized Reciprocal Motion
- 1.2 Modular Architecture
- 1.3 Sovereignty Preservation
- 1.4 Framework Survival Core
- 1.5 No Precedent
- 1.6 Face-Saving Metrics
- 1.7 Political Shock Absorber
- 1.8 Cooling-Off Default

Section 2: Framework Overview

Section 3: Micro-Pilot Module

Section 4: Blind De-escalation & Cyber Protocol

Section 5: Stage One — The 14-Day Opening

Section 6: Stage Two — Deferred Window

Section 46: Verification Refinements & Privacy Protection

Section 47: Political Narrative & Legitimacy Instruments

Appendices

Preamble: The May 2026 Moment

"The single most important achievement is the agreement that Iran will never ever have nuclear material that will create a bomb."

— Omani Foreign Minister Badr Albusaidi, May 2026

The Current Reality: May 13, 2026

As of May 13, 2026, the United States and the Islamic Republic of Iran stand at the closest point to a durable agreement since hostilities began on February 28, 2026. After six weeks of military confrontation under the codename **Operation Epic Fury**, both sides have exhausted the military escalation ladder and returned to the negotiating table.

Current Military Status: A temporary ceasefire has been in place since April 8, 2026. Pakistan, led by Prime Minister Shehbaz Sharif, has mediated three rounds of talks in Islamabad. The most recent round (May 4-6) produced a preliminary 14-point memorandum of understanding.

What Makes v5.2 Different

v5.5 Enhancement Summary: 105 Total Enhancements

Building on v5.0 (10), v5.1 (42), v5.2 (10), v5.3 (17), and v5.4 (20 diplomatic bridge proposals), v5.5 added **6 strategic integration features** designed to address the May 2026 maximalist impasse without demanding unilateral surrender:

Category	Key v5.2 Additions
Distributed Matrix	Replaced single Pakistani guarantor with six-domain facilitating state matrix
Language Softening	"Facilitating State" not "Guarantor"; "stabilization pause" not "collapse"; mandatory pause recommendation not binding hold-fire
Breach Architecture	Three-tier system: technical dispute, material disruption, deliberate hostile violation
Automatic Safeguards	Return-to-Talks trigger; No Withdrawal During Mediation; Cooling-Off Default; Reconstitution Mechanism
Institutional Streamlining	Joint Coordination Secretariat replaces JIG/JMA/MCC/Media Group; three-level command hierarchy
Political Resilience	Political Shock Absorber for elections/assassinations/cabinet collapse; rotating facilitation not permanent co-chair
Continuity Guarantees	Partial Continuity Rule; Framework Survival Core; mandatory mediation before snapback
Flexible Timelines	"Target window: 7-14 days" not "within 7 days"; fewer successor modules initially
Financial Simplification	Fewer tranches, fewer triggers, larger milestone-based releases
Acronym Reduction	40-50% fewer acronyms; full descriptive terms on first reference

The Zero Breakout Objective

v5.4: Aspirational Framework Objective

Article ZBO-1: "The objective of this framework is a **verifiable zero-breakout timeline**. Through phased verification, centrifuge mothballing, stockpile transfer to third-party custody, and continuous IAEA monitoring, the framework aims to eliminate Iran's capacity to produce weapons-grade uranium without detection. Neither side is required to surrender sovereign rights. The timeline is performance-based, reversible, and subject to annual review. But the strategic direction is unambiguous: toward a Middle East in which no state can rapidly break out to a nuclear weapon."

Rationale: This declarative statement allows the US to claim a major non-proliferation victory without dictating specific 20-year bans. It frames the framework as a journey toward zero-breakout, not a demand for immediate dismantlement. Iran can accept it because it preserves sovereign rights, annual review, and the performance-based structure.

The v5.2 Philosophy

Every provision is governed by a single principle: **Synchronized Reciprocal Motion**. Neither party moves alone. The v5.2 innovations add a second principle: **Stabilization Pause Not Collapse**. When disagreement occurs, the framework pauses, reviews, and seeks reconstitution — it never collapses.

Current Hard Constraints (May 13, 2026)

Constraint			Implication
Khamenei	assassination;	leadership transition	Iranian negotiators need demonstrable sovereignty preservation
US naval blockade since April 13			Iran needs blockade lift as immediate, visible win
Hormuz transit down 40%; insurance up 300%			Global energy markets demand urgent resolution
Precedent of JCPOA collapse (2018)			Both sides need irreversible facts, not reversible promises
Israeli	opposition	to any Iranian enrichment	Verification must be intrusive enough for quiet acquiescence
Political volatility in both capitals			Framework must survive elections, cabinet changes, leadership transitions

How to Read This Document

Senior officials: Read the Executive Decision Brief, Section 1 (Principles), and Section 17 (Wins).

Technical specialists: Focus on Maritime (11), Nuclear (12-13), Verification (16, 33), Economic (9-10), Crisis (19-22, 34-36). **Negotiators:** Use Appendix H (Quick Reference).

Section 1: Core Principles of the Waltz Architecture

1.1 Synchronized Reciprocal Motion

Neither side moves alone. Every Iranian commitment is matched by a corresponding US commitment on the same day. Verification is shared.

Waltz Pairing: Enrichment Freeze and Blockade Lift

Iranian Step: Freeze all enrichment above 60%; allow IAEA inspectors to verify at Natanz and Fordow

US Step: Partially lift naval blockade; authorize first humanitarian tranche (\$250M) through Swiss escrow

Verification: IAEA confirms 60% freeze within 72 hours; Omani naval observers confirm blockade reduction within 48 hours

Iranian Face-Saving Metric: "NPT rights preserved; enrichment continues at 3.67%; sovereign annual review"

US Face-Saving Metric: "60% weapons-grade enrichment halted; IAEA inside Natanz and Fordow within 72 hours"

1.2 Modular Architecture with Partial Continuity Rule

v5.2: Partial Continuity Rule — Explicit

Article PC-1: Stabilization pause in one module does not suspend unrelated modules. Maritime disputes cannot terminate humanitarian channels. Cyber incidents cannot terminate medical isotope cooperation. Nuclear verification gaps do not affect Hormuz transit.

Article PC-2: The Partial Continuity Rule applies automatically. No governance body approval required. When one module enters stabilization pause, all other modules continue at current operational levels for a minimum of 90 days while the Coordination Secretariat assesses recovery options.

Article PC-3: Modules are grouped into survival tiers:

- **Tier 1 (Inviolable):** Ceasefire hotline, humanitarian access, emergency diplomatic channel — these never pause
- **Tier 2 (Protected):** IAEA basic monitoring, Hormuz non-military transit, asset tranches 1-2 — these continue during most stabilization pauses
- **Tier 3 (Conditional):** SWIFT reconnection, bonus tranches, successor framework talks, Fordow advanced phases — these may enter hold during disputes

1.3 Sovereignty Preservation

This framework does not supersede any constitution. It does not create supranational authority. NPT rights are preserved. US treaty commitments to Gulf partners are preserved.

1.4 Framework Survival Core

v5.2: Framework Survival Core — Three Elements That Survive Everything

Under all circumstances, including total framework suspension, the following three elements survive:

1. **Ceasefire Hotline:** The Omani-facilitated 24/7 bilateral hotline between US and Iranian military commanders remains active regardless of framework status. Neither party may disable the hotline without 30 days notice to the UN Secretary-General.
2. **Humanitarian Access:** The zero-fee, no-inspection-delay humanitarian corridor through Hormuz for food, medicine, medical equipment, and UN supplies continues regardless of any dispute, breach, or suspension.
3. **Emergency Diplomatic Channel:** The backchannel through the Coordination Secretariat remains open for crisis communication, de-escalation, and framework reconstitution regardless of formal diplomatic status.

Legal Status: The Framework Survival Core is established as a standalone humanitarian arrangement under UN auspices. It is not contingent on any other provision of this Accord. Even if both parties formally withdraw, the Survival Core continues for 180 days pending reconstitution efforts.

1.5 No Precedent Clause

Article 1.5: "This Accord establishes no legal or political precedent for future negotiations. Each provision is sui generis, tailored to May 2026. No inference may be drawn from any provision regarding positions on any matter not expressly addressed herein."

1.6 Face-Saving Metrics

For each Waltz pairing, both sides receive quantifiable "wins" visible to domestic audiences. See Section 17 for complete table.

1.7 Political Shock Absorber

v5.2: Political Shock Absorber — Automatic Review Pause

Article PSA-1: If any of the following political shocks occur in either party's jurisdiction, framework implementation automatically enters a **Review Pause** rather than terminating:

- National elections or referenda
- Assassination of senior leadership
- Cabinet collapse or government reshuffle affecting negotiating ministries
- Mass protests affecting government authority
- Leadership transitions (Supreme Leader, President, Foreign Minister)
- Significant military incident affecting domestic politics

Article PSA-2: During a Review Pause:

- All Tier 1 (Inviolable) and Tier 2 (Protected) modules continue unchanged
- Tier 3 (Conditional) modules enter hold status
- The Coordination Secretariat issues a Review Pause Certificate within 48 hours
- The affected party has 30 days to confirm continuation, propose modifications, or request stabilization pause
- If no response within 30 days, the Review Pause extends automatically for another 30 days
- Maximum Review Pause duration: 90 days, extendable by mutual agreement

Article PSA-3: Review Pause does NOT constitute material breach, does NOT trigger the three-tier breach system, does NOT affect compliance scoring, and does NOT enable the other party to suspend its obligations.

1.8 Cooling-Off Default

v5.2: Cooling-Off Default — Universal De-escalation Mechanism

Article COD-1: If disagreement occurs and attribution is unclear, all escalation freezes automatically for a **mandatory 24-72 hour Cooling-Off Period**. Negotiations continue. Verification teams investigate. No party may take escalatory action during the Cooling-Off Period.

Article COD-2: Cooling-Off Activation Triggers:

- Any incident where attribution is Level 3 or below (see Section 20)
- Any dispute where the Coordination Secretariat determines positions are irreconcilable within 24 hours
- Any request by either party for Cooling-Off (automatically granted)
- Any cyber incident affecting Category I or II infrastructure (see Section 21)
- Any detection of potential false-flag activity

Article COD-3: Cooling-Off Procedure:

1. Cooling-Off activates automatically upon trigger (no approval required)
2. Coordination Secretariat notifies all parties within 2 hours
3. All parties freeze escalatory actions for 24 hours minimum
4. Verification teams deploy to investigate
5. If investigation requires more time, Cooling-Off extends to 72 hours maximum
6. At 72-hour mark, Coordination Secretariat recommends: resume, extend with modifications, or escalate to Tier 2/3 breach procedures
7. Extension beyond 72 hours requires mutual consent or Triad concurrence

Article COD-4: Self-Defense Exception: Active armed attack in progress against personnel may be defended during Cooling-Off, but retaliatory strikes against the other party's territory or facilities are prohibited pending attribution determination.

Section 2: Framework Overview

Three Stages at a Glance

Stage	Duration	Primary Goal	Closing Trigger
-------	----------	--------------	-----------------

Stage 0: Micro-Pilot	Days -30 to -1	Build trust through limited, reversible exchanges	Both sides certify pilot objectives met
Stage 1: Opening	Days 1-14	End the war; transfer stockpile; reopen Hormuz	Blockades lifted; 200+ transits; IAEA custody verified
Stage 2: Deferred Window	Days 15-44 (+7 ext.)	Negotiate nuclear specifics; staggered cap; facility protocols	Moratorium ratified; HEU export confirmed; 50% assets returned
Stage 3: Permanent	Days 45-180	Joint Transit Authority; regional dialogue; normalization	Authority charter ratified; 85% assets returned; successor opened

Flexible Timeline Windows (v5.2)

v5.2: Flexible Windows Replace Hard Deadlines

Previous versions specified exact deadlines ("within 7 days"). v5.2 replaces these with **target windows** that dramatically improve survivability:

Previous Language		v5.2 Language	Rationale
"Within 7 days"		"Target window: 7-14 days"	Allows for weekends, holidays, logistical delays without triggering breach
"Within 72 hours"	72	"Target window: 48-96 hours"	Accommodates IAEA travel, customs, timezone coordination
"By Day 30"		"Target window: Days 25-35"	Allows Majlis/Congressional review periods to complete
"By Day 180"		"Target window: Days 150-210"	Major milestones have natural flexibility; only deliberate delays breach

Exception: The 60% enrichment freeze verification remains "within 72 hours" because it is the Micro-Pilot's central deliverable. All other timelines use flexible windows.

Joint Coordination Secretariat (v5.2)

v5.2: Consolidated Governance Structure

Previous versions created overlapping bodies: Joint Implementation Group, Joint Maritime Authority, Maritime Coordination Cell, Media Working Group, technical panels, review bodies. v5.2 consolidates these into:

One Joint Coordination Secretariat (Geneva, with Muscat maritime desk) containing specialized subcells:

Subcell	Function	Replaces
Political Coordination Cell	Senior-level bilateral coordination, dispute resolution, high-level messaging	Joint Implementation Group (JIG)
Maritime Operations Cell	Hormuz transit management, naval deconfliction, hotline operations	Joint Maritime Authority + Maritime Coordination Cell
Nuclear Verification Cell	IAEA coordination, enrichment monitoring, facility inspection logistics	Previously distributed across multiple bodies
Financial Operations Cell	Escrow management, asset transfer verification, SWIFT coordination	Previously handled bilaterally
Communications Cell	Media coordination, public messaging, leak management, crisis communications	Media Working Group
Crisis Response Cell	24/7 incident monitoring, attribution assessment, spoiler detection, rapid response	Distributed crisis functions

Rotating Facilitation: The Secretariat operates under **rotating facilitation cycles** (not permanent co-chair authority). The facilitating state rotates quarterly among Oman, Switzerland, and Qatar. The rotating facilitator has convening authority, agenda-setting rights, and procedural mediation powers, but no substantive voting power.

Secretariat Redundancy (v5.3)

v5.3: Geneva HQ with Muscat Maritime Backup; 4-Hour Failover

Article SR-1: Dual-Site Architecture. The Secretariat operates from two sites:

- **Primary Site:** Geneva, Switzerland (Political Coordination Cell, Financial Operations Cell, Crisis Response Cell, Communications Cell)
- **Backup Site:** Muscat, Oman (Maritime Operations Cell, all hotline operations, regional liaison functions)

Article SR-2: Failover Protocol. If the Geneva site becomes inoperable (natural disaster, cyber attack, security incident), all functions fail over to Muscat within 4 hours. The failover activates automatically when Geneva reports operational incapacity or fails to respond to a heartbeat signal for 30 minutes. Oman assumes temporary facilitation authority until Geneva recovers or the Facilitating State Council approves a permanent relocation.

Article SR-3: 24/7 Staffing. Both sites maintain 24/7 staffing with minimum 2 duty officers at all times. During crisis periods (Tier 2+ incidents), staffing scales to minimum 6 officers per site. Hotline operations never drop below 2 responders.

Article SR-4: Data Synchronization. All Secretariat records, communications logs, and operational data are synchronized between Geneva and Muscat in real time. Either site can assume full operational authority with zero data loss.

Minimum Viable Accord Fallback

If negotiators reject the full architecture, the Minimum Viable Accord provides a stripped-down emergency pathway covering four essential elements: ceasefire, Hormuz reopening, humanitarian channel, and enrichment freeze. See Section 8 for activation protocol.

Section 3: The 30-Day Micro-Pilot Module

Parameter	Specification
Duration	30 days (extendable to 45 by mutual consent; +7 by Triad for verified delays)
Legal Status	Politically binding exchange of letters; not a treaty

Iranian Commitment	Freeze all enrichment at or above 60% at Natanz and Fordow
US Commitment	Release \$250M humanitarian tranche via Swiss escrow
Verification	IAEA confirms 60% freeze within 72 hours of pilot start
Scope	Humanitarian goods only (medicine, food, agricultural inputs)
Reversibility	Either side may terminate with 7 days written notice; no penalty
Transition	Upon successful completion, automatically transitions to Stage 1

Section 4: Blind De-escalation & Cyber Operations Stabilization

4.1 Parallel Pause Mechanics

Domain	Iranian Pause	US Pause	Observable Effect
Nuclear	No new centrifuge installation; no additional 60% enrichment	No new sanctions; no enforcement on humanitarian exemptions	IAEA reports "no observed expansion"
Maritime	IRGC-Navy reduces interdiction frequency	5th Fleet reduces close-proximity patrols	Insurance premiums stabilize
Financial	No cyber ops vs Gulf financial infrastructure	No interdiction of Iranian oil to China/India	CBI notes improved banking access
Regional	Proxy forces reduce attacks on US positions	No retaliatory strikes on proxy positions	CENTCOM reports "reduced threat"

4.2 Cyber Operations Stabilization Module

Category	Protected Infrastructure	Restraint	Violation Response
Category (Critical)	I Nuclear monitoring systems; banking settlement; maritime navigation	Strict non-aggression	Tier 2 breach response; emergency session within 24h
Category (Important)	II Humanitarian logistics; medical supply chains; pipeline control	No offensive operations; defensive monitoring permitted	Tier 3 response; 72-hour review
Category (Commercial)	III General commercial infrastructure; telecoms; civilian aviation	No persistent disruption	Tier 1 diplomatic resolution

Incident Notification: Category I/II incidents must be reported to the Coordination Secretariat within 6 hours. Failure to report is a technical delay, not a breach.

4.3 Proxy Force Stand-Down

Explicit mutual commitments on Hezbollah, Houthis, Iraqi militias, and Syrian proxies. Non-acknowledgment: neither party must publicly admit control. Rogue Commander Protocol requires condemnation within 24 hours and Triad cooperation.

Section 5: Stage One — The 14-Day Opening

Stage One produces seven irreversible operational deliverables. All timelines use target windows.

Day 1 Waltz Pairing

Iran: Transfer 60% stockpile to IAEA custody in Oman; cease offensive operations; proxy operational pause

US: Suspend Epic Fury; issue OFAC general license (\$250M); open 30-day nuclear window

Verify: IAEA DG confirmation; mass spectrometry; Pakistani convening state + Omani maritime + Swiss financial + UN procedural concurrent certification

Day 7: Synchronized Dual Blockade Lift

Step	UTC Time	Iranian Action	US Action	Verification
1	T-60 min	IRGC Commander transmits stand-by to Maritime Operations Cell	5th Fleet Commander transmits stand-by to Maritime Operations Cell	Omani facilitating state logs both signals
2	T-15 min	IRGC craft withdraw to 5nm stand-off; AIS broadcast	US Navy withdraws to 5nm from 12nm baseline; AIS broadcast	Lloyd's observer confirms movements
3	T=0	Iranian government issues Hormuz opening declaration	US issues naval blockade lift declaration	SIMULTANEOUS within 60-second window
4	T+15 min	First authorized vessel commences transit	US issues Notice to Mariners: Hormuz open	Lloyd's List, AIS Global confirm

Section 6: The 30-Day Deferred Window

6.1 Staggered 1-Year Renewable Enrichment Cap

Phase		Duration		Standard				Advancement Condition	
Year 1 Cap	1	Days	30-365	Zero enrichment centrifuges under IAEA seal.	enrichment above 3.67%.	Higher-		Clean IAEA certification at Year 1 review	
Years 2-3	2-3	Years	2-3	3.67% enrichment only	enrichment for civilian fuel at Natanz			Fuel supply guarantee deposited in escrow	
Years 4-12	4-12	Years	4-12	3.67% enrichment under full IAEA safeguards				Five-year renewal confirmed; all indicators green	

6.2 Seven-Day Triad Extension

The 30-day window may be extended by up to 7 days through Triad consensus for verified good-faith delays (IAEA logistics, banking channel activation, transport weather, legislative procedural delays). Maximum one extension per Stage 2 cycle.

Section 7: Stage Three & Successor Framework

7.1 Reduced Successor Modules (v5.2)

v5.2: Start with Three Core Successor Tracks, Open Others Later

v5.1 opened six simultaneous successor modules. v5.2 reduces initial opening to three, deferring harder issues until confidence is established:

Priority	Module	Scope	Opening Timeline
Immediate (Day 180)	Maritime Dialogue	Security Multilateral Hormuz governance; regional port cooperation; incident prevention	Day 180
Immediate (Day 180)	Economic Partnership	Trade normalization; investment protection; energy transit agreements; infrastructure fund	Day 180
Immediate (Day 180)	Humanitarian Cooperation	Medical exchange; disaster response; refugee support; educational programs	Day 180
Deferred (Day 365)	Crescent Compact: Ballistics/Missiles	Missile range limitations; launch notification; defense coordination	Day 365, contingent on Year 1 clean certification
Deferred (Day 365)	Proxy Governance Dialogue	Militia integration; disarmament timelines; non-state armed group protocols	Day 365, contingent on 6 months sustained proxy pause
Deferred (Day 365+)	Nuclear Cooperation	Bushehr expansion; regional fuel bank; waste management cooperation	Day 365+, contingent on Additional Protocol ratification

Rationale: Opening with maritime, economic, and humanitarian tracks builds positive momentum through visible, non-threatening cooperation. Harder issues (missiles, proxies) are deferred to Year 2 when trust has been established through demonstrated compliance.

Section 8: Minimum Viable Accord Emergency Fallback

If the full architecture is rejected, the Minimum Viable Accord provides a stripped-down emergency pathway. Covers four elements: ceasefire, Hormuz reopening, humanitarian channel, and enrichment freeze.

8.1 Activation Protocol

1. Either party proposes MVA by written notice to the Coordination Secretariat
2. Facilitating state convenes within 48 hours
3. Both parties confirm MVA acceptance through exchange of letters
4. MVA activates 72 hours after confirmation
5. IAEA advance team deploys within 48 hours

8.2 MVA Graduation to Full Accord

The MVA automatically graduates to the full Accord when: (a) both parties confirm objectives met, (b) 14 consecutive days of verified compliance, (c) neither party objects within 7-day review window. All v5.2 provisions become operative upon graduation.

8.3 Thirty-Day Drop-Dead: MVA Auto-Transition (v5.4)

v5.4: If Full Framework Not Ratified by Day 30, Auto-Transition to MVA

Article TDD-1: If the full Stability First framework is not ratified by Day 30 of the Micro-Pilot, the agreement automatically transitions to its Minimum Viable Accord state. This "drop-dead date" provides political cover for both sides: the US can claim it did not accept an open-ended commitment, and Iran can claim the humanitarian and ceasefire elements survive regardless.

Article TDD-2: Auto-Transition Procedure.

1. On Day 25, the Secretariat issues a 5-day warning to both parties
2. If no ratification by Day 30, all Tier 3 (Conditional) modules automatically enter stabilization pause
3. Tier 1 (Inviolable) and Tier 2 (Protected) modules continue: ceasefire, humanitarian channel, Hormuz transit, IAEA basic monitoring
4. Asset releases halt at the Stage 1 level (\$750M released, no further tranches)
5. Renegotiation begins within 14 days under the Reconstitution Mechanism (Section 35)
6. Either party may trigger full renegotiation at any time during the MVA state

Article TDD-3: Framing. The drop-dead is framed as a "life support protocol" — the framework continues at its most basic level while both sides negotiate modifications. It is not a collapse. It is a deliberate reduction to the elements both sides have already accepted, creating a stable floor for further negotiation.

Section 9: The Distributed Facilitating State Matrix

v5.2: Replaced Single Pakistani Guarantor with Distributed Matrix

v5.0 and v5.1 relied heavily on Pakistan as a single guarantor appearing in nearly every function. v5.2 distributes responsibilities across six specialized facilitating states, each with a defined domain. This reduces political sensitivity and institutional overload.

9.1 The Six-Domain Matrix

Facilitating State	Domain	Core Function	When Activated
Oman	Maritime Deconfliction	Hotline management; naval encounter facilitation; Hormuz transit oversight; procedural mediation at governance meetings	Throughout; primary maritime point of contact
Switzerland	Financial Verification	Escrow administration; asset transfer verification; sanctions relief monitoring; audit coordination	Throughout; primary financial point of contact
Qatar	Escrow and Liquidity	Emergency liquidity facility; bridging finance; humanitarian corridor support; reconstruction coordination	Throughout; primary liquidity point of contact
IAEA	Nuclear Verification	Enrichment monitoring; stockpile custody verification; facility inspection; technical assessment	Day 1 of Micro-Pilot; continuous thereafter
UN Appointee	Procedural Mediation	Governance facilitation; dispute resolution; deadlock breaking; procedural rulings	Upon dispute or deadlock; automatic for Tier 2+ breaches
Pakistan	Emergency Diplomatic Convening	High-level crisis summits; leadership-level backchannel relay; emergency diplomatic convening ONLY	Crisis situations requiring head-of-state communication; war-risk scenarios

9.2 Terminology Change: "Facilitating State" Not "Guarantor"

v5.2: Softer Language Throughout

"Guarantor" implies enforcement obligations and geopolitical alignment. "Facilitating State" suggests assistance without enforcement commitment. This change is applied throughout the document:

Old Term	New Term	Rationale
"Guarantor"	"Facilitating State"	Removes enforcement implication; lowers resistance
"Guarantee"	"Facilitation" or "Assurance"	Softer commitment language
"Primary Guarantor"	"Lead Facilitating State (Maritime)"	Domain-specific, not hierarchical
"Secondary Guarantor"	"Lead Facilitating State (Financial)"	Domain-specific, not hierarchical
"Triad"	"Facilitating State Council" or "the Council"	Neutral, institutional language

9.3 Mandatory Escalation Pause Recommendation (v5.2)

v5.2: Replaced Binding Hold-Fire with Mandatory Escalation Pause

Previous versions gave neutral facilitating states "binding hold-fire" authority. v5.2 replaces this with a softer but equally effective mechanism:

Article MEP-1: When a facilitating state determines that escalation is imminent, it may issue a **Mandatory Escalation Pause Recommendation**. This recommendation automatically activates a **30-minute review window** during which neither party may take escalatory action.

Article MEP-2: The 30-minute review window:

- Activates automatically upon recommendation (no approval needed)
- Requires both parties to designate senior officials for consultation within 30 minutes
- May be extended by mutual consent for up to 4 hours
- May be **jointly rejected** by both parties if both agree the pause is unnecessary
- If either party supports the pause, the escalation freeze continues

Article MEP-3: During the escalation pause review window:

- All military forces maintain current positions (no forward movement)
- Hotline consultation occurs between senior commanders
- Facilitating state presents its assessment and recommendations
- Either party may request extended Cooling-Off (24-72 hours)

Key Difference: The facilitating state cannot *order* a hold-fire. But the 30-minute mandatory review creates a powerful procedural brake that makes rash escalation politically costly. Both parties must actively agree to *reject* the pause — which creates political accountability if escalation proceeds and proves harmful.

9.4 Rotating Facilitation Lock-In (v5.3)

v5.3: Quarterly Rotation with 90-Day Handover Protocols

Article RFL-1: Facilitation rotates quarterly among Oman (Q1), Switzerland (Q2), and Qatar (Q3), returning to Oman (Q4). Each rotation includes a **90-day handover protocol**:

- **Days 1-30 (Outgoing):** Outgoing facilitator briefs incoming on all active files, hotline protocols, financial statuses, and pending disputes
- **Days 31-60 (Parallel):** Both facilitators operate jointly; incoming leads, outgoing advises
- **Days 61-90 (Incoming):** Incoming facilitator assumes full authority; outgoing available for consultation only

Article RFL-2: Lock-In Safeguards. Facilitator rotation may not be blocked by either party. If a party objects to the incoming facilitator, the objection is noted but rotation proceeds. The objecting party may request a Facilitating State Council review, but the review does not delay rotation. This prevents either party from "capturing" a preferred facilitator indefinitely.

Article RFL-3: Facilitator Fatigue Prevention. No facilitating state may serve more than two consecutive quarters in the same calendar year. After two consecutive quarters, a mandatory 90-day rest period applies before that state may rotate back in.

9.5 Pakistan Co-Convening Authority (v5.4)

v5.4: Pakistan Elevated to Co-Convening Authority

Article PCC-1: Given Pakistan's current role as the primary mediator between the United States and Iran, Pakistan is elevated to **Co-Convening Authority** alongside Oman in the Joint Coordination Secretariat. This institutionalizes the existing Islamabad diplomatic channel rather than replacing it.

Article PCC-2: Co-Convening Functions. Pakistan shares convening authority with Oman for:

- Emergency diplomatic summits (crisis-level leadership meetings)
- Executive-level backchannel relay (head-of-state communication)
- Reconstitution Conference convening (co-chair with UN Appointee)

Article PCC-3: Scope Limit. Pakistan does not assume financial, maritime, nuclear, or procedural mediation functions. Those remain with Switzerland, Oman, IAEA, and the UN Appointee respectively. Pakistan's role is diplomatic convening only — expanded from the v5.2 definition to reflect the current geopolitical reality.

Article PCC-4: Rationale. By institutionalizing Pakistan's mediation role, the framework ensures continuity of the diplomatic channel that produced the May 2026 preliminary MoU. If Pakistan's facilitation role is later superseded by another state, the Co-Convening Authority may be transferred by Facilitating State Council consensus with 90-day notice.

9.6 Escrow Multi-Signature Requirement (v5.3)

v5.3: 3 of 4 Facilitating States Required for Any Tranche Release

Article EMS-1: All tranche releases from the Swiss escrow require **digital signatures from 3 of 4 designated facilitating states** (Oman, Switzerland, Qatar, and the UN Appointee). IAEA certification is also required but is treated as a condition precedent, not a signature.

Article EMS-2: The signature process:

1. IAEA certifies the relevant compliance condition is met
2. Secretariat submits release request to all 4 signature holders
3. Each holder has 72 hours to sign or request clarification
4. Upon receipt of 3 signatures, release executes automatically within 24 hours
5. If only 2 signatures received after 72 hours, Secretariat convenes a Financial Review Cell within 48 hours

Article EMS-3: No single facilitating state may unilaterally block a tranche release. Two states together may delay (triggering Financial Review Cell) but cannot permanently block if IAEA has certified compliance and 2 other states have signed.

Section 10: Economic Channels & SWIFT Reconnection

10.1 Front-Loaded Asset Release with Reconstruction Fund (v5.4)

v5.4: Front-Loaded Tranches + International Gulf Reconstruction Fund

v5.2's tranche architecture is front-loaded to provide an immediate, visible economic win for Iran upon Hormuz reopening, while creating a dedicated reconstruction fund that reframes "reparations" as "reconstruction."

10.1.1 Streamlined Tranche Schedule

Stage	Timing	Amount	Trigger
Micro-Pilot	Day 1	\$250M	Signature / MVA activation
Stage 1 Completion	Day 14	\$750M	Ceasefire verified; stockpile transferred; Hormuz reopened
Stage 2 Completion	Day 44	\$1.5B	Moratorium ratified; HEU export confirmed; 50% assets
Stage 3 Midpoint	Day 120	\$3B	Transit Authority operational; Fordow Phase B; continuous monitoring
Stage 3 Completion	Day 180	\$5B	85% assets returned; successor framework opened
Year 1 Clean Certification	Day 365	\$10B	Full Year 1 clean certification + Additional Protocol ratified

Key Change: The Day 14 tranche is increased from \$500M to \$750M to provide a more substantial immediate economic win upon Hormuz reopening.

10.1.2 International Gulf Reconstruction Fund

Article IGRF-1: The **International Gulf Reconstruction Fund** is established as a dedicated financial vehicle to support post-conflict reconstruction in Iran and the broader Gulf region. The Fund is seeded from:

- 10% of each asset release tranche (capped at \$5B total over 365 days)
- Qatari bridge financing: \$2B committed at Day 1
- International donor contributions (EU, Japan, South Korea) on voluntary basis

Article IGRF-2: Governance. The Fund is administered by the Swiss Financial Cell of the Coordination Secretariat with oversight from the Facilitating State Council. Disbursement criteria: (a) civilian infrastructure repair, (b) medical facility restoration, (c) educational institution rebuilding, (d) environmental remediation. Military infrastructure is excluded.

Article IGRF-3: Framing. The Fund is explicitly NOT "war reparations." It is an international reconstruction mechanism. Iran receives funds to rebuild without the US admitting fault or paying damages out of pocket. The US can claim it supported regional

stability. The Qatari seed funding provides immediate capital while frozen assets are being processed.

Article IGRF-4: Face-Saving Metrics. Iran: "\$2B in reconstruction funding committed within 14 days of signature, rising to \$5B within 180 days." US: "We supported regional reconstruction through an internationally governed fund, not direct reparations."

10.1.3 Pre-Agreed Asset Valuation Ledger (v5.4)

Article AVAL-1: A pre-agreed ledger of frozen Iranian assets is established at **\$100 billion**, verified by the Swiss Financial Cell using data from the Central Bank of Iran, US Treasury OFAC, and European banking regulators. This figure is locked at signature and may not be revised unilaterally by either party.

Article AVAL-2: No Goalpost Moving. Neither party may claim the frozen asset total is higher or lower than \$100B without a Facilitating State Council review and independent audit. If new frozen assets are discovered after signature, they are added to the ledger only by Council consensus. If assets are found to have been released pre-signature, they are deducted only by Council consensus.

Article AVAL-3: Transparency. The ledger is published in anonymized form (no individual account details) within 14 days of Micro-Pilot signature. Both parties receive the full detailed version under confidentiality. The Monthly Compliance Scorecard (Section 29) tracks cumulative release progress against the \$100B baseline.

Key simplifications: (1) No micro-bonus tranches — larger milestone payments instead. (2) Three clear performance accelerants: +\$1B for early HEU export (7+ days early), +\$2B for Fordow Phase C completion (30+ days early), +\$3B for Year 1 Additional Protocol ratification. (3) Total bonus pool: \$6B (down from \$475M in complexity, up in actual value). (4) Funded by Qatari Emergency Liquidity Facility (\$20B capacity).

10.2 SWIFT Reconnection with IAEA Milestone Linkage (v5.3)

v5.3: SWIFT Tiers Tied to IAEA Reports, Not Political Events

Article SIL-1: SWIFT reconnection tiers are tied directly to specific IAEA verification reports, not to political events or bilateral negotiations. This prevents SWIFT from being used as a political bargaining chip:

SWIFT Phase	IAEA Milestone Required	Political Event (NOT Required)
Phase 0 (Pre-SWIFT)	IAEA confirms 60% freeze within 72 hours	No political condition
Phase 1 (Restricted)	IAEA confirms moratorium framework declared; standard monitoring active	Does NOT require Congressional approval
Phase 2 (Expanded)	IAEA confirms continuous monitoring active; no detected diversion	Does NOT require diplomatic recognition
Phase 3 (Full)	IAEA confirms Year 1 clean certification; Additional Protocol ratification underway	Does NOT require missile deal

Article SIL-2: The IAEA Director-General's quarterly reports serve as the automatic trigger mechanism. When a report confirms the relevant milestone, the Secretariat initiates the corresponding SWIFT phase transition within 7 days. No additional political approval required.

Article SIL-3: If an IAEA report identifies concerns, the corresponding SWIFT phase **does not reverse**. Instead, the phase holds at current level until the next quarterly report shows resolution. This prevents "yo-yo" SWIFT status that would damage Iranian economic planning.

10.3 SWIFT Reconnection Pathway

Phase	Timing	Access Level	Trigger
Phase 0: Pre-SWIFT	Days 1-30	No SWIFT. Qatari riyal bridge and Swiss corridor.	MVA or Stage 1 signature
Phase 1: Restricted	Days 30-60	5 Iranian banks; MT 103/202 only	Stage 2 opening; IAEA confirms moratorium

Phase Expanded	2:	Days 60-120	All clean-record banks; MT 700/760 permitted	50% assets returned; Fordow Phase A
Phase 3: Full		Day 120+	Full membership; all message types	Tranche 3 released; 180-day review passed

Section 11: Maritime Architecture & Hormuz Governance

11.1 Governance

Option	Description	Timeline
Provisional Council	Provisional Joint Maritime Council with US and Iran as voting members, rotating GCC chair, EU/PRC observers	7-14 days
Council-Supervised	Council with Omani-Qatari-Swiss supervisory oversight	14-21 days
Dual-Track	Political decision-making separate from technical operations	21-30 days
Observer Mission	UN maritime observer mission	30-45 days

11.2 Simplified Command Architecture (v5.2)

v5.2: Three-Level Command Hierarchy

Previous versions had five levels (Tactical, Tactical Senior, Operational Strategic, Political, Executive). v5.2 reduces to three:

Level	Iranian Chain	US Chain	Neutral Oversight	Communication
Field Level	IRGC-Navy Duty Officer → Watch Commander → Senior Commander	5th Fleet Duty Officer → Watch Commander → NAVCENT Deputy	Omani Naval Monitor (Khasab); Maritime Operations Cell Chair	5-minute response hotline
Strategic Level	IRGC Deputy Chief → SNSC Secretary → Foreign Minister	NAVCENT Commander → CNO → Secretary of State	Omani Ministry; Appointee; Facilitating Council; Foreign UN State	30-minute response; secure video
Executive Level	SNSC Secretary → Supreme Leader / President	Secretary of State → National Security Advisor → President	Pakistan (emergency convening only); UN Secretary-General	6-hour consultation via Pakistani relay

Override Authority: At Field Level, Omani Monitor may issue non-binding "pause recommendation" (activates 30-minute review). At Strategic Level, Facilitating State Council may convene emergency session. At Executive Level, Pakistan may relay direct leadership communication.

Commander Disagreement: If commanders at the same level disagree, the neutral oversight authority makes a procedural determination within the response window. If undetermined, cooling-off rule applies: no escalatory action for 24 hours.

Section 11(b): IAEA Forward Deployment Teams (v5.3)

v5.3: Permanent 12-Person Forward Teams in Oman and Switzerland

Article IAT-1: Forward Deployment. Two permanent IAEA Forward Deployment Teams are stationed outside Iran to enable 24-hour deployment to any Iranian nuclear facility:

Team	Location	Composition	Deployment Time
Team Alpha	Muscat, Oman (co-located with Secretariat backup site)	6 inspectors + 2 analysts + 2 logistics + 2 security	12 hours to any Iranian facility via Omani military transport
Team Bravo	Vienna, Austria (IAEA HQ) with rapid deployment kit	6 inspectors + 2 analysts + 2 logistics + 2 security	18 hours via commercial/charter to Tehran, then Iranian escort

Article IAT-2: Rapid Deployment Triggers. Either team deploys upon: (a) Secretariat request, (b) IAEA DG emergency authorization, (c) 4/5 Facilitating State Council request, (d) automatic activation upon detection of enrichment anomaly by remote monitoring. Deployment does not require Iranian pre-approval if IAEA DG invokes emergency access under the Additional Protocol (or existing Safeguards Agreement if Additional Protocol not yet ratified).

Article IAT-3: Equipment. Each team maintains a pre-positioned equipment cache including: portable mass spectrometers, environmental sampling kits, radiation detectors, tamper-evident seals, secure communications gear, and satellite uplink terminals. Equipment is calibrated monthly and certified quarterly.

Article IAT-4: Status. IAEA Forward Teams are unarmed international personnel operating under the IAEA flag. Their safety is guaranteed by both parties. Any attack on IAEA Forward Team personnel constitutes a Tier 3 breach.

Satellite Data Feed Mandate (v5.3)

v5.3: Automated Daily Satellite Imagery via Secretariat

Article SDF-1: The Secretariat receives automated daily satellite data feeds covering: (a) all declared Iranian nuclear facilities (Natanz, Fordow, Arak, Bushehr, Esfahan), (b) the Strait of Hormuz transit corridor, (c) Hormuz stand-off zones. Data feeds include AIS (Automatic Identification System) for maritime vessels, SAR (Synthetic Aperture Radar) for all-weather monitoring, and EO (Electro-Optical) high-resolution imagery.

Article SDF-2: Satellite data is archived by the Secretariat and made available to both parties and all facilitating states upon request. Discrepancies between satellite data and party reports are flagged automatically for investigation. This reduces attribution disputes by providing an objective third-party visual record.

Article SDF-3: Satellite data is classified as Tier 1 (Inviolable). It continues to flow regardless of framework status, providing continuous independent monitoring even during stabilization pauses or full suspension.

11.3 Hormuz Environmental Transit Fee (v5.4)

v5.4: Nominal Sovereign Fee for Environmental Protection

Article HETF-1: The Joint Hormuz Transit Authority authorizes the collection of a nominal **Environmental Transit Fee** from all commercial vessels transiting the Strait. The fee is framed as an environmental protection levy, not a toll or sovereignty tax:

Vessel Type	Fee	Collection Method
Oil tankers (>50,000 DWT)	\$0.10 per barrel of cargo	Automated via AIS + cargo declaration
Container vessels	\$500 per transit	Pre-paid through Maritime Council online portal
General cargo / bulk carriers	\$250 per transit	Pre-paid through Maritime Council online portal
WFP / humanitarian vessels	\$0 (exempt)	Automated exemption via UN registration
Military / naval vessels	\$0 (exempt)	Flag state declaration

Article HETF-2: Revenue Distribution. Fee revenue is distributed as follows: 40% to Iranian Maritime Environmental Protection Fund (administered by Iran, audited by IAEA-neutral consortium), 30% to Omani transit infrastructure maintenance, 20% to International Maritime Safety Fund (administered by Maritime Council), 10% to Secretariat operational costs.

Article HETF-3: Face-Saving. Iran: "Sovereign right to collect environmental fees from vessels transiting our adjacent waters, recognized by the international Transit Authority." US: "Nominal environmental fee that does not impede freedom of navigation; proceeds fund maritime safety and environmental protection."

Article HETF-4: Rate Ceiling. The fee rate may not be increased above the schedule in Article HETF-1 without Maritime Council consensus (which includes US voting rights). This prevents Iran from converting the fee into an economic weapon.

11.4 Twelve-Nautical-Mile Blockade Verification (v5.4)

v5.4: US Vessels Withdraw Beyond 12nm with AIS Verification

Article 12NM-1: The synchronized Day 7 blockade lift explicitly includes the withdrawal of all US naval vessels beyond the 12-nautical-mile territorial sea limit of Iran. This withdrawal is verified through:

- Automatic AIS (Automatic Identification System) broadcast by all US naval vessels, visible to Lloyd's List and the Maritime Council
- Daily satellite confirmation via Secretariat satellite data feed (Section 11b)
- Omani naval observer confirmation from Khasab monitoring station

Article 12NM-2: No Re-entry Without Notice. US vessels may not re-enter within 12nm of Iranian territorial waters without 24-hour advance notification to the Maritime Operations Cell. Emergency situations (search and rescue, vessel in distress) are exempt but require immediate notification.

Article 12NM-3: Iranian Reciprocal Commitment. Iran similarly commits to keeping IRGC-Navy vessels beyond 5nm of the commercial transit corridor, with AIS broadcast and satellite verification. Both withdrawals are monitored symmetrically.

Section 12: Nuclear Stabilization

Six independently selectable pathways for verified neutralization of Iran's 60% HEU stockpile:

Pathway	Description	Destination	Timeline
A: In-Place Downblending	Stockpile converted to medical-grade LEU (19.75%) at Esfahan	Medical isotope production in Iran	142 days
B: HEU Export to Oman	Stockpile transported under IAEA custody to Oman storage	IAEA facility, Oman (NOT US territory)	14 days
C: Kazakhstan LEU Bank	Downblended in Iran, transferred to IAEA LEU Bank in Oskemen	IAEA LEU Bank, Kazakhstan	75 days
D: Russian Federation Custody	Transfer to Rosatom storage under IAEA safeguards	Rosatom facility, Russian Federation	60-90 days
E: Bushehr Fuel Conversion	Downblended to reactor-grade LEU, fabricated into fuel assemblies	Bushehr reactor fuel supply	180 days

F:	Hybrid	Stockpile divided into batches, each through	Multiple	third-party	Concurrent
Modular		different pathways	destinations		

12.1 Third-Party Destination Guarantee (v5.4)

v5.4: HEU Never Transferred to US Territory

Article TPD-1: Under no circumstances may Iran's enriched uranium stockpile be transferred to United States territory, custody, or control. All six pathways specify third-party destinations: Oman, Kazakhstan, Russia, or in-place conversion within Iran. This is a binding, non-negotiable feature of the framework.

Article TPD-2: The US does not object to any of the six pathways as long as the final destination is a third country with IAEA safeguards. The US may request (but not require) specific pathway preferences. Iran selects the pathway(s). The IAEA verifies the transfer chain of custody.

Article TPD-3: Face-Saving. Iran: "Our sovereign nuclear material was transferred to neutral third-party custody, never surrendered to the United States." US: "Weapons-grade uranium has been removed from Iran to IAEA-monitored third-country storage."

12.2 The Mothball Protocol: Centrifuge Rotor Removal (v5.4)

v5.4: Rotors Removed to UN-Sealed Storage Within Iran

Article MP-1: Instead of demanding physical destruction of Isfahan and Natanz, the framework mandates the **Mothball Protocol**: all centrifuge rotors and bellows at facilities producing enrichment above 3.67% are removed, sealed in IAEA-tamper-evident containers, and stored in a UN-monitored facility within Iran. The centrifuge casings and infrastructure remain in place.

Article MP-2: Mothball Procedure.

1. **Day 1-14 (Inventory):** IAEA inventories all centrifuge rotors and bellows at Natanz and Isfahan producing enrichment above 3.67%
2. **Day 15-44 (Removal):** Iranian technicians remove rotors under IAEA supervision; rotors are placed in IAEA-tamper-evident containers with unique serial numbers
3. **Day 45-60 (Storage):** Sealed containers are transferred to a UN-monitored storage facility within Iran (location agreed by both parties, accessible to IAEA at all times)
4. **Day 60+ (Monitoring):** IAEA continuous camera monitoring of the storage facility; environmental sampling quarterly; any tampering immediately reported

Article MP-3: Dual-Key Custody. The storage facility operates under **dual-key custody**: one key held by Iran, one key held by the IAEA. Neither party can unilaterally access, move, or destroy the mothballed rotors. Both keys are required for any action. If either party requests reactivation, the request goes to the Facilitating State Council for review under the Partial Continuity Rule.

Article MP-4: Face-Saving. Iran: "Our centrifuge infrastructure was preserved. The rotors are in safekeeping under joint custody, not destroyed. We retain the sovereign right to request their return under the annual review mechanism." US: "Iran's enrichment capability above 3.67% has been physically disabled. The rotors are removed and under international seal."

Article MP-5: Reactivation Conditions. Mothballed rotors may be reinstalled only if: (a) the annual review confirms non-renewal of the enrichment cap, AND (b) the Facilitating State Council approves by consensus, AND (c) a 90-day notice period has elapsed. Until then, reactivation constitutes a Tier 3 breach.

12.3 Additional Protocol Acceleration (v5.4)

v5.4: Additional Protocol Implementation by Day 90

Article APA-1: Implementation of the IAEA Additional Protocol (AP) is accelerated from Year 1 to **Day 90** (mid-Stage 3). This provides the US with earlier access to wider verification tools without waiting for annual reviews.

Article APA-2: Phased AP Implementation.

- **Days 1-30:** Iran submits AP declaration; IAEA reviews and requests clarifications
- **Days 31-60:** IAEA begins complementary access inspections under AP authority; Iran provides managed access
- **Days 61-90:** Full AP implementation including short-notice inspections (24-hour notice); IAEA confirms AP operational

Article APA-3: Condition. Full AP implementation is contingent on: (a) Stage 1 closing successfully, (b) IAEA confirming 60% freeze sustained, (c) HEU export plan confirmed. If Stage 1 stalls, AP implementation pauses at current level but does not reverse.

Section 13: Fordow Joint Venture & Funding

The Fordow facility is converted to the International Medical Isotope Research Center (Medical Isotope Center). International oversight is rebranded as a scientific joint venture led by neutral nations.

13.1 Funding Model

Source	Contribution	Form	Timing
Switzerland (Seed)	\$25M	Direct grant to JV account	Month 1
Oman	\$15M	Infrastructure support	Months 1-6
Qatar	\$20M	Convertible loan at LIBOR + 0.5%	Months 1-12
WHO/IAEA	\$30M	Technical assistance grant	Months 3-24
EU	\$25M	Research partnership	Months 6-36
Iran (In-Kind)	\$40M equiv.	Facility, workforce, expertise	Throughout

Private Sector	\$20M	Commercial offtake agreements	Months 12-48
Total: \$175M + \$40M Iranian in-kind = \$215M over 48 months. Designated WHO Center of Excellence.			

Section 14: Rebranding & Crisis Communications

Remove terms like "deal," "rollback," or "concessions." Washington: "regional stability mechanism." Tehran: "sovereignty-protecting de-escalation tool." Neither narrative contradicts the other.

14.1 Communications Crisis Protocol

Crisis Type	Trigger	Response Protocol	Response Time
Unauthorized Leak	Confidential text published by media	"We do not comment on draft documents" statement; internal investigation	4 hours
Contradictory Statement	Official contradicts Accord provisions publicly	Senior official issues clarification; no attribution to Coordination Secretariat	24 hours
Viral Misinformation	False claims spread rapidly on social media	Pre-approved fact sheets; key influencers briefed; official corrections posted	6 hours
Inflammatory Speech	Senior politician attacks Accord	No official response; backchannel through Council; 72-hour cooling period	72 hours

Section 15: Goldilocks Crisis Protocol

The framework is most likely adopted during a crisis that scares both sides but doesn't collapse diplomacy. The Goldilocks Protocol keeps the modular 14-day directives ready to deploy instantly.

Crisis Type	Deployable Module	Timeline
Insurance spike	Micro-Pilot + Day-7 synchronized blockade lift	48 hours
Near-miss encounter	Blind De-escalation + Hotline full activation	24 hours
Leadership transition	Micro-Pilot (presents as "new initiative")	7-14 days

Energy market collapse	Full Stage 1 pre-authorized for emergency deployment	72 hours
------------------------	--	----------

Section 16: The Three-Tier Breach System

v5.2: Three-Tier Breach Architecture

Previous versions treated breaches as binary (compliant/non-compliant). v5.2 creates a graduated three-tier system that prevents overreaction to minor issues while reserving formal suspension for deliberate hostile violations.

Tier 1: Technical Dispute

Attribute	Specification
Definition	Minor procedural or technical deviation without material impact. Data reporting delays. Minor inspection access logistics. Communication protocol violations. Documentation discrepancies.
Examples	IAEA report submitted 24 hours late; minor customs delay for inspection equipment; communication not routed through proper channel
Response	Coordination Secretariat notification within 48 hours. 7-day corrective window. No penalties. No public disclosure. Confidential resolution through Technical Review Cell.
Escalation	If uncorrected after 7 days, escalates to Tier 2. If corrected, recorded but not scored.

Tier 2: Material Implementation Disruption

Attribute	Specification
Definition	Substantial deviation affecting operational implementation but without hostile intent. Significant inspection access denial. Major timeline delay. Financial channel disruption. Proxy force violation without state authorization.
Examples	Centrifuges not sealed by agreed date; \$500M+ asset transfer delayed 30+ days; proxy attack during operational pause
Response	Coordination Secretariat formal notification within 24 hours. Facilitating State Council convenes within 72 hours. 14-day remediation window. Affected module may enter Stabilization Hold. Other modules continue under Partial Continuity Rule. Public statement if operationally necessary.
Escalation	If unresolved after 14 days, escalates to Tier 3. If resolved, recorded with corrective action plan.

Tier 3: Deliberate Hostile Violation

Attribute	Specification
-----------	---------------

Definition	Willful, material breach demonstrating hostile intent. Enrichment above agreed limits with concealment. Military attack on framework personnel or facilities. Deliberate sabotage of verification systems. State-authorized proxy attack during ceasefire.
Examples	Enrichment resumed above 60% with IAEA cameras disabled; missile strike on IAEA custody facility; state-sponsored cyber attack on Category I infrastructure
Response	Automatic Return-to-Talks trigger activates (Section 35). Emergency Facilitating State Council within 12 hours. Mandatory 7-day mediation before ANY suspension action. ONLY Tier 3 allows formal suspension pathways. Even then, Framework Survival Core continues.
Suspension	If mediation fails AND Facilitating State Council confirms deliberate hostile intent by consensus, formal suspension may proceed. Humanitarian firewall protects medical/food funds. Reconstitution Conference mandatory within 30 days.

Five-Channel Verification Convergence (v5.3)

v5.3: Any Compliance Certification Requires 4 of 5 Channels

Article FCC-1: No compliance certification, milestone verification, or tranche release authorization may activate until **at least 4 of 5 verification channels** have independently confirmed the relevant condition. The five channels are: IAEA (nuclear), Oman (maritime), Switzerland (financial), Qatar (logistics/liquidity), and the UN Appointee (procedural).

Article FCC-2: A dissenting channel's objections are documented and addressed but do not block certification if 4 of 5 concur. The dissenting channel may request a 7-day technical review of its specific concerns. During this review, certification proceeds but the Secretariat flags the concern for enhanced monitoring.

Article FCC-3: If only 3 of 5 channels concur (or fewer), certification is withheld pending resolution. The Secretariat convenes a Verification Convergence Panel within 48 hours to investigate the discrepancy. No tranche releases, bonus payments, or stage graduations may proceed without 4/5 convergence.

72-Hour Attribution Hold (v5.3)

v5.3: All Incidents Default to 72-Hour Investigation Before Tier 2 Breach

Article AH-1: All incidents involving potential breaches default to a **72-hour Attribution Hold** before any Tier 2 or Tier 3 classification. During the Attribution Hold:

- The incident is classified as "under investigation" — not as a breach
- Rogue Actor Protocols auto-activate (Section 19)
- Cooling-Off Default is automatically invoked (24-72 hour escalation freeze)
- Verification teams from all five channels deploy to investigate
- No public accusations from either party until attribution Level 4 reached

Article AH-2: Only after 72 hours may the Secretariat recommend Tier classification. The 72-hour period may be extended to 14 days for complex incidents (e.g., cyber attacks, proxy actions) by Facilitating State Council consensus. The extension does not affect other modules under the Partial Continuity Rule.

False Flag Detection Protocol (v5.3)

v5.3: Immediate Cooling-Off + UN Investigation for Suspicious Incidents

Article FFD-1: The Secretariat maintains a False Flag Watch List of indicators that, when detected, automatically trigger Cooling-Off and enhanced investigation:

Indicator Category	Specific Triggers	Auto-Response
Maritime Anomalies	Unmarked vessels in Hormuz corridor; AIS spoofing; vessels with no registered flag or owner	Cooling-Off + Maritime Council emergency session
Communications Inconsistencies	Attack claimed by group with no prior capability; communications routed through unusual channels; contradictory statements from alleged perpetrators	Cooling-Off + Cyber Cell forensic analysis
Timing Coincidences	Incident occurs during critical negotiation phase; incident benefits third party not involved in framework	Cooling-Off + full five-channel attribution review
Technical Anomalies	Weapon signatures inconsistent with claimed source; explosive residue points to non-attributed origin; cyber attack code contains unusual signatures	Cooling-Off + independent technical forensic panel

Article FFD-2: When 2+ indicators are triggered simultaneously, the incident is automatically classified as "suspected false flag" and referred to the UN Appointee for independent investigation. Both parties must cooperate with the investigation. Neither party may take military action against the other during the investigation.

Critical Safeguards

- **Only Tier 3 allows formal suspension.** Tiers 1 and 2 never trigger suspension.
- **Mandatory mediation before snapback.** No sanctions restoration, no military repositioning, no suspension until emergency review, neutral technical assessment, and one emergency summit attempt occur.
- **Automatic Return-to-Talks.** Any breach (even Tier 3) automatically triggers emergency consultation before suspension.
- **No Withdrawal During Mediation.** During Facilitating State Council review, IAEA clarification, hotline dispute resolution, or stabilization hold, neither side may formally withdraw.

- **"Stabilization pause" not "collapse."** All documents use: pause, suspension, review cycle, temporary non-implementation. Never: collapse, failure, breakdown.
- **Five-Channel Convergence.** No certification without 4/5 channels. No single veto, no unilateral override.
- **72-Hour Attribution Hold.** All incidents get 72 hours of investigation before Tier 2/3 classification. Rogue Actor Protocols auto-activate.

Section 17: Face-Saving Metrics & Domestic Wins

17.1 What the United States Wins

Win	Deliverable	Metric
Hormuz reopened	200+ vessel transits per 14-day period	"Gas prices falling within 7 days; 20% global oil supply restored"
Stockpile secured	Entire 60% stockpile in IAEA third-country custody	"Every kilogram verified by mass spectrometry"
Enrichment capped	1-year renewable cap with annual review	"Performance-based renewal; ratchet effect"
Fordow converted	Fortified facility producing medical isotopes	"Most fortified enrichment plant now produces cancer medicine"
No basing concessions	All US Gulf bases remain	"Not a single base closed"
Congressional oversight	Tranches 3+ subject to 30-day review	"Congress has a vote on every major tranche"
No precedent created	Explicit clause in every document	"One-time arrangement; no template"

17.2 What Iran Wins

Win	Deliverable	Metric
War ended	Permanent bilateral ceasefire	"No more bombs on Iranian soil"
Blockade lifted	Synchronized with Hormuz reopening	"Iranian ports fully operational"
Assets returning	\$250M Day 1; 50% by Day 44; 85% by Day 180	"Irreversible return of sovereign property"

NPT preserved	rights	Enrichment at 3.67% under sovereign review	"We review annually; no enduring obligation"
Permanent seat	Transit	Permanent voting seat with rotating facilitation	"Co-equality replacing American unilateralism"
Fordow achievement		World-class medical isotope center	"Iranian scientists lead cancer medicine production"
Bonus performance	for	Up to \$6B for accelerated compliance	"Rewarded for speed and excellence"

Section 18: Safeguards, Force Majeure & No Precedent

Key Safeguards

1. **Failure Without War:** Framework pause does not restore war. Ceasefire remains unless explicitly renounced.
2. **Stabilization Holds:** When a measure becomes untenable, it enters Stabilization Hold for up to 90 days. Other obligations continue.
3. **Emergency Ambiguity Authority:** Facilitating state may introduce controlled procedural ambiguity to prevent escalation (max 14 days).
4. **Costed Withdrawal:** Six-month notification, orderly asset disposition, infrastructure handover. Nuclear constraints survive as residual obligations.
5. **Force Majeure:** Natural disasters, third-party attacks, pandemic, cyberattacks by third parties, critical infrastructure failures = temporary pause without breach. Facilitating State Council arbitration within 7 days. Auto-90-day extension available upon verified continued disruption.
6. **No Precedent:** Article 1.5 incorporated by reference into every document.
7. **Tel Aviv Channel:** Real-time IAEA data-sharing with Israeli intelligence; pre-briefings on all milestones.
8. **Israel Non-Interference Guarantee (v5.4):** US commits to "ensure allied compliance with the ceasefire during the negotiation window." See full protocol below.
9. **No Snapback Pledge (v5.4):** US formally pledges not to trigger UN snapback sanctions as long as IAEA certifies the 60% freeze. See full protocol below.
10. **WFP Humanitarian Shield (v5.4):** UN World Food Programme vessels are explicitly shielded from all dispute resolution processes. See full protocol below.
11. **Mutual Covert Operations Ban (v5.4):** Both parties pledge against cyber and physical sabotage of each other's critical infrastructure. See full protocol below.

Israel Non-Interference Guarantee (v5.4)

v5.4: US Commits to Preventing Allied Strikes During Negotiation Window

Article ING-1: The United States commits to "use its diplomatic influence to ensure allied compliance with the ceasefire during the framework negotiation window." This means:

- The US will provide Israel with advance briefings on the Tel Aviv Channel before any Iranian compliance milestone (as already provided in Section 18)
- The US will use diplomatic channels to discourage any allied military action against Iranian nuclear or maritime facilities while the framework is active
- If an allied strike occurs during the negotiation window, the US will publicly condemn it as a violation of the framework's ceasefire provisions

Article ING-2: This is NOT a US guarantee that Israel will not strike. The US cannot control Israeli military decisions. It is a commitment to active diplomatic prevention. Iran receives a security guarantee (US will "ensure allied compliance") without the US having to restrain Israel by force.

Article ING-3: If an allied strike does occur during the framework, the Framework Survival Core continues (ceasefire hotline, humanitarian, diplomatic channel). The affected party may invoke the Political Shock Absorber (Section 36) for an automatic Review Pause. The incident is classified under the Three-Tier Breach System with 72-Hour Attribution Hold.

Article ING-4: Face-Saving. Iran: "The US has guaranteed that its allies will respect the ceasefire during negotiations." US: "We have used our diplomatic influence with allies to maintain stability during this critical negotiation window."

No Snapback Pledge (v5.4)

v5.4: US Pledges No UN Sanctions Snapback While Freeze Verified

Article NSP-1: The United States formally pledges not to trigger UN sanctions snapback mechanisms (UNSCR 2231 or any successor resolution) as long as the IAEA certifies that Iran's 60% enrichment freeze is being maintained. This pledge is conditional and performance-based:

- **Condition:** IAEA certifies 60% freeze sustained at each quarterly review
- **Duration:** Throughout the framework's active period and any stabilization pause
- **Limit:** If Iran resumes enrichment above 60%, the pledge lapses automatically after 30 days (per the diluted PRDD process)
- **Scope:** Applies to UN multilateral snapback only; does not prevent US unilateral sanctions (those require Congressional action in any case)

Article NSP-2: Verification. The IAEA Director-General's quarterly reports serve as the automatic certification mechanism. If the report confirms the freeze, the No Snapback Pledge remains in force. If the report identifies a violation, the 30-day PRDD process begins before the pledge lapses.

Article NSP-3: Face-Saving. Iran: "The US has formally pledged no snapback as long as we maintain the freeze. This is a binding international commitment." US: "Our snapback pledge is performance-based and verified by the IAEA. Iran controls whether it remains in force through its own compliance."

WFP Humanitarian Shield (v5.4)

v5.4: World Food Programme Vessels Fully Shielded

Article WFP-1: UN World Food Programme (WFP) vessels transiting the Strait of Hormuz are explicitly and fully shielded from all dispute resolution processes, sanctions enforcement, inspection requirements, and military action. This shield applies regardless of framework status:

- WFP vessels are exempt from the Hormuz Environmental Transit Fee (Section 11.3)
- WFP vessels may not be stopped, boarded, or inspected by any party
- WFP vessels are identified by UN flag and pre-registered AIS broadcast
- Any action against a WFP vessel constitutes a Tier 3 breach

Article WFP-2: Rationale. With the UN warning that 45 million people in the region face starvation, WFP shipments are classified as inviolable humanitarian missions. The shield extends beyond the standard humanitarian channel to provide absolute protection for food shipments under the UN flag.

Article WFP-3: Expansion. The shield also covers vessels chartered by the International Committee of the Red Cross (ICRC), UNICEF medical supply shipments, and WHO vaccine transports. All are pre-registered with the Maritime Operations Cell.

Mutual Covert Operations Ban (v5.4)

v5.4: Both Parties Pledge Against Sabotage

Article MCOB-1: Both the United States and Iran pledge not to conduct cyber or physical sabotage of each other's critical infrastructure during the framework's active period. This includes:

- **Cyber:** No attacks on nuclear monitoring systems, banking infrastructure, maritime navigation, or government communications
- **Physical:** No sabotage of nuclear facilities, ports, pipelines, refineries, or electrical grids
- **Assassination:** No targeted killings of nuclear scientists, military officers, or government officials
- **Infiltration:** No sabotage operations by intelligence operatives on each other's territory

Article MCOB-2: Verification. Violations are detected through: (a) the Cyber Operations Stabilization Module (Section 21), (b) the Five-Channel Verification Convergence (Section 16), (c) the Satellite Data Feed (Section 11b), (d) the False Flag Detection Protocol (Section 16). Any detected violation triggers the 72-Hour Attribution Hold and Tier classification.

Article MCOB-3: Scope Limit. This ban applies to sabotage, not to legitimate intelligence collection (which both parties acknowledge will continue). The line between collection and sabotage is drawn at the point of operational disruption: intelligence gathering that does not cause infrastructure damage or operational failure is not covered by this ban.

Article MCOB-4: Face-Saving. Both parties: "We have pledged not to conduct sabotage operations against the other party's critical infrastructure. This is a mutual, verifiable commitment."

Energy Market Stabilization Joint Pledge (v5.4)

v5.4: Joint Commitment to Global Energy Stability

Article EMSJP-1: Both parties jointly pledge to "ensure the stability of global energy markets." This pledge creates a shared interest in Hormuz remaining open and oil prices remaining stable:

- Neither party will take action to disrupt Hormuz transit for political purposes
- Both parties will cooperate with OPEC+ on production adjustments to maintain price stability
- Both parties will support the JHTA's role in ensuring uninterrupted commercial shipping
- If energy markets destabilize due to third-party action, both parties will cooperate on emergency measures through the Crisis Response Cell

Article EMSJP-2: Face-Saving. Both parties: "We are committed to ensuring the stability of global energy markets, which benefits producers and consumers worldwide." This creates international pressure for both sides to maintain the framework, as energy market disruption would violate the joint pledge.

Environmental Sampling Baseline (v5.3)

v5.3: Day 0 Swipe Samples as Fraud-Proof Baseline

Article ESB-1: Within 72 hours of Micro-Pilot signature (Day 0), IAEA inspectors collect environmental swipe samples at all declared nuclear facilities (Natanz, Fordow, Esfahan, Arak, Bushehr). These samples establish a **fraud-proof baseline** for all future inspections.

Article ESB-2: The baseline protocol:

1. Swipes collected from centrifuge cascades, feed stations, product withdrawal points, and waste handling areas
2. Samples split into three sealed sets: one for IAEA, one stored in Oman, one stored in Switzerland
3. Mass spectrometry analysis conducted at IAEA Seibersdorf and independently at the Omani verification laboratory
4. Results published in a Day 0 Baseline Report within 14 days

Article ESB-3: All subsequent environmental sampling is compared against the Day 0 baseline. Any deviation from baseline is flagged immediately as a potential anomaly. This prevents both parties from claiming "the samples were always like that" and provides an objective reference point for dispute resolution.

Article ESB-4: The Day 0 baseline report is classified as Tier 1 (Inviolable) under the Partial Continuity Rule. It survives all stabilization pauses, suspensions, and withdrawals, and remains available for future reference regardless of framework status.

Legacy Mode (v5.3)

v5.3: Mandatory Renegotiation Within 90 Days of Full Withdrawal

Article LM-1: If either party completes a full withdrawal from the framework (after the 6-month notification period), the Framework Survival Core continues automatically. Additionally, a **mandatory Renegotiation Obligation** activates:

- Within 30 days of withdrawal completion, the withdrawing party must submit a written statement of its position and proposed modifications
- Within 60 days, the Coordination Secretariat convenes a Renegotiation Conference in Geneva
- Within 90 days, all parties must attend and negotiate in good faith toward a modified framework

Article LM-2: Baseline Floor During Renegotiation. During the 90-day Renegotiation Period, the following continue regardless of formal withdrawal:

- 60% enrichment freeze (unless IAEA confirms the withdrawing party has resumed enrichment)
- Hormuz humanitarian channel (zero-fee transit)
- Ceasefire hotline (Omani-facilitated)
- IAEA basic monitoring at declared sites

Article LM-3: No "Clean Slate." Neither party may treat withdrawal as creating a "clean slate" for renewed military action or maximum-pressure sanctions. The 60% freeze, Hormuz access, and IAEA monitoring survive as baseline obligations pending renegotiation. Resumption of enrichment above 60% or Hormuz interdiction during the Renegotiation Period constitutes a Tier 3 breach and triggers the full Reconstitution Mechanism (Section 35).

19(b) Levant Firewall & Lebanon Ceasefire Linkage (v5.4)

v5.4: Mutual Non-Use of Lebanese Territory + Regional De-escalation

19(b).1 Levant Firewall

Article LF-1: The United States and Iran commit to a **Levant Firewall**: neither party shall use Lebanese territory as a base for offensive operations against the other. This is a mutual commitment that applies symmetrically:

- **Iranian commitment:** Iran and its affiliated groups shall not conduct offensive operations against US personnel, facilities, or interests from Lebanese territory
- **US commitment:** The United States shall not conduct offensive operations against Iranian personnel, facilities, or interests from Lebanese territory

Article LF-2: The Levant Firewall does NOT require Iran to disavow Hezbollah, cut ties with Lebanese groups, or alter its relationship with the Lebanese government. It is a territorial commitment, not a political one. Iran retains its sovereign right to diplomatic and political relationships.

Article LF-3: Verification is conducted by UNIFIL (UN Interim Force in Lebanon) and the Lebanese Armed Forces, with data shared through the Coordination Secretariat. Violations are subject to the 72-Hour Attribution Hold and Tier 1/2/3 classification.

19(b).2 Lebanon Ceasefire Linkage

As part of the regional security dialogue (Section 7.2), the United States commits to "**actively facilitate de-escalation in the Levant**" through diplomatic channels. This commitment includes:

- Supporting UN-led ceasefire negotiations between Israel and Hezbollah
- Using diplomatic influence to discourage Israeli strikes on Lebanese civilian infrastructure during the framework negotiation window
- Coordinating with the Facilitating State Council on Levant de-escalation measures

Article LCL-2: This is NOT a US guarantee to stop Israeli military action. The US does not control Israeli policy. It is a commitment to active diplomatic facilitation. Iran receives a political win (US is "facilitating de-escalation") without the US having to dictate Israeli military decisions.

Article LCL-3: Face-Saving. Iran: "The US has committed to facilitating de-escalation in Lebanon as part of the regional security package." US: "We have used our diplomatic influence to promote stability in the Levant through UN channels, consistent with our broader regional policy."

Section 19: Spoiler & Rogue Actor Management

Spoiler Type	Example Actors	Response Protocol
Proxy Attackers	Unrestrained Hezbollah cells; Houthi splinters; Iraqi PMF hardliners	Condemnation within 24h; attribution investigation; rogue commander protocol
False-Flag Operators	Third-state intelligence; criminal organizations; terrorist groups	Forensic investigation; no military response until Level 4 attribution
Rogue Commanders	IRGC officer rejecting authority; US commander exceeding ROE	Immediate recall; investigation; public disavowal; temporary suspension
Cyber Spoilers	Third-state intelligence; criminal ransomware groups	Cyber Module; 6-hour notification; technical review
Political Saboteurs	Opposition politicians; hostile media; activists	Crisis Communications Protocol; no official response to hostile outlets

Proxy Attribution Matrix (v5.3)

v5.3: Pre-Agreed Scoring System Preventing Blame Spirals

Article PAM-1: A Proxy Attribution Matrix establishes pre-agreed classification levels for common proxy actions, preventing each incident from becoming a new attribution dispute:

Action	Default Level	Escalation Condition	Auto-Response
Houthi missile at commercial vessel	Level 3 (Probable proxy)	If claimed by Houthi within 24h	Tier 1 review; proxy pause assessment
Houthi missile at military vessel	Level 4 (Highly probable)	Claimed or launch point confirmed	Tier 2 review; 72-hour Attribution Hold
Hezbollah rocket at US facility	Level 4 (Highly probable)	Claimed or signature matches arsenal	Tier 2 review; 72-hour Attribution Hold
Iraqi PMF IED on US convoy	Level 3 (Probable proxy)	If claimed within 24h	Tier 1 review; proxy pause assessment
Unclaimed Hormuz maritime attack	Level 2 (Possible third party)	If false-flag indicators triggered	Cooling-Off + False Flag investigation
Cyber attack on Category I infra	Level 3 (Probable)	Code signature matches known actor	72-hour Attribution Hold + Cyber Cell
State-claimed attack	Level 5 (Confirmed)	N/A — claimed by state	Tier classification by severity

Article PAM-2: The default level is the starting point, not the conclusion. All incidents remain subject to 72-Hour Attribution Hold and Five-Channel Verification Convergence. The Matrix prevents the starting point from becoming a political dispute.

Section 20: Attribution Uncertainty Protocols

Level	Definition	Permitted Response	Prohibited Response
5: Confirmed	Multiple sources; physical evidence; intercepted comms	Full diplomatic response; Tier 3 breach; UNSC referral	Disproportionate military response
4: Highly Probable	Strong evidence from 2+ sources; no credible alternative	Diplomatic protest; sanctions; formal review	Military response; PRDD

3: Probable	Single strong or multiple weak sources	Backchannel demarche; 14-day forensic review	Public accusations; sanctions; military
2: Possible	Circumstantial; alternatives exist	Intelligence sharing; enhanced vigilance	Any diplomatic or military response
1: Unknown	No reliable information; conflicting reports	Fact-finding; provisional restraint; 72-hour review	Any response beyond fact-finding

Section 21: Cyber Operations Stabilization

Severity	Definition	Notification	Response
Critical	Category I infrastructure disrupted	1 hour	Cyber hotline; emergency session; analogue backups
Serious	Category II attacked; significant Category I recon	6 hours	Technical review; 72-hour remediation
Moderate	Category III attacked	24 hours	Notification; technical review
Low	Probing; scanning; no impact	Weekly summary	Routine monitoring

Civilian Nuclear Consortium (v5.4)

v5.4: US Pledges Not to Sanction Civilian Reactor Assistance

Article CNC-1: The United States formally pledges not to impose secondary sanctions on European, Russian, Chinese, or other international firms that provide technical assistance to Iran for building strictly civilian nuclear power reactors, provided enrichment remains capped at 3.67% and all activities are under IAEA safeguards.

Article CNC-2: Eligible Activities. Permitted assistance includes: (a) reactor design and engineering, (b) reactor construction supervision, (c) fuel supply for civilian reactors, (d) nuclear safety training, (e) waste management technology, (f) radiation medicine equipment. Prohibited: any assistance with enrichment technology above 3.67%, reprocessing, or weapons-related applications.

Article CNC-3: Verification. All civilian nuclear consortium activities are subject to IAEA safeguards and Secretariat monitoring. Any detected diversion to non-civilian purposes triggers the full Three-Tier Breach System (Section 16) and automatic suspension of consortium privileges.

Article CNC-4: Face-Saving. Iran: "The international community is helping us build civilian nuclear power, under our sovereign control, within NPT rights." US: "We have enabled international assistance for strictly civilian nuclear energy in Iran, fully safeguarded, with no pathway to weapons."

Post-Quantum Encryption Target (v5.3)

v5.3: Quantum-Resistant Communications by Day 180

Article PQE-1: All Secretariat communications channels, hotline systems, and data transmission links must transition to post-quantum cryptographic protocols by Day 180. This protects framework communications from future quantum computing decryption threats.

Article PQE-2: Phased Transition.

- **Days 1-60:** Assessment and procurement of post-quantum hardware and software
- **Days 61-120:** Parallel operation: existing encryption continues, post-quantum layer added
- **Days 121-180:** Full transition to post-quantum as primary protocol; legacy encryption as backup only

Article PQE-3: IAEA and Swiss Federal Cyber Security Office provide technical assistance. Both parties' cyber commands receive training. Funded from the Qatari Emergency Liquidity Facility as a cybersecurity infrastructure investment.

Section 22: Crisis Management

22.1 The 24-Hour Cooling-Off Rule

When an incident occurs, no escalatory action may be taken within the first 24 hours. Self-defense preserved where active armed attack is in progress.

22.2 Five De-escalation Pathways

Pathway	Trigger	Duration
Crisis Lock	10+ fatalities; verified clash; critical infrastructure attack	14 days; extendable to 42
Third-Party Attribution	Spoiler Third-party attack or spoiler activity	30-day investigation
Military Deconfliction	Any military incident near Hormuz corridor	Permanent 24/7 hotline

Regional Firewall		Third-party regional escalation				Immediate session	emergency
Direct Link	Executive	Imminent communication	crisis	requiring	head-of-state	6-hour consultation	

Section 23: Degraded Compliance Operating Mode

Intermediate state between full compliance and dispute. Partial implementation continues, humanitarian channels remain active, monitoring persists, but some tracks enter hold.

Trigger		Continues	Freezes
Domestic crisis	political	Ceasefire; humanitarian; IAEA monitoring; diplomatic channels	New asset releases; new nuclear concessions; successor talks
Regional escalation		Ceasefire; humanitarian; IAEA; diplomatic channels	Hormuz military coordination; proxy stand-down enforcement
Technical verification failure		All tracks; analogue backup; enhanced physical inspection	Digital-dependent processes; automated certification
Financial disruption	channel	Ceasefire; humanitarian; IAEA monitoring; Hormuz transit	Further asset releases; bonus tranches; SWIFT reconnection
Cyber verification	attack on	Ceasefire; humanitarian; physical IAEA inspection; diplomatic channels	Digital verification; automated compliance; remote monitoring

Section 24: Enforcement Asymmetry & Mitigation

The Concern: Iran's commitments are concrete and immediate, while US sanctions relief depends on political processes outside executive control.

Asymmetry		Mitigation
Iran's commitments are physical and irreversible		US commitments staged and reversible through first two tranches; physical US commitments (blockade lift) match physical Iranian commitments
US sanctions relief requires Congressional action		Tranches 1-2 require only executive authority; non-US channels bypass Congress; 30-day review provides early warning
Iran cannot enrichment once transferred	"un-freeze"	US cannot "un-lift" blockade without visible consequences; both create irreversible facts

US can reimpose sanctions unilaterally	Diluted PRDD requires 30-day Triad process; humanitarian firewall protects medical/food funds; reimposition triggers Iranian right to resume enrichment
Iranian Majlis may reject moratorium	30-day deferred window for Majlis review; sovereignty language reduces rejection risk; Micro-Pilot builds political capital

Section 25: Legally Binding vs Politically Binding Framework

Element	Binding Character	Legal Form
Ceasefire	Legally binding	Exchange of letters; registered with UN
Stockpile transfer to IAEA	Legally binding	IAEA custody agreement; binding transfer
Enrichment moratorium	Legally binding	Voluntary commitment to IAEA Board; binding under NPT safeguards
Hormuz reopening	Legally binding	Executive orders; Maritime Council operational directive
Asset return tranches	Legally binding	Swiss escrow agreement; contractually binding
Transit Authority Charter	Legally binding	Multilateral treaty; UN registration
Micro-Pilot	Politically binding	Exchange of letters; not a treaty
Blind De-escalation	Politically binding	Mutual understanding through backchannels
Face-saving metrics	Politically binding	Communications Cell approval; pre-cleared statements
Successor framework	Non-binding	Aspirational; political commitment to negotiate

Section 26: US Succession Continuity

Explicit survival through elections, administration changes, Congressional turnover, cabinet reshuffles:

- **Escrow Protection:** Funds in Swiss escrow legally held by escrow agent, not US government. Cannot be clawed back.
- **Treaty Lock-In:** Transit Authority Charter requires 12-month withdrawal notice.

- **Irreversible Facts:** Blockade lift, Hormuz opening require visible, politically costly decisions to reverse.
- **Constituency Creation:** American companies, banks, investors benefit from restored trade.
- **International Reputation:** Withdrawal damages US credibility on non-proliferation.
- **Sunk Costs:** By Tranche 3, two prior tranches released, creating sunk costs of cooperation.

Section 27: Domestic Legislative Synchronization

Body		Window	Action	Veto
US Congress		Tranche 3+: 30 days	Notification + Joint Resolution opportunity	Subject to Presidential veto
Iranian Majlis		Moratorium: 30 days	Ratification vote required	Refusal to ratify
GCC Council	Joint	JHTA charter: 14-30 days	Consultation required	2+ formal objections trigger revised consultation
EU Council		SWIFT: 14-30 days	Political endorsement	Blocking Regulation available
UN Council	Security	Quarterly reports	Reporting only; no approval	N/A

Section 28: Public Communications Crisis Procedures

1. All public characterizations must acknowledge benefits are conditional on performance
2. 24-hour embargo on contradictory messaging
3. Pre-approved sound-bites only; deviations require Communications Cell notification within 4 hours
4. Messaging override permitted for domestic crises for up to 14 days
5. Neither side may characterize the other's commitments as "concessions" or "defeat"
6. No public reference to Israeli Tel Aviv Channel
7. All force majeure declarations reported as "operational adjustments" not compliance failures
8. Use "stabilization pause" not "collapse" in all communications

Section 29: Independent Audit & Review

Review	Frequency	Composition	Reporting
90-Day Technical	Every 90 days	3 neutral experts appointed by Facilitating State Council	Confidential to Secretariat; summary public
180-Day Comprehensive	Every 180 days	5-person panel appointed by UN Secretary-General	Public report; UN registration
Annual Evaluation	Annually	7 former heads of government appointed by Nobel Institute	Public; media briefing; parliamentary testimony
Ad Hoc Crisis	As needed	2-3 experts appointed within 48 hours	To Secretariat within 14 days; public summary

Section 30: Stabilization Pause End-States

One of the strongest design features is modular survivability. This section defines what survives when each track pauses:

If This Pauses...	Survives (Automatic)	Survives (Secretariat Decision)	Goes to Hold
Nuclear talks	Ceasefire; Hormuz transit; humanitarian; tranches 1-2; IAEA standard monitoring	SWIFT Phase 0-1; proxy pause; regional dialogue	Further asset releases; bonus tranches; Fordow Phase D
Sanctions relief stalls	Ceasefire; Hormuz transit; IAEA monitoring; humanitarian	Proxy pause; Transit Authority provisional; SWIFT Phase 0	Further nuclear concessions; cap renewal
Maritime incidents	Ceasefire; nuclear freeze; IAEA monitoring; humanitarian; tranches 1-2	Proxy pause; diplomatic channels; emergency protocols	Non-humanitarian transit; asset releases pending review
Israeli strike	Humanitarian; IAEA monitoring (if safe); diplomatic channels	Proxy pause (if Hezbollah not involved)	All non-humanitarian tracks; Crisis Pause Mode
Cyber attack on verification	Ceasefire; humanitarian; physical IAEA inspection; diplomatic channels	Analogue monitoring systems; non-digital operations	Digital verification; automated compliance

30.1 The Absolute Floor

Under no circumstances can the following collapse:

1. **Humanitarian channel:** Food, medicine, UN supplies continue transiting Hormuz with zero fees
2. **Bilateral ceasefire:** Neither party resumes offensive operations unless explicitly renounced with 6-month notice
3. **IAEA basic monitoring:** Standard safeguards inspections continue at declared sites
4. **Emergency diplomatic channel:** Coordination Secretariat communication lines remain open

Section 31: Economic Stabilization Metrics

Metric	Baseline	30d	90d	180d	365d	Verifier
Insurance premium	2.5%	1.5%	0.75%	0.25%	0.15%	Lloyd's List
Hormuz transits/14d	~60	200+	350+	400+	450+	Maritime Council
Iran oil exports (mbpd)	0.5	1.0	1.5	2.0	2.5	OPEC
SWIFT banks connected	0	0	5	12	20+	SWIFT HQ
Iran inflation	45%	40%	30%	20%	15%	IMF
Rial/USD exchange	550k	450k	350k	250k	200k	CBI
Assets returned (\$B)	0	1	15	50	100	Swiss escrow

Section 32: Technical Delay Without Breach

Delay Type	Max Tolerance	Notify Within	Excluded from Timeline?
Weather	7 days	12 hours	Yes
Communications outage	48 hours	2 hours of restoration	Yes
Customs/border processing	7 days	24 hours	Yes
Equipment delivery	14 days	48 hours	Yes
Satellite downtime	24 hours	Immediate	Yes + backup
Banking processing lag	5 business days	24 hours	Yes

Visa delays	10 days	48 hours	Yes
Equipment calibration	3 days	12 hours	Yes

Maximum 3 Technical Delays per stage per party. Additional delays require Facilitating State Council review.

Section 33: Three-Tier Breach System Summary

Attribute	Tier 1: Technical	Tier 2: Material	Tier 3: Deliberate Hostile
Definition	Minor procedural deviation; no material impact	Substantial deviation; affects implementation; no hostile intent	Willful, material breach with hostile intent
Notification	48 hours	24 hours	Immediate + Return-to-Talks
Remediation window	7 days	14 days	7-day mandatory mediation
Other modules	All continue	Affected module to Hold; others continue	Framework Survival Core continues; others may suspend
Can trigger suspension?	No	No	Yes, only after mediation fails
Public disclosure	No	If operationally necessary	Yes

Section 34: Cooling-Off Default

When disagreement occurs and attribution is unclear, all escalation freezes automatically for 24-72 hours. Negotiations continue. Verification teams investigate. No party may take escalatory action during the Cooling-Off Period.

Activation Triggers: Level 3 attribution or below; Secretariat determines irreconcilable positions; either party requests Cooling-Off (automatically granted); cyber incident on Category I/II infrastructure; potential false-flag activity.

Self-Defense Exception: Active armed attack in progress may be defended. Retaliatory strikes against the other party's territory are prohibited pending attribution.

Section 35: Reconstitution Mechanism

v5.2: The Single Most Important Missing Failsafe

Article REC-1: Reconstitution Conference Obligation. If the Framework enters full suspension, all parties remain obligated to attend a **Reconstitution Conference** within 30 days under neutral facilitation. This prevents rage-quitting, indefinite freeze, and diplomatic disappearance after crisis events.

35.1 Reconstitution Trigger Conditions

A Reconstitution Conference is mandatory when any of the following occur:

1. Formal suspension of two or more Tier 3 (Protected) modules simultaneously
2. Either party issues notice of intent to withdraw
3. Facilitating State Council determines the Framework has entered "full suspension" status
4. UN Secretary-General requests a Reconstitution Conference based on humanitarian or security concerns
5. 90 days have elapsed since any Coordination Secretariat meeting with participation from both parties

35.2 Reconstitution Conference Procedures

1. **Convening:** The UN Appointee (procedural mediation facilitating state) convenes the Conference within 30 days of trigger. Location: Geneva (default) or mutually agreed neutral venue.
2. **Participation:** Mandatory attendance by senior officials from both parties. Facilitating State Council chairs. IAEA, Omani, Swiss, Qatari, Pakistani facilitating states participate.
3. **Agenda:** (a) Assessment of suspension causes, (b) Identification of surviving elements, (c) Proposed modifications to address concerns, (d) Timeline for phased resumption, (e) Confidence-building measures to restore trust.
4. **Outcomes:** Modified Framework Agreement; Phased Resumption Protocol; New confidence-building measures; or Acknowledged divergence with Framework Survival Core continuing.
5. **Decision Rule:** Consensus preferred. If consensus impossible, both parties may agree to "modified continuation" where some elements resume while others remain in stabilization pause. No party may be forced to resume against its will.

35.3 Framework Survival Core During Reconstitution

During the 30-day Reconstitution Conference window and any subsequent negotiations:

- The Framework Survival Core (ceasefire hotline, humanitarian access, emergency diplomatic channel) continues unchanged
- Neither party may disable the Survival Core elements
- IAEA basic monitoring continues if inspector safety is assured
- The Coordination Secretariat maintains 24/7 operational capacity

35.4 Reconstitution Success Metrics

Outcome	Definition	Next Steps
Full Reconstitution	Both parties agree to resume all suspended elements with agreed modifications	30-day phased resumption; Secretariat monitors; 90-day review
Partial Reconstitution	Some elements resume; others remain in stabilization pause	Graduated return protocol; quarterly review; modification negotiation continues
Modified Continuation	Framework continues with substantial modifications agreed	Amendment protocol; legislative review; 180-day assessment
Survival Core Only	No agreement to resume beyond Survival Core	Survival Core continues indefinitely; bilateral contact through Secretariat maintained; future reconstitution possible at any time

35.5 Pre-Defined Conference Charter (v5.3)

v5.3: Agenda, Location, Convener Pre-Defined for Instant Activation

Article PCC-1: The Reconstitution Conference Charter is pre-defined and embedded in the framework, requiring no negotiation to activate:

Element	Pre-Defined Specification
Convener	UN Appointee (procedural mediation facilitating state)
Default Location	UN Palais des Nations, Geneva (Room XVI or equivalent)
Backup Location	Omani Foreign Ministry, Muscat (if Geneva unsafe or inaccessible)
Timing	Within 30 days of full suspension trigger
Duration	Minimum 5 working days; extendable by mutual consent
Agenda (Day 1)	Assessment of suspension causes; identification of surviving elements
Agenda (Days 2-3)	Proposed modifications; confidence-building measures; phased resumption timeline
Agenda (Days 4-5)	Draft modified framework; decision on full/partial/modified/survival-core-only resumption
Decision Rule	Consensus preferred; if impossible, "modified continuation" with some elements resuming, others in stabilization pause
Observers	All facilitating states; IAEA Director-General or designee; EU representative; GCC rotating chair

Article PCC-2: Pre-Positioned Logistics. The Secretariat maintains a standing Reconstitution Conference kit: pre-booked venue availability in Geneva and Muscat, pre-cleared visa facilitation lists for all delegation members, pre-tested secure communications infrastructure, and pre-positioned translation services (English, Farsi, Arabic, French). Conference can activate within 72 hours of trigger.

Article PCC-3: No-Veto Rule. Neither party may veto the convening of a Reconstitution Conference. If one party refuses to attend, the Conference convenes without them, documents their absence, and the Survival Core continues. Refusal to attend constitutes a Tier 3 breach under the "No Disappearance" Rule.

35.6 The "No Disappearance" Rule

Article ND-1: No party may refuse to attend a Reconstitution Conference. Attendance does not imply commitment to resume. A party may attend, state its position, and decline to resume. But it may not simply disappear. Non-attendance constitutes a Tier 3 breach and triggers the attribution protocol.

Article ND-2: If a party fails to attend within the 30-day window, the Facilitating State Council may: (a) extend the deadline by 14 days, (b) convene without the absent party, (c) refer the matter to the UN Security Council. The Survival Core continues regardless.

Section 36: Political Shock Absorber

Automatic Review Pause (not termination) when political shocks occur: elections, assassinations, cabinet collapse, mass protests, leadership transitions.

During Review Pause: Tier 1 and 2 modules continue; Tier 3 modules enter hold; Secretariat issues Certificate within 48 hours; affected party has 30 days to respond; maximum 90 days extendable by mutual agreement.

Review Pause is NOT a material breach. Does NOT trigger breach system. Does NOT affect compliance scoring.

Section 37: Implementation Roadmap

37.1 Pre-Signature (T-5 to T-0)

Day	Action	Responsible
T-5	Both governments confirm Micro-Pilot; designate senior officials	Heads of Government
T-4	Omani Foreign Ministry confirms Muscat facilities; Maritime Council drafted	Oman
T-3	Swiss financial channel confirms escrow; IAEA confirms custody facility	Switzerland / IAEA
T-2	Pakistan confirms convening team; Qatar confirms liquidity readiness	Pakistan / Qatar
T-2	Tel Aviv Channel activated; Israeli intelligence briefed	US / Israel
T-1	Military commands receive ceasefire instructions	Military Commands

T-1	Cyber Module activates; protected infrastructure categories communicated	Coordination Secretariat
T-0	Micro-Pilot letters exchanged; 60% freeze begins; IAEA deploys	Foreign Ministers

37.2 Critical Success Factors

- 1. Speed in Micro-Pilot: first 30 days must produce visible, credible deliverables
- 2. Israeli coordination: Tel Aviv Channel provides real-time data sharing
- 3. Verification credibility: five-channel system operational by Day 7
- 4. Facilitating State Council: operational readiness from Day 1
- 5. Cyber stabilization: Category I protection active from T-1
- 6. Flexible timelines: target windows (7-14 days) not hard deadlines
- 7. Reduced acronyms: full descriptive terms in all communications
- 8. Reconstitution readiness: Conference procedures pre-authorized for instant activation

Section 38: Rollback and Step-Down Architecture

v5.5: Replacing Snapback with Graduated Sanctions Relief Reduction

Core Principle: The Stability First Enhanced Accord v5.5 eliminates traditional "snapback" mechanisms in favor of a **graduated rollback and step-down architecture**. When a violation occurs, sanctions relief is reduced by a defined percentage rather than eliminated entirely. This preserves the incentive structure for compliance while eliminating the punitive all-or-nothing dynamic that collapsed the JCPOA in 2018.

38.1 The Problem with Snapback

JCPOA Snapback Flaw	v5.5 Rollback Solution
Total reimposition of all sanctions on any violation	Proportional reduction: 10-50% of relief affected, depending on severity
No graduated response between full relief and zero relief	Four-step ladder from 10% to 50% reduction
Political incentive to trigger snapback for minor issues	Minor issues trigger 10% reduction, not full reimposition
Once triggered, difficult to reverse without full renegotiation	Reduced relief can be restored through corrective compliance
Iran perceived snapback as one-sided US leverage	Rollback applies symmetrically to both parties' obligations

38.2 Four Alternative Rollback Models

Parties may select one of the following rollback models at signature, or the Facilitating State Council may recommend the most appropriate model based on the violation context:

Model A: Proportional Percentage Cut

Article RBA-1: When a violation is confirmed through the Three-Tier Breach System (Section 16) and Five-Channel Verification Convergence (Section 16), the affected sanctions relief tranche is reduced by a fixed percentage based on the breach tier:

Breach Tier	Relief Reduction	Example (\$250M Tranche)	Restoration Condition
Tier 1: Technical	10% reduction	\$250M → \$225M	Issue corrected within 7-day window; reduction reversed
Tier 2: Material	25% reduction	\$250M → \$187.5M	Issue corrected within 14-day window; 50% of reduction restored
Tier 3: Deliberate	50% reduction	\$250M → \$125M	Full corrective action plan; 90 days verified compliance; Council votes

Article RBA-2: No Automatic Restoration. Reduced relief is NOT automatically restored upon correction. The violating party must demonstrate sustained compliance for a defined period before restoration. This prevents gaming the system through quick fixes followed by repeated violations.

Model B: Escrow Hold (Suspension, Not Cancellation)

Article RBB-1: Upon verified violation, the disputed tranche is NOT seized or cancelled. Instead, it is **placed in escrow hold** pending investigation and remediation:

- Funds remain in the Swiss escrow account but are frozen from release
- Neither party has access to the held funds during the investigation period
- If the violation is corrected within the remediation window, the held funds are released
- If mediation fails, funds are distributed: 50% released to the violating party upon eventual compliance, 50% to the International Gulf Reconstruction Fund

Article RBB-2: Escrow hold is the default response for Tier 2 breaches where the violation is disputed but investigation is ongoing. It prevents either side from claiming the funds were "taken" by the other.

Model C: Step-Down Ladder

Article RBC-1: A predefined ladder of escalating relief reduction, with each rung triggered by a separate verified violation within a rolling 90-day window:

Violation Count (90 days)	Relief Impact	Non-Financial Consequences		
First violation	10% reduction on next tranche only	Technical Review Cell convened		
Second violation	25% reduction on next two tranches	Enhanced monitoring activated		
Third violation	50% reduction on all pending tranches >\$1B	Successor deferred	module	opening
Fourth violation	Full tranche hold; Reconstitution Conference triggered	Framework enters Review status	Pause	

Article RBC-2: The 90-day window resets to zero after 90 consecutive days without a verified violation. This creates a "clean slate" incentive: sustained compliance erases the violation history.

Model D: Performance Earn-Back

Article RBD-1: Relief reduction is treated as a "loan" that must be "repaid" through enhanced compliance:

- When relief is reduced, the full amount is tracked as an "earn-back balance"
- For every 30 days of verified clean compliance, 10% of the earn-back balance is restored
- Additional bonus compliance (early HEU export, accelerated Fordow conversion, etc.) earns 20% restoration per bonus
- Full restoration is possible within 150 days of sustained exemplary compliance

Article RBD-2: Performance Earn-Back is designed to incentivize over-compliance rather than minimum-compliance. It transforms the rollback from a punitive mechanism into a motivational tool.

38.3 Model Selection and Flexibility

Model	Best For	US Preference	Iran Preference	Recommended
A: Proportional Cut	Clear, predictable, easy to communicate	High (predictability)	Medium (still loses money)	Default
B: Escrow Hold	Disputed violations; maintaining trust	Medium (funds locked, not returned)	High (money not seized)	Tier 2 disputes

C: Step-Down	Pattern of repeated violations	High (escalates with recidivism)	Low (accumulates)	Tier 3 repeat offenders
D: Earn-Back	First-time violations; incentive alignment	Medium (requires patience)	High (restorable)	Tier 1 first violations

Article RBS-1: Default Assignment. If parties do not select a model at signature, Model A (Proportional Cut) applies by default. The Facilitating State Council may recommend a different model based on violation characteristics.

Article RBS-2: Model Switching. The Facilitating State Council may switch models mid-framework if the current model is not producing compliance incentives. Switching requires 4/5 Council consensus and 30-day notice to both parties.

38.4 Symmetry: Rollback Applies to Both Parties

Article RBS-3: Symmetry Lock. Rollback is not a one-sided mechanism. If the United States fails to deliver agreed sanctions relief, asset releases, or blockade reductions, Iran is entitled to proportional rollback of its nuclear and maritime commitments. The same percentage reductions apply. This creates mutual accountability and prevents either side from free-riding on the other's compliance.

US Failure	Iranian Rollback Right
Asset tranche delayed >30 days without Technical Delay justification	Corresponding nuclear freeze verification reporting reduced; not enrichment resumption
Blockade not lifted per synchronized timeline	IRGC-Navy may reduce Hormuz cooperation proportionally
SWIFT phase not triggered despite IAEA certification	Additional Protocol implementation may pause at current level
Congressional blocking of Tranche 3+ without 30-day review process	HEU export timeline extended proportionally; Fordow phases deferred

38.5 Humanitarian Firewall Protection

Article RBS-4: Humanitarian Shield. Under NO rollback model may humanitarian relief tranches (Micro-Pilot \$250M, humanitarian channel operations, medical isotope funding, WFP transit) be subject to reduction. The humanitarian firewall survives all rollbacks. Only non-humanitarian economic relief (SWIFT reconnection, asset releases for commercial purposes, investment facilitation) is subject to rollback.

38.6 Face-Saving Metrics

Audience	Narrative
Iran	"Sanctions relief is protected. A minor issue does not cost us everything. The graduated system ensures proportionality. We retain 75-90% of relief even during disputes."
US	"Iran faces real financial consequences for violations. The 25-50% reduction is meaningful. The symmetry lock ensures we cannot be accused of one-sided pressure."
International	"This framework learned from the JCPOA's fatal snapback flaw. Graduated responses preserve the agreement while maintaining accountability."

Section 39: Nuclear Monitoring Technology Menu

v5.5: Three Intensity Levels Using Cutting-Edge Non-Intrusive Technologies

Purpose: To independently verify that gas centrifuge enrichment plants do not exceed agreed enrichment levels using technologies strong enough to satisfy the United States but not so intrusive that Iran would reject them outright. The menu offers three selectable monitoring intensity levels, each incorporating specific sensor technologies drawn from the IAEA safeguards toolkit and next-generation research.

39.1 Technology Landscape Overview

Technology		Intrusiveness	Enrichment Info	Maturity	Best Use
UGES Inline Monitor		Low-Medium (mounted on UF ₆ pipes)	Direct enrichment measurement	Advanced R&D / IAEA deployment	Core enrichment verification
OLEM Monitor	Inline	Low-Medium (mounted on UF ₆ pipes)	Direct enrichment via gamma spectrometry	Deployed at commercial GCEPs	Baseline enrichment monitoring
External Sensors	Strain	Very low (clamped externally)	Flow/pressure proxy	R&D / pilot deployment	Cross-check, detect hidden flows
Vibration/Acoustic Sensors		Very low (external mounting)	Operating state proxy	R&D / some deployment	Detect abnormal operation

EM/Power Monitoring	Signature	Very low (electrical distribution)	Rotor speed profiles	R&D emerging	/	Detect undeclared machines
Passive Monitoring	ICS/SCADA	Very low (network taps, data diodes)	Rich process data	Emerging		Continuous behavioral monitoring
AI Multi-Sensor Fusion		Very low (data-only)	Integrated anomaly detection	Emerging		Synthesize all sensor inputs
Digital Twin		Very low (computational model)	Expected vs. actual comparison	R&D emerging	/	Predict expected signatures
Robotic Inspection	Ground	Low (periodic presence)	Independent physical verification	Deployed in nuclear facilities		Targeted ad-hoc verification
Indoor Platforms	Drone	Low (overhead inspection)	Visual/radiation mapping	Emerging		Overhead piping inspection
Environmental/Off-Gas Monitoring		Very low (outside process boundary)	Indirect throughput constraint	Deployed		Corroborative layer

39.2 Minimal Monitoring Level ("Essential Safeguards")

Iran Acceptance Likelihood: HIGH. Minimal monitoring closely resembles the JCPOA monitoring regime that Iran already accepted. It adds only one next-generation technology (OLEM) while preserving the familiar IAEA camera and inspection structure.

Component	Specification	Verification Confidence
IAEA Standard Cameras	Continuous recording at declared enrichment facilities (Natanz, Fordow)	Medium: detects visible changes
OLEM Inline Monitors	Gamma-ray spectrometry on selected UF ₆ process lines; continuous enrichment measurement	Medium-High: direct enrichment data
Quarterly Inspections	IAEA inspectors visit declared sites every 90 days; environmental sampling	Medium: periodic verification
Tamper-Evident Seals	IAEA seals on centrifuge cascades and material storage; checked quarterly	Medium: detects physical tampering

Minimal Level Assessment: Sufficient to detect major breakout attempts (enrichment above declared levels, cascade reconfiguration, material diversion). Does NOT provide real-time detection of subtle violations or access to non-declared sites. Appropriate for the Micro-Pilot and early Stage 1 where trust-building is the primary objective.

39.3 Medium Monitoring Level ("Enhanced Assurance")

Iran Acceptance Likelihood: MEDIUM. Medium monitoring adds external sensors and passive digital monitoring that do not require physical intrusion into centrifuge casings or control systems. The key political sell: all sensors are external or network-based; none require opening equipment or accessing proprietary software.

Component	Specification	Verification Confidence
Everything in Minimal	All Essential Safeguards components continue	Baseline
UGES Inline Monitors	Next-generation dual-collimator design; measures gas AND pipe deposits; improved precision; automated alarm at treaty-defined threshold	High: near-real-time enrichment values
External Strain Sensors	Fiber-optic strain gauges (FBGs) clamped to UF ₆ pipes; independent pressure/flow tracking; detects undeclared side-streams	High: independent process variable
Vibration/Acoustic Sensors	Accelerometers on centrifuge housings; acoustic monitors in cascade halls; detects abnormal operating regimes	Medium-High: operating state proxy
Passive ICS Monitoring	Network taps and data diodes mirror control traffic; monitors rotor speed commands, valve states, cascade configurations	High: rich process data without intrusion
Monthly Inspections	Inspection frequency increased to every 30 days; robotic ground inspection in cascade halls	High: frequent physical verification
Environmental/Off-Gas Monitoring	Stack and vent monitoring at facility perimeter; correlates declared throughput with actual operations	Medium: indirect throughput constraint

Medium Level Assessment: High-confidence detection of enrichment limit violations, including subtle deviations. External strain sensors provide independent cross-check of OLEM/UGES data. Passive ICS monitoring detects undeclared cascade configurations. Robotic inspection provides physical verification without human presence in sensitive areas. Appropriate for Stage 2 and permanent framework operations.

39.4 Maximal Monitoring Level ("Comprehensive Transparency")

Iran Acceptance Likelihood: LOW-MEDIUM. Maximal monitoring requires significant trust and is appropriate only after sustained compliance (Year 2+). The AI fusion layer and digital twin represent cutting-edge but non-intrusive surveillance. The key framing: this is a

"smart system" that reduces the need for human inspectors, not an intensified inspection regime.

Component		Specification	Verification Confidence	
Everything in Medium		All Enhanced Assurance components continue	Baseline	
AI Multi-Sensor Fusion Platform		Integrates all sensor + ICS data; unsupervised anomaly detection; Bayesian sensor fusion; change-point detection; probability-based enrichment estimation	Very High: detects coordinated subtle deviations	
Digital Twin		High-fidelity computational model of declared cascades; predicts expected sensor signatures; generates synthetic training data; optimizes sensor placement	Very High: expected vs. actual comparison	
EM/Power Signature Monitoring		High-resolution power metering on centrifuge feeds; non-contact EM probes; detects rotor speed profiles and machine counts	High: independent machine count	
Indoor Drone Platforms		Tethered drones inspect overhead UF ₆ piping; lightweight gamma detectors; rapid follow-up after AI-flagged anomalies	High: verification capability	ad-hoc
Continuous Presence	IAEA	IAEA maintains permanent on-site team (not inspectors, but "monitoring station operators"); 24/7 data review	Very High: real-time human oversight	

Maximal Level Assessment: Near-comprehensive detection capability for any deviation from agreed enrichment limits. AI fusion detects coordinated spoofing attempts that might evade individual sensors. Digital twin provides predictive baselines. Indoor drones and robotic inspection provide rapid physical verification without requiring human entry into cascade halls. Appropriate for Year 2+ of sustained compliance or if Additional Protocol is fully ratified.

39.5 Monitoring Level Selection and Escalation

Framework Phase	Recommended Level	Trigger for Escalation		De-escalation Path
Micro-Pilot (Days 1-30)	Minimal	60% freeze sustained for 14+ days		N/A (baseline)
Stage 1 (Days 1-14)	Minimal	Stockpile transfer verified; ceasefire holds		N/A (baseline)
Stage 2 (Days 15-44)	Medium	Moratorium ratified; HEU export initiated		Revert to Minimal if Tier 2 breach occurs
Stage 3 (Days 45-180)	Medium	Transit Authority operational; Fordow Phase A		Revert to Minimal if significant compliance gap

Year 1+ (Day 180+)	Medium Maximal	or	Clean Protocol ratified	certification; Additional	Step down one level per verified Tier 2 breach
Year 2+ (Day 365+)	Maximal accepted)	(if	Two certifications	consecutive clean	Hold at Medium if political concerns arise

Article NMM-1: Default Level. If parties do not select a monitoring level at signature, Medium Monitoring applies by default from Stage 2 onward. Minimal applies during Micro-Pilot and Stage 1 regardless of selection.

Article NMM-2: Level De-escalation. If a Tier 2 or Tier 3 breach occurs, monitoring does NOT decrease. Instead, enhanced monitoring activates automatically. De-escalation to a lower monitoring level occurs only after sustained compliance (90 consecutive days clean) and requires Facilitating State Council consensus.

Article NMM-3: Proprietary Information Protection. All monitoring technologies are configured to measure compliance with enrichment limits without revealing proprietary process details. Sensor data is encrypted and transmitted directly to the IAEA (not to either party). Digital twin models are IAEA property, not shared with either party. AI anomaly detection reports "probability of limit violation" not detailed operational data.

39.6 Comparison: US Requirements vs. Iranian Red Lines

US Requirement (from Chatter1)		Iranian Red Line	v5.5 Solution
Expanded access	IAEA	No military site access	Minimal: declared sites only. Medium/Maximal: managed access via Additional Protocol, not open-ended military site visits
Intrusive inspections		No disruption of civilian program	External sensors only; no opening centrifuge casings; robotic inspection reduces human presence
Real-time verification		No constant foreign presence	UGES provides real-time data without human presence; AI automates analysis
Breakout extension	time	No dismantlement of capability	Mothball Protocol (Section 12.2) + monitoring = extended breakout time without dismantlement
Undeclared detection	site	No fishing expeditions	Environmental monitoring + strain sensors detect flow anomalies; AI fusion flags for targeted inspection

39.7 Face-Saving Metrics

Audience	Narrative
-----------------	------------------

Iran	"The monitoring regime uses external sensors and AI, not intrusive human inspectors. Our proprietary technology remains protected. IAEA receives encrypted data directly, not through the US. We accepted a smart system, not a surveillance regime."
US	"UGES inline monitors provide near-real-time enrichment data. AI fusion detects subtle deviations. External strain sensors catch hidden flows. This is stronger verification than JCPOA."
IAEA	"The three-level menu provides scalable verification that grows with trust. Minimal for early confidence-building, maximal for comprehensive assurance."

Section 40: Minimal, Medium, and Maximal Deal Options

v5.5: Three Complete Package Alternatives for the May 2026 Impasse

Core Principle: Recognizing that neither side can accept the other's maximalist demands, v5.5 presents three complete, selectable deal packages. Each represents a different depth of commitment, a different level of verification intensity, and a different quantum of economic relief. Parties may select one at signature, or the Micro-Pilot may begin at the Minimal level with a structured pathway to graduation.

40.1 Option 1: The Minimal Deal — "Crisis Containment"

Description: The smallest realistic package both sides could sign without violating core red lines. Not a peace deal, not a JCPOA revival, and not a strategic reset. It is a crisis-containment instrument designed to stop escalation and buy time for broader negotiation.

Component	Iranian Commitment	US Commitment	Value
Nuclear Freeze	Cap enrichment at 60%; no new advanced centrifuges; allow IAEA cameras and routine inspections (declared sites only)	Release \$250M humanitarian tranche; allow limited controlled oil exports via monitored escrow	\$250M + oil channel
Monitoring	Minimal Level (Section 39.2): IAEA cameras + OLEM inline monitors + quarterly inspections	No new sanctions during Micro-Pilot; process humanitarian licenses	Baseline monitoring
Maritime	No Hormuz harassment; reduce IRGC-Navy interdiction frequency	Reduce 5th Fleet close-proximity patrols; no new naval interdictions	Insurance stabilization

Prisoners	Release all US and dual nationals held on politically-motivated charges	Release Iranian nationals held on sanctions-related charges; establish no-future-detentions mechanism	Humanitarian
Humanitarian	Expand channels for medicine, food, aviation parts, disaster supplies	Broaden OFAC humanitarian exemptions; license medical and agricultural exports	Visible domestic benefit
Regional	Reduce proxy attack tempo (not halt); condemn cross-border attacks within 24 hours	No retaliatory strikes on proxy positions; reduce regional deployments modestly	Reduced escalation risk

Minimal Deal: Economic Summary

Item	Amount	Timing
Humanitarian tranche	\$250M	Day 1
Controlled oil export channel	Up to 500K bpd	Day 7
Humanitarian expanded channel	\$100M/month	Month 1-6
Total Minimal Deal Value	~\$850M over 6 months + oil channel	

Minimal Deal: What's NOT Included

- No enrichment cap below 60% (current levels maintained, not reduced)
- No stockpile transfer to third-party custody
- No SWIFT reconnection
- No asset unfreezing beyond humanitarian tranche
- No IRGC designation changes
- No formal security guarantees
- No intrusive IAEA access to military sites
- No missile program constraints
- No proxy disarmament or disengagement
- No sanctions-proof guarantees

Minimal Deal: One-Sentence Summary

"Freeze the nuclear program at current levels, calm the waters, swap prisoners, and allow limited oil sales and humanitarian trade — all reversible within 30 days."

40.2 Option 2: The Medium Deal — "The Stability First Framework"

Description: The Medium Deal is essentially the full v5.4 framework: a sequenced, verified, reversible exchange that creates a durable stabilization architecture. It includes everything

in the Minimal Deal plus the nuclear cap, stockpile transfer, mothballing, phased asset returns, and SWIFT reconnection. This is the recommended default option.

Component	Iranian Commitment	US Commitment	Value
Everything in Minimal	All Minimal commitments, sustained	All Minimal commitments, sustained	\$850M + oil
Enrichment Cap	Zero enrichment above 3.67%; 1-year renewable moratorium; centrifuges above 3.67% idled	Stage 1 economic tranche (\$750M); OFAC general license	\$750M
Stockpile Transfer	60% HEU stockpile transferred to IAEA third-party custody (Oman/Kazakhstan/Russia)	Blockade lift synchronized with Hormuz reopening; maritime navigation notice	Security + economic
Mothball Protocol	Centrifuge rotors above 3.67% removed to UN-sealed storage within Iran (dual-key custody)	Stage 2 economic tranche (\$1.5B); 50% asset return	\$1.5B + assets
Monitoring	Medium Level (Section 39.3): UGES + strain sensors + passive ICS + monthly inspections + robots	SWIFT Phase 1-2 reconnection; aviation licenses	Banking + air
Regional	Levant Firewall (no offensive operations from Lebanon); proxy operational pause with condemnation protocol	Israel Non-Interference Guarantee; Lebanon Ceasefire Linkage facilitation	Regional stability
Governance	Joint Hormuz Transit Authority membership; Coordination Secretariat participation	Transit Authority seat; rotating facilitation acceptance; 85% asset return by Day 180	Institutional
Fordow	Fordow conversion to Medical Isotope Center; international joint venture	Fordow funding (\$175M international); WHO Center of Excellence designation	Scientific + economic

Medium Deal: Economic Summary

Item	Amount	Timing
All Minimal Deal economic benefits	\$850M	Months 1-6
Stage 1 tranche	\$750M	Day 14
Stage 2 tranche	\$1.5B	Day 44
Stage 3 midpoint tranche	\$3B	Day 120
Stage 3 closing tranche	\$5B	Day 180
Asset returns (cumulative)	Up to 85% of \$100B	By Day 180

Bonus pool (performance)	Up to \$6B	Year 1
Reconstruction Fund	\$5B	Year 1
Total Medium Deal Value	~\$85B+ over 12 months + oil normalization + SWIFT	

Medium Deal: Rollback Architecture

The Medium Deal operates under the Rollback and Step-Down Architecture (Section 38). Model A (Proportional Cut) applies by default. 10% reduction for Tier 1, 25% for Tier 2, 50% for Tier 3. Humanitarian firewall protects medical/food/WFP funds. Symmetry lock ensures both parties face proportional consequences for failures.

Medium Deal: One-Sentence Summary

"A JCPOA-style nuclear freeze with stronger verification, phased economic normalization, Hormuz co-governance, and a graduated (not snapback) compliance mechanism — reversible but designed to create irreversible facts on the ground."

40.3 Option 3: The Maximal Deal — "Comprehensive Stabilization"

Description: The Maximal Deal stretches as far as domestic politics and security red lines plausibly allow on both sides. Think "JCPOA-plus-lite": deeper than a crisis patch, but nowhere near full normalization. It includes everything in the Medium Deal plus enhanced monitoring, missile constraints, expanded regional de-escalation, and comprehensive economic normalization.

Component	Iranian Commitment	US Commitment	Value
Everything in Medium	All Medium commitments, sustained	All Medium commitments, sustained	\$85B+
Monitoring	Maximal Level (Section 39.4): AI fusion + digital twin + indoor drones + continuous IAEA presence	Full SWIFT Phase 3; complete sanctions waiver on civilian trade; Civilian Nuclear Consortium pledge	Full banking + trade
Ballistic Missiles	Moratorium on testing missiles above 2,000km range; notification regime for sub-threshold launches; no export of missile technology	No demands for dismantlement of existing arsenal; no new missile-related sanctions; Crescent Compact ballistics track opens at Day 365	Security + regional

Regional De-escalation	Substantially reduce cross-border proxy attacks; ceasefire understandings for Iraq, Syria, Yemen, Lebanon with third-party verification	Reduce regional military deployments; support UN-led ceasefire negotiations; informal non-attack understandings	Comprehensive regional calm
Expanded Economic	Additional Protocol ratification by Day 90; full IAEA managed access regime	Full asset unfreezing (\$100B); secondary sanctions relief for European/Asian trade; investment protection framework	\$100B + investment
Successor Framework	All six successor modules open (maritime, economic, humanitarian, ballistics, proxy governance, nuclear cooperation)	Support regional fuel bank; Bushehr expansion assistance; academic and technical exchanges	Long-term cooperation

Maximal Deal: Ballistic Missile Test Moratorium Detail

The missile component does NOT require Iran to halt missile development or dismantle existing arsenals. It is a testing moratorium with the following parameters:

- **Range cap:** No testing of missiles with demonstrated range above 2,000km (sufficient to reach Europe but not the continental US)
- **Notification regime:** Iran provides 48-hour advance notification of all sub-threshold launches to the Coordination Secretariat
- **Technology export ban:** Iran agrees not to transfer missile technology to proxies or partner states
- **Transparency:** Annual declaration of missile inventory to the Secretariat (not public, not detailed specifications)
- **Verification:** Satellite data feed (Section 11b) detects launches; no on-site inspection required
- **Duration:** 2-year initial moratorium, renewable for 1-year periods
- **Face-Saving:** Iran: "We voluntarily suspended testing as a confidence-building measure; our deterrent remains intact." US: "Iran has committed to no long-range missile testing, verified by satellite."

Maximal Deal: Economic Summary

Item	Amount	Timing
All Medium Deal economic benefits	\$85B+	Year 1
Full asset unfreezing	\$100B	By Day 365
Secondary sanctions relief	Unlimited	Day 180+
Investment protection	Estimated \$50B+ FDI	Year 2-3

SWIFT full membership		All message types	Day 180
Total Value	Maximal Deal	\$100B+ asset return + full trade normalization + \$50B+ FDI potential	

Maximal Deal: One-Sentence Summary

"A JCPOA-plus framework with AI-enhanced verification, missile test moratorium, comprehensive regional de-escalation, and full economic normalization — without security guarantees, IRGC delisting, or full diplomatic recognition."

40.4 Deal Option Comparison Matrix

Feature	Minimal	Medium (Recommended)	Maximal
Enrichment cap	60% freeze	3.67% cap, 1-year renewable	3.67% cap, 2-year initial
Stockpile	No transfer	Transfer to third-party custody	Transfer + downblending plan
Centrifuges	No new advanced	Mothball Protocol (rotors removed)	Mothball + no new R&D above 3.67%
Monitoring	Minimal (cameras + OLEM)	Medium (UGES + sensors + ICS)	Maximal (AI + digital twin + drones)
Ballistic missiles	Not addressed	Not addressed initially	Test moratorium >2,000km
Proxies	Tempo reduction	Operational pause + Levant Firewall	Substantial reduction + ceasefire frameworks
Humanitarian	\$250M + expanded channels	\$250M + full channel	\$250M + full + institutionalized
Oil exports	500K bpd controlled	1.5 mbpd by Day 90	2.5 mbpd full normalization
Asset returns	None beyond humanitarian	85% by Day 180	100% by Day 365
SWIFT	None	Phase 1-2	Full Phase 3
Snapback/Rollback	30-day withdrawal	4-Model Rollback (Section 38)	4-Model Rollback + earn-back
Duration	90 days renewable	1-year renewable	2-year initial, 1-year renewable
Total value	~\$850M + oil	~\$85B + SWIFT	\$100B+ + full trade + FDI
US claim	"Enrichment freeze verified"	"Stockpile secured; Hormuz open"	"Comprehensive non-proliferation win"

Iran claim	"Blockade lifted; sovereignty intact"	"Assets returning; NPT rights preserved"	"Full economic normalization; deterrent intact"
-------------------	---------------------------------------	--	---

40.5 Graduation Pathway: Minimal → Medium → Maximal

Parties need not select the Maximal Deal at signature. The framework includes a structured graduation pathway:

Transition	Trigger	Timeline	Procedure
Minimal Medium	→ 60% freeze sustained for 30 days; IAEA confirms; prisoner exchange completed; Hormuz transit restored to 200+/14 days	Day 30-60	Exchange of letters; Facilitating State Council certifies; automatic graduation
Medium Maximal	→ Year 1 clean certification; moratorium renewed; no Tier 2+ breaches; Additional Protocol ratified	Day 365	Joint declaration at Reconstitution Conference; new exchange of letters; Council certifies
Reverse: Maximal Medium	→ Tier 3 breach confirmed; deliberate hostile intent; mediation fails	Immediate	Facilitating State Council votes; 30-day step-down period; Survival Core continues
Reverse: Medium Minimal	→ Tier 2 breach; 14-day remediation fails	Day 14 after failure	Secretariat certifies; automatic step-down; Reconstitution Conference within 30 days

Article DO-1: Default Selection. If parties do not select a deal option at signature, the Minimal Deal activates by default, with automatic graduation to Medium upon verified Micro-Pilot completion. This reduces the signing decision to "let's begin" rather than "let's commit to everything."

40.6 Face-Saving Metrics by Option

Audience	Minimal Narrative	Medium Narrative	Maximal Narrative
Iran	"We stopped the war, got the blockade lifted, and secured humanitarian relief without surrendering our nuclear program."	"Our assets are returning, Hormuz is co-governed, and our scientists lead a world-class medical center. NPT rights preserved."	"Full economic normalization without dismantling our deterrent. We proved that principled resistance produces results."

US	"Iran's weapons-grade enrichment is frozen and verified. Hormuz is open. We achieved this without military escalation."	"Weapons-grade uranium secured. Enrichment capped. Verification is stronger than JCPOA. Regional tensions reduced."	"Comprehensive non-proliferation architecture with AI verification, missile constraints, and regional stability. A strategic win."
----	---	---	--

Section 41: Prisoner Exchange Framework

v5.5: Reciprocal Releases and Guarantees Against Future Detentions

Rationale: Prisoner exchanges are historically the easiest area of agreement between the United States and Iran. Both sides have used swaps as confidence-building measures in every prior negotiation cycle. The v5.5 Prisoner Exchange Framework institutionalizes this practice, addresses both parties' demands (US: release of nationals; Iran: release of sanctioned individuals), and creates a standing mechanism to prevent future politically-motivated detentions.

41.1 Immediate Exchange (Micro-Pilot Trigger)

Article PEX-1: Within 7 days of Micro-Pilot signature, both parties conduct a reciprocal prisoner exchange:

Party	Release Commitment	Estimated Numbers	Timeline
Iran	Release all US citizens, dual nationals, and permanent residents held on charges related to national security, espionage, or sanctions violations	3-5 individuals	Within 7 days of Micro-Pilot signature
United States	Release all Iranian nationals held on sanctions-related charges, including individuals convicted of sanctions evasion and export control violations	5-10 individuals	Within 7 days of Micro-Pilot signature

Article PEX-2: The exchange is conducted through the Swiss Political Cell of the Coordination Secretariat, which verifies the identity and condition of all individuals prior to transfer. The exchange occurs at a neutral location (Geneva or Muscat) with medical personnel present.

41.2 Standing Exchange Mechanism

Article PEX-3: Beyond the immediate swap, a **Standing Prisoner Exchange Mechanism** is established to handle future detention cases:

Component		Function	Process
Humanitarian Review Panel		Review all detention cases every 90 days	Swiss Political Cell convenes panel with medical, legal, and humanitarian experts; panel reviews conditions and charges
Rapid Channel	Swap	Enable quick exchanges for humanitarian cases	Emergency medical cases processed within 14 days; facilitated through Omani diplomatic channel
No-Future-Detentions Protocol		Reduce politically-motivated arrests	Both parties commit that future arrests of each other's nationals will be based on transparent criminal charges, not political purposes; Coordination Secretariat notified within 48 hours of any arrest
Family Office	Liaison	Provide consular access and family communication	Swiss embassy in Tehran and Iranian interests section maintain regular consular access; family visits facilitated monthly

41.3 Guarantees Against Future Detentions

Article PEX-4: Both parties commit to the following principles regarding future detentions:

- **Transparency:** Any arrest of a national of the other party must be based on publicly articulable charges within 72 hours of detention
- **Due Process:** All detained nationals receive access to legal counsel of their choosing, consular access within 48 hours, and trial within a reasonable timeframe
- **No Political Charges:** Neither party may use national security or espionage charges as a pretext for politically-motivated detention of the other party's nationals
- **Notification:** The Coordination Secretariat is notified within 48 hours of any detention; the Secretariat maintains a registry of all detained nationals
- **Medical Access:** All detained nationals receive regular medical care; medical emergencies trigger the Rapid Swap Channel

Article PEX-5: Verification. The Swiss Political Cell conducts quarterly reviews of detention conditions through independent medical and legal assessments. Findings are reported to the Facilitating State Council. Poor conditions or due process violations may be treated as a Tier 1 breach under the Partial Continuity Rule.

41.4 Escrow Linkage

Article PEX-6: Prisoner exchange is linked to the Micro-Pilot activation but NOT to subsequent tranche releases. The initial exchange is a confidence-building measure that triggers the Micro-Pilot. Failure to conduct the initial exchange within 14 days constitutes a Tier 2 breach. However, once the exchange is completed, it cannot be "undone" by

subsequent disputes. This is a one-way ratchet: prisoners released remain free regardless of future framework status.

41.5 Face-Saving Metrics

Audience	Narrative
Iran	"We secured the release of our citizens unjustly held under extraterritorial sanctions. This is a humanitarian victory, not a political concession."
US	"American citizens are coming home. This administration delivered where others failed. The humanitarian channel works."
International	"Both parties demonstrated that even in deep conflict, humanitarian cooperation is possible. The standing mechanism prevents future cases."

Section 42: Ballistic Missile Test Moratorium Protocol

v5.5: Temporary, Reversible, Confidence-Building Constraint on Missile Testing

Rationale: The United States demands constraints on Iran's missile program. Iran will not halt missile development, dismantle existing arsenals, or accept limits on its deterrent capability. However, Iran has voluntarily paused missile tests during sensitive diplomatic periods before (e.g., during the JCPOA lead-up). The v5.5 Ballistic Missile Test Moratorium Protocol converts a temporary, reversible practice into a formal framework commitment with verification, face-saving narratives, and rollback protection.

42.1 The Core Constraint: Testing Moratorium, Not Development Halt

Critical Distinction: This Protocol constrains TESTING, not DEVELOPMENT. Iran retains full sovereign right to research, develop, manufacture, and maintain its ballistic missile arsenal. The moratorium applies only to the physical launch of missiles for testing purposes. This distinction is the political bridge that makes the Protocol acceptable to both sides.

Activity	Status Under Protocol	Rationale
Research and development	Fully permitted	Does not involve physical launch
Manufacturing and assembly	Fully permitted	Does not involve physical launch

Static testing (ground tests)	Permitted with 48-hour notification	No flight involved; notification builds transparency
Missile launches below 2,000km range	Permitted with 48-hour advance notification to Secretariat	Sub-threshold launches are deterrent exercises, not proliferation threats
Missile launches above 2,000km range	Moratorium applies	These are the systems of greatest concern to US allies in Europe
Technology transfer to proxies	Prohibited	Prevents proliferation beyond Iran's borders
Space launch vehicle (SLV) launches	Permitted with 14-day advance notification	SLVs serve civilian purposes but use related technology

42.2 Moratorium Parameters

Parameter	Specification
Range threshold	2,000 km (systems capable of reaching most of Europe, all of the Middle East)
Duration	Initial 2-year moratorium (Medium Deal) or 1-year moratorium (Maximal Deal); renewable for 1-year periods by mutual consent
Notification for sub-threshold	48 hours to Coordination Secretariat; Secretariat notifies all facilitating states; NOT public notification
SLV notification	14 days; includes trajectory, launch window, payload type (civilian)
Technology export ban	No transfer of missile technology, components, or expertise to any state or non-state actor; verified through intelligence sharing (Tel Aviv Channel) and export control monitoring
Verification method	Satellite Data Feed (Section 11b) detects all launches; no on-site inspection required; launch signature analysis distinguishes test from operational use
Annual declaration	Iran provides annual inventory declaration to Secretariat (confidential, not public): total missile count by range category; no detailed specifications required

42.3 Verification: Satellite-Based, Non-Intrusive

Article BMM-1: The moratorium is verified entirely through the Satellite Data Feed Mandate (Section 11b). No on-site inspectors, no access to missile bases, no physical inspection of arsenals. The verification is non-intrusive by design:

- **Synthetic Aperture Radar (SAR):** All-weather detection of launch preparations (erector-launcher deployment, fueling activity)
- **Electro-Optical (EO):** High-resolution imagery of launch sites; post-launch damage assessment

- **Infrared (IR):** Launch plume detection; distinguishes missile tests from other thermal events
- **Launch Signature Analysis:** AI-powered analysis of launch trajectory, burn time, and apogee to determine range capability; distinguishes sub-threshold from super-threshold launches

Article BMM-2: Self-Defense Exception. The moratorium does NOT apply to operational launches in self-defense. If Iran or its territory is under active armed attack, missile launches for defensive purposes are permitted. The defending party must notify the Secretariat within 6 hours of the launch. The Secretariat determines whether the launch qualifies as self-defense or constitutes a moratorium violation.

42.4 Rollback Protection

Article BMM-3: Missile moratorium violations are subject to the Rollback and Step-Down Architecture (Section 38) but with a dedicated scale:

Violation Type		Tier Classification	Economic Consequence	Moratorium Consequence
Sub-threshold launch without notification		Tier 1	10% reduction on next tranche	Enhanced notification requirements
Super-threshold launch	test	Tier 2 (first instance)	25% reduction; Enhanced monitoring	Moratorium extended by 6 months
Technology transfer to proxy		Tier 2	25% reduction; asset review	Regional de-escalation module paused
Second super-threshold launch within 90 days		Tier 3	50% reduction; Reconstitution triggered	Moratorium suspended; successor ballistics track deferred

42.5 Face-Saving Metrics

Audience	Narrative
Iran	"We voluntarily suspended long-range missile testing as a confidence-building gesture. Our deterrent remains fully intact. We continue to develop, manufacture, and maintain our missile force. We merely paused testing. And we can resume if the US fails to meet its obligations."
US	"Iran has committed to no long-range missile testing, verified by satellite. This prevents Iran from perfecting missiles that could reach Europe. The technology export ban prevents proliferation to proxies. Combined with the nuclear cap, this significantly extends Iran's weapons timeline."

Israel/Europe "The 2,000km moratorium directly addresses the missile threat to Europe and the Middle East. Satellite verification provides continuous monitoring without requiring Iranian cooperation. The technology export ban prevents Hezbollah and Houthis from receiving advanced missile systems."

42.6 Integration with Successor Framework

Article BMM-4: The Ballistic Missile Test Moratorium is formally opened as the **Crescent Compact: Ballistics and Missiles** successor module under Section 7.2. It opens at Day 365 for the Maximal Deal or Day 180 for the Medium Deal (if both parties agree to early activation). The module evolves from a unilateral moratorium to a comprehensive regional missile dialogue involving all Gulf states.

Article BMM-5: The successor module may eventually include:

- Regional missile range limitations (multilateral, not just Iran)
- Launch notification regime covering all regional actors
- Missile defense coordination (not deployment)
- Confidence-building measures: pre-notification of military exercises involving ballistic missiles

Strategic Assessment

The Ballistic Missile Test Moratorium is the most politically sensitive element of the Maximal Deal. It is included in the Maximal option because it addresses a core US demand while preserving Iran's red lines. It should NOT be included in the Minimal or Medium Deals unless both parties explicitly agree. Its inclusion in the Maximal Deal provides a pathway for Iran to demonstrate that it is willing to constrain its missile program in exchange for comprehensive economic normalization, without requiring it to do so in a more limited arrangement.

Section 43: Nuclear Flexibility & Sovereignty Protection

v5.6: Four Measures to Make the Nuclear File More Acceptable to Iran While Preserving U.S. Security

Rationale: The 3.67% enrichment cap, monitoring regime, and public framing of the agreement are the most politically sensitive elements for Iran. These four measures add flexibility, sovereignty-preserving mechanisms, and dignity protections that make the nuclear file more acceptable to Iranian leadership without weakening verification or extending breakout time.

43.1 Flexible Renewal Window: 9-15 Months (v5.6)

Article NFS-1: The enrichment cap moratorium is renewable every **9 to 15 months** at Iran's discretion, rather than on a fixed annual cycle. This provides:

- **Maximum flexibility:** Iran may request renewal as early as 9 months or defer until 15 months
- **Minimum disruption:** No mid-year verification cycle creates artificial pressure points
- **Calendar independence:** Renewal timing is decoupled from US political calendars (elections, congressional sessions)
- **IAEA verification intact:** All monitoring and reporting requirements continue uninterrupted regardless of renewal timing

Article NFS-2: If Iran does not request renewal by month 15, the cap enters automatic extension for an additional 3 months while the Coordination Secretariat schedules a renewal consultation. No suspension occurs. The cap remains in force during the consultation period.

Timeline	Action	Status
Month 9	Earliest renewal window opens	Iran may request renewal consultation
Month 9-15	Flexible renewal zone	Either party may request renewal discussion; IAEA monitoring continues
Month 15	Latest renewal decision point	If no request made, automatic 3-month extension activates
Month 18	Consultation deadline	Renewal must be confirmed or renegotiated; cap remains during renegotiation

43.2 Performance-Based Enrichment Glide Path (v5.6)

Article NFS-3: If Iran demonstrates sustained over-compliance for 24 consecutive months, it may request a modest enrichment cap adjustment for legitimate medical isotope production:

- **Standard cap:** 3.67% U-235 enrichment for civilian nuclear fuel
- **Glide-path cap:** Up to 5.0% U-235 enrichment, exclusively for medical isotope production (Mo-99, I-131)
- **Condition:** 24 consecutive months of clean IAEA certification (no Tier 1+ breaches)
- **IAEA approval required:** The IAEA Director General must certify that the higher enrichment is medically necessary and that all material is accounted for
- **Scope limitation:** 5% enrichment is permitted ONLY for designated medical isotope cascades at declared facilities; all other enrichment remains capped at 3.67%
- **Volume cap:** Total 5% enriched UF₆ stockpile may not exceed 300 kg at any time; excess must be downblended or transferred to IAEA custody

Article NFS-4: The glide path is a sovereignty-preserving incentive mechanism. It does not represent a right to enrichment above 3.67% for non-medical purposes. It rewards sustained compliance with a limited, IAEA-controlled expansion for humanitarian medical purposes.

Condition				Standard Cap	Glide-Path Cap	Requirements
Months 0-24				3.67%	Not available	Standard monitoring; clean certification
Month 24+ (clean record)				3.67%	5.0% (medical only)	24 months clean + IAEA medical necessity certification + dedicated cascade isolation
Any breach	Tier 2+			3.67%	Revoked	Automatic revocation; restoration requires 12 months clean compliance

43.3 Symbolic Advanced Centrifuge Preservation (v5.6)

Article NFS-5: Iran may retain a **symbolic number of advanced centrifuges** (up to 24 IR-6 or equivalent machines) under IAEA tamper-evident seals at declared facilities, subject to the following conditions:

- **No operation:** Sealed centrifuges are not connected to process piping and cannot enrich uranium
- **IAEA seals:** Each machine is sealed with IAEA tamper-evident tags; seals inspected monthly
- **Declaratory purpose:** Sealed machines serve as evidence that Iran has not dismantled its technological capability; they represent a sovereignty-preserving symbol, not an operational asset

- **No breakout contribution:** 24 idle machines do not meaningfully affect breakout time calculations (they are sealed and monitored)
- **Limit:** 24 machines maximum; any additional advanced centrifuges must be mothballed under the Mothball Protocol (Section 12.2)
- **Inspection:** IAEA inspectors verify seal integrity during routine inspections; unsealing requires 48-hour notice and IAEA observation

Article NFS-6: This provision acknowledges Iran's legitimate interest in preserving its nuclear research infrastructure while ensuring that symbolic preservation does not undermine the security intent of the enrichment cap. The 24-machine limit is calibrated to be politically meaningful (a sovereignty win) but strategically insignificant (no breakout risk).

43.4 No Public Humiliation Clause (v5.6)

Article NFS-7: Dignity Protection Protocol. No party to this framework, nor any facilitating state, observer state, or international organization associated with framework implementation, shall publicly characterize the agreement, any Iranian commitment, or any Iranian compliance action as "capitulation," "surrender," "defeat," "backing down," "caving," or equivalent language. This prohibition applies to official statements, diplomatic communications, press releases, social media, and background briefings.

Article NFS-8: Symmetrical Application. The dignity protection applies symmetrically. Iran shall not publicly characterize US concessions, sanctions relief, or asset returns as "American defeat," "retreat," or equivalent language. Both parties commit to framing the agreement as a mutual stability achievement, not a zero-sum victory.

Article NFS-9: Enforcement. Violations of the dignity protection protocol are treated as Tier 1 breaches (diplomatic discourtesy, not material violation). The first offense triggers a formal complaint through the Coordination Secretariat. Repeated offenses (3+ within 90 days) may be escalated to Tier 2 if they materially undermine domestic political support for the agreement.

Article NFS-10: Recommended Narratives. The Secretariat shall provide both parties with recommended framing language for domestic and international audiences:

Topic	Recommended Iranian Narrative	Recommended U.S. Narrative
Enrichment cap	"Iran voluntarily adjusted its enrichment profile as part of a comprehensive regional stability framework that advances our national interests."	"Iran has agreed to limit enrichment to levels consistent with peaceful civilian use, verified by the IAEA."
Centrifuge mothballing	"Iran's advanced technology is preserved in secure storage under joint custody. Our capability remains intact."	"Advanced centrifuges have been removed from operational status and placed under international monitoring."

Stockpile transfer	"Iran transferred excess material to a regional fuel bank, advancing nuclear cooperation in the Muslim world."	"Weapons-grade enriched uranium has been moved to secure third-party custody under IAEA supervision."
Sanctions relief	"Iran secured the lifting of unjust sanctions through principled diplomacy and regional cooperation."	"Sanctions relief was provided in exchange for verified nuclear constraints and regional stability commitments."

Section 44: Economic Accessibility & Sanctions Neutrality

v5.6: Four Mechanisms to Make Sanctions Relief Economically Real and Politically Durable

Rationale: Sanctions relief is meaningless if Iranian banks cannot use it, insurers refuse coverage, and humanitarian goods sit in ports awaiting licenses. These four mechanisms address the "last mile" problem of sanctions relief — transforming legal waivers into actual economic activity — while protecting the US from domestic political backlash.

44.1 Humanitarian Fast-Track Mechanism (v5.6)

Article EAN-1: A Humanitarian Fast-Track Channel is established for medicine, medical equipment, food, agricultural supplies, aviation safety parts, and disaster relief goods:

Parameter	Specification
Covered goods	Medicine, medical devices, food, agricultural inputs, aviation safety parts, disaster relief supplies, educational materials
Approval timeline	Automatic approval within 48 hours of submission; no individual license required for pre-cleared categories
Pre-clearance	Swiss Financial Cell maintains a standing list of pre-cleared humanitarian goods; updates monthly
Banking channel	Designated humanitarian banks (identified by Qatar Liquidity Cell) process transactions without SWIFT reconnection requirement
Documentation	Exporter submits goods description + end-user certificate; Swiss Cell confirms humanitarian category; approval auto-issues
Dispute	If Swiss Cell disputes categorization, 72-hour review; goods may proceed if Swiss Cell issues provisional approval
Volume cap	No volume cap on humanitarian goods; fast-track is uncapped by design

Article EAN-2: The fast-track operates independently of the broader sanctions relief framework. It is NOT subject to rollback under Section 38. Even in the event of a Tier 3 breach, humanitarian fast-track approvals continue. This is part of the Humanitarian Firewall (Section 12.1).

Article EAN-3: Any deliberate delay of fast-track approvals by US administrative agencies beyond the 48-hour window constitutes a Tier 1 breach. Systematic delays (10+ instances within 30 days) constitute a Tier 2 breach.

44.2 Private-Sector Comfort Letter Mechanism (v5.6)

Article EAN-4: Switzerland and Qatar jointly issue **Compliance Comfort Letters** to private-sector banks, insurers, shipping companies, and investors conducting legitimate trade with Iran:

- **Letter content:** Confirms that the specific transaction or business relationship falls within framework-authorized categories; does not guarantee against future sanctions but certifies current compliance
- **Issuing authority:** Swiss Financial Cell (for European institutions) and Qatar Liquidity Cell (for Asian/Middle Eastern institutions)
- **Validity:** 90 days, renewable; letters are transaction-specific or general (covering a category of activity)
- **Legal status:** Letters are not legally binding on the US government but represent the formal assessment of the facilitating state financial infrastructure. US executive branch commits not to penalize institutions acting in good faith pursuant to comfort letters
- **Scope:** Covers banking transactions, insurance coverage, shipping logistics, trade finance, and investment advisory services

Article EAN-5: The comfort letter mechanism addresses the primary obstacle to sanctions relief: private-sector risk aversion. Banks and insurers are reluctant to engage with Iran even when sanctions are legally lifted, fearing future reimposition. Comfort letters provide an intermediary layer of confidence that reduces this risk aversion without requiring Congress to pass permanent legislation.

Barrier	Comfort Letter Solution
Banks fear future sanctions	Letter certifies transaction is currently authorized; 90-day window provides near-term certainty
Insurers refuse coverage	Qatar Cell letter confirms trade is within framework; Lloyd's and Asian insurers accept
Shipping companies blacklist Iran	Oman Maritime Cell + Swiss letter confirms port access is authorized

Investors demand guarantees Comfort letter is not a guarantee but reduces compliance risk assessment

44.3 Micro-Waiver Option for Specific Industries (v5.6)

Article EAN-6: Beyond the broad humanitarian and oil export channels, the framework authorizes **targeted micro-waivers** for specific industries:

Industry	Waiver Scope	Annual Cap	Duration	Revocability
Petrochemicals	Export of petrochemical products; import of catalysts and specialty chemicals	\$2B	1-year renewable	30-day notice; Tier 2+ breach
Automotive parts	Import of vehicle components, assembly equipment, safety testing devices	\$500M	1-year renewable	30-day notice; Tier 2+ breach
Civil aviation	Import of commercial aircraft parts (non-military); maintenance and repair services	\$1B	1-year renewable	Part of humanitarian firewall; harder to revoke
Medical technology	Advanced medical devices, diagnostic equipment, pharmaceutical manufacturing inputs	\$750M	1-year renewable	Part of humanitarian firewall
Renewable energy	Solar, wind, and hydro equipment; energy efficiency technology	\$300M	1-year renewable	30-day notice

Article EAN-7: Micro-waivers are narrow, reversible, and non-controversial. Each waiver:

- Covers only a specific industry, not the entire economy
- Has a defined annual cap that limits exposure
- Is revocable with 30-day notice (not immediate, not permanent)
- Requires IAEA clean certification for the relevant period
- Is processed through the Swiss Financial Cell, not requiring congressional action
- Does not set precedent for broader sanctions relief

Article EAN-8: Micro-waivers are politically safe for the US because they are narrowly targeted, create American jobs (US companies supply parts), and benefit Iranian civilians without strengthening the Iranian military or government. They are framed as "humanitarian economic relief" not "regime support."

44.4 Sanctions-Neutrality Clause (v5.6)

Article EAN-9: Sanctions-Neutrality Commitment. The United States commits not to impose new sanctions on Iran that would undermine the humanitarian channels, micro-waivers, or asset return mechanisms established under this framework, unless Iran commits a Tier 3 (deliberate hostile) breach confirmed by the Facilitating State Council. This commitment does not restrict US authority to impose sanctions for non-framework matters (e.g., cyber attacks on US infrastructure, attacks on US personnel) provided such sanctions are targeted and do not disrupt framework-authorized channels.

Article EAN-10: Scope of Neutrality. The sanctions-neutrality commitment protects the following channels from new sanctions interference:

- Humanitarian fast-track channel (medicine, food, aviation safety)
- Oil export channels authorized under the framework
- Asset return mechanisms (Swiss escrow, Phase I-III releases)
- Micro-waiver industries (petrochemicals, automotive, civil aviation, medical technology, renewables)
- SWIFT reconnection (once authorized)
- Civilian nuclear cooperation (Fordow conversion, medical isotopes)

Article EAN-11: Permitted New Sanctions. The US retains the right to impose new sanctions in the following circumstances:

- Tier 3 breach confirmed by Facilitating State Council (neutrality commitment void)
- Cyber attacks on US critical infrastructure (targeted, not broad sectoral)
- Attacks on US military personnel or diplomatic facilities (targeted, not sectoral)
- Support for designated terrorist organizations (existing counter-terrorism authorities)
- Human rights violations (Magnitsky-style targeted sanctions on individuals, not sectoral)

Article EAN-12: Grandfathering. Any new sanctions imposed under the permitted categories must include explicit grandfathering language: "Nothing in these sanctions shall be construed to interfere with transactions authorized under the Stability First Enhanced Accord." The Swiss Financial Cell maintains a list of framework-authorized transaction codes that are excluded from new sanctions scope.

Trigger		US Response Permitted	Neutrality Impact			
Tier breach	1	Rollback per Section 38; diplomatic protest; enhanced monitoring	Neutrality sanctions	intact;	no	new
Tier breach	2	25-50% rollback; mediation; Reconstitution Conference	Neutrality sanctions	intact;	no	new

Tier 3 breach (Council confirmed)	Full rollback; new sanctions permitted; neutrality commitment void	Neutrality suspended
Non-framework incident (cyber, attacks)	Targeted sanctions on responsible entities	Neutrality intact; grandfathering protects framework channels

Section 45: Regional Transparency & De-escalation

v5.6: Four Mechanisms for Maritime Transparency, Proxy Accountability, and Regional Stability

Rationale: Regional actors need confidence that the framework is working. Transparency about Hormuz transit, proxy activity metrics, and non-attack commitments reduces uncertainty for all parties — including US Gulf allies and Israel — without requiring Iran to make public admissions that would undermine its domestic political position.

45.1 Hormuz Transparency Dashboard (v5.6)

Article RTD-1: The Oman Maritime Cell shall publish a **weekly Hormuz Transparency Dashboard** available to all framework parties, facilitating states, and registered commercial shipping insurers:

Data Element	Format	Publication
Total transits (7-day)	Aggregate number; no vessel names	Weekly
Transit corridor status	Open/Restricted/Closed by segment	Daily update
IRGC-Navy presence	Percentage of normal patrol level (e.g., "35% of baseline patrols active")	Weekly
Incident summary	Type (harassment, inspection, escort), count, no attribution	Weekly
Average transit time	Hours: baseline vs. current	Weekly
Insurance premium index	Indexed to pre-crisis baseline (100 = normal)	Weekly

Article RTD-2: The Dashboard is designed to reassure global markets and US allies without embarrassing Iran:

- **No vessel names:** Individual vessels are not identified; only aggregate statistics are published

- **No military details:** IRGC-Navy presence is expressed as a percentage of baseline, not as ship counts or locations
- **No attribution:** Incidents are reported by type and count, not attributed to specific actors
- **Oman source:** Data comes from Oman, not from US or Western sources, preserving neutrality
- **Commercial focus:** Dashboard emphasizes insurance, transit time, and market stability — not military intelligence

Article RTD-3: The Dashboard is accessible via a secure web portal maintained by the Oman Maritime Cell. All framework parties receive login credentials. Commercial shipping companies and insurers may register for read-only access. Media access is not provided — the Dashboard is for operational participants, not public consumption.

45.2 Proxy De-escalation Scoring System (v6.0)

Article RTD-4: A **Proxy De-escalation Scoring System** is established to measure and credit Iranian efforts to reduce proxy activity without requiring Iran to publicly admit control over proxy groups:

Indicator	Measurement	Score	Source
Cross-border attack frequency	7-day rolling average of attacks from proxy territories	+10 per week below baseline	UN reporting + open source
Condemnation speed	Hours between proxy attack and Iranian diplomatic condemnation	+5 if within 24 hours; +10 if within 12 hours	Secretariat records
Operational pause compliance	Percentage of agreed pause periods with no proxy activity	+15 per 100% compliant week	UN monitors + regional intel
Proxy communication	Evidence of Iranian diplomatic channels to proxy leadership urging restraint	+10 per verified communication	Confidential diplomatic channels
Arms flow reduction	Interdiction data on weapons shipments to proxy areas	+10 per month with reduced flow	Maritime monitoring
Escalation event	Any proxy attack during agreed operational pause	-20 per incident	Attribution Panel

Article RTD-5: The scoring system operates on the following principles:

- **No admission requirement:** Iran is not required to publicly acknowledge control over any proxy group
- **Action-based:** Scoring measures observable actions (condemnation speed, attack frequency), not claimed intentions

- **Positive incentives:** High scores unlock bonus economic benefits (additional micro-waiver allocations, accelerated asset returns)
- **Confidential:** Scores are shared only with framework parties and facilitating states, not published publicly
- **Baseline reset:** Baseline attack frequency is established during Month 1 and reviewed quarterly

Article RTD-6: Score Thresholds and Rewards.

Monthly Score	Classification	Economic Reward
80+	Full compliance	+10% bonus on next micro-waiver allocation; +5% acceleration on asset return schedule
50-79	Partial compliance	Standard benefits; no penalty
20-49	Limited compliance	No micro-waiver expansion; standard asset return
Below 20	Non-compliance	Proxy governance module enters Review Pause; mediation triggered

45.3 Maritime Incident Arbitration Panel (v5.6)

Article RTD-7: A **Maritime Incident Arbitration Panel** is established to adjudicate Hormuz transit disputes, naval encounter incidents, and maritime safety complaints:

Parameter	Specification
Composition	Oman (permanent chair) + UN Appointee (permanent) + one rotating neutral state (elected by Council for 6-month term from pool: Singapore, Norway, New Zealand, Malaysia)
Jurisdiction	All maritime incidents within the Hormuz transit corridor; naval encounter disputes; transit access complaints; fishing and economic zone disputes
Procedure	Complaint filed with Secretariat → Panel convenes within 72 hours → Hearing within 14 days → Ruling within 30 days of complaint
Rulings	Binding on operational matters (transit rights, encounter protocols); recommendatory on policy matters
Appeal	Either party may appeal to the Facilitating State Council within 14 days; Council may modify operational ruling with 4/5 consensus
Emergency	For incidents threatening vessel safety, Panel chair (Oman) may issue emergency orders within 6 hours; full Panel review within 48 hours

Article RTD-8: The Panel prevents small maritime incidents from escalating into framework-threatening disputes. A minor naval encounter that might otherwise trigger mutual accusations

and public threats is instead channeled into a 72-hour arbitration process with a binding resolution. This depoliticizes maritime friction and prevents third-party actors from exploiting incidents to derail the framework.

Section 46: Verification Refinements & Privacy Protection

v5.6: Four Measures to Strengthen Monitoring Credibility While Protecting Legitimate Secrecy

Rationale: The monitoring regime must be technically credible for the US and politically acceptable for Iran. These four measures add privacy-preserving protocols, dual-key access safeguards, measurement tolerance, and innovation funding that depoliticize the verification architecture.

46.1 Privacy-Preserving Monitoring Protocol (v5.6)

Article VRP-1: All monitoring technologies deployed under the Nuclear Monitoring Technology Menu (Section 39) shall operate under a **Privacy-Preserving Protocol** that verifies compliance without accessing sensitive industrial or proprietary data:

Data Type	What IAEA Receives	What IAEA Does NOT Receive
Enrichment levels	UF ₆ enrichment percentage; compliance status (within/beyond limits)	Cascade configuration details; machine performance data; operating parameters
Material flow	Feed/product tails mass balance; material accountancy	Process optimization data; proprietary piping layouts; commercial production schedules
Operational status	Running/idle/shutdown status per declared cascade	Rotor design specifications; bearing types; control system architecture
Sensor data	Processed anomaly probabilities; trend analysis; compliance score	Raw sensor waveforms; industrial process data unrelated to enrichment limits
AI fusion output	Probability of compliance; deviation alerts; confidence intervals	Training data; model architecture; feature extraction methods

Article VRP-2: Data Minimization. IAEA monitoring systems are configured to collect only the data necessary to verify compliance with the agreed enrichment cap. All other industrial data is filtered at source and never transmitted. The filtering configuration is jointly reviewed by the IAEA and Iranian technical experts during the Pre-Operational Review.

Article VRP-3: Encryption Architecture. All sensor data is encrypted at the measurement point using a dual-key system:

- **Key A (Iran):** Iranian technical experts hold one encryption key
- **Key B (IAEA):** IAEA holds the second encryption key
- **Decryption:** Compliance data can only be decrypted when both keys are applied together
- **Single-key access:** Neither party can unilaterally decrypt the data
- **Escrow:** A third key is held by the Swiss Financial Cell as an escrow, usable only if both parties agree or if the Facilitating State Council orders it (e.g., during a dispute investigation)

Article VRP-4: The privacy-preserving protocol addresses Iran's concern that monitoring could be used for industrial espionage. By filtering data at source, encrypting all transmissions, and restricting IAEA access to compliance-relevant information only, the protocol ensures that monitoring serves verification, not intelligence gathering.

46.2 Dual-Key Access System for Sensitive Sites (v5.6)

Article VRP-5: For inspections at sensitive facilities (Fordow, centrifuge manufacturing sites, R&D laboratories), a **Dual-Key Access System** applies:

Parameter	Specification
Authorization	Site access requires authorization from both: (a) IAEA Director General or designated inspector, AND (b) Iranian Atomic Energy Organization (AEOI) representative
Scope limitation	Access is limited to declared areas relevant to the inspection purpose; IAEA may request access to additional areas but AEOI may decline with justification
Managed access	If AEOI declines access to a requested area, a 72-hour managed access negotiation opens; if unresolved, the dispute goes to the Facilitating State Council
Observer presence	Iranian technical observers accompany IAEA inspectors at all times; observers do not interfere with inspection but witness all activities
Photography/video	IAEA may photograph/video only with AEOI observer consent; AEOI may require certain areas to be off-camera with written justification
Sample collection	Environmental samples collected jointly by IAEA and AEOI; split samples retained by both parties
Emergency override	In cases of suspected diversion or concealed enrichment, IAEA may request emergency access; AEOI may delay up to 24 hours; if access still denied, matter goes to Council within 48 hours

Article VRP-6: The dual-key system is standard practice in arms control agreements (e.g., CWC, BWC inspection protocols). It balances IAEA verification rights with Iranian sovereignty

concerns. Neither party has unilateral access authority. Both must agree for an inspection to proceed.

46.3 Verification Grace Period for Minor Discrepancies (v5.6)

Article VRP-7: A **Verification Grace Period** applies to minor measurement discrepancies that do not indicate material non-compliance:

Discrepancy Type	Threshold	Grace Period	Response
Measurement error	Enrichment reading within 0.05% of declared value	14 days	Technical review; recalibration; no breach
Material accountancy gap	Less than 1% of declared inventory	30 days	Inventory reconciliation; enhanced monitoring; no breach
Sensor malfunction	Single sensor failure with redundant backup operational	7 days	Sensor replacement; no breach if backup confirms compliance
Administrative error	Incorrect declaration (typo, date error) with no material impact	14 days	Corrected declaration; no breach
Environmental interference	Temporary signal anomaly due to external factors (power surge, seismic event)	7 days	Root cause analysis; no breach if verified as external

Article VRP-8: The grace period protects both sides from accidental escalation. A minor measurement discrepancy caused by sensor calibration drift should not trigger a Tier 2 breach and 25% rollback. Instead, the technical review process resolves the issue without political escalation. This is a de-escalation safeguard, not a loophole.

Article VRP-9: The grace period does NOT apply to:

- Confirmed enrichment above the agreed cap (no grace period; immediate Tier classification)
- Material diversion (no grace period; immediate investigation)
- Intentional sensor tampering (no grace period; Tier 3 investigation)
- Repeated discrepancies (same discrepancy 3+ times voids grace period)

46.4 Joint Monitoring Innovation Fund (v5.6)

Article VRP-10: Qatar and Switzerland establish a **Joint Monitoring Innovation Fund** to develop and deploy next-generation non-intrusive monitoring technologies:

Parameter	Specification
-----------	---------------

Funding	\$50M initial capitalization (\$25M each from Qatar and Switzerland); \$10M annual replenishment
Governance	Independent technical board: 2 IAEA experts, 1 Iranian scientist, 1 US scientist, 1 neutral (rotating: Japan, South Korea, EU)
Purpose	Research and deploy non-intrusive monitoring technologies that enhance verification confidence while reducing physical presence requirements
Projects	Next-generation OLEM/UGES sensors; AI-powered anomaly detection; quantum sensing for remote enrichment verification; drone-based radiation mapping
Deployment	Technologies developed by the Fund are offered to framework parties for voluntary deployment; no party is required to adopt any technology
Intellectual property	All technologies are open-source and non-proprietary; any party may manufacture and deploy
Depoliticization	Fund decisions are technical, not political. The technical board evaluates technologies on accuracy, intrusiveness, and cost — not on which country developed them

Article VRP-11: The Innovation Fund depoliticizes monitoring technology by creating a neutral, multilateral funding mechanism. When the US or IAEA proposes a new monitoring technology, Iran may be skeptical of its intent. When the Innovation Fund (co-funded by Qatar and Switzerland, governed by a multilateral board) recommends the same technology, it carries neutral credibility. The Fund transforms monitoring from a bilateral surveillance issue into a multilateral technical cooperation project.

Section 47: Political Narrative & Legitimacy Instruments

v5.6: Three Instruments to Protect Domestic Political Support in Both Capitals

Rationale: Even the best technical framework fails if either side cannot sell it domestically. These three instruments provide pre-approved talking points, symmetrical precedent protection, and a regional consultation mechanism that protects both Washington and Tehran from domestic political backlash while reassuring US regional partners.

47.1 Parallel Public Narrative Annex (v5.6)

Article PNL-1: The Coordination Secretariat shall maintain a **Parallel Public Narrative Annex** — a confidential document containing pre-approved talking points for both parties:

Topic	Iranian Pre-Approved Narrative	U.S. Pre-Approved Narrative	Red Line (Forbidden Language)
Overall framework	"A comprehensive regional stability agreement that advances Iran's national interests through principled diplomacy."	"A verified arrangement that constrains Iran's nuclear program and stabilizes the Gulf region."	Neither side may call it a "defeat" or "surrender" for the other
Enrichment cap	"Iran voluntarily adjusted its enrichment profile as part of a broader stability framework."	"Iran agreed to limit enrichment to levels consistent with peaceful civilian use."	US: not "we forced Iran"; Iran: not "we had no choice"
Sanctions relief	"Iran secured the lifting of unjust sanctions through regional cooperation."	"Sanctions relief was provided in exchange for verified nuclear constraints."	Neither side may claim the other "gave in"
Hormuz	"Iran co-manages the Strait of Hormuz as part of a regional security architecture."	"The Strait is open and safe for international shipping through a multilateral arrangement."	Neither side claims "control" of Hormuz
Monitoring	"Iran accepted a smart multilateral monitoring system that protects our sovereignty."	"IAEA verification is stronger than the JCPOA, using cutting-edge technology."	US: not "we inspect everything"; Iran: not "foreign spies"
Asset returns	"Iran's frozen assets are being returned as part of a fair settlement."	"Asset releases were carefully staged and verified at each step."	Neither side may claim the other "paid us off"
Missile moratorium	"Iran voluntarily suspended long-range missile testing as a confidence-building measure."	"Iran committed to no missile testing above 2,000km, verified by satellite."	US: not "Iran gave up missiles"; Iran: not "our deterrent is gone"
Proxies	"Iran supports regional stability and condemns violence that undermines peace."	"Iran is taking steps to reduce proxy activity in the region."	Neither side may claim Iran "controls" or "has cut off" proxies
Prisoners	"Iran secured the release of unjustly detained citizens through humanitarian diplomacy."	"American citizens are coming home through this administration's diplomatic efforts."	Neither side may call it a "ransom" or "hostage deal"

Article PNL-2: Both parties commit to using the pre-approved narratives or language that is substantively equivalent. The Secretariat monitors public statements and flags deviations. Minor deviations trigger a quiet diplomatic reminder (Tier 1 dignity breach). Major contradictions trigger formal consultation.

Article PNL-3: The Annex is updated quarterly by the Secretariat with input from both parties' communications teams. Updates require mutual consent. Neither party may unilaterally modify talking points.

47.2 Symmetrical No-Precedent Clause (v5.6)

Article PNL-4: Dual No-Precedent Commitment. This framework creates no legal or political precedent for either party in future negotiations. The United States explicitly states that this arrangement does not establish a template for future agreements with Iran or any other state. Iran explicitly states that this arrangement does not establish a template for future nuclear arrangements. Neither side may cite this framework as precedent in any future negotiation, arbitration, or legal proceeding without the other party's written consent.

Article PNL-5: Congressional Protection Language. The No-Precedent Clause is designed to protect both sides' domestic political positions:

- **For the US Administration:** "This arrangement is sui generis — specific to the current circumstances in the Gulf region. It does not create a template for future Iran policy or a model for other nuclear negotiations. Each future situation will be evaluated on its own merits."
- **For Iran:** "This framework addresses the specific stabilization needs of the region in 2026. It does not establish a permanent nuclear architecture or constrain Iran's future energy sovereignty decisions."
- **For both:** "Neither party has acknowledged the other's legal or political positions. This is a practical stabilization measure, not a juridical settlement."

Article PNL-6: Explicit Congressional Language. The framework includes the following language for the US Administration to use in congressional notifications: "This arrangement does not constitute a treaty under Article II of the US Constitution. It is an executive agreement reflecting current US policy. It creates no obligation on future administrations. It establishes no precedent for future nuclear agreements. Congress retains full authority over sanctions legislation."

Audience		No-Precedent Message
US (Republicans)	Congress	"This is not JCPOA 2.0. It is a limited executive arrangement with no treaty status and no precedent value."
US (Democrats)	Congress	"This demonstrates that diplomacy works. The no-precedent clause protects future flexibility."
Iranian hardliners		"Iran did not accept a permanent nuclear constraint. The arrangement is renewable and reversible."

Iranian moderates	"This is a diplomatic achievement that advances Iran's interests without surrendering sovereignty."
--------------------------	---

47.3 Regional Consultation Mechanism Including Gulf States (v5.6)

Article PNL-7: A Regional Consultation Mechanism is established to provide Gulf Cooperation Council (GCC) states and other regional actors with a voice in framework implementation without giving them veto power:

Parameter	Specification
Membership	All GCC states (Saudi Arabia, UAE, Qatar, Kuwait, Bahrain, Oman) + Iraq + Jordan + Egypt (observer)
Forum	Regional Consultation Forum meets quarterly; hosted on a rotating basis by member states
Function	Information sharing on framework implementation; regional security concerns; economic coordination; NOT a decision-making body
Input rights	Forum members may submit concerns to the Coordination Secretariat; Secretariat must acknowledge within 14 days and respond within 30 days
No veto	Forum members have no veto over framework decisions; their input is advisory only
Israel	Israel participates as an observer (not full member) through the Tel Aviv Channel (Section 14); receives Forum summaries but does not attend meetings
Secretariat liaison	UN Appointee maintains permanent liaison with the Forum; ensures Forum concerns are communicated to framework decision-makers

Article PNL-8: The Regional Consultation Mechanism serves multiple purposes:

- **For US allies:** They are not ignored. Their concerns are heard, documented, and addressed. This reduces Israeli and Saudi opposition.
- **For Iran:** Regional consultation creates a platform where Iran can explain its positions to neighbors, reducing Gulf state fear and suspicion.
- **For the framework:** Regional buy-in increases the political durability of the arrangement. A deal that only involves the US and Iran is fragile. A deal with regional consultation has broader legitimacy.
- **For Israel:** Observer status through the Tel Aviv Channel ensures Israel is informed without being able to block decisions.

Article PNL-9: GCC Financial Participation. To incentivize GCC engagement, Qatar and the UAE are invited to contribute to the Joint Monitoring Innovation Fund (Section 46.4). GCC financial participation gives Gulf states a stake in the framework's success without requiring them to formally endorse it.

Concern	v5.6 Solution
Saudi Arabia fears US-Iran deal undermines its security	Quarterly Forum briefings; Saudi input on regional security concerns; no veto but voice heard
UAE fears Hormuz control shifts to Iran	UAE participates in Hormuz Transit Authority; Dashboard data shared; maritime arbitration panel includes neutral judges
Israel fears weak verification	Tel Aviv Channel; Israeli observer status; quarterly intelligence briefings on monitoring data
Iraq fears proxy spillover	Iraq is full Forum member; proxy scoring system tracks activity on Iraqi border; Rapid Swap Channel for detained nationals

47.4 Strengthened Civil Nuclear Cooperation Window (v5.6)

Article PNL-10: The existing Civilian Nuclear Consortium (Section 12.2) is strengthened with the following additional cooperation mechanisms:

Cooperation Area	Details	Participants
Regional nuclear fuel bank	Low-enriched uranium stockpile hosted in a neutral Gulf state for civilian reactor use; Iran has priority access rights	IAEA + host state + contributing states
Bushehr expansion feasibility	Joint technical study for additional Russian-built reactors at Bushehr; non-binding; financed by international consortium	Rosatom + AEOI + IAEA + potential investors
Nuclear safety cooperation	Joint emergency response drills; seismic safety assessment; spent fuel management consultation	IAEA + AEOI + neighboring states
Academic exchanges	Nuclear engineering scholarships; joint research programs; conference participation	Universities in framework states + IAEA Technical Cooperation
Medical isotope production	Fordow Medical Isotope Center (Section 12.2) produces isotopes for regional use; Iran becomes a medical isotope exporter	Iran + WHO + IAEA + regional buyers

Article PNL-11: Civil nuclear cooperation is framed as a "reward for compliance" not a "concession to Iran." It only activates after 12 months of clean IAEA certification. If Iran breaches the enrichment cap, civil nuclear cooperation is suspended (but humanitarian medical isotope production at Fordow continues as part of the Humanitarian Firewall).

Appendices

Monthly Compliance Scorecard (v5.3)

v5.3: Public Anonymized Dashboard Building Stakeholder Buy-In

Article MCS-1: The Secretariat publishes a **Monthly Compliance Scorecard** on the first business day of each month. The scorecard provides an anonymized, aggregated view of compliance across all framework modules:

Module	Metric	Scoring
Nuclear Freeze	% of days 60% freeze verified by IAEA	Green (95%+), Yellow (80-94%), Red (<80%)
Hormuz Transit	Commercial transits vs. 14-day target	Green (90%+), Yellow (70-89%), Red (<70%)
Ceasefire	Days without reported incident	Green (100%), Yellow (1 incident), Red (2+ incidents)
Asset Releases	Tranches released on schedule vs. target window	Green (on time), Yellow (within extension), Red (delayed)
Proxy Pause	Reported proxy incidents per 30 days	Green (0), Yellow (1-2), Red (3+)
IAEA Access	Inspection requests granted vs. requested	Green (95%+), Yellow (80-94%), Red (<80%)
Hotline Response	Hotline calls answered within target time	Green (95%+), Yellow (80-94%), Red (<80%)
Overall Score	Weighted average of above	Green (90%+), Yellow (75-89%), Red (<75%)

Article MCS-2: Anonymization Rules. The scorecard does not identify which party is responsible for any deficiency. It reports module-level performance only. If a module is Red, the scorecard notes "requires enhanced attention" without attributing cause. This protects both parties from public blame while maintaining transparency.

Article MCS-3: Stakeholder Communication. The scorecard is distributed to: both parties' negotiating teams, the Facilitating State Council, UNSC quarterly reports, insurance markets (for Hormuz transit data), and OPEC+ (for oil export data). It is also posted on a secure public portal accessible to authorized subscribers.

Article MCS-4: Scorecard Triggers. Three consecutive Red scores in any module automatically triggers a Secretariat Technical Review. Two consecutive Red overall scores triggers a Facilitating State Council review.

Annual Audit by Neutral Consortium (v5.3)

v5.3: Independent Financial and Verification Audit Every 365 Days

Article AAC-1: Every 365 days, an independent consortium conducts a comprehensive audit of all financial flows and verification data. The consortium is appointed by the UN Secretary-General from a roster of neutral states, rotating among: Singapore, India, Brazil, South Africa, and New Zealand (one per audit cycle, 5-year rotation).

Article AAC-2: Audit Scope. The annual audit covers: (a) all escrow transactions and asset transfers, (b) IAEA monitoring data integrity and chain of custody, (c) Secretariat operational effectiveness, (d) Facilitating State performance, (e) compliance with the Partial Continuity Rule, (f) Reconstitution Mechanism readiness.

Article AAC-3: Audit Authority. The audit consortium has full access to: Swiss escrow records (with IAEA DG approval), IAEA monitoring data, Secretariat operational records, and personnel interviews. The consortium does not have enforcement authority but its findings are considered binding interpretations for Secretariat decision-making.

Appendix A: Visual Sequencing Matrix — 180-Day Overview

Track	D1-14	D15-30	D31-44	D45-60	D61-90	D91-120	D121-150	D151-180
NUCLEAR TRACK								
60% Freeze	CONTINUOUS FROM MICRO-PILOT							
IAEA Standard	ACTIVE							
IAEA Enhanced			ACTIVE					
IAEA Continuous					ACTIVE			
Moratorium Ratification			TARGET					
HEU Export			EXECUTE					
Fordow Phase A					ACTIVE			
Fordow Phase B							ACTIVE	

MARITIME TRACK				
Ceasefire	CONTINUOUS			
Blockade Lift	D7	SUSTAINED		
Maritime Council	ACTIVE			
Transit Authority			ACTIVE	
Humanitarian Channel	CONTINUOUS			
ECONOMIC TRACK				
Swiss Escrow (Pilot)	\$250M			
Stage 1 (\$500M)		RELEASE		
Stage 2 (\$1.5B)		RELEASE		
Stage 3 Mid (\$3B)			TARGET	
Stage 3 Close (\$5B)				TARGET
SWIFT Phase 0	ACTIVE			
SWIFT Phase 1		ACTIVE		
SWIFT Phase 2			ACTIVE	
GOVERNANCE TRACK				
Coordination Secretariat	CONTINUOUS			
Facilitating State Council	AVAILABLE			
90-Day Technical Review			R1	R2
180-Day Audit			A1	
Successor Opening (3 tracks)				OPEN

Appendix B: Glossary — Reduced Acronym Edition

Acronym Reduction (v5.2): 40-50% fewer acronyms than v5.1. Full descriptive terms on first reference. Short forms in parentheses used only after full term established. Key simplifications: "the Transit Authority" (not JHTA), "the Maritime Council" (not JMA), "the Coordination Secretariat" (not JIG), "the Medical Isotope Center" (not IMIRC), "the Facilitating State Council" (not Triad), "the Pakistani Convening State" (not Pakistani Guarantor).

Full Term	Short Form	Definition
-----------	------------	------------

Joint Hormuz Transit Authority	Transit Authority	Permanent multilateral body governing Hormuz transit
Joint Maritime Council	Maritime Council	Provisional Hormuz governance body
Joint Coordination Secretariat	the Secretariat	Central coordination body in Geneva
Facilitating State Council	the Council	Neutral oversight: Oman, Qatar, Switzerland
International Medical Isotope Research Center	Medical Isotope Center	Converted Fordow facility
Highly Enriched Uranium	HEU	Uranium enriched to 60% U-235
Petroleum Revenue Direct Deposit	Revenue Deposit	Mechanism for oil revenue; 30-day freeze window
Political Shock Absorber	Shock Absorber	Automatic review pause for political crises
Cooling-Off Default	Cooling-Off	Automatic 24-72 hour escalation freeze
Framework Survival Core	Survival Core	Three elements that survive everything
Reconstitution Mechanism	Reconstitution	Mandatory conference within 30 days of suspension
Stabilization Hold	Hold	Module-specific pause (not framework-wide)
Stabilization Pause	Pause	Temporary non-implementation (never "collapse")

Appendix C: All Enhancements at a Glance

#	Enhancement	Version	Section
1-10	Micro-Pilot, Blind De-escalation, Staggered Cap, Diluted PRDD, Facilitating State Council, Non-US Channels, Phased IAEA, Fordow JV, Rebranding, Goldilocks	v5.0	Various
11-42	No Precedent, Face-Saving Metrics, 7-Day Extension, Gantt Matrix, Cyber Module, Proxy Stand-Down, Tel Aviv Channel, Force Majeure, Tiered Accelerants, Fordow Funding, SWIFT Pathway, Messaging Toolkit, Successor Roadmap, Executive Brief, Visual Timeline, MVA Fallback, Spoiler Management, Attribution Protocols, Technical Delay Clauses, Quick Reference, Legally vs Politically Binding, US Succession, Legislative Sync, Red Team Annex, Economic Metrics, Crisis Communications, Cyber Stabilization, Degraded Compliance, Enforcement Asymmetry, Command Diagrams, Independent Audit, Failure Without Collapse	v5.1	Various
43	Distributed Facilitating State Matrix (replaced single Pakistani guarantor)	v5.2	Section 9
44	"Facilitating State" terminology (replaced "Guarantor")	v5.2	Throughout
45	Mandatory Escalation Pause Recommendation (replaced binding hold-fire)	v5.2	Section 9.3

46	Automatic Return-to-Talks trigger after any breach	v5.2	Section 16
47	No Withdrawal During Active Mediation clause	v5.2	Section 16
48	"Stabilization pause" vocabulary (replaced "collapse/failure/breakdown")	v5.2	Throughout
49	Three-tier breach system (technical/material/deliberate)	v5.2	Sections 16, 33
50	Cooling-Off Default universal mechanism	v5.2	Sections 1.8, 34
51	Simplified command architecture (3 levels: Field/Strategic/Executive)	v5.2	Section 11.2
52	Joint Coordination Secretariat with subcells (merged JIG/JMA/MCC/Media)	v5.2	Section 2
53	Rotating facilitation (replaced permanent co-chair)	v5.2	Section 2
54	Reduced successor modules (3 initially: maritime/economic/humanitarian)	v5.2	Section 7.2
55	Flexible timeline windows (target window: 7-14 days)	v5.2	Section 2
56	Partial Continuity Rule (explicit)	v5.2	Section 1.2
57	Mandatory mediation before snapback actions	v5.2	Section 16
58	40-50% acronym reduction	v5.2	Appendix B
59	Framework Survival Core (3 inviolable elements)	v5.2	Section 1.4
60	Political Shock Absorber (elections, assassinations, cabinet collapse)	v5.2	Sections 1.7, 36
61	Simplified financial incentives (fewer tranches, larger milestones)	v5.2	Section 10.1
62	Reconstitution Mechanism (mandatory conference within 30 days)	v5.2	Section 35
63	Five-Channel Verification Convergence (4/5 required for certification)	v5.3	Section 16
64	72-Hour Attribution Hold (auto-activates rogue protocols)	v5.3	Section 16
65	False Flag Detection Protocol (indicator triggers + UN investigation)	v5.3	Section 16
66	Escrow Multi-Sig (3/4 facilitating states required for release)	v5.3	Section 9
67	Rotating Facilitation Lock-In (90-day handover; fatigue prevention)	v5.3	Section 9
68	Secretariat Redundancy (Geneva + Muscat; 4-hour failover)	v5.3	Section 2
69	IAEA Forward Deployment Teams (12-person teams in Oman/Switzerland)	v5.3	Section 11(b)
70	Satellite Data Feed Mandate (daily automated imagery via Secretariat)	v5.3	Section 11(b)
71	Environmental Sampling Baseline (Day 0 swipe samples; fraud-proof)	v5.3	Section 18
72	SWIFT-IAEA Milestone Linkage (tiers tied to IAEA reports, not politics)	v5.3	Section 10
73	Monthly Compliance Scorecard (public anonymized dashboard)	v5.3	Section 29
74	Annual Audit by Neutral Consortium (365-day independent review)	v5.3	Section 29
75	Reconstitution Conference Charter (pre-defined agenda/location/convener)	v5.3	Section 35
76	Enhanced Force Majeure (cyber, natural disaster, third-party; auto-90d)	v5.3	Section 18

77	Proxy Attribution Matrix (pre-agreed scoring for militia actions)	v5.3	Section 19
78	Post-Quantum Encryption Target (Day 180 transition)	v5.3	Section 21
79	Legacy Mode (mandatory renegotiation within 90 days of withdrawal)	v5.3	Section 18
80	Mothball Protocol (centrifuge rotors to UN-sealed storage)	v5.4	Section 12.2
81	Dual-Key Custody (Iran + IAEA keys required)	v5.4	Section 12.2
82	Third-Party HEU Guarantee (never to US territory)	v5.4	Section 12.1
83	Additional Protocol Acceleration (Day 90)	v5.4	Section 12.3
84	Civilian Nuclear Consortium	v5.4	Section 12.4
85	Zero Breakout Preamble Statement	v5.4	Preamble
86	International Gulf Reconstruction Fund	v5.4	Section 10.1.2
87	Hormuz Environmental Transit Fee	v5.4	Section 11.3
88	12nm Blockade Verification (AIS + satellite)	v5.4	Section 11.4
89	Lebanon Ceasefire Linkage	v5.4	Section 19(b).2
90	Levant Firewall	v5.4	Section 19(b).1
91	Front-Loaded Asset Release (\$750M Day 14)	v5.4	Section 10.1.1
92	Pre-Agreed Asset Valuation (\$100B)	v5.4	Section 10.1.3
93	Israel Non-Interference Guarantee	v5.4	Section 18
94	WFP Humanitarian Shield	v5.4	Section 18
95	No Snapback Pledge	v5.4	Section 18
96	Mutual Covert Operations Ban	v5.4	Section 18
97	Energy Market Stabilization Pledge	v5.4	Section 18
98	Pakistan Co-Convening Authority	v5.4	Section 9.5
99	Thirty-Day Drop-Dead / MVA Auto-Transition	v5.4	Section 8.3
100	Rollback and Step-Down Architecture (4 models replacing snapback)	v5.5	Section 38
101	Nuclear Monitoring Technology Menu (3 intensity levels, 11 technologies)	v5.5	Section 39
102	Minimal, Medium, and Maximal Deal Options (3 selectable packages)	v5.5	Section 40
103	Prisoner Exchange Framework (standing mechanism + guarantees)	v5.5	Section 41
104	Ballistic Missile Test Moratorium (testing freeze, not development halt)	v5.5	Section 42
105	Graduated Rollback with Symmetry Lock (applies to both parties)	v5.5	Section 38

Appendix D: Three-Tier Breach Quick Reference

	Tier 1: Technical	Tier 2: Material	Tier 3: Deliberate
Definition	Minor procedural deviation	Substantial disruption; no hostile intent	Willful breach with hostile intent
Notify	48 hours	24 hours	Immediate
Fix window	7 days	14 days	7-day mediation first
Other modules	All continue	Affected to Hold; others continue	Survival Core continues
Suspend?	Never	Never	Only after mediation fails
Public?	No	If necessary	Yes

Appendix E: Dual-Track Messaging Toolkit

E.1 Joint Announcement Template

"The United States and Iran have agreed to a limited, reversible humanitarian stabilization measure to reduce tensions and create space for comprehensive negotiations. This measure involves no binding long-term commitments and creates no precedent. Both sides have taken parallel steps to reduce military and nuclear tensions. These steps will be verified by the International Atomic Energy Agency and neutral facilitating states."

E.2 US Domestic Template

"Today I can report that Operation Epic Fury has achieved its objectives. Iran's weapons-grade uranium has been transferred to international custody and verified by the IAEA. The Strait of Hormuz is open. We have secured a performance-based enrichment cap with annual renewal. We did it without losing a single American life or closing a single military base. This is a regional stability mechanism, not a comprehensive peace treaty. It creates no precedent."

E.3 Iranian Domestic Template

"The war is over. The American naval blockade has been lifted. Our frozen sovereign property is returning. We have chosen to redirect our nuclear program toward guaranteed civilian energy and cancer medicine production. Our NPT rights remain fully intact. The arrangement is subject to our sovereign annual review. We negotiated every detail as equals. This creates no enduring obligation beyond what is expressly agreed."

Appendix F: Red Team Objections & Responses

Source	Objection	Framework Response
Israel	"Any Iranian enrichment is unacceptable"	3.67% cap below weapons-grade; IAEA continuous monitoring; Tel Aviv Channel provides real-time data; any deviation triggers immediate notification
GCC Hawks	"Iran gets a permanent Hormuz seat"	So does the US; Oman has tiebreaker; rotating facilitation prevents permanent Iranian control
US Congress	"This is another JCPOA that will collapse"	Modular architecture prevents total suspension; three-tier breach system; Congress has vote on Tranche 3+; Reconstitution Mechanism prevents disappearance
IRGC	"This surrenders Iran's nuclear achievements"	Enrichment continues at 3.67%; 60% was a negotiating chip; NPT rights preserved; Fordow is a scientific achievement; annual review
Europe	"Verification is too weak"	Five independent channels; continuous monitoring by Day 60; 30-day dispute resolution; stronger than JCPOA
Proliferation Experts	"1 year is too short"	Annual renewal creates ratchet effect; IAEA monitoring detects breakout; stockpile transfer removes immediate threat

Appendix G: RCSA v3.6 Analysis — 20 Crucial Changes Incorporated

20 Strengthening Changes Drawn from RCSA v3.6 Analysis

The RCSA v3.6 is a comprehensive 50+ page diplomatic framework with innovative governance mechanisms. Analysis identified these 20 crucial changes for incorporation:

#	RCSA Innovation	How v5.2 Incorporates
1	Track Maturity Band system (Warm/Cool/Not-yet-active)	Tier 1/2/3 module survival system (Section 1.2, 30)
2	Non-Humiliation Doctrine	Face-Saving Metrics (Section 17); neither side may characterize other's commitments as "concessions"
3	Quiet Compliance Track	Confidential correction through Secretariat (Section 16 Tier 1)
4	Emergency Ambiguity Authority	Facilitating state may introduce procedural ambiguity (Section 18)
5	Trigger Dampening Windows (15-min/1-hour/6-hour/24-hour/14-day)	Three-tier breach response windows; Cooling-Off Default (Sections 16, 34)
6	Escalation Insurance Pools	Qatari Emergency Liquidity Facility (\$20B capacity) (Section 10.1)
7	Proxy Transformation Incentives	Successor framework proxy governance track (Section 7.2)
8	Civic Visibility Layer	Economic stabilization metrics with public reporting (Section 31)
9	Grand Bargain Conversion Pathways	Crescent Compact successor modules (Section 7.2)
10	Default Action Rule ("maintain current status")	When no decision, current status continues; no automatic snapback (Section 16)
11	Silence Procedure	72-hour silence period on Secretariat decisions; no objection = adoption (Section 2)
12	Weighted Majority Override (2/3 + 1 + chair)	Secretariat subcell decisions by weighted consensus; chair has procedural casting vote (Section 2)
13	Automatic Procedural Fallback	If primary mechanism fails, automatic fallback to next level (Section 16)
14	Face-Saving Exit Ramps	Costed withdrawal with six-month notice; nuclear constraints survive as residual obligations (Section 18)
15	Burden-Sharing Transitions	OPEC+ coordination for production adjustments; Qatari bridging for SWIFT (Sections 10, 31)

16	Narrative Protections	Sovereignty	Dual-track messaging; each capital frames independently; Communications Cell coordination (Sections 14, 28)
17	Religious Forum	Stabilization	Optional: Grand Ayatollahs + Vatican/WCC + Al-Azhar religious peace declaration (Appendix reference)
18	Institutional Binding (not individual)		Commitments attach to offices, not persons; Political Shock Absorber for transitions (Sections 26, 36)
19	Regional Stakeholder Buy-In Protocol		GCC consultation requirement; EU endorsement for SWIFT; UNSC reporting (Section 27)
20	Irreversible Facts on the Ground		Once blockade lifted and stockpile transferred, reversal requires deliberate visible decision (throughout)

Appendix H: Negotiator Quick Reference

H.1: Key Numbers

Item	Value
Micro-Pilot duration	30 days (extendable to 45; +7 by Council)
Stage 1	14 days
Stage 2	30 days (+7 extension)
Stage 3	Days 45-180 (flexible: 135-210 days)
PRDD freeze window	30 days (was 72 hours)
Cooling-Off Period	24-72 hours (automatic)
Mandatory Escalation Pause	30-minute review window
Hotline Tier 1 response	5 minutes
Stabilization Hold max	90 days per module
Technical Delay max per stage	3 per party
Force Majeure max	90 days
Political Shock Absorber max	90 days (extendable)
Reconstitution Conference	Within 30 days of full suspension
Withdrawal notice	6 months
Total simplified tranches	6 milestones (\$250M to \$10B)
Bonus pool	Up to \$6B
Framework Survival Core elements	3 (ceasefire hotline, humanitarian, diplomatic channel)

Successor modules (Day 180)	3 (maritime, economic, humanitarian)
Successor modules (Day 365)	+3 (ballistics, proxies, nuclear cooperation)

H.2: Emergency Contacts

Function	Contact	Response

Financial verification	Swiss Federal Department, Bern	24 hours
Nuclear verification	IAEA Director General, Vienna	6 hours (emergency)
Procedural mediation	UN Appointee	12 hours
Liquidity emergency	Qatari Financial Centre, Doha	4 hours

Document Certification

This document, the **Stability First Enhanced Accord v5.6**, reflects the diplomatic trajectory of May 2026 and incorporates **125 total enhancements**. It addresses every major blocker that prevented agreement in the JCPOA, the Qatar talks, the Oman channel, and the April 2026 Islamabad round, plus **20 crucial innovations** drawn from analysis of the Regional Comprehensive Stability Architecture v3.6.

The distributed facilitating state matrix replaces single-point-of-failure guarantors. The three-tier breach system prevents accidental escalation. The stabilization pause vocabulary shapes psychology toward continuity. The Framework Survival Core guarantees three elements survive everything. The Political Shock Absorber automatically pauses rather than terminates during crises. The Cooling-Off Default freezes escalation before attribution. The Reconstitution Mechanism prevents rage-quitting and diplomatic disappearance. The simplified command architecture, consolidated governance structure, reduced acronyms, and flexible timelines make the framework operationalizable by real negotiators under real pressure.

Every provision is paired. No party moves alone. The waltz continues as long as both partners step together. And if one stumbles, the stabilization pause ensures they can find their footing again.

"Nuclear Stabilized. Hormuz Open. Sovereignty Preserved. No One Moves Alone. Stabilization Pauses. But Nothing Collapses."

Stability First Enhanced Accord v5.6 | May 2026

Drawing from: SFEA v1.0 | 14-Day Directive v2.5 | Maritime Annex v1.2 | Nuclear Annex v1.2 | RCSA v3.6

125 Enhancements | 12 Core Principles | 5 Phases | 3-Tier Breach System | 3-Tier Deal Options | Rollback
Architecture | 20 Acceptability Measures | Framework Survival Core | Reconstitution Guarantee | Five-Channel
Convergence | Zero Breakout Objective
