

The Reciprocal Opening Window

A Narrow, Symmetrical Framework to Break the Current Deadlock
May 2026

Diplomatic Working Document — Version 1.1

10. If Talks Stall: The Emergency Fallback

The Situation in Six Lines

1. **Uranium:** Iran holds roughly 400 kg of uranium enriched to 60%, enough for breakout to weapons-grade within weeks. The IAEA has not verified any facility for over eight months.
2. **Sanctions:** Iran's economy is in crisis — currency collapse, rolling blackouts, inflation above 35%. Tehran needs hard currency and oil-market access.
3. **The Gap:** Iran has offered to *downblend* (dilute) its 60% stockpile, a real concession. Washington insists on *zero domestic enrichment* or full export of all material.
4. **Hormuz:** Oil trades above \$107/barrel. The Strait of Hormuz is a pressure point for both sides — Iran can disrupt it; the world economy pays the price.
5. **Trust:** Neither side believes the other will keep its word. Both need a mechanism that moves them *simultaneously*, so neither moves alone.
6. **Time:** The ceasefire is described as on "life support." Every week without progress raises the risk of reversion to military confrontation.

One Rule

**Nothing happens unless both things happen at the same time.
Iran does not move first. The United States does not move first.
Every obligation is paired with a reciprocal obligation, verified
simultaneously.**

This document proposes a **narrow, three-step reciprocal window** measured in weeks, not years. Each step is small enough to implement quickly, concrete enough to verify independently, and paired so neither side advances unilaterally.

The scope is deliberately limited to the nuclear file. Regional issues — missiles, proxies, maritime security — are explicitly excluded. They can be addressed in a second track only after this window demonstrates that reciprocal motion is possible.

Joint Technical Secretariat

Location: Muscat, Oman (neutral jurisdiction, existing diplomatic infrastructure)
Composition: Six technical liaisons — three nominated by each party. Liaisons are non-political civil servants or retired inspectors, not ministers or spokespeople.
Mandate: Operational management of the 24-hour window protocol, IAEA data relay, sensor dashboard maintenance, dispute logging, and escrow administration.

The Secretariat operates on a **pre-agreed Protocol Manual** signed before Day One. Its functions:

- **24-Hour Window Protocol:** Neither announcement is released until the Secretariat confirms both are logged and timestamps them.
- **Sensor Dashboard:** Live portal aggregating IAEA reporting, oil waiver flags, and banking clearances. All data visible to both parties in real time.
- **Dispute Log:** Time-stamped concerns shared simultaneously. No unilateral declarations.
- **Escrow Administration:** Holds the 40% performance reserve; releases only upon IAEA-certified moratorium completion.

Dead-Man Liquidity: Before Day One, the Designated Commercial Bank pre-stages the first \$500 million tranche in a Swiss-held sub-account. This tranche releases automatically the instant both Day-One announcements are logged by the Secretariat, confirming the funds are physically available and not merely promised.

The Secretariat has **no political authority** — it verifies, logs, and relays only.

Three Symmetrical Steps

1 The Simultaneous Opening *Days 1-14*

Baseline Reconciliation (Days 1-5): Before any oil waiver activates, the IAEA audits the 60% stockpile history. Iran provides production records and cascade logs; the IAEA cross-references against its own data. The stockpile is automatically split into a **Reconciled Tranche** (material verified within 5% of declared quantities, which moves forward instantly) and a **Disputed Tranche** (any discrepancies exceeding 5%, diverted to the 14-day VIU mediation track). The Reconciled Tranche proceeds on schedule; the Disputed Tranche is resolved in parallel, not in series. Oil sanctions suspension activates after the Reconciled Tranche is verified.

What Iran does (announced simultaneously with US action):

- Submits to the IAEA, within 72 hours, a complete written inventory of all enriched uranium stockpiles (locations, quantities, enrichment levels, chemical forms) at all four declared enrichment facilities.
- Restores IAEA inspector access to all four declared facilities within 7 days, including the Isfahan Nuclear Technology Center.
- Commits in writing to begin downblending all uranium enriched above 20% to a maximum of 19.75% within 14 days, with IAEA cameras recording the process in real time. Iran may alternatively satisfy this commitment by converting equivalent masses of 20%+ material into verified uranium oxide (UO₂) fuel form under IAEA monitoring — a technically irreversible civilian disposition.
- Permits the IAEA to verify the history of the 60% stockpile during the 5-day Baseline Reconciliation Period before any sanctions relief activates.

What the United States does (announced simultaneously with Iranian action):

- Issues executive waivers authorising the release of \$2.5 billion in frozen Iranian assets held in third-country accounts, restricted to medical supplies, agricultural commodities,

water-treatment chemicals, civilian electrical grid transformers, and aviation safety parts. Once these funds are spent on verified humanitarian goods, their value is non-reversible.

- Suspends for 90 days the enforcement of secondary sanctions on purchasers of Iranian crude oil, up to a volume ceiling of 1.0 million barrels per day (reported transparently to the third-party clearing account managed by the Secretariat).
- Issues a public statement affirming that the United States accepts Iran's right to peaceful nuclear energy under the NPT and that this window does not seek regime change.
- Confirms that the \$500 million pre-staged tranche releases automatically upon Secretariat timestamp confirmation.

Verification: The Joint Technical Secretariat confirms both announcements are issued within the same 24-hour window before either takes effect. The IAEA Reconciled Tranche Verification must be issued before the oil waiver activates.

2 The Verification Window *Weeks 3-8*

Automated Stepback Trigger: The Secretariat's sensor dashboard monitors IAEA reporting in real time. If the IAEA portal shows "Down" for more than 10 consecutive days, the corresponding oil waiver is automatically suspended by the clearing bank. Alerts fire at Day 7 and Day 10. When the portal resumes "Active" for 5 consecutive days, the waiver reactivates automatically. No political decision required.

Data Relay Protocol (Portal Dark Scenarios): If the IAEA portal goes dark due to an external technical fault (regional outage, third-party cyberattack, infrastructure failure), the 10-day countdown is paused if the IAEA provides manual, verified telemetry or physical data dumps to the Muscat Secretariat within 48 hours. The Secretariat logs the external cause; the Stepback clock freezes until the portal resumes or the 48-hour window closes.

Emergency Gas-Out Protocol: If a sudden cascade failure, gas leak, or mechanical fault at Fordow or Natanz accidentally disrupts live camera feeds, a 48-hour mechanical grace period applies before any Stepback trigger activates. The Secretariat logs the incident cause; Iran must provide IAEA physical access within 48 hours to verify the fault was mechanical, not deliberate. This protects Iran's physical infrastructure from penalisation for genuine equipment failures.

Hard-Coded Banking Channel: The Designated Commercial Bank (UBS AG, Zurich, or Qatar National Bank, Doha) processes all medical, agricultural, and infrastructure transactions under pre-issued U.S. Treasury comfort letters. If the primary bank faces compliance paralysis, the Swiss Humanitarian Trade Arrangement (SHTA) serves as an active backstop for grain and medical equivalents. Transactions clear mechanically per the published compliance protocol.

Tanker Safe Harbor: If a Stepback occurs, oil tankers currently at sea at the moment of suspension have a guaranteed 14-day safe-harbor window to offload cargo without retroactively triggering secondary sanctions. This prevents sudden maritime chaos and protects third-country shipping operators.

What Iran does:

- Downblending of all material above 20% proceeds under continuous IAEA monitoring. IAEA publishes weekly confirmation. Alternatively, equivalent material may be converted

to uranium oxide (UO₂) fuel form under IAEA seals as an irreversible civilian disposition.

- Allows installation of IAEA containment and surveillance measures at Natanz and Fordow (cameras, seals, tamper-evident enclosures).
- Provides IAEA access to declared centrifuge rotor assembly workshops for a one-time inventory verification. This explicitly excludes generalized precision machine shops, raw maraging steel storage sites, and non-nuclear component fabrication facilities.
- **Net inventory freeze:** Iran's total enriched uranium inventory across all declared facilities cannot increase beyond the reconciled baseline. Any new enrichment output must be matched by equivalent downblending or oxide conversion of material above 20%, verified weekly.
- **Downblending floor:** Downblending or oxide conversion ceases immediately if Iran's remaining stockpile of low-enriched uranium (at or below 19.75%) drops below the minimum threshold required to operate the Tehran Research Reactor for 12 months, as calculated by the IAEA. This guarantees Iran's domestic fuel security.

What the United States does:

- Authorises the Designated Commercial Bank (or SHTA backstop) to process Iranian transactions under pre-issued Treasury comfort letters.
- Issues a 90-day renewable general license permitting export of civilian aircraft spare parts to Iran (pre-approved part numbers listed in Annex C).
- Suspends threatened tariffs on countries trading with Iran for the duration of the Verification Window.

The "Stepback Line": Either side can step back (pause) its obligations if the IAEA confirms the other side has failed to perform for more than 10 consecutive days. Prior gains remain in place; nothing is undone. The automated trigger removes the need for political accusations.

3 The Stabilisation Extension *Months 3-6*

Trigger: IAEA confirms that all uranium previously enriched above 20% has been downblended to 19.75% or below (or converted to UO₂ fuel form), and the United States has maintained its sanctions relief for 60 consecutive days.

72-Hour Administrative Transition: Upon IAEA certification, both sides have 72 hours to issue their Step Three operational directives simultaneously through the Secretariat. The oil escrow (60/40), enrichment cap, and centrifuge moratorium all activate at the same timestamp. No party implements unilaterally.

Oil Revenue Escrow (60/40 Split): Revenue is deposited into a monitored escrow at the Designated Commercial Bank, denominated in EUR, RMB, or AED (non-USD), with conversion rates locked to a Day-One currency basket to insulate Iran from exchange-rate shocks. Sixty percent is released monthly for civilian imports. Forty percent is held by the Secretariat as a **performance reserve**, released only upon IAEA-certified completion of the 12-month centrifuge moratorium. If broken, the 40% is forfeited to an international humanitarian fund — not retained by the United States. Escrowed funds are held under Omani sovereign immunity and are immune to judicial seizure or third-party attachment.

Emergency Oil Valve: If Brent crude spikes above \$115/barrel at any point during the window, the oil export ceiling automatically expands from 1.0 mb/d to 1.3 mb/d (Step Two)

and from 1.5 mb/d to 1.8 mb/d (Step Three), maintaining the agreement's economic stabilisation function during external market shocks. This trigger is automatic and requires no diplomatic renegotiation.

Pre-Authorised Stockpile Disposition: Conversion to fuel plates for the Tehran Research Reactor is the default path. Iran begins conversion under IAEA monitoring within 30 days of Step Three activation. Alternatives (domestic IAEA-sealed storage, third-country escrow) must be declared by Day 60 with a transition plan. Absent notification, fuel plate conversion proceeds.

What Iran does:

- Caps all enrichment activity at 3.67% for a renewable 6-month period, with IAEA continuous monitoring.
- Agrees to a 12-month moratorium on installing new centrifuge cascades at any declared facility. Completion is certified by the IAEA and triggers release of the 40% performance reserve.
- Begins conversion of the downblended stockpile to fuel plates for the Tehran Research Reactor under IAEA monitoring, as the pre-authorised default disposition path.

What the United States does:

- Issues a 6-month general license for Iran to export up to 1.5 million barrels per day (expanding to 1.8 mb/d if the Emergency Oil Valve triggers), with revenue deposited into the escrow account under the 60/40 split mechanism.
- Suspends designation of additional Iranian financial institutions for the duration of the extension.
- Convenes, with EU and Gulf partners, a technical working group on long-term civilian nuclear cooperation framework (fuel supply guarantees, medical isotope collaboration).

What Iran Gets

IMMEDIATE (DAYS 1-14)

- **\$2.5 billion** in frozen assets released for medical, agricultural, water-treatment, grid-transformer, and aviation safety use. Once spent on verified humanitarian goods, this value is non-reversible.
- **\$500 million pre-staged** in a Swiss sub-account, releasing automatically upon Secretariat confirmation — proof the money is real, not promised.
- **90-day suspension** of secondary sanctions on oil buyers (up to 1.0 mb/d, auto-expanding to 1.3 mb/d if oil spikes above \$115)
- **Public US affirmation** of Iran's NPT right to peaceful nuclear energy and non-interference in domestic governance
- **Reconciled/Disputed Tranche** splits any inventory discrepancies so the deal proceeds on verified material while disputes resolve in parallel

SHORT-TERM (WEEKS 3-8)

- Designated Commercial Bank (with Treasury comfort letters, SHTA backstop) processes **humanitarian and infrastructure trade** mechanically, not case-by-case
- Civilian aviation spare parts (**pre-approved part numbers, Annex C**) clear customs under general license
- **48-hour Gas-Out grace period** protects Iran from Stepback triggers caused by genuine mechanical cascade failures
- **Downblending floor** guarantees Iran retains enough LEU to fuel the Tehran Research Reactor for 12 months
- **Tanker safe harbor**: 14-day offload window for tankers at sea if Stepback occurs

MEDIUM-TERM (MONTHS 3-6)

- Oil export ceiling raised to **1.5 million barrels per day** (1.8 mb/d if Emergency Oil Valve triggers)
- **60% of oil revenue** released monthly for civilian imports; **40% held as performance reserve** and released upon centrifuge moratorium completion
- **Currency protection**: EUR/RMB/AED escrow locked to Day-One basket rates
- Downblended material converted to **fuel plates for the Tehran Research Reactor** — civilian use, not surrender
- Escrow held under **Omani sovereign immunity**, immune to judicial seizure

What Iran can tell its domestic audience: "We did not surrender our nuclear programme. We retained enrichment capability. We secured frozen funds, oil markets, and a US guarantee against regime change. The 60% material became fuel plates for our research reactor. Our infrastructure gets water-treatment chemicals and grid transformers. The banking channel has pre-approved Treasury letters and a Swiss backstop. Our LEU stockpile is protected by a fuel-security floor."

What the United States Gets

IMMEDIATE (DAYS 1-14)

- **Complete inventory** of all enriched uranium stockpiles submitted to IAEA within 72 hours, with Reconciled Tranche cross-checked against the 8-month gap
- **Physical inspector access** restored to all four enrichment facilities within 7 days
- **Written commitment** to downblend all material above 20% within 14 days (or irreversible UO2 conversion)
- **Automated suspension** of oil waivers if IAEA reporting goes dark for 10 days — no political fight required

SHORT-TERM (WEEKS 3-8)

- **Continuous IAEA monitoring** of downblending or oxide conversion in real time
- **Containment and surveillance** installed at Natanz and Fordow
- **Centrifuge rotor assembly inventory** at declared workshops — one-time verified count; excludes non-nuclear facilities
- **Net inventory freeze** prevents stockpile growth during the Verification Window

MEDIUM-TERM (MONTHS 3-6)

- **Enrichment capped at 3.67%** for 6 months, continuously monitored
- **12-month moratorium** on new centrifuge installation, with 40% performance reserve forfeited if broken
- **Stockpile disposition** converted to fuel plates — near-breakout material transformed into unusable reactor fuel
- **Emergency Oil Valve** auto-expands exports if global prices spike, stabilising world markets

What the United States can tell its domestic audience: "Every sanction relief is paired with a verified nuclear constraint. Iran's 60% stockpile becomes fuel plates under live camera feed. Inspector access restored. Breakout time extended. A net inventory freeze prevents stockpile growth during verification. The 40% escrow means Iran gets full revenue only after 12 months of compliance. No sunset clause. If Iran stops, we stop — automatically."

Shields Against Spoilers

A narrow reciprocal window lives or dies on its ability to absorb shocks from domestic opponents, regional actors, and unexpected events:

SHIELD 1: THE SIMULTANEOUS ANNOUNCEMENT PROTOCOL

Neither side announces its steps until the Joint Technical Secretariat confirms both are logged and ready. The 24-hour window protocol timestamps both submissions and issues a joint release only when both are within the window.

SHIELD 2: THE AUTOMATED STEPBACK LINE

The Secretariat's sensor dashboard automates Stepback: the clearing bank suspends the corresponding oil waiver when the IAEA portal shows "Down" for 10 days. Prior gains remain in place; nothing is undone. Alerts fire at Day 7 and Day 10. The waiver auto-reactivates when the portal shows "Active" for 5 consecutive days. Tankers at sea enjoy a 14-day safe-harbor offload window.

SHIELD 3: VIU CLASSIFICATION + 14-DAY EXPERT MEDIATION

Ambiguous data is classified **Verification Integrity Uncertain (VIU)**, not "violation." Each VIU item must be resolved within **14 days** or it auto-escalates to a formal mediation track staffed exclusively by active IAEA technical experts and non-aligned nuclear physicists — no political diplomats. Only confirmed, intentional cessation of cooperation escalates beyond the Stepback Line.

SHIELD 4: THE NON-REVERSIBILITY CLAUSE

The \$2.5 billion in released assets, once spent on verified humanitarian goods, is non-reversible. Iran retains the value of goods already delivered regardless of subsequent events.

SHIELD 5: REGIONAL ACTOR CONTAINMENT + AGGRESSOR PENALTY

The window explicitly excludes missiles and regional proxies, keeping the scope manageable. If a regional third party attacks an enrichment facility or a commercial tanker, the Stepback clock freezes instantly. External violence cannot be used to force an automatic suspension of the agreement. Both parties commit to refraining from offensive cyber operations (defined as active digital intrusion causing operational disruption, data falsification, or physical damage). Passive scanning, intelligence collection, and defensive hardening are excluded.

SHIELD 6: THE PUBLIC SILENCE PACT

A mandatory 14-day moratorium on unilateral public announcements regarding compliance issues forces both Washington and Tehran to process disputes privately through the Muscat Secretariat log before making press statements. This prevents media spectacle from derailing technical progress.

SHIELD 7: DOMESTIC LAW DECOUPLING

Domestic judicial actions, internal security measures, law enforcement operations, or civil litigation unrelated to the nuclear file cannot be invoked by either party as a legitimate basis for triggering a Stepback. The Stepback mechanism responds only to verified nuclear non-performance, not to arrests, indictments, protests, or court proceedings in either jurisdiction.

SHIELD 8: THE OIL PRICE ANCHOR

With oil above \$107/barrel, both sides share an incentive to prevent Hormuz disruption. If Brent crude spikes above \$115/barrel, the Emergency Oil Valve automatically expands export ceilings, maintaining the agreement's economic stabilisation function. This creates positive-sum framing: both sides benefit from stability.

Implementation Matrix

Who	What	When	Verified By	If Not Done
US	Pre-stage \$500M in Swiss sub-account	Before Day One	Secretariat confirms deposit	Day-One window cannot open

Iran	Submit complete uranium inventory to IAEA	Day 3	IAEA confirms receipt	US waivers do not activate
Iran	Baseline Reconciliation: Reconciled vs Disputed Tranche	Days 1-5	IAEA tranche split to Secretariat	Reconciled Tranche must proceed
US	Issue humanitarian waivers (\$2.5bn, non-reversible once spent)	Day 1-3 (simultaneous)	Secretariat confirms issuance	Iran access not required
Iran	Restore IAEA facility access	Day 7	IAEA confirms on-site	Automated Stepback at Day 10
US	Suspend secondary sanctions (1.0 mb/d)	Day 6 (contingent on Reconciled Tranche verified)	Secretariat confirms IAEA log	Iran downblending void
Iran	Begin downblending >20% material (or UO2 conversion)	Day 14	IAEA real-time cameras	Automated Stepback at Day 10
US	Open Designated Bank (or SHTA backstop) for trade	Week 3	SWIFT data	Iran may pause containment
Iran	Install IAEA cameras and seals	Weeks 3-8	IAEA confirms	US may pause aviation license
US	Authorise aviation spare parts (Annex C)	Week 3	Export registry	Iran may restrict IAEA access
Both	Cyber non-interference commitment	Day 1 onwards	Secretariat monitoring	Treated as Stepback event
Both	Public Silence Pact active	Day 1 onwards	Secretariat dispute log	Press statements only after 14-day log
Iran	Cap enrichment at 3.67%; begin fuel plate conversion	Month 3	IAEA continuous monitoring	Escrow 60% suspended
US	1.5 mb/d license + 60/40 escrow (EUR/RMB/AED)	Month 3	Clearing account	Iran cap not binding
Iran	Centrifuge moratorium (12 months)	Month 3-15	IAEA quarterly reports	40% reserve forfeited to ICRC
Secretariat	Release 40% reserve to Iran	Month 15	IAEA certifies moratorium	Forfeited to humanitarian fund
Both	Technical working group	Month 4-6	Published communiques	Window continues

Technical Annexes

ANNEX A: DESIGNATED COMMERCIAL BANK

Primary: UBS AG, Zurich. **Alternative:** Qatar National Bank (QNB), Doha. **Backstop:** Swiss Humanitarian Trade Arrangement (SHTA) for grain and medical equivalents if primary bank faces compliance paralysis.

Comfort Letters: Pre-issued by U.S. Treasury OFAC before Day One, confirming transactions under the compliance protocol will not trigger secondary sanctions.

Compliance Protocol: Published whitelist of approved categories (medical supplies, agricultural commodities, water-treatment chemicals, civilian electrical grid transformers, aviation parts). Matching transactions clear mechanically.

ANNEX B: OIL REVENUE ESCROW 60/40 MECHANISM

Escrow Holder: Joint Technical Secretariat, operating under the sovereign jurisdiction of the Sultanate of Oman (Muscat).

60%: Transferred monthly for civilian imports. **40%:** Held as performance reserve, released only upon IAEA-certified completion of the 12-month centrifuge moratorium. If broken, forfeited to ICRC humanitarian programmes — not retained by the US.

Judicial Protection: Both parties agree that all escrowed funds are legally held under the sovereign immunity of the Sultanate of Oman and are entirely immune to domestic judicial seizure, civil litigation attachment, or third-party claims in any jurisdiction. Neither party nor its courts may attach, freeze, or seize escrowed assets.

Currency: All oil revenue deposits and escrow accounts are denominated and cleared exclusively in Euros (EUR), Chinese Yuan (RMB), or Emirati Dirhams (AED), with conversion rates locked to a Day-One currency basket. USD clearing through Fedwire is excluded to prevent unilateral structural control.

Emergency Oil Valve: If Brent crude exceeds \$115/barrel, export ceilings auto-expand: Step Two from 1.0 to 1.3 mb/d; Step Three from 1.5 to 1.8 mb/d. Both parties receive monthly escrow statements.

ANNEX C: APPROVED AVIATION PARTS

Pre-approved under 90-day general license (no individual review): **Airbus A300/A310** (landing gear ATA 32, navigation ATA 34, APU ATA 49); **Boeing 737** (flight controls ATA 27, CFM56 fan blades ATA 72, pitot-static ATA 34); **ATR 72** (propellers ATA 61, gear ATA 32); **General** (tyres, brakes, batteries, fire extinguishers, oxygen, ELTs).

Exclusions: No encryption-capable avionics, night vision, or military-grade materials.

ANNEX D: BASELINE RECONCILIATION PROTOCOL

Cross-references Iran's inventory against IAEA historical data before sanctions relief activates:

1. Iran provides IAEA access to production records and cascade logs for the 8-month gap.
2. IAEA compares declared quantities against its own estimates.
3. Material within 5% of declared: classified as **Reconciled Tranche**, proceeds on schedule.
4. Material exceeding 5% discrepancy: classified as **Disputed Tranche**, logged as VIU, resolved under 14-day VIU protocol in parallel.
5. Oil sanctions suspension activates only after the Reconciled Tranche is verified. The Disputed Tranche is resolved without halting the main window.

If Talks Stall: The Emergency Fallback

If the full three-step window cannot be launched, a smaller "Minimum Viable Opening" should still be pursued. Each option carries a mandatory 30-day expiration: if triggered, both parties are automatically reconvened in Muscat within 30 days to resume negotiations on the full framework.

Option A: The Custody Exchange

Iran places its 60% enriched uranium stockpile under IAEA physical custody and seal at a declared facility. In exchange, the United States releases \$500 million in frozen medical/humanitarian funds. No enrichment cap. No political commitments. Just a physical custody arrangement for a financial release. **Expires in 30 days;** both parties must return to Muscat to resume the full framework.

Option B: The Humanitarian Parallel

The United States authorises a one-time \$1 billion humanitarian channel (food, medicine, civilian aviation safety, and civilian air-traffic-control radar components) through the Designated Commercial Bank. Simultaneously, Iran allows a one-time IAEA physical inventory verification at one declared enrichment facility of its choosing. No ongoing obligations. Just a single exchange. **Expires in 30 days;** both parties must return to Muscat to resume the full framework.

Option C: The Technical Talks Track

If even the above are politically impossible, both sides authorise technical experts (not politicians) to meet at the pre-booked IAEA headquarters in Vienna. Their mandate: to agree on a standardised reporting format for Iran's nuclear material, a baseline set of IAEA access modalities, and verification procedures to maintain continuity of knowledge during any diplomatic pause. A dual-encrypted, offline digital repository managed by the IAEA preserves all historical telemetry to prevent data loss. This produces no political agreement but rebuilds the technical infrastructure for future diplomacy. **Expires in 30 days;** both parties must return to Muscat to resume the full framework.

The goal of the Emergency Fallback is not to solve the nuclear dispute. It is to prove that reciprocal motion between these two parties is still physically possible — and to create a small pool of verified facts from which a larger agreement can later be built. The 30-day clock ensures no fallback becomes a permanent stall.
