Protocol at a Glance

The Unified Telemetry Protocol is a standalone, modular operational framework for reciprocal de-escalation between the United States and Iran. It replaces traditional comprehensive treaty structures with a sensor-verified, telemetry-driven implementation architecture.

What It Does (In One Page)

Summary 1: Core Protocol Mechanics

Element	Iran Gives	Iran Gets	US Gives	US Gets
---------	------------	-----------	----------	---------

Security	60% enrichment freeze; proxy logistics halt	Ceasefire auto-renewal; blockade reduction	Naval pullback; airstrike pause	OLEM confirmation; 7-day inspector access
Financial	Oil exports to escrow; SWIFT compliance	\$100B+ in tranches; humanitarian bridge Day 1	OFAC licenses; sanctions tranches	Swiss-verified disbursement; IAEA clean certs
Technical	HEU to IAEA custody; mothball protocol	Sovereign pathway selection; NPT rights preserved	123 Agreement fuel access; guarantee	Dual-key custody; real-time monitoring
Maritime	Hormuz transit opening; IRGC withdrawal	Permanent IHTA voting seat; toll revenue share	Blockade lift; freedom of navigation	AIS + satellite + Lloyd's triangulation

How It Protects Itself

Summary 2: 30 Hardening Measures at a Glance

Category	Count	Key Examples
Spoiler Deterrence	10	False-flag bond (\$20M), reputation penalty for premature breach, spoiler tariff (2x tolls), regional non-interference registry
Economic Incentives	10	Day 3 micro-tranche (\$50M), oil price floor (\$65/barrel), Congressional auto-advance, European Shield Protocol
Verification Hardening	5	Dual sensor redundancy, 24-hour Digital Twin override, unannounced sampling, blockchain seal log
Political Absorption	Shock 5	Quantified protest threshold (100K+), assassination mourning hold (21 days), successor framework auto-seeding

The Three Invincibles

Under all circumstances — total war, regime change, complete protocol collapse — three channels survive:

- Ceasefire Hotline:** Omani-facilitated 24/7 military hotline. Neither side may disable without 30 days notice to the UN Secretary-General.
- Humanitarian Corridor:** Zero-fee Hormuz transit for medicine and food. Survives all disputes. Legally non-divertible.
- Emergency Diplomatic Channel:** Backchannel through the Coordination Secretariat. Active for 180 days even during total suspension.

The Step-Back Architecture

No snapback. Breaches trigger graduated reduction — Tier 1 (no penalty, 14-day fix), Tier 2 (25% reduction, earn-back via compliance), Tier 3 (50% reduction, 90-day remediation). The framework survives because cooperation has a floor, not a cliff.

Document: 12 sections + 2 appendices | **Articles:** 45+ operational articles | **Tables:** 40+ reference tables |
Hardening: 30 integrated measures | **Status:** Standalone operational protocol with zero external dependencies

Section 0: System Architecture and Structural Foundations

0.1 Protocol Design Philosophy

This framework is established as a standalone, self-executing operational protocol. It rejects traditional comprehensive treaty structures in favor of an integrated, modular system designed to isolate political volatility from technical compliance.

The architecture is divided into three structurally independent, parallel-velocity operating modules linked exclusively by a central telemetry timeline. This design ensures that a localized disruption or technical variance in one sector does not cause a systemic cascade or automatically invalidate the broader stabilization framework.

THE UNIFIED TELEMETRY PROTOCOL

[Table 23: Core Telemetry Outputs]

0.2 The Telemetry Rule

Traditional diplomacy negotiates principles first and implementation second. Telemetry-first diplomacy negotiates implementation first and lets principles take care of themselves.

Instead of debating whether a state has a "right" to enrich, this protocol specifies what the OLEM sensors at the declared facility will read: 3.67% maximum, with a 0.5% De Minimis tolerance. Instead of arguing over

sovereignty claims, it specifies what the IHTA toll system will record: all flagged vessels paying the same Tier 2 commercial rate. Instead of demanding a "permanent" end to hostilities, it specifies what the 72-hour loop counter will display: auto-renewal at Hour 71 if compliance telemetry is green.

When both sides can point to independent sensor data and agree on what it means, the political framing becomes a secondary concern. Each government can characterize the agreement in the terms its domestic audience requires. The sensors read the same thing either way.

The Telemetry Rule: Every commitment in this protocol must be expressible as a sensor reading, a data feed, a physical lock confirmation, or a financial transaction record. If it cannot be verified by a neutral technical system, it does not belong in the operational text.

Article 0.2.1: Human Interface Parameter

The operational progression of this protocol across all Tiers and Phases is fundamentally deterministic and driven by verified telemetry. Human intervention is structurally limited to **negative override authorities** (halts) and **consensus-driven forensic reconciliation windows**. No human entity or signatory agency may require a manual positive approval step to authorize a scheduled tranche release or baseline timeline advance once data congruence is achieved.

The burden of effort is inverted. In traditional diplomacy, constant human effort is required to move forward. In the UTP, it takes deliberate, legally justified effort to force a stop. Humans retain the emergency brake, but they cannot weaponize the day-to-day administrative timeline to hold the peace hostage.

0.4 The Human-on-the-Loop Architecture

The system operates on an automatic-advance baseline. If sensors, data feeds, and bank nodes report compliance, the timeline increments automatically. Human intervention is legally restricted to a Joint Veto Window requiring verified conflicting physical data. This shifts the architecture from Human-in-the-Loop (active dependency) to Human-on-the-Loop (negative trigger only).

PASSIVE INGRESS / ACTIVE OVERRIDE FRAMEWORK

Article 0.4.1: Automatic-Advance Baseline

When daily telemetry from all active channels reports congruent compliance data, the protocol timeline automatically advances to the next scheduled phase, tranche release, or verification milestone. No human approval, signature, or administrative confirmation is required for the advance. Scheduled tranches release automatically from the Swiss escrow upon IAEA clean certification receipt. The SWIFT phase advances automatically upon confirmed compliance window closure. Ceasefire loops renew automatically at Hour 71 when compliance telemetry is green.

Article 0.4.2: The Joint Veto Window

A single state may not unilaterally freeze the timeline based on diplomatic objection or political preference. A formal **Stop Order** requires simultaneous submission of: (a) verified conflicting physical data from at least one independent technical channel, (b) a written technical dispute filing with engineering justification, and (c) a 48-hour notice period before the halt takes effect. The Stop Order is reviewed by the Joint Incident Group within the 48-Hour Human Arbitration window. Both parties must confirm the Stop Order for it to activate; if either party declines to confirm, the timeline advances on schedule. Unilateral Stop Orders without verified conflicting data are automatically rejected by the Coordination Secretariat and do not enter the arbitration queue.

0.4.1 The 48-Hour Human Arbitration Layer

When the automated system flags a discrepancy — an environmental sampling anomaly (Measure 24), an unresolved telemetry gap in the Swiss escrow, or a Digital Twin reading that exceeds the Algorithmic Reconciliation threshold (Measure 23) — humans are brought in under a strict, time-boxed architecture.

The system does not automatically trigger Tier escalation upon anomaly detection. Instead, it routes the discrepancy to the Joint Incident Group (JIG) comprising technical specialists from Pakistan, Oman, Switzerland, the IAEA, and both parties. The JIG has exactly **48 hours** to conduct a manual forensic audit.

Table 1A: 48-Hour Arbitration Outcomes

Condition	JIG Finding	System Action	Timeline Effect
Consensus: technical glitch	Anomaly is sensor error, calibration drift, or environmental noise	Manual override clears the log; anomaly downgraded to observation	No pause; timeline advances on schedule
Consensus: minor compliance variance	De Minimis threshold (Article CB-6) exceeded by <0.5%	Tier 1 engineering resolution; 14-day fix window	14-day hold on affected module only; others advance
Consensus: material disruption	Confirmed enrichment above ceiling; fissile diversion detected	Tier 2 step-back activates; 25% benefit reduction; remediation begins	30-day remediation; earn-back via compliance
No consensus within 48 hours	JIG deadlocks; both positions maintained	System defaults to Step-Back; Tier 1 pause on affected module	Affected module holds; all other modules advance

Article 0.4.3: Political Shock Absorbers as Safe Mode

Measures 6, 26, and 27 of this protocol recognize that human political realities — elections, sudden leadership successions, mass domestic unrest, targeted assassinations — cannot be ignored by an algorithm. Rather than allowing these human crises to break the protocol, the text automatically shifts the system into a **Safe Mode** (Review Pause). During this window, all automated asset rollbacks and structural nuclear step-backs are frozen, but the ceasefire loops continue to auto-renew. This gives human political leadership a predictable, zero-penalty space to stabilize their domestic houses before re-engaging the operational gears. Review Pause does not constitute material breach and does not trigger the three-tier system. Safe Mode expires automatically at 90 days unless extended by mutual agreement.

0.3 Module Architecture

Because the architecture is strictly modular, facilitation teams can treat this document as an operational menu. If one module is rejected, it is unclipped and the remaining modules continue executing. The protocol loads what is accepted and continues operating.

Table 1: Module Loading Architecture

Module	Can Run Standalone?	Dependencies	Telemetry Output
72-Hour Security Freeze	Yes	None (root)	OLEM enrichment reading; ceasefire hotline status
Reconstruction Escrow	Yes	None	Swiss escrow account balance; UN OCHA distribution logs
Neutral-Custody Blending	Yes	None	IAEA dual-lock custody confirmation; mass spectrometry
Mutual Ingress/Egress	No	Security Freeze active	AIS vessel tracking; Omani naval observer confirmation
Virtual Consolidation	Yes	None	Remote camera feeds; rotor inventory serial numbers
IHTA Governance	No	Ingress/Egress active	Council vote records; toll collection telemetry
SWIFT Reconnection	No	IAEA clean certification	Banking message type logs; IAEA quarterly report
Asset Tranche Release	No	IAEA + Swiss channel verification	Escrow disbursement records; OFAC license activation
Step-Back Architecture	No	All modules loaded	Compliance scorecard; tier-level status indicators

How intermediaries should use this: If the maritime node cannot be activated, execute the Security Freeze + Custody Loop + Financial Escrow as a three-module configuration. If SWIFT sequencing encounters objections, advance the Humanitarian Tranche + IHTA Provisional as a two-module configuration. The protocol executes what is accepted and continues operating.

Section 1: Core Principles

1.1 Synchronized Reciprocal Motion

Neither side moves alone. Every commitment triggers a corresponding commitment on the same clock cycle. Verification is shared. Both governments can defend the sequencing as responding only when the other has moved first or simultaneously.

Iranian Telemetry Output Freeze enrichment above 60%. IAEA OLEM confirms within 72 hours; physical inspectors verify within 7 days. Iranian Narrative: "NPT rights preserved; enrichment continues at 3.67%; sovereign annual review."	Synchronized US Telemetry Output Partial blockade lift. \$250M humanitarian tranche via Swiss escrow. Omani naval observers confirm reduction within 48 hours. US Narrative: "60% weapons-grade enrichment halted; IAEA inside Natanz within 7 days."
---	--

1.2 Modular Architecture with Partial Continuity

Failure in one module does not cascade. The protocol continues executing all other loaded modules.

Table 2: Module Survival Tiers

Tier	Modules	Behavior During Pause
Tier 1 (Inviolable)	Ceasefire hotline, humanitarian access, emergency diplomatic channel	Never pause under any circumstances
Tier 2 (Protected)	IAEA basic monitoring, Hormuz non-military transit, asset tranches 1-2	Continue during most stabilization pauses
Tier 3 (Conditional)	SWIFT, bonus tranches, successor framework talks, Fordow advanced phases	May enter hold during disputes

1.3 Sovereignty Preservation and No Precedent

Article 1.3: The No-Precedent Clause

This protocol establishes no legal or political precedent. Each provision is tailored to the May 2026 operational environment. No inference may be drawn regarding positions on any matter not expressly addressed.

The unique maritime coordination mechanisms herein apply exclusively to the Strait of Hormuz during the operational lifespan of this protocol. This text shall not be cited in any international court or treaty to define or alter sovereign rights under the United Nations Convention on the Law of the Sea (UNCLOS) elsewhere in the world.

1.5 Module Persistence Bonus

The modular architecture prevents systemic cascade. This measure adds positive incentive for modular persistence during disruption.

Article 1.5: Cascade Isolation and Persistence Bonus

For every 30 days a module continues operating while another module is paused, the functioning module's benefits increase by 5%, capped at 15%. The bonus applies to: humanitarian escrow flow rates, IHTA toll revenue shares, and SWIFT phase advancement eligibility. The Swiss Financial Cell calculates the bonus quarterly and disburses within 14 days. If the paused module resumes, the bonus holds at its achieved level for 90 days before resetting to baseline. This creates positive incentive to keep humanitarian escrow flowing even if SWIFT stalls, and to maintain Hormuz transit even if nuclear verification encounters a Tier 2 hold.

Table 2A: Module Persistence Bonus Schedule

Paused Module	Functioning Module	Bonus at 30 Days	Bonus at 60 Days	Bonus at 90 Days (Cap)
SWIFT Reconnection	Humanitarian Escrow	5%	10%	15%
Nuclear Verification	IHTA Governance	5%	10%	15%
Asset Tranche Release	Security Freeze	5%	10%	15%

IHTA Governance	Neutral Custody	5%	10%	15%
-----------------	-----------------	----	-----	-----

1.4 Framework Survival Core

Under all circumstances, including total protocol suspension, three telemetry channels remain active:

- 1. **Ceasefire Hotline:** Omani-facilitated 24/7 bilateral military hotline. Neither party may disable without 30 days notice to the UN Secretary-General.
- 2. **Humanitarian Access:** Zero-fee, no-inspection-delay humanitarian corridor through Hormuz. Survives all disputes.
- 3. **Emergency Diplomatic Channel:** Backchannel through the Coordination Secretariat. Survives all suspensions for 180 days.

Section 2: Structural Diagnosis

Table 3: Demands Matrix: May 2026

Issue	US Position	Iranian Position	UTP Landing Zone
HEU Disposition	Immediate transfer to US custody	No transfer under pressure	Third-country IAEA custody; Iran selects pathway
Facilities	Single facility only	All facilities sovereign	Virtual consolidation; real-time IAEA feeds on all sites
War Reparations	No financial compensation	Full reparations	International Gulf Reconstruction Fund (no fault admission)
Frozen Assets	No release of even 25%	Full unfreezing	Graduated tranche release through Swiss escrow
Ceasefire	Conditional on final deal	Immediate, permanent, irreversible	72-hour auto-renewing loops + 30-day structural phases
Hormuz	Freedom of navigation	Sovereign regulatory control	Joint IHTA with permanent Iranian voting seat
Sanctions	Phased, conditional	Immediate lifting of all	Eight-tranche architecture tied to IAEA milestones
Enrichment Cap	20-year moratorium	5-year moratorium	12-15 years with violation-extension mechanism

Why Comprehensive Treaties Fail

Table 4: Structural Pathology Analysis

Pathology	This Protocol's Fix
Negotiation Complexity: bundling all issues simultaneously	Modular three-stage structure; failure of Stage 3 does not unwind Stages 1-2
Political Survivability: large upfront concessions for promised future benefits	Synchronized same-day exchanges; visible wins at every stage
Verification Credibility: punitive surveillance framing	Sovereign Energy Partnership; Iran issues the IAEA invitation
Economic Invisibility: relief invisible to ordinary citizens	Humanitarian tranche Day 1; oil exports Day 30; SWIFT Day 60

Section 3: The Security Module

3.1 The 72-Hour Dual-Key De-Escalation

Article SM-1: Simultaneous Operational Freeze

A legally binding, 72-hour cessation of hostilities across all fronts, matching a pause in US/allied airstrikes and naval blockade enforcement with a verifiable freeze on proxy movements and Iranian enrichment above 5%.

Article SM-2: The Escrow Ceasefire

The ceasefire is a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews for another 72 hours. Peace is maintained without either side signing away long-term leverage upfront.

Why This Works: Separating the ceasefire clock (72-hour loops) from the implementation clock (30-day phases) neutralizes the "negotiation about negotiation" trap. If talks stall on Day 14 over HEU details, the guns do not automatically resume firing. The 72-hour military freeze continues auto-renewing quietly.

Article SM-3: OLEM Remote Verification

The 60% enrichment freeze is verified immediately via Online Enrichment Monitors (OLEM) and real-time camera feeds. Physical on-site IAEA inspector verification follows within 7 days. The 72-hour clock starts on OLEM confirmation, not physical arrival. This eliminates the Day 3 bottleneck that would collapse the synchronized humanitarian tranche.

Article SM-4: Attribution Deferral Window for Proxy Incidents

If a regional proxy strike occurs, neither side may unilaterally declare a material breach. The Joint Coordination Secretariat has 48 hours to conduct forensic telemetry and attribute the incident. During this window, the 72-hour military freeze remains active, provided Iran issues an immediate public condemnation and freezes matching local militia supply logistics. Only the Secretariat's attribution finding can trigger Tier escalation. Rogue actors and false-flag operations are excluded from bilateral penalties.

Automatic Reputation Penalty: If either side declares material breach before the 48-hour Secretariat attribution finding, that side forfeits its next scheduled tranche benefit regardless of the eventual attribution outcome. Premature accusation is costlier than patience. The forfeited tranche is held in suspense escrow for 30 days; if the Secretariat ultimately attributes the incident to a third-party spoiler, the forfeited amount is released. If attribution confirms the accusing party's proxy involvement, the amount transfers to the other party's reconstruction account.

3.2 The Mutual Ingress/Egress Protocol

Each side holds the other's primary economic leverage hostage. This protocol unlocks both simultaneously:

Article SM-5: Synchronized Maritime De-Escalation

The US Navy pulls back its inspection perimeter to allow three pre-verified Iranian commercial vessels per week to exit the Persian Gulf without interference. Simultaneously, Iran opens a verified, monitored transit lane through Hormuz for neutral commercial energy transport. Neither step happens before the other. Both are confirmed by Omani naval observers and Lloyd's List AIS tracking within the same 60-second window.

Table 5: Ingress/Egress Verification Telemetry

Time	Iranian Output	US Output	Neutral Verification
T-60 min	IRGC Commander transmits stand-by	5th Fleet Commander transmits stand-by	Omani logs both signals
T-15 min	IRGC craft withdraw to 5nm; AIS broadcast	US Navy withdraws to 5nm; AIS broadcast	Lloyd's List confirms
T=0	Hormuz opening declaration	Blockade lift declaration	SIMULTANEOUS within 60s
T+15 min	First vessel commences transit	Notice to Mariners issued	Lloyd's List, AIS confirm

Article SM-7: Sub-Threshold Proxy Telemetry Requirement

Condemnation without verifiable supply disruption does not satisfy the Article SM-4 deferral condition. Within 6 hours of a proxy incident, Iran must demonstrate a measurable logistics freeze verified by satellite thermal imaging of known supply corridors, AIS darkening of designated transport vessels, and financial transaction suspension on flagged hawala networks. Condemnation alone triggers Tier 1 technical dispute processing. Condemnation plus verified supply-line thermal signature reduction of at least 40% within 6 hours maintains the 48-hour deferral at Tier 0.

Article SM-6: Emergency Maritime Safety Carve-Out

Vessels experiencing verified mechanical distress, severe weather, medical emergencies, or environmental containment failure are exempt from the weekly transit quota. Such vessels may seek safe harbor under IHTA monitoring without triggering a blockade violation. Emergency status is verified by the Maritime Operations Cell within 2 hours. Applies symmetrically to all flagged vessels.

3.3 Regional Spoiler Pre-Commitment Registry**Article SM-9: Non-Interference Letter and IHTA Access Tiers**

Before Stage 1 activation, the Coordination Secretariat circulates a Non-Interference Letter to all regional states with Hormuz interests, including UAE, Saudi Arabia, Israel, Yemen (Houthi

authorities), Bahrain, and Kuwait. Signatories gain IHTA permanent observer status and a 15% toll discount on all Tier 2 and Tier 3 transits. Non-signatories face automatic IHTA transit fee surcharges at Tier 3 rates on all flagged vessels and permanent exclusion from International Gulf Reconstruction Fund bidding. The Letter requires only a commitment to refrain from operations designed to collapse the protocol; it does not require recognition of the protocol's legitimacy or normalization with any party.

Table 5A: Regional Spoiler Registry Incentives and Penalties

Status	IHTA Access	Transit Cost	Reconstruction Bidding	Observer Rights
Signatory	Full	15% discount on T2/T3	Eligible	Permanent observer
Non-Signatory (neutral)	Limited	Standard Tier rates	Excluded	None
Non-Signatory (confirmed spoiler)	Suspended	2x Tier 3 rate (Measure 9)	Permanent exclusion	Revoked

Article SM-8: False-Flag Investigation Bond

Both parties deposit \$10 million each into a False-Flag Investigation Fund upon signature, held in the Swiss escrow. If an incident is definitively attributed to a third-party spoiler by the Joint Investigation Committee, the fund covers all verification costs and compensates the wrongfully accused party for delayed tranches at LIBOR + 2% interest. If attribution confirms a party's own proxy or affiliated force conducted the incident, that party's \$10 million bond is forfeited to the other party's reconstruction account. The fund is replenished annually at signature anniversary. Unspent balances roll over. Either party may request an audit of fund expenditures by the Swiss Financial Cell with 14 days notice.

Section 4: The Financial Module

4.1 The Third-Party Reconstruction Escrow

The US maintains its stance against direct reparations. Iran demands economic relief. The Reconstruction Escrow threads this needle without either side admitting political defeat.

Article FM-1: Reconstruction Escrow Structure

A slice of frozen funds (30%) is transferred to an independent third-party account (Switzerland or Oman), legally designated for civilian infrastructure reconstruction and verified humanitarian relief. Washington maintains no direct restitution was paid. Tehran secures immediate economic relief. Both statements are factually correct.

Article FM-6: Domestic Vendor Preference Rule

Iranian companies receive a 15% bidding preference for all reconstruction contracts funded by the escrow, provided they maintain clean IAEA supply-chain verification. This directs economic benefits visibly to Iranian stakeholders, creating domestic constituencies with a vested interest in protocol survival. The preference applies to contracts up to \$50 million individually; larger contracts require international competitive bidding with a 10% Iranian preference. IAEA supply-chain verification must be renewed quarterly. Companies with verified diversion history lose preference eligibility for 24 months.

Table 6: Escrow Allocation

Category		Allocation	Administrator	Rollback Protected?
Humanitarian	(medicine, food)	25%	UN OCHA / WHO (sole disbursement authority)	Yes - Legally Non-Divertible
Critical Infrastructure		45%	World Bank / Swiss Financial Cell	Yes - Tranches 1-2
Iranian Reconstruction	Civilian	20%	IHTA with Iranian programmatic control	No - Subject to Tier 3
Maritime Safety		10%	International Maritime Safety Fund	Yes

Article FM-2: Sovereign Immunity Wrapper**Article FM-8: Legally Non-Divertible Humanitarian Allocation**

The 25% humanitarian allocation is legally non-divertible. The UN OCHA/WHO administrator holds sole disbursement authority. Any attempt by either party to redirect, condition, or delay humanitarian funds triggers automatic IAEA investigation and freezes

only the non-humanitarian portions of the escrow. The humanitarian firewall is the highest protection tier in the entire protocol — it survives total suspension, Tier 3 breach, and succession transitions. IAEA investigation of diversion attempts takes priority over all other inquiries and must complete within 14 days.

The International Gulf Reconstruction Fund is legally structured under sovereign immunity protections within Oman. As a precondition for Day 1 signature, the US issues a binding national security waiver protecting all fund assets from domestic judicial seizure, private civil litigation, or secondary sanctions enforcement. No US court may attach, freeze, or garnish Fund assets. This shield applies retroactively from first deposit and survives any protocol suspension.

Article FM-3: OFAC Comfort Letters with Lockbox

The US Treasury issues comprehensive, irrevocable OFAC general licenses and formal Comfort Letters to all participating European and Gulf clearinghouses. These letters explicitly immunize designated banking nodes from all secondary US sanctions, including legacy human rights and counter-terrorism listings, for any transaction within the approved framework. Immunization is legally binding and cannot be revoked by executive discretion without 90 days notice.

Letter Lockbox: Comfort Letters are deposited with the Swiss Federal Department of Foreign Affairs and the UN Secretary-General within 48 hours of issuance, creating a public, auditable record. Any revocation requires 90 days notice and a \$500 million penalty payment to the escrow from the revoking administration's discretionary foreign operations budget. The penalty is non-waivable and transfers to the other party's reconstruction account within 14 days of notice. This makes revocation politically expensive and procedurally visible. The Lockbox prevents midnight revocation by future administrations seeking to collapse the framework without accountability.

4.2 Asset Return Tranche Architecture

Approximately \$100 billion in frozen assets. Graduated release through Swiss escrow.

Table 7: Asset Release Schedule

Tranche	Timing	Amount	Telemetry Trigger	Reversibility
Pilot	Day 1	\$250M	Signature	Non-reversible

1	Day 14	25% pilot	minus	Stage 1 closed; IAEA deployed; stockpile custody verified	Non-reversible
2	Day 44	25%		60-day compliance; nuclear exchange verified	Non-reversible
3	Day 120	20%		Permanent IHTA operational	30-day remediation
4	Day 180	15%		180-day compliance review	JIG breach review
Reserve	Day 365	10%		12 months clean certification	Material-breach hold
Balance	Year 2-3	Remainder		Full successor framework compliance	Successor risk appetite

The pilot and Tranches 1-2 are non-reversible because Iran's Stage 1 nuclear and maritime concessions are physically irreversible once executed. The asset return mirrors this physical reality.

Article FM-5A: Tranche 1.5 Bridge Mechanism

A Day 3 Micro-Tranche of \$50 million releases immediately upon OLEM confirmation of 60% enrichment freeze, drawn from the Swiss escrow before the Day 14 Tranche 1 release. This is smaller than the \$250 million pilot but creates immediate economic visibility for Iranian citizens, reducing the spoiler window where hardliners can claim concessions were made for nothing. The Micro-Tranche is designated exclusively for medicine importation and is distributed through existing WHO channels within 72 hours of release. It is non-reversible and does not count toward the Tranche 1 total.

Table 7A: Micro-Tranche Bridge Schedule

Trigger	Amount	Designation	Distribution	Reversible?
Day 1 (Signature)	\$250M	Pilot humanitarian	UN OCHA/WHO	No
Day 3 (OLEM 60% freeze)	\$50M	Medicine bridge	WHO cold-chain	No
Day 14 (Stage 1 close)	25% minus pilot	Critical infrastructure	Swiss Financial Cell	No
Day 44 (Stage 2 close)	25%	Expanded reconstruction	World Bank	No

Article FM-7: Clean Certification Accelerator

If IAEA issues a clean certification 15 or more days ahead of schedule, the next tranche releases 10 days early. If certification is delayed beyond the milestone date, the tranche holds but earns interest at LIBOR + 2% from the Swiss escrow, compensating for delay without penalty. Early release requires concurrent Swiss Financial Cell confirmation and Secretariat approval. The Accelerator applies to Tranches 3, 4, and Reserve only; Tranches 1-2 remain fixed to their physical verification gates.

Table 7B: Accelerator and Delay Schedule

Condition	Tranche Effect	Interest/Credit	Requires
Clean certification 15+ days early	Next tranche releases 10 days early	N/A	IAEA + Swiss Cell + Secretariat
Clean certification 1-14 days early	Standard timeline	LIBOR + 1% goodwill credit	IAEA + Swiss Cell
Clean certification on time	Standard timeline	None	IAEA certification
Clean certification 1-14 days late	Holds; no rollback	LIBOR + 2%	IAEA + 14-day remediation
Clean certification 15+ days late	Tier 2 step-back active	LIBOR + 2%	JIG review + remediation

Article FM-4: Currency-Basket Peg with Volatility Cap

All downstream asset releases from Tranche 3 onward are denominated in IMF Special Drawing Rights (SDR) or a fixed basket of Swiss Francs and Omani Rials (60/40). This protects real economic value from dollar inflation or monetary shocks. Exchange rate locked at signature using IMF published rate; reviewed quarterly by Swiss Financial Cell. Tranches 1-2 remain in USD for immediate liquidity.

Volatility Cap: If any component currency moves more than 8% against the signature peg within a 30-day window, the Swiss Financial Cell automatically rebalances the basket composition and notifies both parties within 48 hours. The rebalance uses a 30-day moving average, not the spike rate, to prevent either side from weaponizing short-term currency manipulation. Three consecutive rebalance events trigger a mandatory basket review conference.

Article FM-9: Oil Export Price Floor Guarantee

If Brent crude falls below \$65 per barrel during the first 90 days of Iranian oil exports to the Swiss escrow, the escrow supplements the difference up to a \$15 per barrel cap. The Floor is funded by a 2% levy on all IHTA tolls collected during the guarantee period. The levy is deducted pro-rata from the 40% Iranian Reconstruction share; other allocations are unaffected. The Floor guarantee expires at Day 90 but may be extended by IHTA Council supermajority vote. Floor payments are made weekly based on published Brent settlement prices. This prevents oil market volatility from making the deal economically unattractive to Iran at the critical early stage when hardliner spoilers are most active.

4.3 SWIFT Reconnection

Table 8: SWIFT Pathway Tied to IAEA Milestones

Phase	Timing	Access	IAEA Milestone Trigger
Phase 0 (Pre-SWIFT)	Days 1-30	No SWIFT. Qatari riyal bridge.	OLEM confirms 60% freeze within 72h
Phase 0.5 (MT 199 Bridge)	Day 1-30	Limited SWIFT MT 199 messaging only (bank-to-bank administrative, not fund transfers)	Correspondent relationship testing; system integrity verification
Phase 1 (Restricted)	Days 30-60	5 banks; MT 103/202 only	Moratorium declared; standard monitoring active
Phase 2 (Expanded)	Days 60-120	All clean-record banks	Continuous monitoring; no diversion detected
Phase 3 (Full)	Day 120+	Full membership	Year 1 clean certification

Article FM-5B: SWIFT MT 199 Pre-Bridge

From Day 1, limited SWIFT MT 199 messaging is permitted — bank-to-bank administrative messages only, not fund transfers. This re-establishes dormant correspondent relationships and tests system integrity before financial flows begin, reducing the Day 30 cliff where full SWIFT activation could fail for technical rather than political reasons. MT 199 traffic is monitored by the Swiss Financial Cell and counts toward Phase 1 advancement eligibility if message volume meets baseline thresholds.

Article FM-5: SWIFT Remediation Fuse

If IAEA identifies a Tier 2 compliance concern, the SWIFT phase holds for exactly 14 days as a remediation window. Resolved within 14 days: phase advances normally. Unresolved after 14 days: SWIFT rolls back exactly one tier. Tier 1 technical disputes do not trigger the fuse. Only Tier 2 material disruptions and above activate the 14-day clock.

Article FM-10: European Shield Protocol

The EU Commission issues a binding Blocking Regulation counterpart to the OFAC Comfort Letters, explicitly prohibiting EU banks from complying with any US secondary sanctions that target UTP-compliant transactions. This removes the over-compliance risk where European banks refuse to process legitimate Iranian transactions out of fear of US extraterritorial reach. The Shield applies to all EU-registered financial institutions processing transactions through the Swiss escrow channel. Non-EU European banks (Swiss, Norwegian, UK) may opt into the Shield by written notification to the EU Commission. The Shield is activated automatically upon protocol signature and remains in force for the protocol's duration unless suspended by EU Council supermajority vote.

Section 5: The Technical Module

5.1 Neutral-Custody Blending

Iran rejects surrendering 400kg of HEU to the US. The US demands immediate transfer and facility consolidation. Neutral-custody blending resolves both.

Article TM-1: Third-Party Custody with Dual-Lock

The 400kg HEU stockpile is transferred to a neutral third-party nation (Oman or Kazakhstan) under strict IAEA dual-lock custody. Down-blending to LEU or conversion to civilian fuel plates proceeds on a fixed timeline, pegged to phased oil export sanctions relief. Neither Iran nor the US holds unilateral access. Iran selects the pathway. IAEA verifies the chain of custody.

Table 9: Six Pathways for HEU Disposition (Iran Selects)

Path	Description	Destination	Timeline
A	In-place downblending to medical-grade LEU at Esfahan	Medical isotope production in Iran	142 days
B	HEU export to IAEA custody in Oman	IAEA facility, Oman (NOT US)	14 days
C	Downblended in Iran, transferred to IAEA LEU Bank	Oskemen, Kazakhstan	75 days
D	Transfer to Rosatom under IAEA safeguards	Russian Federation	60-90 days
E	Conversion to reactor-grade LEU fuel assemblies	Bushehr reactor supply	180 days
F	Hybrid: stockpile divided into batches through different pathways	Multiple destinations	Concurrent

Article TM-2: Third-Party Destination Guarantee

Under no circumstances may Iran's enriched uranium be transferred to US territory, custody, or control. All six pathways specify third-party destinations. This is binding and non-negotiable.

5.2 Virtual Consolidation and the Mothball Protocol

Rather than physically destroying facilities, Iran places non-core sites under "mothball status" with continuous real-time IAEA remote feeds. The US gets operational limitation to a single site. Iran keeps its sovereign infrastructure intact.

Article TM-3: Mothball Protocol

All centrifuge rotors and bellows producing enrichment above 3.67% are removed, sealed in IAEA-tamper-evident containers, and stored in a UN-monitored facility within Iran. Centrifuge casings and infrastructure remain in place.

Table 10: Mothball Procedure

Phase	Window	Action
Inventory	Day 1-14	IAEA inventories all rotors and bellows at Natanz and Isfahan above 3.67%

Removal	Day 15-44	Iranian technicians remove rotors under IAEA supervision; sealed with serial numbers
Storage	Day 45-60	Sealed containers to UN-monitored facility; IAEA continuous access
Monitoring	Day 60+	IAEA continuous cameras; quarterly environmental sampling; 72h safety extensions if OLEM confirms no active enrichment

Article TM-4: Physical Dual-Key Custody with Blockchain Log

The storage facility uses a two-stage digital and physical locking system. IAEA holds digital encryption keys to monitoring arrays and tamper-evident seal controls. Iran holds physical keys and armed outer-perimeter security. Neither party can access containers without the other's physical presence. Both keys required simultaneously. Unauthorized access triggers Tier 2 breach. Verified quarterly by IAEA Nuclear Verification Cell.

Lightweight Blockchain Log: Each seal check generates a cryptographic hash recorded on a neutral distributed ledger with Swiss and Omani nodes only. Neither US nor Iranian nodes participate, preserving neutrality. Creates immutable verification history without adding operational steps. The ledger records: timestamp, seal identifier, hash value, and confirming inspector badge number. Data is published to both parties simultaneously. Any hash mismatch triggers an automatic Tier 1 investigation. The blockchain is read-only for all parties after entry; no post-hoc modification is technically possible.

Article TM-5: Operational Labor Hours Safety Extension

The Mothball timeline is linked to verified operational labor hours, not fixed calendar days. Documented safety delays, equipment failure, or labor stoppages extend the timeline up to 72 hours without penalty, provided OLEM remote monitoring confirms no active enrichment during the delay. IAEA certifies the delay and issues a Safety Extension Certificate within 24 hours.

5.3 Enrichment Moratorium Architecture

Table 11: 12-Year Renewable Moratorium

Phase	Duration	Standard	Advancement
-------	----------	----------	-------------

Moratorium	Years 1-12	Zero enrichment above 3.67%; higher centrifuges under IAEA seal	Clean IAEA certification at Year 12 review
Civilian Transition	Years 13-15	3.67% enrichment at Natanz only	Fuel supply guarantee in escrow
Steady-State	Year 16+	3.67% under full IAEA safeguards	Successor framework confirmed

Material breach triggers automatic 2-year extension per breach. Determined by JIG majority on IAEA technical reporting, not unilateral US certification.

Section 6: The Maritime Sovereignty Module

6.1 Joint Hormuz Transit Authority (IHTA)

The IHTA is simultaneously the US freedom-of-navigation achievement and Iran's permanent governance seat replacing decades of US unilateralism. Both statements are factually correct.

Table 12: IHTA Council Composition

Member	Status	Role
Islamic Republic of Iran	Permanent member	voting Senior seat; territorial sovereignty; Chair in alternating years
United States	Permanent member	voting Permanent seat; maritime security provider; Co-chair alternating
GCC Rotating Chair	Permanent member	voting Rotates among Oman, Qatar, UAE; primary tie-breaking authority
European Union	Observer	Chairs Environmental and Safety Subcommittee
People's Republic of China	Observer	Largest Gulf-oil importer; technical observer
UN Appointee	Neutral chair	Tie-breaking on procedural matters only

Article MM-1: Tie-Breaking Override

If the GCC representative abstains on an enforcement vote, tie-breaking defers to joint consensus of the EU and PRC observers. Their shared commercial interest in open shipping lanes provides an automatic override that bypasses regional political gridlock.

Article MM-3: Spoiler State Deterrence Tariff

If intelligence confirms a non-party state conducted operations designed to collapse the protocol, the IHTA Council may impose a Transit Surcharge on that state's flagged vessels at 2x Tier 3 rates by majority vote excluding the accused state's proxy. Revenue flows to the affected party's reconstruction fund. The evidentiary standard requires convergent findings from at least two of: National Technical Means, IAEA incident reporting, or Omani naval observer testimony. The surcharge requires a 48-hour notice period before activation and remains in force until the IHTA Council votes to lift it by the same majority threshold. Affected states may appeal to the UN Secretary-General within 14 days; appeal does not suspend the surcharge.

Article MM-2: Automated Toll Disbursal Default

If the IHTA Council fails to pass an annual budget due to US-Iran deadlock, toll revenues automatically distribute per baseline percentages (40% Iranian Reconstruction, 35% Maritime Safety, 25% Operations). The neutral Secretariat executes within 7 days. Political deadlock cannot freeze baseline distributions.

6.2 Synchronized Dual-Blockade Lift

Day 7, 0000 GMT: Both blockades lift simultaneously within a 60-second window. Confirmed by Omani naval observers, Lloyd's List AIS tracking, and JHA observation vessels.

Table 13: IHTA Tolling

Tier	Vessel Category	Rate
Tier 1	Humanitarian (medicine, food, medical equipment)	Zero (24h fast-track)
Tier 2	Standard commercial	\$0.15/ton
Tier 3	Energy/premium (oil, LNG, chemicals)	\$0.25/ton or \$35K flat VLCC

Member States	IHTA Council member vessels	Exempt
Annual revenue: ~\$500M. Allocation: 40% Iranian Civilian Reconstruction Fund; 35% International Maritime Safety Fund; 25% IHTA Operations.		

Article MM-4: Compliance Rebate for Clean Vessel Operators

Vessels from signatory states that have maintained clean AIS tracking and zero sanctions violations for 12 consecutive months receive a 10% toll rebate, paid from the Maritime Safety allocation. Creates bottom-up incentive for shipping companies to pressure their governments to remain compliant. The rebate is calculated quarterly and credited against future transits. Vessels from non-signatory states or states under Spoiler Deterrence Tariff (Measure 9) are ineligible. Clean status is verified by Lloyd's List and IHTA Maritime Operations Cell jointly.

Section 7: Institutional Governance

The protocol operates through a distributed network of facilitating states and international organizations, each with a precisely scoped mandate. No single facilitator holds comprehensive authority. Functions are separated by domain to prevent any one actor from becoming a bottleneck or a point of political capture.

7.1 The Distributed Facilitating State Architecture

Table 14: Distributed Facilitating State Matrix

State	Domain	Function	Activated
Oman	Maritime Deconfliction	Hotline; naval encounter facilitation; Hormuz oversight	Throughout
Switzerland	Financial Verification	Escrow; asset transfer verification; sanctions monitoring	Throughout
Qatar	Escrow and Liquidity	Emergency liquidity; bridging finance; humanitarian corridor	Throughout
IAEA	Nuclear Verification	Enrichment monitoring; stockpile custody; facility inspection	Day 1

UN Appointee	Procedural Mediation	Governance; dispute resolution; deadlock breaking	Upon dispute
Pakistan	Emergency Diplomatic Convening	Crisis summits; backchannel relay; leadership relay	Crisis only

7.2 Crisis Convening and Escalation Management

Article IG-1: Pakistan Co-Convening Authority

Pakistan is elevated to Co-Convening Authority alongside Oman, institutionalizing the existing Islamabad channel. Pakistan convenes emergency diplomatic summits and executive-level backchannel relay. Pakistan does not assume financial, maritime, nuclear, or procedural mediation functions.

7.3 The Escalation Pause Protocol

Article IG-2: Mandatory Escalation Pause

When a facilitating state determines escalation is imminent, it issues a Mandatory Escalation Pause Recommendation. This activates a 30-minute review window. Neither party may take escalatory action. Both must designate senior officials for consultation within 30 minutes. Either party may request extended Cooling-Off (24-72 hours). If either party supports the pause, the freeze continues.

7.4 Facilitating State Conduct Standards

Table 14A: Code of Conduct for Facilitating States

Principle	Obligation	Enforcement
Neutrality	Facilitators may not advance the interests of either party over the other	Either party may request facilitator replacement with 14 days notice to Secretariat
Transparency	All verification findings reported simultaneously to both parties	Asymmetric disclosure triggers automatic JIG review
Continuity	Facilitators maintain operations through Review Pauses and succession transitions	Failure to maintain continuity triggers Module Persistence Bonus for affected modules

Non-Intervention	Facilitators do not propose policy; they verify implementation only	Policy advocacy by a facilitator is grounds for replacement
Security	Facilitator personnel and communications enjoy protected status equivalent to UN observers	Attack on facilitator personnel triggers Article CB-7 Mourning Hold

7.5 Governance Dispute Resolution

Article IG-3: Governance Deadlock Procedure

When facilitating states disagree on procedural matters, the dispute escalates through three stages. **Stage 1 (48 hours):** The disagreeing facilitators attempt bilateral resolution through the Secretariat. **Stage 2 (14 days):** If unresolved, the dispute is elevated to the JIG for binding procedural determination. **Stage 3 (30 days):** If the JIG deadlocks, the UN Appointee casts the deciding vote on procedural matters only. Substantive matters — whether a party is in compliance — are never decided by procedural vote. They require convergent verification from at least two independent technical channels.

7.6 The Joint Veto Window

Article IG-4: The Joint Veto Window and Stop Order Protocol

The Joint Veto Window is the sole human interface for halting automatic timeline advancement. It is designed as a negative trigger — humans may stop the machine, but they may not require the machine to wait for human permission to proceed.

Stop Order Requirements: To activate a halt, the submitting party must concurrently file: (a) verified conflicting physical data from at least one independent technical channel demonstrating non-compliance or system failure, (b) a written technical dispute with specific engineering justification for why the telemetry does not reflect actual conditions, and (c) a 48-hour advance notice to the Coordination Secretariat before the requested halt takes effect.

Bilateral Confirmation: Both parties must confirm the Stop Order within the 48-hour notice window. If either party declines to confirm, the timeline advances on schedule and the Stop Order is archived as a formal objection without operational effect. Unilateral Stop Orders lacking verified conflicting data are automatically rejected by the Secretariat within 24 hours.

Automatic Expiration: A confirmed Joint Veto expires after 72 hours unless extended by renewed bilateral confirmation. During the veto window, affected modules pause while all other modules continue advancing. The Framework Survival Core (ceasefire hotline, humanitarian corridor, diplomatic channel) never pauses under any veto condition.

Table 14B: Joint Veto Window Parameters

Parameter	Requirement	Consequence of Non-Compliance
Conflicting Data	Physical At least 1 independent technical channel	Automatic rejection; timeline advances
Engineering Justification	Written technical dispute with specificity	Returned for revision; 24-hour resubmission window
48-Hour Advance Notice	Filed with Coordination Secretariat	Retroactive halts prohibited
Bilateral Confirmation	Both parties confirm within 48h window	Unilateral orders archived without effect
Veto Duration	72 hours auto-expire unless renewed	System resumes at Hour 73
Affected Scope	Named modules only; others advance	Full protocol freeze prohibited
Framework Core	Survival Never veto-eligible	Ceasefire, humanitarian, diplomatic survive all vetoes

Section 8: Verification Architecture

8.1 Five-Channel Verification Convergence

No single channel can trigger or block compliance findings. Every material finding requires convergent evidence from at least two independent channels.

Table 15: The Five Channels

Channel	Coverage	Authority
Pakistani Mediator	Diplomatic channel; ceasefire compliance; crisis hotline	Pakistani PM Office
Omani Technical	Maritime operations; JHA observation; nuclear custody oversight	Omani Foreign Ministry
Swiss Financial	Asset transfer; sanctions relief; escrow management	Swiss Federal DFA

IAEA	Nuclear exchange: stockpile custody, moratorium, Fordow conversion	IAEA General	Director
National Technical Means	Satellite imagery, signals intelligence. Co-equal channel for maritime verification (triangulated with AIS + Lloyd's List).	US and partner intelligence	

8.2 Nuclear Monitoring Technology Menu

Table 16: Sensor Technologies

Technology	Measures	Data Output
OLEM	Real-time enrichment at cascade headers	Quantitative enrichment %, flow rates
Black-Box Sensors	Tamper-evident data logging	Continuous operational parameter logs, encrypted
UGES	Non-intrusive UF6 cylinder enrichment	Cylinder-by-cylinder verification
ICS	24/7 visual monitoring	Encrypted video, AI anomaly detection
Digital Twin	Virtual facility modeling	Behavioral pattern analysis (requires physical cross-verification)
Satellite Feed	Data Daily imagery of all facilities and Hormuz	AIS, SAR, EO high-resolution

Article SF-4: Black-Box Sensor Redundancy Mandate

Parallel Black-Box and OLEM installation is required at all declared facilities. If either system fails, the other maintains continuous logging without protocol pause. A single-system failure does not pause the protocol; the Nuclear Verification Cell issues a Single-System Degradation Notice within 24 hours and dispatches repair technicians within 72 hours. Dual-system failure triggers the 14-day remediation fuse, not an immediate Tier escalation. Both systems must be down for more than 14 consecutive days before a Tier 2 material disruption is declared. Redundant installation includes independent power supplies, separate data transmission paths, and distinct encryption keys.

Article SF-3: Algorithmic Reconciliation Step

Before any Digital Twin anomaly is submitted as a compliance discrepancy, it must be cross-verified by manual physical data from at least two independent non-software channels (environmental

sampling, on-site inspector logs, or OLEM telemetry). The algorithm alone cannot trigger a breach report. The Nuclear Verification Cell issues a Reconciliation Certificate confirming multi-channel physical convergence before any Tier escalation.

24-Hour Override Clock: If the Nuclear Verification Cell cannot complete physical cross-verification within 24 hours of the Digital Twin anomaly detection, the anomaly is automatically downgraded to "observation" status and logged without tier impact. The 24-hour clock is non-extendable except by mutual consent of both parties. Prevents the verification system itself from becoming a spoiler through bureaucratic delay. Observations accumulate; three observations within 30 days trigger a mandatory JIG review, but do not activate the step-back architecture.

Article SF-6: Unannounced Environmental Sampling Windows

Quarterly environmental sampling is replaced by Unannounced Sampling Windows. IAEA may collect environmental samples at any time within 72-hour windows, notified only to the Omani facilitator — not the facility operator — 6 hours in advance. Predictable schedules allow sanitization; randomization prevents it. The Omani facilitator confirms the window opening without disclosing the specific collection time within the 72-hour period. Sampling teams arrive unannounced. Results are transmitted directly to the Nuclear Verification Cell with no intermediate stop. Three consecutive clean sampling windows advance the facility to a reduced-frequency protocol (one window per quarter instead of continuous windows). Any anomalous reading triggers an immediate second sample within 24 hours before Tier classification.

Article SF-5: Satellite Co-Equal Channel for Maritime Verification

Satellite imagery is elevated to co-equal channel status for Hormuz maritime verification. AIS + Lloyd's List + satellite triangulation must agree for all Hormuz transit confirmations. No single channel can confirm or deny transit compliance. Prevents AIS spoofing — a documented sanctions evasion tactic — from creating false compliance or false breach scenarios. For nuclear facility verification, satellite remains a backstop and discrepancy detector only, consistent with the Algorithmic Reconciliation Step (SF-3). The triangulation requirement applies to all vessels transiting under IHTA authority; non-IHTA transit remains verified by AIS + Lloyd's List only.

Privacy: Data filtered at source; dual-key encryption; IAEA receives only compliance data, not industrial secrets.

Section 9: Compliance and the Step-Back Architecture

9.1 Three-Tier Breach System

Article CB-6: De Minimis Threshold

Tier 1 technical disputes are defined by strict mathematical boundaries: enrichment fluctuations not exceeding 0.5% above the 3.67% ceiling; up to two un-mothballed centrifuge rotors; IAEA reporting delays not exceeding 48 hours. Deviations below these thresholds are handled via confidential engineering adjustments. Hardliners cannot weaponize microscopic anomalies into deliberate breach allegations. IAEA certifies above/below the De Minimis line within 24 hours.

Table 17: Three-Tier Breach Classification

Tier	Classification	Telemetry Signature	Response
Tier 1	Technical Dispute (De Minimis)	<0.5% above ceiling; ≤2 rotors; ≤48h reporting delay	Engineering resolution 14 days; no rollback; confidential
Tier 2	Material Disruption	>0.5% above ceiling; >2 rotors; >72h IAEA obstruction	25% benefit reduction; 30-day remediation; earn-back via compliance
Tier 3	Deliberate Violation	Hostile Nuclear weapons activity; fissile diversion; IAEA attack	50% reduction; 90-day remediation; full earn-back after sustained compliance

9.2 Graduated Step-Back and Earn-Back

Do not use the snapback. Use the step-back and earn-back method.

Snapback is toxic to trust. When one side loses everything overnight, it has no remaining stake in the framework. Step-back preserves a cooperation floor during disputes, creating a pathway back to full compliance.

Article CB-1: Graduated Step-Down

Tier 1: No benefit reduction. 14-day resolution. JIG technical assistance. Quiet compliance corrections confidential.

Tier 2: 25% reduction in non-humanitarian benefits. Humanitarian tranches protected. SWIFT phase holds (14-day fuse active). 30-day remediation. Full restore on IAEA clean certification within 14 days.

Tier 3: 50% reduction in non-humanitarian benefits. Tier 3 modules enter hold. 90-day remediation. Full earn-back requires: 90-day sustained compliance + IAEA clean certification + JIG majority confirmation.

9.3 Stabilization Pause and Reconstitution

Article CB-2: Stabilization Pause

When disagreement occurs, the protocol pauses, reviews, and seeks reconstitution. It never collapses. The Framework Survival Core (hotline, humanitarian access, diplomatic channel) survives everything.

Article CB-3: Reconstitution Mechanism

If the protocol enters full suspension, all parties attend a Reconstitution Conference within 30 days, convened by Pakistan and the UN Appointee. Root causes reviewed. Modifications proposed. Conditions for graduated restoration defined. No party may unilaterally block reconstitution.

Article CB-4: Political Shock Absorber

Protocol implementation enters automatic Review Pause (not termination) upon: elections; assassination of senior leadership; cabinet collapse; mass protests; leadership transitions; kinetic disruptions within regional security architectures.

Election Pause Scope: No new tranche releases occur during the 30-90 day Review Pause, but all existing benefits (humanitarian allocation, basic IAEA monitoring, Hormuz maritime transit, ceasefire hotline) continue uninterrupted. New IHTA Council decisions require unanimous consent

during the pause. The pause prevents election-season grandstanding from collapsing functioning modules.

During Review Pause: Tier 1-2 modules continue; Tier 3 enters hold; Secretariat issues Review Pause Certificate within 48 hours; 30 days to confirm continuation. Max 90 days, extendable by mutual agreement. Does NOT constitute material breach. Does NOT trigger the three-tier system.

Article CB-4A: Regional Proxy Shock Extension

If a leadership vacuum or unauthorized structural fracture occurs within a key regional non-state ally, the 72-hour ceasefire loops enter a mandatory 72-hour hold. Secretariat deploys stabilization teams to re-establish local command lines. No material breach may be declared during the hold.

Article CB-4C: Quantified Protest Threshold

Review Pause activates for mass protests only if: (a) 100,000 or more demonstrators in a single city on a single day, verified by independent media and satellite crowd-density analysis, or (b) the host government declares a formal state of emergency in its capital. Below these thresholds, protests are treated as normal democratic expression and do not trigger Review Pause. Either party may file a Review Pause petition if it believes the threshold is met; the Secretariat has 48 hours to verify against the quantitative criteria. Prevents either side from manufacturing protest claims to stall implementation. The threshold applies symmetrically to both Tehran and Washington.

Article CB-4B: Succession Telemetry Certificate

If either nation's head of state, supreme leader, or similarly designated executive authority changes, the 72-hour ceasefire automatically extends from 72 hours to 14 days. OLEM and IAEA monitoring intensifies to daily reporting. No tranche releases occur during the 14-day Succession Window, but no rollbacks either. The protocol enters a holding pattern. Prevents new leadership from inheriting a live conflict without time to review the telemetry. The Succession Telemetry Certificate is issued by the Coordination Secretariat within 24 hours of the leadership change confirmation. Either party may request an additional 14-day extension by written notice; automatic if both parties confirm.

Article CB-7: Personnel Protection Telemetry and Mourning Hold

If any IAEA inspector, Secretariat official, or designated facilitator is assassinated or attacked, the protocol enters an automatic 21-day Mourning Hold: all modules pause except the Framework Survival Core (ceasefire hotline, humanitarian access, diplomatic channel), a \$5 million compensation fund releases to the victim's estate within 14 days, and the Joint Investigation Committee (Pakistan + UN appointee) has 21 days to attribute. Attribution to a party triggers Tier 3 with 90-day remediation. Attribution to a spoiler triggers the Spoiler Deterrence Tariff (Article MM-3). No party may declare material breach during the Mourning Hold. The \$5 million compensation is drawn from the False-Flag Investigation Bond (Article SM-8) if the incident is ultimately attributed to a third party.

Article CB-5: Cooling-Off Default

If disagreement occurs and attribution is unclear, all escalation freezes automatically for 24-72 hours. Negotiations continue. Verification teams investigate. No escalatory action permitted. Cyber incidents affecting protected infrastructure trigger Cooling-Off automatically. Any detection of potential false-flag activity triggers Cooling-Off.

Section 10: Implementation Timeline

The 72-hour rolling loops feed into a broader tiered schedule. Every milestone has a telemetry verification gate.

Stage 0: Micro-Pilot (Days -30 to -1)

Trust-building through limited, reversible exchanges

Iran: Freeze enrichment above 60%; IRGC presence reduced 30%.

US: \$250M humanitarian tranche via Swiss escrow; partial blockade reduction.

Telemetry Gate: OLEM confirms 60% freeze within 72h; physical IAEA within 7 days; Omani observers confirm blockade reduction within 48h.

Transition: Auto-graduates to Stage 1 on verified completion.

Stage 1: The 14-Day Opening (Days 1-14)

End the war; transfer stockpile; reopen Hormuz

Day 1: Joint signature. Permanent ceasefire 0000 GMT. Iran transfers 60% stockpile to IAEA Oman custody. US issues \$250M OFAC license, suspends offensive operations. First humanitarian vessel cleared for Hormuz transit.

Day 7: Synchronized dual-blockade lift. Hormuz opens fully. US lifts naval blockade. 200+ commercial transits verified by Lloyd's List and Omani observers.

Day 14: Stage 1 closing certification. JHA provisional mode confirmed. IAEA custody verified. Pakistan, Oman, Switzerland concurrent certification. Auto-transition to Stage 2.

Stage 2: The 30-Day Deferred Window (Days 15-44)

Nuclear specifics; staggered cap; facility protocols

Day 15: Fordow sealed; Natanz cap at 3.67% verified. First sanctions tranche (aviation, consumer exports). Second asset tranche.

Day 30: Downblending begins under IAEA cameras. Oil exports to Swiss escrow (2.1M barrels/day). SWIFT Phase 1.

Day 44 (+7 extension available): Moratorium ratified; HEU export confirmed. 50% assets returned. SWIFT Tier B/C. Stage 2 closing.

Stage 3: Permanent Architecture (Days 45-180)

Joint Transit Authority; regional dialogue; normalization

Day 30 Pre-Dialogue Telemetry Exchange: Both parties submit classified inventories of regional proxy personnel counts and known weapons transfers (not public; shared only with Pakistan and Oman). No action required, but establishes a baseline. If Stage 3 dialogue fails, the baseline prevents either side from claiming "we didn't know the scale."

Day 60: Fordow medical-isotope conversion verified. Third tranche (50% cumulative). SWIFT Tier A.

Day 90: Permanent IHTA charter ratified. Iranian co-chair begins. Fourth tranche (70% cumulative).

Day 120: Regional Security Dialogue on missiles and proxies. Fifth tranche (85% cumulative).

Day 150: Section 123 Agreement opens for guaranteed civilian fuel supply.

Day 180: Stage 3 closing. Successor framework opened. 180-day compliance review published.

Successor Seeding Protocol: By Day 90, both parties must submit a one-page Non-Binding Intent Statement outlining their desired successor framework scope. If either fails to submit by Day 120, the Secretariat publishes a default template based on prevailing international law. By Day 150, both parties

must confirm receipt of the other's Intent Statement (not agreement — only receipt). This prevents the empty-chair problem where one side refuses to engage and the protocol expires into vacuum. The Non-Binding Intent Statement has no legal force and creates no obligation to negotiate.

Successor Framework Auto-Seeding Timeline

Days 90-180: Intent, Template, Receipt

- Day 90:** Both parties submit Non-Binding Intent Statement (one page maximum).
- Day 120:** Deadline. Missing party receives default template from Secretariat.
- Day 150:** Both parties confirm receipt of the other's statement (not agreement).
- Day 180:** Successor framework negotiations formally opened. Seeding complete.

Table 18: 30-Day Velocity Milestones

Milestone	Target	Telemetry Deliverable
Escrow Lock	Day 7	Swiss escrow accounts active; first asset release confirmed
Custody Shift	Day 15	HEU under dual-lock IAEA seals; Fordow sealed; OLEM reads <3.67%
Oil Trigger	Day 30	First legal Iranian tankers clear port; sanctions tranche 1 active
Banking Bridge	Day 45	SWIFT Phase 1 active; 50% assets returned
Authority Charter	Day 90	Permanent IHTA operational; Iranian co-chair authority live
Successor Opening	Day 180	Full regional dialogue opened; successor framework negotiation begins

Section 11: Domestic Political Architecture

Technical compliance does not generate its own political support. This section engineers the domestic conditions that give the protocol breathing room to survive.

11.1 Dual Narrative Telemetry

US Domestic Narrative	Iranian Domestic Narrative
"We forced Iran to open Hormuz and eliminate its weapons-grade uranium." "We got their assets returned in tranches with Congressional review at every step." "We didn't give up a single base. Gas prices are coming down." "We did it without losing another American life." "This is what maximum pressure looks like when it works."	"We ended the war the United States started against us." "The American naval blockade of our ports has been lifted." "Hormuz is governed by an authority on which Iran holds a permanent seat." "We chose to redirect our nuclear program toward civilian energy leadership." "Our NPT rights remain inviolable; our sovereignty is intact."

11.2 The Dual-Key Congressional Lock

Article DM-1: Congressional Notification with Auto-Advance

Tranches 3 and above require a 30-Day Congressional Notification with Auto-Advance. Congress receives full tranche documentation, IAEA certification, and Swiss escrow confirmation within 48 hours of the certification trigger. Tranche releases automatically proceed after 30 days unless both houses of the US Congress pass a joint resolution of disapproval. Individual senators may not place holds. Committee chairs may not block. Only a concurrent majority of both chambers can stop the release. The Auto-Advance feature prevents indefinite hostage-taking by any single legislator while preserving full Congressional oversight authority. The 30-day clock starts on Swiss Financial Cell confirmation of IAEA clean certification, not on legislative receipt.

Table 19A: Tranche Congressional Requirements

Tranche	Notification Required	Hold Permitted?	Auto-Advance?	Blocking Threshold
Pilot (Day 1)	Executive only	No	N/A	Executive discretion

1-2 (Days 14-44)	48h notice to leadership	No	N/A	Executive authority
3+ (Day 120+)	Full 30-day review	No individual holds	Yes	Joint resolution, both houses
Reserve (Day 365)	Full 30-day review	No individual holds	Yes	Joint resolution, both houses

11.2 Hardliner Management

Table 19: Architectural Elements for Domestic Survival

For Tehran	For Washington
No clause requires acknowledging defeat	Each tranche 3+ subject to 30-day Congressional review
IRGC Navy retains authority in Iranian waters	All US Gulf bases preserved
NPT rights preserved; moratorium is time-limited	"Toughest inspections ever" with OLEM + Black-Box
Missile program untouched	Israeli security backstop via stockpile elimination
Asset return framed as sovereign property restitution	Explicit "no precedent" clause prevents future binding
Lebanon track separated	Lebanon referred to successor framework
Nuclear exchange framed as Iran's initiative	Front-loaded nuclear concessions Day 1-15
Supreme Leader Review Window: 72h penalty-free deferral	Congressional auto-advance prevents individual holds

Article DM-2: Supreme Leader Review Window

Any Iranian technical compliance step may be framed as "pending Supreme Leader approval" for up to 72 hours without penalty. OLEM monitoring continues uninterrupted during the Review Window. The 72-hour clock starts on formal written notification to the Coordination Secretariat. This gives Iranian negotiators a domestic political buffer without affecting the telemetry timeline. The Review Window may be invoked once per 30-day phase, not per individual step. If the 72-hour window expires without confirmation, the step proceeds on its original timeline unless a Tier 1 technical dispute is formally filed with engineering justification.

11.3 Synchronized Public Statement Protocol

Article DM-3: Media Narrative Convergence Requirement

Before each stage transition, both parties must issue Synchronized Public Statements within 6 hours using their own domestic framing, but both acknowledging the same telemetry facts. The Secretariat verifies statement timing and content alignment against the Telemetry Matrix. The requirement is not narrative uniformity — each government uses its own vocabulary — but factual convergence on: enrichment percentage readings, asset tranche amounts, Hormuz transit volumes, and IHTA operational status. Failure to issue within the 6-hour window triggers a 7-day stage extension, preventing one side from building domestic momentum against the deal while technically complying. Statements are published simultaneously through the Secretariat to prevent either side from pre-empting the other's framing.

Table 19B: Synchronized Statement Telemetry Checklist

Stage Transition	Required Factual Acknowledgments	Window	Miss Penalty
Stage 0 to 1	OLEM freeze; \$250M tranche; Hormuz opening	6 hours	7-day extension
Stage 1 to 2	HEU custody; Fordow seal; dual-blockade lift	6 hours	7-day extension
Stage 2 to 3	Moratorium ratified; SWIFT Phase 1; 50% assets	6 hours	7-day extension
Stage 3 Close	IHTA permanent; successor opened; 180-day review	6 hours	7-day extension

Section 12: Safeguards and Face-Saving Instruments

12.1 The Crisis Lock

Article SF-1: Crisis Lock Escape Valve

If negotiations collapse, both sides have an exit ramp that does not blow up the Middle East. Funds frozen in Switzerland, not seized. Cameras stay on. For 30 days, mediators force both sides to the

table. After 30 days, walk away or re-engage. You are not locked in.

12.2 Minimum Viable Accord (Emergency Fallback)

If the full architecture is rejected, a stripped-down version covers four essential elements: ceasefire, Hormuz reopening, humanitarian channel, and enrichment freeze.

1. Either party proposes MVA by written notice to the Coordination Secretariat
2. Facilitating state convenes within 48 hours
3. Both parties confirm MVA acceptance through exchange of letters
4. MVA activates 72 hours after confirmation
5. IAEA advance team deploys within 48 hours

MVA auto-graduates to full protocol when: (a) both confirm objectives met, (b) 14 consecutive days verified compliance, (c) neither objects within 7-day review window.

12.3 Thirty-Day Drop-Dead Auto-Transition

Article SF-2: Auto-Transition to MVA

If the full framework is not ratified by Day 30, automatic transition to Minimum Viable Accord. The US can claim it did not accept open-ended commitment. Iran can claim humanitarian and ceasefire elements survive regardless. Framed as a "life support protocol" while both sides negotiate modifications.

12.4 Rebranding Protocol

Remove terms: "deal," "rollback," "concessions." Washington: "regional stability mechanism." Tehran: "sovereignty-protecting de-escalation tool." Neither narrative contradicts the other. Both are factually supported by the telemetry.

12.5 The MVA-to-Full Auto-Graduation Trigger

Article SF-7: Auto-Graduation from Minimum Viable Accord

The Minimum Viable Accord is not a permanent alternative to the full protocol. It is a temporary stabilization bridge. MVA auto-graduates to the full protocol when all three conditions are met: (a) both parties confirm MVA objectives have been achieved through written notification to the Secretariat, (b) 14 consecutive days of verified compliance across all MVA modules, and (c) neither party lodges an objection within the 7-day review window following the 14-day compliance period. Auto-graduation proceeds without requiring a new signature ceremony. The existing MVA acceptance letters serve as the authorization. Graduation occurs at 0000 GMT on the day after the review window closes.

12.6 The No-Surprise Telemetry Commitment

Article SF-8: Advance Notification for Major Policy Shifts

Neither party may implement a major policy decision that would materially affect protocol operations without providing 14 days advance written notification to the Coordination Secretariat. Major policy shifts include: designation of new sanctions on entities involved in protocol-compliant transactions, closure of ports or airspace used for IAEA inspector travel, suspension of diplomatic relations with a facilitating state, or public repudiation of the protocol by senior leadership. The 14-day window allows for diplomatic intervention before the shift crystallizes into an irreversible breach. The Secretariat distributes the notification to all facilitating states within 24 hours. Does not apply to responses to actual armed attack or UN Security Council-mandated action.

12.7 Document Integrity and Version Control

Table 24: Document Version Control

Version	Scope	Authority to Modify	Notification
v1.0-v2.0	Base protocol with 15 structural patches	Joint Coordination Secretariat	48 hours to both parties

v3.1	Base + 30 hardening measures (this document)	JCS with IAEA technical concurrence	72 hours to both parties + facilitators
v3.1+	Operational amendments only	JCS by written notice	14 days; either party may object
v4.0	Major structural revision	Requires bilateral re-confirmation	New signature required

Appendix A: The Module Menu

Because the architecture is strictly modular, intermediaries should treat this protocol as an operational menu. If one module is rejected, unclip it and continue executing the rest. The system loads what is accepted.

Table 20: Independent Module Activation Matrix

Configuration		Modules Loaded		Minimum Viable?	Political Framing
Emergency modules)	Brake	(2	Security Freeze + Humanitarian Escrow	Yes - MVA core	"Crisis containment only"
Humanitarian modules)	Core	(3	+ Reconstruction Escrow	Yes	"Civilian relief first"
Nuclear modules)	Freeze	(4	+ Neutral Custody	Yes	"Stockpile secured, blockade reduced"
Maritime modules)	Opening	(5	+ Ingress/Egress	Yes	"Hormuz open, shipping restored"
Stability First (7 modules)		+ Virtual Consolidation + IHTA Governance		Yes - Medium option	"Full Stage 1 operational"
Economic modules)	Bridge	(8	+ SWIFT Phase 1 + Asset Tranche 1	Yes	"Banking reconnected, assets flowing"
Full Protocol (all modules)		+ Step-Back + Full Timeline + Successor		Yes - Maximal option	"Comprehensive stabilization"

How to Use This Menu (for facilitating teams): If the maritime node cannot be activated, propose the "Nuclear Freeze" configuration. If SWIFT sequencing encounters objections, propose the "Maritime Opening" configuration. Each configuration is independently executable. Partial activation is always preferable to system collapse.

Module Dependency Graph

Table 21: What Each Module Requires to Function

Module	Requires Active	Required By
72-Hour Security Freeze	None (root module)	All other modules
Humanitarian Escrow	Security Freeze	Reconstruction Escrow
Reconstruction Escrow	Humanitarian Escrow	Asset Tranche Release
Neutral Custody Blending	Security Freeze	Virtual Consolidation
Virtual Consolidation	Neutral Custody	SWIFT Reconnection
Ingress/Egress Protocol	Security Freeze	IHTA Governance
IHTA Governance	Ingress/Egress	Toll Disbursal
Asset Tranche Release	Reconstruction Escrow + IAEA clean	SWIFT Phase 2+
SWIFT Reconnection	Virtual Consolidation + Asset Tranche 1	Full economic normalization
Step-Back Architecture	All modules loaded	None (meta-module)

Appendix B: Operational Reference Matrix

Table 22: Structural Baselines and Unified Operational Targets

Issue	Maximalist Security Baseline	Sovereign Regulatory Baseline	Unified Operational Target
HEU Disposition	Transfer to United States custody	No transfer under any condition	Third-country IAEA custody; selecting state chooses pathway
Facilities	Single operational facility permitted	All facilities are sovereign national assets	Virtual consolidation; real-time IAEA feeds on all sites
War Reparations	No financial compensation	Full reparations for all damages	International Gulf Reconstruction Fund (no fault admission)
Frozen Assets	No release of even 25%	Full immediate unfreezing	Graduated tranches via Swiss escrow
Ceasefire	Conditional upon final comprehensive deal	Immediate, permanent, irreversible	72-hour auto-renewing verification loops

Hormuz	Unrestricted freedom of navigation	Full sovereign regulatory control	Joint IHTA with permanent voting seat for coastal state
Sanctions	Phased and fully conditional	Immediate lifting of all measures	Eight-tranche architecture tied to IAEA milestones
Enrichment Cap	20-year moratorium	5-year moratorium maximum	12-15 years with violation-extension mechanism
Missile Architecture	Comprehensive limitations required	Not subject to negotiation	Deferred to Stage 3 Regional Security Dialogue
Lebanon	Full disarmament of all non-state actors	Immediate bilateral ceasefire	Operational pause only; successor framework jurisdiction

Table 23: Core Telemetry Outputs by Day

Day	Iranian Telemetry	US Telemetry	Neutral Verification
1	60% freeze; stockpile transfer initiated	\$250M OFAC license; offensive ops suspended	IAEA DG + Pakistan + Oman + Swiss concurrent
7	Hormuz open; IRGC craft withdrawn 5nm	Naval blockade lifted	Lloyd's List + JHA vessels + UN OCHA
15	Fordow sealed; Natanz $\leq 3.67\%$ OLEM	Sanctions tranche 1; asset tranche 2	IAEA continuous monitoring + JIG
30	Downblending begins; oil exports to escrow	SWIFT Phase 1; 30-day Congressional notice	IAEA cameras + Swiss escrow confirmation
44	Moratorium ratified; HEU export plan	50% assets returned	JIG closing certification
90	Permanent IHTA member; co-chair active	Full IHTA charter ratified	UN SG + JIG unanimous certification
180	Successor framework opened	85% assets returned; 180-day review published	JIG comprehensive compliance review

Document Status: Unified Telemetry Protocol v3.1 — May 18, 2026. Standalone Operational Protocol. All 15 structural vulnerability patches plus 30 hardening measures integrated (10 Spoiler, 10 Economic, 5 Verification, 5 Political Shock). Zero external document dependencies.

"The Unified Telemetry Protocol: A Synchronized Execution Framework for Crisis Stabilization"
Operational Reference v3.1 — May 18, 2026

Document Status: Standalone Operational Protocol
Authority: Joint Coordination Secretariat Reference Text
Implementation Engine: Telemetry Matrix T-23
Hardening Measures: 30 (Fully Integrated)
Classification: Direct Diplomatic Working Reference
