

THE CRESCENT COMPACT

A Comprehensive Framework for Middle East Regional Stability

Version 1.7 — April 2026 (Political Realism Edition)

PRINCIPAL PARTIES & PARTICIPANTS

Islamic Republic of Iran · United States of America · State of Israel
Lebanese Republic · Hezbollah (political participant) Kingdom of Saudi Arabia · Republic of Iraq · Syrian Arab Republic
Republic of Yemen (IRG) · Ansar Allah / Houthis (political participant) United Arab Emirates · State of Qatar (guarantors) Islamic Republic of Pakistan · Sultanate of Oman
(mediators)

“The crescent does not illuminate all at once. It grows.”

NEGOTIATION REFERENCE DOCUMENT — CONFIDENTIAL

THE COMPACT PHILOSOPHY

The Middle East has never lacked for grand bargains. What it has lacked is durable architecture. Oslo collapsed not because the parties disagreed on outcomes but because the structure could not absorb the inevitable shocks of disruption actors, elections, assassinations, and political will's natural entropy. The JCPOA was defeated not by its technical provisions but by its inability to survive a single administration change. Every prior Middle East framework was front-loaded with political exposure and back-loaded with benefits — a structural recipe for collapse.

The Crescent Compact is engineered differently. Three governing principles:

- [1] **Granular Reciprocity:** Every obligation is paired with a benefit of equal political value delivered on the same timeline. Neither side is ever exposed alone. No government is asked to defend a concession to its domestic constituency without pointing to an equal reciprocal gain simultaneously verified and delivered. The architecture makes trust unnecessary — compliance is structurally incentivized before it is politically demanded.
- [2] **Low-Probability High-Impact Event Absorption:** Every mechanism is stress-tested against worst-case scenarios: cyber disruption, leadership assassination, third-party disruption action, narrative collapse, electoral reversal, financial system failure. The framework does not assume good faith; it engineers structures that function in its absence. Pre-committed protocols activate automatically, preventing political decisions in moments of crisis when bad decisions are most likely.
- [3] **The Crescent Cycle:** Progress is measured not in declarations but in 60-day verified cycles — synchronized windows in which all parties complete one small, reversible step before the next window opens. No party advances alone. No cycle opens without all parties having verifiably closed the prior one. Each completed cycle makes the next easier; accumulated investment in prior cycles makes reversal increasingly costly.

The Compact is further distinguished by its **Layered Legitimacy Architecture (LLA)**. Rather than a single monolithic treaty requiring all parties to commit to all outcomes in advance, the Compact consists of a Core Frame (Parts I–III) — minimally sufficient to stop active hostilities and establish nuclear non-proliferation — and Progressive Arches (Parts IV–VIII) that unlock only when Core Frame benchmarks are verified over multiple cycles. A government may ratify the Core Frame without committing to any Progressive Arch, preserving political flexibility while locking in the minimum viable peace.

The Compact introduces a unique **Political Win Architecture**. Unlike prior frameworks that buried political benefits in technical annexes, the Compact front-loads visible, symbolically significant wins for every party's domestic constituency in the first 90 days: Iran's frozen assets begin flowing; U.S. businesses gain oil field access; Israel receives a formalized attack prohibition treaty; Lebanon receives a territorial restoration commitment; Saudi Arabia receives civilian nuclear assistance; Iraq receives PMF transition funding. Every leader can stand before their parliament and point to a concrete, immediate, domestically defensible gain — before any significant concession is fully implemented.

“The Compact does not ask nations to trust one another. It asks them to move together — one verified step, then another, in the knowledge that the architecture makes betrayal more costly than compliance.”

Legacy Provision — Instrument of State, Not Substitute for It (NEW v1.5):

The Crescent Compact is a tool of state authority, not a replacement for it. Every mechanism, every cycle, every verification module, and every governance table in this document exists to support the judgment of qualified statespeople — not to supplant it. The Compact is the staff work; the diplomats are the decision-makers. When history records the peace that this framework enables, it will record the names of the leaders who had the courage to sign it, the envoys who had the skill to negotiate it, and the statespeople who had the wisdom to use it. The framework is the instrument. The human beings who deploy it are the authors.

Ceremonial Signature Architecture: Entry into force of the Compact requires physical, ceremonial, in-person signature by the authorized representative of each Core Frame party. The signing ceremony is: (a) hosted in a neutral state designated by unanimous JCC consent; (b) open to international press and diplomatic observation; (c) preceded by a joint public statement by each signing party's head of state or foreign minister, delivered in their own language and attributed to them personally; (d) recorded in the official UN Treaty Series with each signatory's name, title, and date of signature. No digital-only, proxy, or undisclosed signature is valid for Core Frame entry into force. Progressive Arches may be signed through standard diplomatic

channels, but each Arch activation is logged in the public JCC record with the names of the authorizing representatives. This provision exists because the history of failed agreements includes too many frameworks that entered force quietly, without political ownership, and therefore without political durability.

TABLE OF CONTENTS

CORE FRAME — THE MINIMUM VIABLE PEACE

- Part I:** Iran–United States: Nuclear, Military & Economic Normalization
 - I-1:** Permanent Cessation of Hostilities & Force-Use Restraint Compact
 - I-2:** Permanent Non-Proliferation Framework & Nuclear Dignity Doctrine
 - I-3:** Enrichment Suspension, Fordow Conversion & Civilian Energy Guarantee
 - I-4:** Return of Frozen Sovereign Assets — Staged, Verified, Irreversible
 - I-5:** Phased Sanctions Relief — Friction-Locked, Commercially Anchored
 - I-6:** Iranian Energy Reintegration & U.S. Commercial Access
 - I-7:** Regional Security Dialogue & Proxy Wind-Down Framework
 - I-8:** Strait of Hormuz & Maritime Corridor Obligations
- Part II:** Israel–Lebanon–Hezbollah: Security Architecture & Sovereignty
 - II-1:** Permanent Attack Prohibition & International Attribution Tribunal
 - II-2:** Disputed Territories Restoration — Phased, Security-Buffered
 - II-3:** Hezbollah Institutional Integration & Southern Lebanon Governance
 - II-4:** LAF Capacity Building & Israeli 7-Year Phased Withdrawal
 - II-5:** Civilian Protection Command & Casualty Insurance Pool
- Part III:** Joint Compact Commission, Dispute Architecture & Contingency Protocols
 - III-1:** The Joint Compact Commission (JCC)
 - III-2:** Dispute Resolution Hierarchy — Three-Tier Architecture
 - III-3:** The Crescent Cycle — Mechanics & Transition Rules
 - III-4:** Weighted Breach Index (WBI) & Compliance Scoring
 - III-5:** Contingency Protocol Register — Eight Pre-Committed Protocols

PROGRESSIVE ARCHES — DEEPER STRUCTURAL PEACE

- Part IV:** Israel–Arab Normalization & Extended Abraham Accords
- Part V:** Yemen Conflict Resolution & Red Sea–Hormuz Maritime Security
- Part VI:** Iraq Stabilization, Militia Integration & Sovereignty Restoration
- Part VII:** Syria De-escalation, Reconstruction & Golan Pathway
- Part VIII:** Regional Economic Integration, Arms Control & Counterterrorism

IMPLEMENTATION ARCHITECTURE

- Annex A:** Crescent Cycle Full Mechanics & Incentive Acceleration (IAM)
- Annex B:** Contingency Protocol Register — Full Specifications
- Annex C:** Verification Architecture — Five-Channel Multi-Source System
- Annex D:** Domestic Ratification Pathways
- Annex E:** Implementation Sequencing Matrix
- Annex F:** Humanitarian & Refugee Framework
- Annex G:** Interpretive Registry & Pre-Agreed Definitions
- Annex H:** Calibration Summary & Strategic Balance Assessment
- Annex I:** Modular Verification Systems — Five Technology Modules (NEW v1.3)
- Annex G §G.8:** Consolidated Material Breach Definition & Cross-Reference Table (NEW v1.4)
- Annex G §G.9:** JCC Voting Authority Matrix — 19-Row Consolidated Reference (NEW v1.4)
- Annex J:** Strategic Narrative Protocol — Parallel Communications Framework (NEW v1.5)

CORE FRAME — PART I

Iran–United States: Nuclear, Military & Economic Normalization

Part I constitutes the irreducible foundation of the Crescent Compact. Its provisions are mutually conditioning: nuclear verification and sanctions relief proceed in locked tandem. No party may accept economic provisions while deferring security provisions. The 3-3-2-1 structure ensures parity: Iran receives three core political wins (cessation of hostilities, force-use restraint, non-interference guarantee); the U.S. receives three core security wins (non-proliferation legislation, enrichment suspension, verified challenge inspection regime). Economic provisions are jointly beneficial, sequenced to reinforce rather than undermine security provisions at every stage.

IRAN MAX

I-1: Permanent Cessation of Hostilities & Force-Use Restraint Compact (FURC)

Upon Compact entry into force, all direct and proxy military operations between Iran and the United States permanently cease. This obligation is **institutional, not personal**: it binds both states as corporate entities, not their current leadership. Successor governments inherit it in full without renegotiation. The Compact is deposited with the UN Secretary-General and constitutes binding international law independent of signatory government continuity.

Force-Use Restraint Protocol (FURP) — Presidential Policy Directive Architecture (REVISED v1.7): Once IAEA certifies Iranian compliance with nuclear provisions I-2 through I-3 for two consecutive Crescent Cycles, the U.S. President issues and maintains a Presidential Policy Directive (PPD) establishing U.S. restraint on initiating military operations against Iranian territory absent: (a) verified imminent armed attack under UN Charter Article 51; or (b) JCC determination of material breach.

Constitutional architecture: The FURP is explicitly structured as a PPD-based restraint protocol grounded in the President's own statutory national security authority, not as a binding treaty obligation creating Congressional consent requirements. The PPD is renewable every 180 days upon JCC certification of continued Iranian compliance. Non-renewal or revocation does not constitute a Compact breach, but triggers a 30-day JCC notification and Iran's right to suspend Compact economic obligations proportionately during the review period. **Operational effect:** The FURP behaves identically to the prior FURC in practice — restraining U.S. military action against a compliant Iran — while presenting a constitutional profile that does not trigger Senate treaty consent or Pentagon veto. The 18-month stability lock from v1.1 is preserved: the PPD designates its first 18 months as 'continuity-critical' under the Congressional Continuity Shield (see III-1), requiring supermajority to override. Israeli participation: full speaking rights; 72-hour expedited review; U.S. consultation required before major military action but not automatic operational support.

Non-Interference Covenant (NIC): Both parties permanently prohibit: covert financing of opposition with destabilization intent; cyber operations against electoral or governance infrastructure; **state-sponsored propaganda campaigns using fabricated evidence, including specifically: AI-generated synthetic media (deepfakes) targeting electoral candidates or officials; algorithmically amplified disinformation networks targeting electoral infrastructure or voting-system integrity; fabricated intelligence dossiers designed to trigger political or military responses;** physical sabotage timed to political transitions; support for armed challenges to constitutional authority. The explicit specification of AI/deepfake interference is intended to prevent subjective disputes over what constitutes 'propaganda' — routine state media, counter-narratives, and political commentary remain fully permitted. **Permitted:** intelligence collection on military capabilities; diplomatic pressure; public criticism; academic analysis; journalism; human rights documentation organizations not engaged in partisan political activity.

■ FURC Anti-Gaming Lock

FURC cannot be suspended unilaterally within 18 months of entry into force. After 18 months, 90-day advance notice plus JCC majority vote required. Suspension for 'policy preference' or 'changed administration' is explicitly prohibited — only verified material breach or Article 51 triggers recognized. Any U.S. President invoking emergency suspension must certify in writing to the Gang of Eight within 7 days. This provision specifically addresses the scenario of a hawkish successor administration seeking to unilaterally dismantle the framework.

US MAX

I-2: Permanent Non-Proliferation Framework & Nuclear Dignity Doctrine

Iran, in a sovereign act codifying its own doctrinal prohibition on nuclear weapons, enacts through the Majlis: (a) domestic legislation criminalizing nuclear weapons development with minimum 20-year penalties for individuals and corporate criminal

liability for institutions; (b) an independent **Civilian Nuclear Oversight Council (CNOC)** reporting jointly to the Majlis and the IAEA with quarterly public reports and mandatory referral authority; **CNOC Institutional Framework (SIMPLIFIED v1.7)**: The Compact establishes the CNOC's mandate and composition principles; detailed institutional design is delegated to Iranian domestic implementing legislation to be enacted within 18 months of Compact entry into force. Mandate: the CNOC is an independent civilian oversight body with authority to review, audit, and report on all Iranian civilian nuclear activities covered by this Compact; quarterly public reports to the Majlis and IAEA; mandatory referral authority to the IAEA Board of Governors for verified compliance concerns. Composition principles (minimum requirements for domestic legislation): (i) civilian composition — no active military or IRGC personnel; (ii) scientific literacy — majority of members must hold qualifications in nuclear science, engineering, or related disciplines; (iii) IAEA reportability — the CNOC chair submits directly to the IAEA; no ministry may filter or delay CNOC reports to the IAEA. Domestic legislation establishing the CNOC is submitted to the JCC for information within 30 days of enactment. Failure to enact implementing legislation within 18 months accumulates 2 WBI points as an institutional obligation breach; (c) mandatory automatic UNSC referral for any verified fissile-material diversion, triggered by IAEA Director General certification without requiring additional Iranian authorization. Guardian Council review proceeds with a constitutional conformity presumption. The religious-legal dimension is satisfied by either a Guardian Council declaration affirming the nuclear weapons fatwa or an Assembly of Experts formal opinion — the U.S. acknowledges either mechanism fully satisfies this provision.

Iranian Sovereign Right to Peaceful Nuclear Energy — Affirmation (NEW v1.7): The Compact explicitly and unambiguously recognizes Iran's sovereign right to peaceful nuclear energy under the Nuclear Non-Proliferation Treaty and customary international law. Iran's voluntary enrichment limits, verification obligations, and Fordow conversion under this Compact constitute sovereign choices made in exchange for concrete reciprocal benefits — not imposed constraints or admissions of prior non-compliance. The Compact's non-proliferation architecture supplements Iran's NPT rights; it does not abrogate them. Iran retains the right to resume full enrichment activities consistent with its NPT rights if the Compact is terminated or if the U.S. fails to fulfill its reciprocal obligations. Nothing in this Compact shall be construed as a permanent waiver of any Iranian right under the NPT or customary international law.

Nuclear Dignity Doctrine: All IAEA monitoring is publicly framed as 'compliance parity' — identical in scope to obligations accepted by Brazil, Argentina, South Africa, and Japan. Both parties jointly publish a Normalization Narrative within 30 days, approved by JCC. Unauthorized official framings of Iran's obligations as 'punitive surveillance' or 'imposed capitulation' accumulate 0.5 WBI points per incident.

Narrative Sovereignty Clause (NEW v1.7): Each party retains sovereign control over domestic narrative framing of Compact provisions, provided such framing does not materially contradict verified obligations or incite breach-triggering behavior. The Yellow/Red Card system penalizes externally-directed escalatory statements; this Clause protects domestic parliamentary communication. Framing for your own parliament is protected; framing designed to provoke the other party is not.

Fissile Material Custody: Iran's entire stockpile of uranium enriched above 3.67% is transferred in two equal tranches over 12 months. Tranche 1 (50%) transferred within 90 days to a mutually agreed third-country consortium. If no agreement within 60 days, automatic fallback to in-country dilution under continuous IAEA supervision activates without further negotiation. The U.S. may not veto all proposed recipient states without offering a viable alternative — persistent deadlock without U.S. counterproposal triggers automatic dilution fallback. Tranche 2 transferred or diluted by Month 12. Iran retains nominal ownership of material in third-country custody; return requires unanimous JCC consent plus IAEA Director General certification of legitimate civilian need.

■ **Tranche Anti-Deadlock, Anti-Diversion & Dual-Key Dilution Rules (v1.7)**

If recipient-state negotiations deadlock for 60 days, automatic dilution activates. DUAL-KEY DILUTION PROTOCOL (REVISED v1.7): In-country dilution is executed by Iranian technical staff under mandatory dual-key oversight: (a) IAEA-resident inspector holds Key A — provides real-time material accountancy certification and physical presence throughout the process; (b) a neutral technical observer from the JCC-approved roster (Switzerland, Sweden, Canada, Japan, or South Korea) holds Key B — independently verifies chain-of-custody documentation and co-signs the dilution certificate. Neither key-holder operates equipment; Iranian staff operate equipment under their observation. Chain-of-custody documentation is co-signed by: Iranian AEOI representative, IAEA inspector, and neutral technical observer. Rationale (revised): dual-key oversight achieves equivalent verification confidence to contractor-only execution while preserving Iranian technical sovereignty over the process — directly addressing the sovereignty objection that neutral-contractor-only execution raised. If Iran requests fissile material return within 24 months without JCC consent, Tranche 2 compliance restoration triggers. All logistics pre-agreed before Compact entry into force.

US MIN

I-3: Enrichment Suspension, Fordow Conversion & Civilian Energy Guarantee

Iran voluntarily suspends all uranium enrichment above 3.67% within 30 days of Compact entry into force. All enrichment infrastructure placed under continuous IAEA monitoring; stockpiles capped at 300 kg UF6. Conversion to non-operational status: (a) physical removal of centrifuge rotors and bellows to IAEA-supervised third-country storage or in-place welding; (b) continuous IAEA camera coverage; (c) quarterly neutral-state technical audits verifying irreversibility. Reconversion requires unanimous JCC consent plus 90-day advance notice. **R&D; Preservation:** Iran retains 164 centrifuges (IR-1 equivalent) at Natanz for technical institutional capacity under 24-hour IAEA camera coverage — no enriched material accumulation permitted. This preserves Iran's scientific institutional dignity while maintaining enrichment far below weapons-relevant threshold.

Fordow Conversion: Fordow converts to the International Persian Gulf Medical Isotope Research Center (IPGMIRC) under IAEA monitoring with an international scientific advisory board including U.S., European, and regional scientists. All military personnel withdraw within 90 days; IRGC retains no operational role. Within 5 years Iran supplies 35% of global medical isotope market at full capacity — \$200M annual revenue stream. **Revised Timeline and Capacity Bridge Agreement (v1.2):** Market capture target extended from 5 to 10 years, reflecting realistic isotope production ramp-up constraints. To prevent a supply vacuum during transition, a Capacity Bridge Agreement is negotiated with European suppliers (Netherlands NRG, Belgium SCK-CEN, France CEA/Orano) within 12 months of Compact entry into force: (a) European suppliers maintain current production levels for Years 1–5; (b) Fordow production ramps progressively — 10% global share by Year 3, 20% by Year 6, 35% by Year 10; (c) European suppliers reduce output proportionally as Fordow capacity is verified, ensuring no global isotope shortage during transition. Center receives priority access to WHO/IAEA initiatives and G7/EU research programmes.

Civilian Energy Guarantee: The U.S. commits to launching Section 123 Agreement negotiations on Day 1, with agreed terms within 30 days and Congressional submission within 180 days. If Senate fails to ratify within 180 days, automatic alternative performance activates: IAEA LEU Bank (Kazakhstan) or equivalent multilateral fuel bank; third-country fuel supply with U.S. non-objection guarantees; continuation of sanctions relief for fuel-related transactions regardless of 123 Agreement status. Iran's civilian energy needs are never held hostage to U.S. legislative politics. **Bushehr cooperation:** U.S. provides spare parts licensing within 90 days, independently of all other provisions.

IRAN MOD

I-4: Return of Frozen Sovereign Assets — Staged, Verified, Irreversible

All frozen Iranian sovereign assets released with interest (U.S. Treasury rates). Released funds constitute return of sovereign property, not U.S. payment or reparations. Release follows verified compliance milestones:

Tranche / Timeline	Amount	Verification Trigger
Tranche 1 — Day 30	5% (liquidity bridge)	Compact entry into force only. Immediate humanitarian & economic liquidity bridge preventing Iranian economy from seizing during the negotiation window. NOT contingent on nuclear milestones. Non-reversible.

Tranche / Timeline	Amount	Verification Trigger
Tranche 2 — Day 90	40% (primary release)	Full verified completion of 60% enriched uranium Tranche 1 dilution or export as certified by IAEA — not merely IAEA arrival or baseline deployment. Enrichment cap independently confirmed. Combined Days 1–90 release: 45%. This prevents the prior structure where 25% was released for mere IAEA baseline deployment.
Tranche 3 — Day 180	20%	Fordow conversion 50% complete; IAEA 3-cycle compliance certification
Tranche 4 — Day 270	15%	Full 60% stockpile disposition; IAEA 5-cycle certification
Tranche 5 — Day 360	10%	12-month sustained compliance; non-proliferation legislation enacted
Reserve Fund	10%	Held against material breach; released automatically at Month 24 if clean

Irreversibility Protocol: Once released, funds transferred to Iran's Central Bank. No re-freeze within 12 months of release. If U.S. reimpose sanctions, Iran retains 100% of released funds plus LIBOR+3% penalty interest. Re-freezing requires: 60-day JCC majority process; IAEA Director General material breach certification; Congressional 30-day notification. Earliest-released tranches may never be re-frozen regardless of subsequent developments — completed sovereign property return is permanent.

US MOD

I-5: Phased Sanctions Relief — Friction-Locked, Commercially Anchored

Nuclear-related sanctions lift in phases corresponding to IAEA-certified Crescent Cycle completions. Humanitarian exemptions (medicine, equipment, food, agricultural inputs) activate Day 1 concurrently with IAEA deployment. Upon initial enrichment suspension certification: U.S. supports Iran's World Bank IDA membership application and authorizes Boeing/Airbus civilian aircraft parts licenses.

Sanctions Inertia Buffer (SIB): Reimposition of any nuclear-related sanctions requires 90-day JCC majority process plus 60-day commercial wind-down — 150-day minimum interval. No compliance restoration within this window. Partial reimposition requires 45-day JCC process. Full reimposition requires unanimous JCC vote plus IAEA Director General material breach certification — a technical determination, not a political one.

Targeted Individual Sanctions Snap-Forward (NEW v1.7): The U.S. retains the right to impose targeted sanctions on specific named individuals — persons credibly identified as directing, executing, or materially enabling violations of Compact obligations — without triggering the full Compliance Restoration Protocol ladder. Targeted individual sanctions: (a) are directed at named natural persons or entities, not at Iranian state institutions or the Iranian economy broadly; (b) require JCC notification within 24 hours of imposition with factual justification; (c) may be challenged by Iran through the Rapid Panel within 14 days; (d) do not constitute a Compact breach or trigger Iranian reciprocal measures unless the JCC majority determines they are designed to circumvent the Compliance Restoration Protocol rather than to address genuine individual violations. Rationale: the U.S. will face domestic pressure to ‘do something’ about specific violators without collapsing the broader framework. This mechanism provides a targeted valve that satisfies that pressure without triggering general sanctions restoration.

U.S. Congressional Continuity Shield (NEW v1.7): All executive authorities exercised under this Compact — FURP Presidential Policy Directive, humanitarian exemptions, aviation parts licenses, oil services licensing — are designated as ‘continuity-critical national security measures’ by concurrent executive order. This designation triggers expedited legislative review procedures and presumptive waiver continuity: existing measures remain operative unless overturned by supermajority (two-thirds of both chambers). Simple majority resolutions of disapproval are insufficient. Operates within existing constitutional authority; requires only the executive order at signing, not new legislation. Raises the political and procedural cost of Congressional sabotage without requiring upfront Congressional approval.

Compliance Restoration Friction Ladder: Step 1 — WBI 5.0+: JCC warning statement plus enhanced monitoring; 48-hour interval; no economic effect. Step 2 — WBI 8.0+ or 2-cycle minor breach pattern: targeted sector freeze plus new banking review;

14-day minimum interval. Step 3 — verified material breach plus WBI 12+: full reimposition consideration; 30-day interval plus IAEA certification required. No single-step escalation from compliance to full Compliance Restoration is permitted under any scenario.

Private Sector Sanctity Shield (PSSS): Commercial contracts certified under PSSS protocol receive 24-month post-compliance restoration protection: asset freeze exemption, banking channel continuation, legal standing in neutral arbitration (Singapore or Swiss chambers), JCC advocacy support. Certification requires: 12+ month duration, 3+ national jurisdictions, neutral arbitration clause, political risk insurance. Creates domestic U.S. commercial constituency with financial opposition to reimposition.

IRAN MOD

I-6: Iranian Energy Reintegration & U.S. Commercial Access

Iran restores pre-sanctions oil export capacity (2.0 million barrels/day) within 24 months. Iran accedes to EITI; publishes quarterly production and revenue data; transparent competitive bidding for all new field development contracts under EITI standards.

U.S. Commercial Access: U.S. firms participate, on a commercially competitive basis, in up to 25% of new field development contracts in South Pars (gas) and Azadegan (oil). No nationality-based contract awards. European and Asian firms receive equal bidding status. This creates a major U.S. business constituency — energy, oilfield services, financial services — with direct financial interest in Compact stability.

15-Year Oil Sanctions Moratorium (Retained as Commercial Certainty Anchor): The 15-year moratorium is preserved as the primary commercial certainty mechanism anchoring U.S. business constituencies. Automatic 5-year extensions unless either party provides 24-month advance notice of non-extension. Survives technical lapse unless material breach is verified by IAEA and confirmed by JCC. **U.S. Congressional Consultation Clause (NEW v1.7):** The Executive Branch provides quarterly classified briefings to the Congressional Gang of Eight on Compact implementation, plus notification within 7 days of any Category A breach, within 48 hours of any Ambassador Override invocation, and before major U.S. military action implicating FURP. Consultative, not approval-seeking.

Rolling 5-Year Presidential Certification (Congressional Bypass — NEW v1.2): In addition to the moratorium, the U.S. President may issue a Rolling 5-Year Certification based on JCC compliance reports, renewed annually, that authorizes continued waiver of any Congressionally-imposed oil sanctions inconsistent with the moratorium. This creates a dual-track protection: the moratorium provides commercial certainty for private-sector planning; the Presidential Certification provides an executive override to prevent Congressional obstruction from collapsing the framework. The certification is grounded in the President's national security waiver authority and does not require affirmative Congressional action to remain effective.

Mutual Pain Index: If U.S. reimpose oil-related sanctions, Iran may proportionately adjust enrichment pace and initiate commercial countermeasures. Both sides bear measurable costs — preventing unilateral cost-free escalation.

US MOD

I-7: Regional Security Dialogue & Proxy Wind-Down Framework

Both parties commit to structured bilateral consultations on regional stability through a dedicated diplomatic channel separate from nuclear provisions.

Proxy Wind-Down Protocol: Iran commits to phased reduction of operational military support to designated proxy organizations. Three-year milestones: Year 1 — cessation of advanced weapons transfers (precision-guided munitions, drone components, anti-ship missiles) to groups operating against U.S. or allied partners; Year 2 — 50% reduction in IRGC Quds Force personnel in external operational deployments; Year 3 — full transition to non-operational advisory status. Failure to achieve any milestone triggers: suspension of subsequent sanctions tranches; freeze on new U.S. oilfield services licenses; JCC review of 123 Agreement timeline. Political and cultural ties between Iran and regional communities remain fully permitted — only operational military command and weapons flows are prohibited.

Cyber Non-Escalation Protocol During Disputes (NEW v1.7): Neither party may initiate offensive cyber operations against the other's critical infrastructure or against the Compact's own operational infrastructure while a JCC dispute resolution process is underway. Confirmed violation during active dispute: 4 WBI points.

Iran's Missile Sovereignty: Iran's ballistic missile capabilities are acknowledged as within its national defense prerogative and are not addressed by Core Frame provisions. Separate bilateral missile transparency discussions may be initiated if both parties agree — treated as a Year 2–3 Progressive Arch matter. **Voluntary Year-2 Confidence-Building Data Exchange (CBDE) Pilot (NEW v1.4):** Beginning in Year 2 of the Compact, Iran may voluntarily submit a Missile Confidence Declaration (MCD) to the JCC. Participation is entirely voluntary — no WBI penalty attaches to non-participation, and non-participation may not be cited as evidence of non-compliance in any JCC or arbitration proceeding. MCD contents (if submitted): declared summary of ballistic

missile inventory by range category (below 500km / 500–2000km / above 2000km), general geographic basing regions (not specific coordinates), and total inventory count per category. No centrifuge data, no guidance system specifications, no warhead information, and no targeting data. MCD handling: the declaration is filed in a sealed format with the JCC Secretariat, reviewed only by a three-person neutral technical panel (Swiss, Brazilian, Singaporean experts with security clearances). The panel issues a single public finding: ‘Missile Confidence Declaration received and logged.’ No contents are disclosed. No verification inspections, no caps, no operational restrictions derive from the MCD. Political value: gives U.S. negotiators a demonstrable ‘missile transparency’ deliverable for Congressional presentation without binding Iran to any missile limitation. This reflects the operational reality that demanding Iranian missile disarmament as a Core Frame precondition has historically prevented any agreement, while a voluntary pilot creates an on-ramp to future transparency without sovereign cost.

JOINT

I-8: Strait of Hormuz & Maritime Corridor Obligations

Direct Military-to-Military Deconfliction Lines (NEW v1.7): Direct, secure military-to-military deconfliction channels are established and maintained between all relevant parties, operating independently of JCC processes for real-time incident management. These channels operate 24/7 and require no JCC authorization to use — they are direct military communications, not diplomatic communications. Required channels: (a) U.S. CENTCOM – Iranian Armed Forces direct line: response within 2 hours for any incident report; pre-agreed de-escalation language protocols; (b) Israeli IDF – LAF – UNIFIL trilateral channel: response within 1 hour for Blue Line incidents; (c) Saudi SANG – Houthi military command channel through Omani facilitation: response within 4 hours for Yemen ceasefire incidents; (d) IMCA Maritime Operations Center: 24/7 channel for all Hormuz and Red Sea incidents, routing to relevant party military commands within 30 minutes. Deconfliction channel communications are privileged: they are not discoverable in any JCC proceeding and may not be used as evidence of breach or admission. Their sole purpose is real-time incident management.

Iran permanently commits to unobstructed commercial passage through the Strait of Hormuz and participates in the International Maritime Corridor Authority (IMCA) established in Part V. Iranian sovereignty over adjacent territorial waters is explicitly acknowledged; the commitment is non-interference with innocent passage conforming to UNCLOS — not a sovereignty waiver. Any interdiction triggers automatic IMCA emergency session within 4 hours. The 15-year oil sanctions moratorium (I-6) suspends automatically if Iran unilaterally blocks transit, creating structural economic cost for maritime disruption independent of military deterrence.

CORE FRAME — PART II

Israel–Lebanon–Hezbollah: Security Architecture & Sovereignty

Part II addresses the most structurally complex node in the region: a trilateral involving a state (Israel), a state with fractured sovereignty (Lebanon), and an armed non-state political-military organization (Hezbollah) whose participation is required for any durable arrangement but whose full formalization is politically impossible in Year 1. The Compact treats Hezbollah's political wing as a recognized political actor within the Lebanese constitutional framework for purposes of Compact implementation — not a terrorist organization for framework purposes — while requiring verifiable operational constraints as the price of institutional legitimacy. This approach reflects the operational reality that Hezbollah cannot be wished away, that Lebanon cannot assert sovereignty without its cooperation, and that Israel's security interests are better served by a regulated Hezbollah within state architecture than an unregulated one outside it.

ISRAEL MAX

II-1: Permanent Attack Prohibition & International Attribution Tribunal

Israel and Lebanon register a Permanent Non-Aggression Treaty (PNAT) under UN Charter Article 102. Lebanon bears state responsibility for all attacks originating from its territory against Israel regardless of which actor launches them. This state-responsibility doctrine is the critical legal innovation: it creates an Israeli security guarantee that does not depend on Hezbollah's goodwill but on Lebanon's structural accountability.

Attack Categories: (a) Rocket and missile attack; (b) Drone/UAV attack; (c) Infiltration attack — armed personnel crossing the Blue Line; (d) Cyber-physical attack targeting Israeli critical infrastructure with kinetic effect; (e) Indirect attack — facilitation, financing, or C2 support from Lebanese territory.

International Attack Attribution Tribunal (IAAT): Permanent body at The Hague with judges from Switzerland, Singapore, Brazil, South Africa, Norway. **Revised Timeline (reflecting forensic scientific realities):** (a) **4-Hour Freeze Declaration:** upon any reported attack, IAAT issues an automatic Freeze Declaration within 4 hours — all parties commit to no retaliatory military action during the attribution process. The Freeze Declaration does not prejudice attribution; it prevents the attribution window from becoming a war window; (b) **7-Day Preliminary Attribution:** IAAT issues a preliminary classification (attributable/non-attributable/inconclusive) within 7 days, based on available physical, digital, and satellite evidence. Preliminary classification determines whether Response Cascade Phases 1–2 activate; (c) **21-Day Final Ruling:** full forensic investigation including propellant residue analysis, casing metallurgy, biometric data, and independent laboratory verification. Binding final ruling within 21 days. Phases 3–6 of the Response Cascade activate only upon final ruling. Appeal within 14 days of final ruling suspends Phases 3–6 for 7 days pending expedited review.

Israeli Fast-Track Self-Defense Carve-Out (NEW v1.7): In cases of active, ongoing multi-vector attack posing immediate civilian risk — defined as simultaneous attacks from two or more vectors (rocket + drone, infiltration + cyber, or equivalent) with verified impact on Israeli populated areas — Israel retains a limited-duration proportional response authority of up to 24 hours prior to IAAT preliminary classification. Parameters: (a) response proportional to ongoing attack, directed at identified launch sites; (b) JCC Crisis Hotline notification within 1 hour; (c) response authority expires after 24 hours regardless; (d) post-action IAAT review mandatory within 7 days; (e) disproportionate invocation: 3 WBI points.

Israeli Reciprocal Restraint: Israel commits to no offensive military operations in Lebanese territory absent: (a) verified ongoing attack; (b) IAAT attribution; or (c) JCC material breach determination. All Israeli military overflights of Lebanese airspace cease within 60 days, with sole exception of Blue Line altitude-restricted reconnaissance. **Modified Notification Protocol (v1.2):** Pre-mission advance notice replaced with post-flight notification within 1 hour of Blue Line crossing. Rationale: advance notice of intelligence overflights tips off surveillance targets and structurally compromises mission value. Exception: pre-planned humanitarian corridor reconnaissance retains advance notice. **Humanitarian Corridor Exception Scope and Limits (NEW v1.4):** Pre-planned humanitarian corridor reconnaissance applies only to: (a) flights explicitly scheduled in support of a named active humanitarian operation under UNOCHA, ICRC, or UCPC auspices; (b) maximum frequency of two advance-notice flights per humanitarian corridor per week — any additional flights in the same corridor that week revert to post-flight notification; (c) advance notice must specify flight path, altitude, duration, and named humanitarian operation being supported — generic 'humanitarian purpose' designations are not sufficient; (d) Lebanon may flag a specific advance-notice flight as operationally sensitive within 2 hours of notification, converting it to post-flight reporting — Israel acknowledges the flag and proceeds under post-flight rules for that flight only. This scope prevents the humanitarian exception from being used as a blanket advance-notice

workaround for routine intelligence gathering. Standard intelligence-gathering flights use post-flight reporting in all cases. Israel commits to monthly aggregate overflight reporting to JCC for all flights, maintaining transparency without operational compromise.

■ Attribution Anti-Exploitation & Disruption Actor Lock

IAAT cannot be invoked more than once per 30-day period without JCC approval — prevents litigation weaponization. Disruption Actor attacks by third parties designed to trigger IAAT response activate the Disruption Attribution Protocol (Annex B) — joint investigation with default non-attribution, preventing war triggered by proxy deception.

LEBANON MAX

II-2: Disputed Territories Restoration — Phased, Security-Buffered

Israel commits to complete withdrawal from Shebaa Farms, Kfar Shouba Hills, and northern Ghajar through a three-phase protocol verified by independent technical team (Swiss, Brazilian, Indonesian experts). Withdrawal occurs within a security architecture, not a vacuum.

Phase	Territory	Actions & Conditions
Phase 1 (M1–12)	Kfar Shouba Hills	Israeli military withdrawal; LAF security within 60 days; \$100M environmental restoration fund
Phase 2 (M13–36)	Shebaa Farms partial	Israeli presence reduced 50%; LAF-UNIFIL joint patrol; bilateral Litani water authority established
Phase 3 (M37–60)	Full restoration + Ghajar	Complete Shebaa withdrawal; 2km demilitarized buffer zones; Ghajar enters 5-year UN Administrative Cooling-Off Period before referendum

Blue Line Demarcation Roadmap (NEW v1.7): The phased territorial restoration (Phases 1–3) is supported by a parallel cartographic process to definitively resolve Blue Line ambiguities and disputed points: Phase 1 (concurrent with territorial Phase 1): UN Cartographic Support Mission (UNCSCM) deploys to map all Blue Line segments using modern satellite survey methods; both parties designate technical representatives to the UNCSCM; disputed points are catalogued and flagged for Phase 2 resolution. Phase 2 (concurrent with territorial Phase 2): UNCSCM issues definitive cartographic determinations on disputed Blue Line segments using the 1923 boundary treaty as primary reference; determinations are non-binding but automatically entered into the Precedent Registry; either party may challenge a determination to the Rapid Panel. Phase 3 (concurrent with territorial Phase 3): definitive Blue Line agreed upon, registered with the UN Secretariat, and physically demarcated with jointly agreed markers. Demarcated line governs all future territorial dispute resolution. Rationale: the phased territorial restoration creates a perverse incentive to delay demarcation (ambiguity benefits the occupier); the parallel cartographic timeline ensures that territorial hand-over and cartographic certainty progress together.

Ghajar 5-Year UN Administrative Cooling-Off Period (NEW v1.2): Rather than an immediate referendum upon Phase 3 completion, Ghajar enters 5 years of UN civil administration: (a) UN administers local services, courts, and land registry; (b) Lebanese and Israeli residents retain full civil rights and access; (c) no political campaigning for referendum outcomes permitted; (d) UN administrator facilitates community reconciliation programs. Referendum on permanent status takes place only after the 5-year cooling-off period when sectarian temperatures have normalized. Rationale: an immediate referendum during Phase 3 withdrawal creates maximum sectarian friction at the most politically fragile moment. **Referendum Neutrality Clause (NEW v1.6):** The Compact explicitly provides that the outcome of the Ghajar referendum is not pre-determined by this framework. The three options — reunification under Lebanon, divided administration, or joint governance — are equally valid and none is structurally favored. Neither Israel nor Lebanon may condition any Compact provision on a particular referendum outcome in advance. The UN administrator is explicitly prohibited from advocating for any particular outcome during the cooling-off period. Rationale: frameworks that appear to predetermine outcomes produce performative engagement — parties participate rhetorically while working to prevent the process from reaching a conclusion. Genuine neutrality is the prerequisite for genuine community participation.

Technical Lapse Protocol (TLP): If security conditions deteriorate during transition, phase freezes for 90 days without reverting. Independent technical team certifies readiness unanimously for each transition. Prevents either side using security incidents to permanently block territorial restoration.

Border Economic Zone Development Fund (BEZDF): The \$2 billion figure is reframed as a Border Economic Zone Development Fund, jointly financed 50/50 by Israel (\$1B) and Gulf states (Saudi Arabia + UAE, \$1B combined), paid through World Bank trust fund over 10 years: 70% to affected communities, 30% to Lebanese state reconstruction. This reframing serves three structural purposes: (a) removes the domestic Knesset liability that makes 'reparations' politically lethal in Israeli parliamentary politics; (b) draws Gulf states into a joint financial stake in Lebanese border stability; (c) preserves full economic value for Lebanese communities while making the instrument Knesset-ratifiable. Payments do not constitute admission of legal liability.

HEZBOLLAH PART.

II-3: Hezbollah Institutional Integration & Southern Lebanon Governance

The Compact treats Hezbollah's political wing as a recognized political actor within the Lebanese constitutional framework for purposes of Compact implementation. The military wing undergoes structured transformation through the **Southern Lebanon Governance Architecture (SLGA)** — operational constraint within a state-regulated framework that transforms Hezbollah from an external armed actor into a licensed sub-state security contractor under LAF supervision.

Joint Security and Reconstruction Zone (JSRZ): A 5-kilometer strip north of the Blue Line governed tripartitely: LAF (45%), Hezbollah-designated security coordinators under LAF chain of command (30%), international observers — UNIFIL + EU monitors (25%). Coordinators formally licensed by Lebanon's Ministry of Interior as 'sub-state security contractors,' transforming legal status without requiring political surrender.

Weapons Registration & Constraints: Hezbollah military personnel in JSRZ register with LAF within 60 days. Permitted: small arms (rifles, machine guns, RPGs) with quantities registered with LAF and UNIFIL. Prohibited: rockets, missiles, drones, anti-tank systems above 85mm. **Specialized International Weapons Seizure Team (SIWST) Confiscation Protocol (NEW v1.2):** Confiscation of prohibited heavy weapons is executed exclusively by a SIWST rather than LAF personnel. SIWST composition: military engineers from Switzerland, Norway, and Singapore; UNIFIL explosive ordnance disposal specialists; and UN weapons inspectors with applicable technical credentials. Rationale: direct LAF confiscation of Hezbollah heavy weapons creates unacceptable risk of either (a) kinetic confrontation between LAF and Hezbollah units, or (b) quiet rubber-stamping where LAF units record confiscation without executing it. The SIWST removes both risks by eliminating the LAF-Hezbollah direct confrontation dynamic while providing internationally witnessed chain-of-custody documentation. Annual independent audit by Norwegian, Swiss, Singaporean experts with public report.

Concurrent Independent Verification of Initial Registration (CIVIR): The independent technical team (Norwegian, Swiss, Singaporean experts) must be physically present and co-sign the initial 60-day registration process alongside LAF. The LAF may not complete registration alone. CIVIR operates as follows: (a) the independent team conducts its own parallel physical inventory of all weapons in the JSRZ concurrently with the LAF registration, using separate documentation and chain of custody; (b) if the LAF inventory and the independent team's inventory diverge by more than 5% on any weapons category, the discrepancy is automatically referred to the JCC Rapid Panel within 72 hours before registration is certified as complete; (c) registration is not legally effective until both the LAF and the independent team have independently certified their inventories and discrepancies have been resolved; (d) any LAF-certified registration that is subsequently found to have omitted weapons categories discovered in the independent audit constitutes a WBI-accumulating institutional breach (2 points) attributed to Lebanon as the responsible state party. This provision exists specifically to prevent the LAF from rubber-stamping prohibited heavy weapons during the politically sensitive initial registration window, where institutional pressure to avoid confrontation with Hezbollah is highest.

Social Services Integration: Hezbollah's schools, clinics, and welfare networks become state-licensed institutions funded through Lebanese ministries with international supplement. This preserves Hezbollah's constituency base and creates structural incentive for Hezbollah leadership to support state institutional success.

Hezbollah Formal Political Party Rights and Electoral Participation Pathway (NEW v1.6): A critical finding from analysis of Hezbollah's demand structure is that institutional legitimacy — formal recognition as a political party with guaranteed participation rights — is the primary material incentive for Hezbollah's cooperation with the SLGA and JSRZ architecture. The Compact's operational constraints are politically viable for Hezbollah only if paired with explicit political participation guarantees. Accordingly:

- [1] **Formal Party Registration:** Hezbollah’s political wing is formally registered as a Lebanese political party within 60 days of Compact Part II activation, conferring full rights to: participate in Lebanese parliamentary and municipal elections; hold cabinet positions through normal coalition mechanisms; receive state-allocated electoral broadcast time and campaign funding on equal terms. The military wing’s SLGA operational constraints are separate from and do not restrict the political wing’s full participation rights.
- [2] **Electoral Non-Interference Guarantee:** Israel, the U.S., and the JCC explicitly commit not to condition any Compact provision on the outcome of Lebanese elections or on Hezbollah’s electoral performance. A Lebanese government including Hezbollah ministers remains fully recognized for all Compact purposes, provided the military wing’s SLGA constraints are verified as maintained. This separates the political question (democratic participation) from the security question (military operational constraints).
- [3] **JSRZ Governance Credits:** Hezbollah’s verified compliance with JSRZ constraints generates formal Governance Credits presentable by the political wing in electoral campaigns. The JCC publishes a quarterly Governance Performance Report for each JSRZ party on equal terms. This converts compliance into political capital — giving Hezbollah’s leadership a domestic electoral incentive to maintain JSRZ constraints rather than resist them. Military compliance becomes the price of political legitimacy, not an imposed cost.

Iranian Decoupling: Iran's Part I obligations require cessation of military funding, weapons transfers, and IRGC advisory presence to Hezbollah within 18 months, verified through SWIFT tracking, correspondent banking surveillance, and satellite monitoring of known weapons corridors. Political and cultural ties remain permitted.

■ **Hezbollah Compliance Anti-Disruption Lock**

If any Hezbollah unit conducts cross-border attacks, entire JSRZ governance architecture suspends for 30 days: all institutional recognition revoked, benefits halted, LAF assumes full JSRZ control. No negotiation during suspension. Hezbollah leadership must proactively discipline offending units to restore recognition — the organization's institutional legitimacy depends directly on its own compliance enforcement.

ISRAEL MOD

II-4: LAF Capacity Building & Israeli 7-Year Phased Withdrawal

A 7-Year Phased Security Transition Framework (PSTF) conditions Israeli security reduction on verified LAF capability expansion. \$2 billion in international military assistance over 7 years: U.S. (40%), EU (30%), Gulf states (20%), others (10%).

Phase	Israeli Posture	Lebanese Actions
Phase 1 (M1–12)	Israel consolidates	4,000 troops at 6 forward bases; offensive ops cease; LAF deploys 3,000 with international training
Phase 2 (M13–30)	Israel reduces	2,000 troops at 3 bases; LAF deploys 6,000; joint ops against common threats authorized
Phase 3 (M31–54)	Israel hands over	500 personnel at liaison base only; LAF assumes full security; joint border patrols with UNIFIL
Phase 4 (M55–84)	Normalization	Israel withdraws to Blue Line; Naqoura liaison office; bilateral security cooperation agreement

UNIFIL Mandate Modernization (NEW v1.7): UNIFIL’s mandate is upgraded concurrently with the PSTF phased withdrawal. Modernization package: (a) drone surveillance capacity: UNIFIL receives a fleet of medium-altitude UAVs for continuous Blue Line surveillance, supplementing existing ground patrols; (b) ground sensor network: acoustic, seismic, and motion-detection sensors installed along the Blue Line perimeter, feeding real-time data to the Trilateral Coordination Commission and IAAT forensic database; (c) maritime monitoring: UNIFIL’s naval component receives AIS tracking and patrol vessel upgrades for Lebanese coastal waters; (d) mandate language: UNIFIL’s Chapter VI mandate is upgraded to Chapter VI+ — retaining the consent-based framework while adding explicit authority to report weapons violations directly to the UN Security Council without requiring Lebanese government authorization. Funding: EU (40%), Gulf states (30%), U.S. (20%), others (10%).

Good Faith Conditionality: Conditions assessed by UNIFIL and Joint Transition Authority — not unilaterally by Israel — based on LAF capability indicators: force levels, operational tempo, weapons interdiction rate, Hezbollah constraint compliance. Amnesty covers all Hezbollah combatants who register and transition.

JOINT

II-5: Unified Civilian Protection Command & Casualty Insurance Pool

A Unified Civilian Protection Command (UCPC) co-located in Tyre integrates: Hezbollah Civilian Protection (30%), Lebanese Civil Defense (35%), UNOCHA (20%), ICRC (15%). Three-veto structure: state veto on internationally sensitive operations; UN veto on operations violating humanitarian law; Hezbollah delay veto on operations in its areas — not absolute block. **Tiered Veto Duration (NEW v1.2):** (a) Standard planned operations: 48-hour maximum delay; (b) Life-saving emergency operations (active casualty response, acute medical emergencies, imminent civilian danger): 12-hour mandatory non-extendable cap. The 12-hour cap aligns the procedural veto with the core humanitarian non-suspendability clause: the right to be consulted cannot override the obligation to save lives. UCPC UN Chair makes final emergency/non-emergency classification within 2 hours. No single party controls protection operations.

Civilian Casualty Insurance Pool (CCIP): \$500 million fund (Gulf states 40%, EU 30%, Lebanon 15%, UN 15%) compensates all civilian property damage regardless of which side caused harm. No-fault, need-based, politically neutral. Claims adjudicated within 60 days by independent three-person panel.

CORE FRAME — PART III

Joint Compact Commission, Dispute Architecture & Contingency Protocols

Part III is the institutional backbone of the Crescent Compact. The Joint Compact Commission (JCC) is deliberately over-engineered for failure tolerance: designed to function when principal parties are in open dispute, when leadership transitions occur, or when regional shocks destabilize participating governments. The JCC is not a diplomatic forum but a governance institution with binding authority.

III-1: The Joint Compact Commission (JCC)

Composition: Iran (2 seats), U.S. (2 seats), Israel (1 seat, security matters only — no vote on nuclear/sanctions/asset decisions), Lebanon (1 seat), Saudi Arabia (1 seat), Iraq (1 seat), UN Neutral Chair (1 seat rotating from pool: Switzerland, Singapore, Oman, Brazil, Sweden — each party may strike one per dispute). Hezbollah holds observer status with speaking rights on JSRZ and southern Lebanon matters. Pakistan and Oman serve as permanent guarantor observers with full speaking rights. **Israel Blue Line Equal-Weighting Veto on Border-Adjacent Arms Control (NEW v1.2):** To compensate for Israel's structural 1-seat disadvantage on a commission where it has no vote on nuclear/sanctions/asset decisions, Israel is granted an equal-weighting co-vote on any Part VIII RATP decision directly affecting weapons systems, deployment limits, or air defense arrangements within 150km of the Blue Line or Israel-Lebanon border. This veto is geographically scoped and does NOT apply to RATP decisions affecting Yemen, Iraq, the Persian Gulf, or the Red Sea — Israel has no territorial stake in those domains. Rationale: Israel is the only Core Frame party directly affected by Lebanon-border arms architecture who lacks full JCC voting parity; the geographically-scoped veto corrects this structural asymmetry without scope creep.

Shadow Compliance Channel (NEW v1.7): The JCC Secretariat maintains a confidential Shadow Compliance Channel (SCC) through which parties may disclose emerging risks, near-breaches, or implementation difficulties without triggering immediate WBI accumulation. SCC mechanics: (a) any party may submit a Shadow Disclosure to the JCC Secretariat through a designated confidential channel; the disclosure is not included in public reporting; (b) upon receipt of a Shadow Disclosure, a 30-day Preemptive Remediation Window opens: the JCC deploys technical assistance to the disclosing party, and no WBI accumulates for the disclosed issue during the 30-day window; (c) if the issue is resolved within 30 days, it is logged in the JCC confidential record as a 'Proactively Resolved Technical Issue' with no public disclosure and no WBI consequence; (d) if unresolved after 30 days, the normal Crescent Cycle compliance machinery applies from Day 31; (e) the disclosing party receives a 0.25 WBI credit for proactive disclosure, separate from and in addition to the Good Faith Self-Disclosure Credit. Rationale: prevents small problems from becoming public crises. Creates an incentive to surface difficulties early rather than hoping they resolve undetected.

Decision Architecture: Core Frame amendments require unanimity. Progressive Arch activation requires supermajority (6 of 9 seated members). Technical implementation requires simple majority. Emergency measures require UN Chair certification plus majority. All binding decisions published within 14 days. Decisions binding on all parties without further domestic authorization.

Supreme National Interest Waiver (SNIW) — NEW v1.7: Any Core Frame party may invoke a one-time Supreme National Interest Waiver suspending a specific Compact obligation for up to 21 days, subject to: (a) written justification submitted to the JCC Secretariat within 4 hours of invocation, specifying the obligation suspended and the sovereign interest requiring suspension; (b) automatic Rapid Panel review within 72 hours to assess whether the invocation meets the 'supreme national interest' threshold — defined as: an imminent, verifiable threat to state survival or constitutional order that cannot be addressed through any existing Compact mechanism; (c) non-renewability within the same 12-month period — one invocation per party per year maximum; (d) the suspended obligation is preserved — it resumes automatically on Day 22 regardless of whether the invoking party's justification was validated; (e) Category A material breaches (nuclear enrichment, fissile diversion, maritime blockade, attributed armed attack) are explicitly excluded — the SNIW cannot suspend these obligations under any circumstance; (f) the Rapid Panel's finding is published within 14 days; if the Panel finds the invocation did not meet the threshold, 1.5 WBI points accumulate for the invoking party. Rationale: the SNIW is a psychological safety valve, not a structural escape hatch. Its 21-day limit, non-renewability, and automatic obligation resumption mean it cannot be used to permanently escape compliance. It can be used exactly once per year to handle a genuine national emergency — the kind of situation that, without a safety valve, would cause a party to exit the Compact entirely.

Distinguished Advisors Panel (DAP) — NEW v1.5: The JCC is advised by a Distinguished Advisors Panel consisting of 5–7 former heads of state, foreign ministers, or senior diplomats with demonstrated expertise in the region, appointed by unanimous JCC consent to staggered 3-year terms. DAP function: (a) the DAP issues non-binding annual assessments of the Compact’s political health, trajectory, and areas of diplomatic stress; (b) any party may request a DAP good-offices intervention in a deadlocked JCC situation — the DAP’s role is quiet persuasion, shuttle diplomacy, and the application of accumulated diplomatic wisdom to problems that technical panels cannot resolve; (c) the DAP may propose re-calibrations for consideration at the Annual Calibration Summit, but has no authority to implement any change directly. **Critical authority limitation:** the DAP has no power to modify, delay, override, or countermand any JCC technical determination, Rapid Panel ruling, material breach finding, or automatic consequence. It is an advisory body, not an appellate court. Its currency is prestige and persuasion, not legal authority. This limitation is intentional: giving former political leaders appellate power over technical determinations would recreate precisely the political override of scientific findings that caused the JCPOA’s collapse. The DAP’s value is its ability to move people; its integrity is that it cannot move the machine.

Meeting Cadence: Weekly working-level; monthly full plenary; emergency within 24 hours of any party request (no veto on emergency session convening). Crisis hotline maintained 24/7. Permanent secretariat: 35-person neutral team (Swiss, Brazilian, Singaporean, Norwegian nationals). JCC headquarters rotates annually among neutral states.

III-2: Dispute Resolution Hierarchy — Three-Tier Architecture

Joint Legal Interpretation Panel (JLIP) — NEW v1.7: A standing 3-person neutral legal panel (international law scholars from states not party to the Compact, appointed by the UN Secretary-General) is maintained throughout Compact implementation to provide non-binding legal interpretations of treaty text, resolve ambiguities in operative language, and prevent text disputes from escalating to the Rapid Panel or UN arbitration. JLIP opinions: issued within 21 days of request; non-binding but automatically entered into the Precedent Registry as persuasive authority; any party may request an opinion; opinions are published in full. Relationship to Rapid Panel: the JLIP interprets treaty text; the Rapid Panel resolves compliance disputes. A JLIP opinion on ambiguous text precludes WBI accumulation for conduct within the JLIP-interpreted scope during the opinion period.

Tier 1 — Rapid Panel: Any party may invoke for urgent technical disputes. Five experts: 2 appointed by disputing parties, 1 mutually agreed neutral. **Differentiated Resolution Timelines (NEW v1.2):** (a) **Nuclear and Fissile Material Disputes (Part I):** 7-day binding ruling. Rationale: nuclear disputes require independent laboratory verification, isotopic analysis, and environmental sampling that cannot be completed with scientific credibility in 72 hours. Parties may request a non-binding 72-hour Preliminary Findings statement enabling provisional measures pending the full 7-day ruling; (b) **All Other Disputes:** 72-hour binding ruling (unchanged). All interpretations published in Precedent Registry; binding on all future disputes involving identical or substantially similar facts.

Tier 2 — JCC Adjudication (21 days): Dual-Speed Rule: urgent classifications (attack attribution, compliance restoration triggers, fissile material custody) resolved in 72 hours; all others in 21 days maximum. Absolute cap: no issue pending beyond 45 days. **Silence Rule:** if a situation is not explicitly addressed, neither party may act unilaterally — dispute goes to Rapid Panel within 7 days; panel may authorize provisional measures if imminent threat exists.

Tier 3 — UN Arbitration (binding): JCC deadlock on core obligations triggers UN Secretary-General binding arbitration. Neutral chair appointed from five-state pool; either party may strike one per dispute. Core obligations remain in force during any arbitration.

Quiet Diplomacy Channel (QDC) — NEW v1.7: The JCC maintains a confidential Quiet Diplomacy Channel separate from all public processes, through which parties may raise sensitive issues, float proposals, and conduct preliminary soundings without triggering formal proceedings, public records, or WBI implications. QDC communications are strictly confidential, privileged, and not discoverable in any JCC proceeding. The QDC is facilitated by the JCC UN Chair. Any party may request a QDC session; the other party may decline without explanation. QDC sessions have no formal outcome and produce no binding commitments; they serve the sole purpose of enabling private diplomatic exploration. The QDC is the Compact’s recognition that some problems are solved in corridors, not committee rooms.

Annual Calibration Summit (NEW v1.3): Every 12 months, all Core Frame parties convene an Annual Calibration Summit — a formal diplomatic event at which parties may by unanimous consent propose re-calibrations to the Compact’s operational parameters: WBI point weights, Crescent Cycle durations, Verification Fallback Ladder thresholds, and Progressive Arch good-faith floor definitions. Re-calibration rules: (a) any proposed change requires unanimous JCC consent and a 90-day advance

notice period; (b) no re-calibration may reduce a verification requirement or increase a benefit without a corresponding reciprocal adjustment — the structural balance of the Compact cannot be eroded through incremental calibration; (c) Core Frame operative obligations (ceasefire, IAEA monitoring, fissile custody, humanitarian access) are excluded from re-calibration and may not be modified at a Calibration Summit — those require a full treaty amendment process; (d) the Summit itself is a diplomatic performance venue: JCC co-chairs issue a joint public assessment of Compact health, parties exchange political statements affirming commitment, and the Complexity Transparency Summary for the year is publicly released. Rationale: converts the Compact from a ‘permanent machine’ into a ‘living framework’ with a recurring diplomatic event at which leaders can claim credit, adjust parameters, and perform the art of statecraft within the science of the Compact.

Sunset of Automation — 48-Month Earned Discretion Pathway (NEW v1.5): The Compact’s automatic penalty mechanisms are governance training wheels: essential while trust is being established, and removable once the parties have demonstrated they do not need them. After 48 consecutive months in which all Core Frame parties have maintained green or amber Crescent Cycle status — with no Red cycle, no Category A breach, and no Ambassador’s Override that lapsed without resolution — the JCC may, by supermajority vote (7/9), transition **Category B material breach consequences** from automatic execution to ‘JCC-Recommended Response.’ Under Recommended Response, the JCC still determines the consequence, but it requires an affirmative JCC implementation vote within a 14-day deliberation window rather than automatic execution. **Category A breaches remain permanently algorithmic** regardless of Sunset activation — nuclear enrichment violations, fissile diversion, maritime blockade, and attributed attacks will always trigger automatic consequences. These are the domains where human judgment in crisis has historically caused escalation, not prevented it. Reversal: any Red cycle or Category A breach after Sunset activation reinstates automatic execution immediately and resets the 48-month clock. The keys are earned; they can also be taken back.

Partial Automation-to-Recommendation Conversion (NEW v1.7): Independently of the 48-month Sunset, three Category B triggers are immediately JCC Default Recommendations from entry into force: (a) rhetoric/narrative WBI — 48-hour contest window; (b) VFL Stage 2 — 7-day alternative proposal right; (c) proxy weapons transfer WBI — 14-day factual challenge right. Category A consequences remain fully automatic.

III-3: The Crescent Cycle — Mechanics & Transition Rules

The Compact progresses through 60-day Crescent Cycles (20-day assessment + 40-day implementation). No party advances until all parties have completed current-cycle obligations, verified by at least two of three independent sources.

Status	Condition	Effect
Green	All benchmarks met	Full benefits; advance to next cycle; no WBI accumulation
Amber	75–99% met	Advance with 80% benefits; technical assistance deployed to lagging areas
Yellow	50–74% met	Hold at current cycle; benefits at 60%; 30-day extension vote
Red	<50% OR material breach	Full freeze; no new benefits; Enhanced Review Protocol; WBI assessment

Asymmetric Pause Rule: If one party requires additional time, all parties pause. The Compact does not proceed with missing partners. Pause: 30 days extendable by JCC majority. During pause, existing provisions remain in force; JCC deploys technical assistance to lagging party. **Skip Prohibition:** no party may skip cycles — Cycle N cannot begin before Cycle N–1 completes.

Political Circuit Breaker — 14-Day Consultation Stay (NEW v1.3): When a technical breach occurs during a Crescent Cycle, the automatic consequence machinery does not fire immediately. Instead, a 14-day Consultation Stay activates: the breach is logged, the clock continues, but penalty consequences are stayed for 14 days to allow diplomatic resolution. During the Stay: (a) JCC convenes within 48 hours; (b) both parties may negotiate a remediation plan without the stay constituting an admission; (c) if remediation is agreed and filed with JCC within 14 days, the breach is reclassified as a ‘Remediated Technical Variance’ and accumulates 50% of the standard WBI points rather than 100%; (d) if no remediation is agreed, consequences fire automatically at Day 15. **Exclusions:** The Consultation Stay does NOT apply to WBI 8.0+ situations, nuclear enrichment above the 3.67% cap, fissile material custody breaches, or cross-border attacks — in those cases the algorithmic response proceeds immediately. Rationale: the Stay gives diplomatic teams the space to be the heroes who resolve a problem before the machine penalizes it.

converting 'compliance failure' into 'compliance recovery' in the political narrative.

Ambassador's Override — 72-Hour Consequence Suspension (NEW v1.5): When a WBI penalty is about to be publicly logged, the principal ambassadors of the affected parties may invoke a unanimous Ambassador's Override to suspend the *consequence* of the penalty for 72 hours while a diplomatic resolution is privately negotiated. Critical distinction: the breach entry is always logged in the JCC confidential record immediately and permanently — the Override cannot delete, modify, or delay the factual record. What it suspends is only the public announcement and automatic escalation trigger for 72 hours. Mechanics: (a) both ambassadors jointly notify JCC Secretariat within 4 hours; (b) JCC holds public cycle report publication for 72 hours; (c) if a joint remediation agreement is filed within 72 hours, the penalty is reclassified as a Remediated Technical Variance at 50% WBI points, and the JCC report includes both the breach and the resolution; (d) if no agreement is filed within 72 hours, the original consequence fires automatically and the report notes the Override lapsed. Exclusions: unavailable for Category A material breaches (§G.8). Maximum one Override per party per Crescent Cycle. Rationale: restores the secret diplomatic channel. Ambassadors become the primary problem-solvers who prevented a public penalty — not passive observers of an algorithm. The Compact is the silent auditor; the diplomats are the actors.

III-4: Weighted Breach Index (WBI) & Compliance Scoring

Nuclear breach	4 points per incident
Fissile material diversion (suspected)	8 points — automatic Enhanced Review; no WBI ladder required
Cross-border attack (IAAT attributed)	3 points plus full IAAT investigation process
Proxy military weapons transfer	2 points per verified instance
Maritime chokepoint incident	1 point
Verification obstruction / denied access	2 points per incident
Unauthorized escalatory official rhetoric — Yellow/Red Card System (NEW v1.5)	SCOPE: statements by Head of State, Foreign Minister, or Chiefs of Staff only. Legislators, former officials, media, and civil society are explicitly excluded. YELLOW CARD (first offense per rolling 90-day window): private written JCC notice only — zero WBI accumulation. The JCC Secretariat sends a confidential communication to the relevant official's government noting the statement and requesting clarification or retraction. No public record. No penalty. Diplomats may bark for their home audience once without machine consequences. RED CARD (second offense within the same 90-day window): 0.5 WBI points (reduced from prior 0.5/incident). The Red Card is publicly logged in the JCC cycle report. A third offense within the same 90-day window: 1.0 WBI points + mandatory Joint Communication Window within 48 hours. RESET: the Yellow/Red card slate resets at the start of each new 90-day window. This structure gives domestic political theater its 'safe zone' while ensuring that sustained escalatory rhetoric still has real consequences.
3+ minor breaches in single cycle	Automatic elevation to 1 major breach
Good-faith self-disclosure of breach	–0.5 point credit per disclosure. CYCLE CAP: maximum –1.0 WBI points credited per cycle (2 disclosures maximum). 3-CYCLE ROLLING MAX: cumulative credits may not exceed –2.0 WBI points in any rolling 3-cycle window. This prevents a party from stockpiling credits through minor voluntary disclosures across multiple cycles to create an offset buffer against a future major breach. The mechanism rewards genuine transparency; the caps prevent gaming it as an accounting strategy.

90-Day Early-Cycle Stabilization Window (NEW v1.7)	During the first 90 days of each party's initial Compact participation (the stabilization window), only Category A material breaches accumulate WBI points. Category B breaches and minor violations during this window are logged in the JCC confidential record and subject to technical assistance but do not accumulate WBI points. This applies once per party at initial entry and once per party upon ratification of each additional modular track. Rationale: new participants should not face maximum penalty exposure during the institutional learning phase when administrative errors are most likely.
WBI 5.0 threshold	Enhanced Review Protocol activated
WBI 8.0 threshold	Compliance Restoration consideration; Rapid Panel convenes
WBI 12.0+ threshold	Full compliance restoration available; treaty suspension vote
Annual Goodwill Credit (NEW v1.3)	Each party receives 1.0 WBI Goodwill Credit per 12-month period. A party may spend this credit to formally forgive a minor violation by the other side without triggering the standard penalty ladder. Credit activation: the forgiving party notifies JCC in writing that it is deploying its Goodwill Credit for a named specific breach; the breach is reclassified as 'Forgiven Technical Variance' and accumulates zero WBI points. Constraints: (a) non-stackable — unused credits do not carry over to the next year; (b) may not be applied to nuclear enrichment breaches, fissile material custody breaches, cross-border attacks, or WBI 5.0+ situations; (c) the forgiving party publicly states the credit has been deployed — this creates diplomatic reciprocity currency: 'we chose to overlook this breach; we expect equivalent goodwill in return.' Rationale: transforms forgiveness from passive tolerance into active diplomatic capital. Builds trust incrementally by making generosity visible and reciprocity socially expected.

III-5: Contingency Protocol Register — Eight Pre-Committed Protocols

The following events activate automatic pre-committed protocols without requiring political decision in the moment of crisis. Full specifications in Annex B.

■ Leadership Assassination or Incapacitation

30-day Framework Preservation Hold; JCC neutral chair administers; benefits frozen but not reversed; core obligations auto-continue.

■ Major Cyber Attack on Critical Infrastructure

Cyber Attribution Panel (CAP) convenes within 24 hours; 10-day investigation; default non-attribution if inconclusive; proportional response.

■ Third-Party Disruption Actor Attack

Disruption Actor Attribution Panel within 72 hours; 10-day investigation; default non-attribution; joint threat mitigation — no bilateral penalties.

■ Electoral or Political Transition

30–60 day Political Stabilization Hold (DPDC); existing obligations continue; new obligations pause; benefits at 50%.

■ Natural Disaster or Force Majeure

30-day obligation suspension; JCC review at 14 days; extension to 90 days by majority; no WBI accumulation.

■ Narrative / Media Collapse

Narrative Alignment Protocol activates; Joint Communication Window within 48 hours; Dispute Gag Rule prohibits public escalation before resolution.

■ Financial System Disruption (SWIFT/banking)

Pre-agreed backup channels activate automatically; humanitarian flows via alternative corridors; 30-day commercial wind-down grace period.

■ **Compact-Adverse Actor Provocation or Unauthorized Military Action**

Confirming party publicly acknowledges unauthorized action within 72 hours; WBI penalty applies to the confirming state; FURC clock resets.

PROGRESSIVE ARCH — PART IV

Israel–Arab Normalization & Extended Abraham Accords

Part IV is a Progressive Arch unlocking after two consecutive green Crescent Cycles in Core Frame Parts I–III. No party is obligated to enter Part IV; it represents the deeper structural peace achievable once Core Frame stability is demonstrated. Part IV represents the 'ultimate deal' sought by the Trump administration: Saudi-Israeli normalization, Palestinian progress, and regional alignment against extremism.

Constructive Ambiguity Doctrine for Progressive Arches (NEW v1.3): Unlike the Core Frame — which uses mandatory operative language ('shall,' 'must,' 'commits to') because it governs the cessation of hostilities — the Progressive Arches (Parts IV–VIII) employ aspirational operative language: parties 'commit to a good-faith effort' toward defined outcomes, 'subject to technical feasibility and domestic political conditions.'" A good-faith effort floor is defined as: (a) submitting a written implementation plan to the JCC within 90 days of Arch activation; (b) conducting at least two substantive working-group sessions per Crescent Cycle; (c) not taking unilateral actions that make the Arch objective materially harder to achieve. Good-faith failure (falling below this floor) accumulates 1 WBI point per cycle. This structure allows diplomats to sign the comprehensive deal today while negotiating hard details in a future political climate; progress is measured in demonstrated effort, not in achieved outcomes alone.

JOINT

IV-1: Saudi Arabia–Israel Normalization Protocol

Saudi Arabia and Israel establish full diplomatic relations through a sequenced Normalization Protocol. Unlike prior 'peace for nothing' proposals, each Saudi step is explicitly conditioned on a verified Israeli step — providing both governments domestic political cover.

Step	Israeli Verified Action	Saudi Response
Step 1	Israel: 18-month settlement freeze in specified West Bank zones	Saudi Arabia: Opens trade liaison offices in Tel Aviv
Step 2	Israel: Releases 500 Palestinian prisoners; unblocks \$1B PA tax revenue	Saudi Arabia: Full diplomatic recognition; ambassadors exchanged
Step 3	Israel: Accepts 'credible pathway' language for Palestinian statehood at UNSC	Saudi Arabia: Joins Abraham Accords; defense consultations begin
Step 4	Joint: Israel–Palestine permanent status negotiations formally launched	Saudi Arabia: Full normalization and strategic economic partnership

Saudi Civilian Nuclear Program (Saudi 123 Agreement): U.S. provides technical assistance for Saudi civilian nuclear energy under a 123 Agreement with 'gold standard' provisions — no enrichment, no reprocessing on Saudi soil. Satisfies Saudi's long-standing strategic demand; creates structural parallel to Iran's civilian nuclear recognition; reduces Saudi incentive to pursue independent enrichment. U.S.–Saudi Defense Cooperation Agreement (separate bilateral instrument) provides Saudi armed forces continuous U.S. technical support; U.S. receives enhanced Saudi territory and airspace access.

JOINT

IV-2: Palestinian Horizon Architecture

The Compact does not resolve the Israeli-Palestinian conflict — that requires its own framework with Palestinian parties at the table. Part IV establishes the structural conditions under which permanent status negotiations become politically viable.

Gaza Reconstruction Authority (GRA): International governance body replacing Hamas's administrative role, with Palestinian participation but no Hamas operational command. \$50 billion 10-year reconstruction fund (Gulf states 40%, EU 30%, U.S. 15%, others 15%). Hamas political wing may participate in Palestinian elections after formally renouncing military force targeting civilians.

West Bank Settlement Freeze: All expansion in Area C outside established blocs freezes for 18 months upon Part IV activation. Any violation is a WBI-accumulating breach. This is the minimum Israeli concession required to preserve Arab political cover for normalization.

IRAN MAX

IV-3: Iran–Israel Managed Non-Belligerence Protocol (MNBP)

Iran and Israel do not normalize diplomatic relations under this Compact. The MNBP instead establishes formalized structures for reducing direct military confrontation risk: (a) back-channel via Swiss intermediary; (b) absolute prohibition on cyberattacks against each other's civilian infrastructure; (c) no nuclear targeting under any scenario; (d) 48-hour advance notification of military exercises within 200km of each other's borders; (e) shared de-escalation hotline through JCC. Iran ceases public statements calling for Israel's elimination; Israel ceases public statements calling for regime change in Iran.

PROGRESSIVE ARCH — PART V

Yemen Conflict Resolution & Red Sea–Hormuz Maritime Security

JOINT

V-1: Houthi (Ansar Allah) Participation Framework & Ceasefire

Ansar Allah participates in the Compact's Yemen track through a Yemen Stabilization Dialogue (YSD) hosted in Oman. Structural incentives make political participation more valuable than continued conflict:

- [1] Houthi political leadership not treated as a designated terrorist organization for purposes of YSD participation. Existing designations suspended for 18 months pending good-faith participation.
- [2] **Yemen Reconstruction Fund — Milestone-Verified 1:1 Matching Structure:** Up to \$30 billion total, structured as a strict 1:1 matching fund. Gulf states and international donors release funds only upon verified completion of pre-agreed Houthi-zone infrastructure milestones certified by a World Bank Verification Cell (WBVC): (a) each \$500M tranche requires independent verification of specific completed infrastructure (water, electricity, hospital, road) in the zone receiving funds; (b) no tranche may be released as a political goodwill gesture — only verified physical deliverables unlock disbursement; (c) proportional allocation to population and need, but only as milestones are verified; (d) WBVC publishes quarterly disbursement reports. This structure caps total donor exposure at \$15B until matching is earned, reducing fiscal risk while preserving the full reconstruction incentive.
- [3] Houthis receive formal representation in a **Yemen Transitional Power-Sharing Council (YTPC)** with guaranteed seats proportional to territorial control and population representation. The YTPC governs for a minimum of 24 months before any election can be scheduled. **Revised Election Timeline: Month 48** from Compact entry into force (not Month 24). Rationale: internationally supervised elections in a post-conflict zone with active militia demobilization, displaced populations, and no functioning civil registry are logistically impossible in 24 months. Month 48 allows: 12 months ceasefire consolidation; 12 months civil registry reconstruction and voter roll development; 12 months pre-election period with party registration and international monitoring setup; 12 months reserved contingency for delays. The YTPC provides interim governance legitimacy preventing the power vacuum that collapses peace processes. No pre-commitment to disarmament required.
- [4] Saudi Arabia and UAE commit to cessation of new offensive operations against Houthi territories upon YSD entry. This creates mutual de-escalation rather than unilateral Houthi concession.

PLC/Coalition Recognition Module — Structural Symmetry (NEW v1.6): The Yemen architecture requires explicit recognition of the Saudi-backed Presidential Leadership Council's core conditions alongside Houthi incentives. Four PLC conditions are incorporated as structural requirements for YTPC formation:

- [A] **Hudaydah Stockholm Agreement Compliance:** The 2018 Stockholm Agreement — requiring Houthi withdrawal from Hudaydah port with revenue flowing to the Central Bank of Yemen — must be fully implemented as a prerequisite for Houthi YTPC participation. Verified by UN Monitoring Mission on Yemen (UNMMY) within 90 days of Part V activation. Port revenue transfers to YTPC-administered Central Bank fund within 30 days of UNMMY certification.
- [B] **Child Soldier Prohibition and DDR Commitment:** Houthi recruitment of child soldiers — documented by UN bodies — must cease immediately upon YTPC formation. Commitments: (a) immediate halt to all recruitment of persons under 18; (b) release of currently recruited minors to UNICEF-administered demobilization within 90 days; (c) quarterly UNICEF verification to YTPC. Violation triggers suspension of Houthi reconstruction funding for the relevant quarter. Non-waivable and non-deferrable.
- [C] **UN Arms Embargo Compliance (UNSCR 2216):** Houthi compliance with Resolution 2216 — prohibiting Iranian weapons transfers to Houthi forces — is reinforced by Iran's Part I proxy wind-down obligations (I-7). IMCA maritime monitoring (Part V-2) verifies weapons interdiction at Yemen's ports. Verified ongoing Iranian transfers constitute a Category B material breach attributed to Iran, not the Houthis — preserving YTPC participation while creating source accountability.
- [D] **Territorial Unity Guarantee:** The Compact affirms Yemen's territorial unity. The YTPC is constituted as a unified national governing body, not a confederation. Any unilateral declaration of independence or permanent partition by any faction during the YTPC period triggers automatic suspension of that faction's participation rights and reconstruction funding pending UN Security Council determination.

YTPC Structural Symmetry: YTPC seat allocation: Houthis (proportional to northern territorial control); PLC/internationally recognized government (proportional to southern and eastern control); Southern Transitional Council (proportional representation); tribal and civil society (minimum 20% of total seats, UN-facilitated). No single faction may hold more than 35% of YTPC seats. Decisions by 60% qualified majority (75% for constitutional matters). UN Special Envoy chairs with procedural authority but no vote. Saudi Arabia and Oman hold observer status with speaking rights.

■ Anti-Disruption Shipping Attack Protocol (Revised v1.2 — Targeted Personal Sanctions)

Any verified Houthi attack on commercial shipping after Compact entry triggers: (a) **TARGETED PERSONAL SANCTIONS** on named Houthi political and military leadership personally responsible for authorizing the attack: international travel bans and asset freezes determined by IAAT-equivalent attribution panel within 7 days. NOT a blanket reconstruction fund suspension (which would harm civilian populations and remove the material incentive making political participation valuable); (b) YSD participation suspension for attacking leadership faction for 30 days; (c) New reconstruction fund tranches pause for 30 days; existing disbursed funds and active humanitarian operations continue uninterrupted; (d) U.S./GCC coordinated graduated military response per pre-agreed tiers. Maximum 2 graduated responses before full enforcement authorization activates.

JOINT

V-2: International Maritime Corridor Authority (IMCA)

The IMCA replaces ad-hoc enforcement coalitions with permanent rules-based maritime governance for the Red Sea, Gulf of Aden, and Strait of Hormuz.

Governance: Iran (permanent), Saudi Arabia (permanent), UAE (permanent), U.S. (permanent), Djibouti/Eritrea (rotating), Yemen transitional authority (rotating), EU (observer), China (observer). Enforcement against Iranian-flagged vessels requires Iranian concurrence.

Tiered Tolling: Tier 1 (humanitarian essential): zero toll, 24-hour clearance. Tier 2 (standard commercial): \$0.12/ton, 48-hour clearance. Tier 3 (energy/VLCC): \$0.22/ton or \$30,000 flat. **Tier 4 — Premium Security Transit (NEW v1.2):** \$0.50/ton or \$75,000 flat for high-value technology, dual-use equipment, military-adjacent cargo, and sensitive commercial shipments requiring enhanced escort and tracking. Tier 4 includes: dedicated IMCA naval escort coordination, 12-hour priority clearance, continuous AIS tracking with tamper-evident seals, and priority IMCA dispute resolution. Estimated annual revenue with Tier 4: \$475 million. Allocation: 30% Iran Reconstruction, 28% Yemen Reconstruction, 24% Maritime Safety & Naval Operations, 9% IMCA operations, 5% **Diplomatic Innovation Fund (DIF) — NEW v1.5** (approximately \$24M/year). The Tier 4 uplift to Maritime Safety specifically addresses the gap between the \$400M prior estimate and actual naval operational costs. **Diplomatic Innovation Fund (DIF):** The 5% DIF allocation (~\$24M/year) is administered by the JCC with disbursement authority delegated to the principal ambassadors of all Core Frame parties acting by simple majority. DIF funds may be used for locally-initiated stability projects that fall outside the Progressive Arch structure: small infrastructure, community reconciliation programs, cross-border cultural exchange, joint environmental projects, local economic development in border communities. DIF is explicitly not subject to the Progressive Arch activation requirements — it is discretionary. Eligibility: any local or regional project proposed by a JCC member state with documented community support and a defined completion milestone. DIF projects are co-named for the proposing ambassador, creating visible diplomatic attribution and personal stake in successful delivery. Rationale: gives diplomats genuine discretionary tools — the ability to act as artists rather than engineers, using targeted resources to grease the wheels of local cooperation in ways that no algorithm can prescribe.

Freedom of Navigation Guarantee: Iran permanently commits to unobstructed commercial passage. Iranian sovereignty over territorial waters explicitly acknowledged. U.S. naval presence reduction: 40% within 18 months if Compact compliance verified, contingent on IMCA operational status.

JOINT

V-3: Saudi Arabia–Iran Yemen De-Escalation

Building on the 2023 Beijing normalization, Saudi Arabia and Iran commit to direct bilateral Yemen consultations within 30 days of Part V activation: (a) no new weapons transfers to any Yemeni faction; (b) active YSD support; (c) joint humanitarian aid corridors through Aden and Hudaydah; (d) intelligence sharing on ISIS/AQAP activities.

JOINT

V-4: Saudi Arabia–Iran Bilateral Stabilization Annex (NEW v1.7)

Saudi Arabia and Iran establish a bilateral stabilization relationship extending beyond Yemen, grounded in the 2023 Beijing normalization agreement and deepened through Compact implementation:

Direct Hotline: A permanent Saudi-Iran direct communication hotline, hosted through Omani facilitation, maintained 24/7. Initial response within 2 hours for any regional incident involving Saudi or Iranian interests. The hotline is military-to-military at the operational level and foreign-ministry-to-foreign-ministry at the political level — two parallel channels to the same Omani facilitator.

Hajj Coordination Protocol: Saudi Arabia and Iran establish a bilateral Hajj coordination protocol ensuring uninterrupted Iranian pilgrim access to Mecca and Medina and Iranian government communication with its pilgrims throughout the Hajj season. Disruption to Hajj access for political reasons constitutes a breach of this bilateral annex and triggers QDC (Quiet Diplomacy Channel) consultation within 24 hours.

Persian Gulf Maritime Deconfliction: Saudi and Iranian naval commands establish a dedicated deconfliction protocol for Persian Gulf patrol operations: 24-hour advance notification of major naval exercises; immediate communication within 30 minutes of any vessel incident or close-approach event; joint maritime incident database accessible to both parties through the IMCA system.

Bilateral Economic Normalization: Saudi Arabia and Iran commit to reopening bilateral trade and investment channels suspended since 2016, with implementation timelines managed through the JCC DIF (Diplomatic Innovation Fund) for small-scale economic pilot projects and through MEIZ for larger integration. Both states exchange accredited diplomatic missions within 90 days of Part V activation.

PROGRESSIVE ARCH — PART VI

Iraq Stabilization, Militia Integration & Sovereignty Restoration

JOINT

VI-1: Popular Mobilization Forces (PMF) Transition Framework

Iraq's PMF — particularly Iran-aligned factions (Kataib Hezbollah, Asaib Ahl al-Haq) — represent the central challenge to Iraqi sovereignty. The Compact addresses this through an **Iraq Sovereign Transition Fund (ISTF)** of \$15 billion over 5 years (Gulf states 40%, U.S. 25%, EU 25%, others 10%) providing material incentives for PMF integration or demobilization.

PMF Transition Options: (a) Full integration into Iraqi Security Forces at rank-equivalent positions with full state salary and benefits; (b) Honorable discharge with \$25,000–\$50,000 buyout plus 2-year vocational training; (c) Transfer to Ministry of Interior domestic policing; (d) Agricultural land grant in underdeveloped Iraqi provinces with 10-year tax exemption.

Geographical Dispersion Limits (NEW v1.2): Agricultural land grants are subject to mandatory geographic dispersion caps preventing the accidental creation of concentrated militia-organized territories: (i) maximum 50 ISTF land grant recipients per Iraqi administrative district (qada); (ii) no more than 3 adjacent districts may receive grants totaling more than 100 recipients combined; (iii) grant recipients may not acquire additional adjacent land within 5 years; (iv) ISTF Verification Cell monitors grant distribution quarterly and flags any geographic clustering approaching concentration thresholds for JCC review. These limits apply regardless of which PMF faction the recipient formerly served. **5-Year Re-Arming Clawback Provision (NEW v1.2):** any demobilized PMF member who re-arms or rejoins a militia within 5 years of receiving ISTF benefits is subject to automatic clawback: (a) pension payments freeze immediately; (b) agricultural land grants revert to Iraqi state ownership within 90 days of verified re-arming; (c) ISTF Verification Cell biometric registry cross-checked against ISF arrest records; (d) clawback prosecuted through specialized financial crimes courts with international observer presence. Non-registered personnel after 60-day window lose eligibility and face weapons possession penalties.

Iraq Sovereignty Guarantee (NEW v1.7): Baghdad holds exclusive authority over all PMF integration decisions. No Compact provision compels Iraq against the expressed will of its Council of Ministers and Parliamentary majority. External parties fund but do not direct. Using financial conditionality beyond agreed ISTF terms to direct Iraqi decisions: 2 WBI points for sovereignty violation.

Iran's PMF Obligation: Cessation of direct command, funding, and weapons supply to Iraqi PMF factions within 18 months. Iran retains the right to maintain cultural, religious, and economic ties with Iraqi Shia communities. The distinction is between political influence (permitted) and operational military command (prohibited).

U.S. Force Posture Transition: U.S. forces transition from combat advisory to counterterrorism cooperation within 12 months of Part VI activation. Full withdrawal from Iraqi military bases outside Kurdistan within 24 months. A residual counterterrorism partnership (500–1,000 personnel) continues at Iraqi government invitation under bilateral security agreement renegotiated by Iraqi parliament.

JOINT

VI-2: Regional Counterterrorism Intelligence Cell (RCIC)

RCIC hosted in Baghdad under Iraqi authority facilitates sanitized intelligence sharing on ISIS and AQAP — operational threat data without source disclosure. Iran's strategic interest in ISIS suppression creates genuine common ground with the U.S. and Gulf states. **Cryptographic No-Targeting-Data Wall (NEW v1.2):** A one-way hash architecture governs all RCIC intelligence flows ensuring shared threat data cannot be reverse-engineered to identify source assets, collection methods, or proxy targeting coordinates. Implementation: (a) all shared intelligence processed through a RCIC Technical Sanitization Cell (TSC) operated by neutral-state technicians (Norway, Singapore) before distribution; (b) TSC applies one-way cryptographic hashing to location data — recipients receive threat classification and general area, not coordinate precision sufficient for targeting; (c) annual independent cybersecurity audit verifies the architecture has not been compromised; (d) any participant found attempting to reverse-engineer targeting data is suspended from RCIC for 12 months and accumulates 2 WBI points. This addresses the specific concern that ISIS threat data shared with Iran could be used to target Iranian proxy adversaries rather than ISIS formations.

JOINT

VI-3: Sadrist Political Reintegration Module — Boycott Resolution Framework

Iraq's structural political instability extends beyond PMF militia integration to the Sadrist Movement's parliamentary boycott since 2022 — which has prevented governmental quorum and filled the political vacuum with Iran-aligned factions. The

Compact's Iraqi stabilization architecture cannot succeed if the political process remains delegitimized by the absence of Iraq's largest political bloc. Module VI-3 addresses Sadrist reintegration through a phased, Arab League-facilitated framework. Critical design principle: the Sadrist political wing (Ahrar bloc) and the Saraya al-Salam armed wing are addressed on entirely separate tracks. Conflating political participation with militia disarmament has historically caused both to fail simultaneously.

Phase 1 — Electoral Process Legitimacy Assurance (Months 1–3): The Iraqi government establishes an Independent Electoral Integrity Commission (IEIC) with Sadrist-nominated representatives holding one-third of seats. IEIC mandate: review and certify the seat-allocation methodology from the 2021 election; publish findings within 90 days; adopt agreed procedures for future elections including real-time public count transparency and internationally witnessed challenge procedures. This addresses the Sadrist core grievance without requiring any party to admit specific past fraud.

Phase 2 — Conditional Parliamentary Return (Months 3–6): Upon IEIC publication of findings and adoption of agreed procedures, the Sadrist Movement commits to: (a) not actively disrupting parliamentary quorum through physical blockade or organized intimidation; (b) engaging in Arab League-mediated government formation consultations; (c) participating in IEIC-certified electoral processes. The Sadrist Movement is not required to immediately return to the current parliament — politically impossible given 2022 boycott terms — but commits to participation in the next electoral cycle.

Phase 3 — Arab League Political Stability Mission (Months 6–24): The Arab League Political Stability Mission (ALPASM), headquartered in Baghdad, provides ongoing monitoring of political assembly rights and electoral administration integrity. Graduated response: Sadrist threats of violence trigger ALPASM-mediated consultation; pattern of threats triggers targeted Arab League political measures; government-side electoral integrity violations trigger equivalent graduated response applied to responsible officials. Symmetry is structural: neither side can exploit the framework as a one-way commitment.

■ Sadrist Reintegration Anti-Cycling Lock

The Sadrist boycott has historically operated cyclically: withdraw when demands are unmet, return when conditions improve, withdraw again when dissatisfied. The framework addresses this through conditionality symmetry: a Sadrist return to active parliamentary obstruction after Phase 2 commitment suspends ALPASM support to the Sadrist political wing for 90 days. Government-side electoral integrity failures suspend ISTF tranche releases for the relevant ministry for 60 days. Both sides bear the cost of non-performance.

PROGRESSIVE ARCH — PART VII

Syria De-escalation, Reconstruction & Golan Pathway

JOINT

VII-1: Syria Stabilization & Reconstruction Framework

Post-Assad Syria represents the Compact's greatest strategic opportunity: the primary Iranian proxy infrastructure in the Levant has collapsed. The Compact supports transition without requiring Syria to join any normalization track before it is politically ready.

Israel–Syria De-escalation: Building on the December 2025 intelligence-sharing and military de-escalation mechanism: (a) Israeli cessation of strikes on Syrian military and civilian infrastructure absent verified Iranian re-entrenchment; (b) Syrian commitment to prevent reconstitution of Iranian-aligned military presence; (c) Israeli forces withdraw from all Syrian territory seized after November 2024 within 24 months of Part VII activation with mutually agreed buffer zone security arrangements. Golan Heights permanent status discussions begin in Year 3 — premature pressure explicitly prohibited.

Syria Reconstruction Fund: \$50 billion over 10 years (EU 30%, Gulf states 30%, U.S. 20%, others 20%) unlocks in tranches tied to Syrian transitional governance milestones: inclusive government formation, constitutional process, minority protections verification, and RCIC counterterrorism cooperation. **Anti-Diversion World Bank Audit Layer (WBVAL):** A dedicated Syria Reconstruction Verification Cell (SRVC) operates independently of Syrian government structures. SRVC mandate: (a) verify each tranche reaches designated end-use beneficiaries before subsequent tranches are authorized; (b) maintain a Real-Time Beneficial Ownership Registry identifying all contracting entities and their ultimate beneficial owners; (c) publish quarterly EITI-standard public reports on disbursement and contracting. Automatic suspension trigger: if SRVC identifies diversion of 5% or more of any tranche to former Assad regime inner-circle affiliates (as defined by UN sanctions lists), the next tranche freezes automatically pending JCC review. This provision specifically addresses the political reality that Western parliamentary authorization for Syrian reconstruction funding is contingent on credible anti-corruption architecture.

Armed Group Transition (HTS context): Syria's governing forces are treated as transitional state actors rather than designated terrorist organizations for reconstruction cooperation, provided they: (a) demonstrate inclusive governance with minority protections verified by UN monitors; (b) renounce targeting of civilian populations; (c) cooperate with RCIC. **HTS Full Entity Delisting Precondition — Al-Qaeda Veteran Registry (NEW v1.2):** Full entity-level delisting of HTS from U.S., EU, and UN terrorism designations requires, as a strict precondition, extradition to international jurisdiction or commencement of internationally supervised domestic trial proceedings for designated top-tier Al-Qaeda veterans within HTS leadership. 'Top-tier' is defined by a JCC-maintained Al-Qaeda Veteran Registry (AQVR) compiled within 90 days of Part VII activation, with UN Counter-Terrorism Committee input. Individual-level delisting for lower-level HTS members not on AQVR proceeds on the standard governance milestone track without this precondition, allowing reconstruction cooperation to begin while preserving accountability for senior AQ-connected individuals. U.S. and EU work toward lifting HTS designations that block reconstruction.

Syria Refugee Return Authority (SRRA): Voluntary return program funded at \$10 billion over 5 years. Return is always voluntary and never coerced. Receiving Syrian communities receive equivalent reconstruction support per capita to returnee support packages, reducing resentment-driven resistance to return.

PROGRESSIVE ARCH — PART VIII

Regional Economic Integration, Arms Control, Counterterrorism & Humanitarian

JOINT

VIII-1: Middle East Economic Integration Zone (MEIZ)

The MEIZ is modeled on the EU's economic integration logic adapted for the region's political constraints — voluntary, incentive-driven, sectoral rather than comprehensive, progressing from trade facilitation toward deeper integration as political conditions allow.

Gulf-to-Mediterranean Infrastructure Corridor: \$100 billion joint rail, energy, and digital infrastructure with Iran, Iraq, Jordan, Israel, and Lebanon as nodes. Financed by Gulf sovereign wealth funds (40%), international development banks (35%), private sector (25%) under MEIZ investment guarantee framework.

Persian Gulf Regional Energy Transition Fund: \$50 billion for renewable energy, desalination, and grid interconnection across all Compact signatories. Reduces regional dependence on fossil fuel revenue that currently creates incentives for instability.

Medical Isotope Trade Network: Iran's Fordow IPGMIRC becomes anchor supplier in a regional network serving Gulf, Levant, and North African markets. \$200M annual revenue; creates commercial relationships between Iran and states with which it has no diplomatic relations.

Private Sector Lock-In Protocol (PSLP): Multinational commercial contracts of 12+ months involving 3+ Compact signatories receive treaty protection: 24-month post-compliance restoration sanctuary, political risk insurance discounts, expedited dispute resolution, export credit guarantees. JCC sub-committee certifies PSLP contracts quarterly. Creates domestic commercial constituencies in every signatory state with financial opposition to treaty collapse.

JOINT

VIII-2: Regional Arms Transparency Protocol (RATP)

The Compact does not attempt comprehensive regional disarmament in Year 1. The RATP builds the information architecture making future arms control verification possible.

RATP Components: (a) Annual declaration of major weapons systems above threshold values (missiles above 300km range, advanced naval vessels, advanced air defense systems); (b) 14-day advance notification of military exercises within 150km of international borders; (c) Naval deconfliction protocol for Hormuz, Red Sea, and Eastern Mediterranean; (d) Air defense coordination to prevent accidental engagements; (e) Regional cyber non-aggression pact covering civilian critical infrastructure.

Iranian Ballistic Missile Transparency: In exchange for U.S. acknowledgment of Iran's sovereign defensive missile rights, Iran provides annual declarations of missile inventory, ranges, and general basing locations to JCC. This is not a cap or operational restriction — it is the first step toward eventual missile transparency. The Compact explicitly prohibits using these declarations as targeting data.

Naval & Air Defense Deconfliction: All signatories maintain dedicated military deconfliction channels: U.S. CENTCOM–Iranian Armed Forces direct line (24/7, 2-hour maritime response); Israel–Lebanon–UNIFIL trilateral channel; Saudi–Houthi ceasefire channel. No party may initiate air defense engagement of another party's military aircraft without 48-hour advance notification except in immediate self-defense.

JOINT

VIII-3: Regional Counterterrorism Cooperation

All signatories commit to: sanitized threat intelligence sharing on ISIS, Al-Qaeda affiliates, and Salafi-jihadist networks through RCIC; denying safe haven or weapons to listed terrorist organizations; FATF standards for anti-money laundering and counter-terrorism financing.

Regional Cyber Incident Response Center (RCIRC): Hosted in Oman, coordinates responses to cyberattacks on regional critical infrastructure. Participation is voluntary and non-attributional — only threat signature data shared, not source intelligence. This allows Iran and Israel to cooperate on regional cyber defense without any political acknowledgment of coordination.

JOINT

VIII-4: Humanitarian & Refugee Framework

A **Regional Humanitarian Coordination Authority (RHCA)** under UNOCHA auspices coordinates four concurrent humanitarian crises:

Syria — 6.5M+ refugees	SRRA coordinates voluntary return (Part VII); \$10B return fund; host community support equal per capita to returnee support
Palestine — UNRWA reform	Status coordination under Palestinian Horizon Architecture (IV-2); EU/Gulf funding reform; UNRWA mandate modernization
Yemen — active crisis	Joint Saudi-Iran-IMCA humanitarian corridor via Hudaydah; \$5B emergency fund alongside YSD negotiations
Iraq — IDPs (1.2M+)	ISTF allocates \$3B for IDP return; RCIC ensures security corridor safety; provincial reconstruction incentives
Core Guarantee	NON-SUSPENDABLE: any party obstructing humanitarian access = double-weight WBI + immediate UNSC notification. No political condition may be applied to life-saving operations.

ANNEX A: Crescent Cycle Full Mechanics & Incentive Acceleration

Days	Phase	Activities
Days 1–5	Opening Assessment	JCC reviews prior cycle compliance; WBI recalculated; IAAT findings reviewed; outstanding Rapid Panel rulings issued
Days 6–10	Verification Input	All five verification channels submit compliance reports; satellite imagery reviewed; financial tracking reviewed
Days 11–15	Cycle Certification	JCC issues Green/Amber/Yellow/Red status; disputed certifications to Rapid Panel (72-hour binding ruling)
Days 16–20	Dispute Resolution	Any certification disputes resolved; final status locked and published; next-cycle obligations formally defined and notified
Days 21–50	Implementation	All parties execute current-cycle obligations; technical assistance deployed to lagging party; daily JCC monitoring
Days 51–55	Pre-Close Review	JCC assesses progress; if <75% benchmarks met, 30-day extension vote (requires majority); if extension fails, Yellow status
Days 56–60	Cycle Close	Final compliance verification; WBI calculated; status determined; benefits released per status; cycle recorded in Precedent Registry

Phased Complexity Activation — Three-Cycle Ramp (NEW v1.7): To reduce cognitive and administrative overload at the moment of Compact signature, certain technical mechanisms activate progressively over the first three Crescent Cycles rather than at entry into force:

Entry into force (Day 1)	Core obligations active: ceasefire, IAEA baseline monitoring, humanitarian channels, JCC constituted, crisis hotlines active, FURP PPD issued, Part II ceasefire obligations. Core Frame fully operative. No WBI scoring yet.
Cycle 1 (Days 1–60)	Basic WBI scoring active (nuclear, fissile, maritime, cross-border attack categories only). Crescent Cycle Green/Amber/Yellow/Red status active. Advanced WBI tiers (narrative penalties, proxy attribution, rhetoric scoring) dormant.
Cycle 2 (Days 61–120)	Full WBI scoring stack activates including narrative, rhetoric, and proxy attribution tiers. Consultation Stay and Ambassador’s Override mechanisms activate. Shadow Compliance Channel opens.
Cycle 3 (Days 121–180)	Full verification stack activates: VFL complete ladder, ZKPEV cryptographic reporting, ASPAN AI satellite analysis, secondary arbitration layers. Goodwill Credit first available. IBZ designation authority activates. All Compact mechanisms now fully operational.

Rationale: the first 60 days are the most politically fragile. A new administration explaining Compact entry to its parliament cannot simultaneously defend 52 interlocking mechanisms. The ramp lets parties ‘learn the Compact’ through experience before the full system engages.

Incentive Acceleration Mechanism (IAM)

Three consecutive green cycles with zero WBI, no PEDM (Pattern of Evasion Designation), and on-time delivery activates IAM. The overperforming party chooses: (a) next benefit tranche accelerated by 15%; or (b) next cycle timeline advanced by 15 days. Capped at 20% per cycle; maximum 2 accelerations per 12-month period. Framed as 'performance dividends,' not concessions. If overperformance ceases, benefits revert to standard schedule without penalty.

IAM Reserve Fund Exclusion: The IAM may not under any circumstances accelerate the release of the 10% Reserve Fund (Tranche 6, Annex E). The Reserve Fund is structurally excluded from IAM eligibility for the following reason: the Reserve Fund's function is to serve as a late-stage compliance anchor — a financial stake that remains at risk throughout the full implementation period and is released only upon clean performance through Month 24. If the IAM could accelerate the Reserve Fund, a party could overperform in Cycles 1–3 to drain all asset tranches early, eliminating the financial incentive for compliance in the critical Cycles 4–8 when the most politically difficult obligations (Fordow full conversion, non-proliferation legislation, proxy wind-down Year 2 milestones) come due. The Reserve Fund releases automatically at Month 24 if and only if the full 24-month compliance record is clean — it cannot be front-loaded, accelerated, or traded against other provisions.

Late-Cycle Compliance Anchor (LCCA): To further ensure that early overperformance does not hollow out compliance incentives in later cycles, the Compact establishes a complementary LCCA mechanism: if a party's cumulative asset releases reach 85% or more of total eligible tranches before Month 18, the JCC automatically activates a Compliance Continuity Review (CCR). The CCR assesses whether remaining incentive structures are sufficient to sustain compliance through the remaining obligations. If the CCR determines that incentive structures are insufficient, the JCC may, by majority vote, restructure the remaining benefit schedule to introduce new non-asset incentives — for example: accelerated MEIZ membership, expedited PSLP certification, additional Fordow research partnership access, or enhanced oil services licensing — to maintain compliance motivation through the final implementation phase.

Domestic Political Disruption Clause (DPDC)

Any party experiencing election transition, legislative deadlock, executive incapacitation, or referendum requirement may invoke a 30–60 day Political Stabilization Hold. During Hold: new obligation activation pauses; existing obligations continue without breach classification; benefits at 50%. Maximum 1 Hold per 12-month period per party. Core obligations (ceasefire, IAEA monitoring, fissile custody, civilian protection, maritime passage) are NEVER paused under DPDC invocation under any circumstances.

ANNEX B: Contingency Protocol Register — Full Specifications (LPHIE Events)

B-1: Cyber Attack Protocol (CAP)

Major cyberattack on critical infrastructure of any signatory triggers: (a) CAP Panel convening within 24 hours — 1 technical expert per affected party plus 2 neutral experts from standing pool; (b) 10-day joint investigation; (c) Preliminary classification: state-sponsored / proxy / independent actor / inconclusive; (d) Default non-attribution if inconclusive after 10 days — no penalties imposed, joint protective measures only; (e) Confirmed state-sponsored attack: CDRM proportional response through JCC; no unilateral retaliation during investigation. **Permanent prohibition:** both parties commit 'no first use' of offensive cyber against each other's civilian critical infrastructure — hospitals, water, electricity grids, and financial systems permanently excluded from offensive operations regardless of all other framework status.

B-2: Leadership Succession Protocol (LSP)

If any signatory government's leadership is assassinated, incapacitated, or experiences institutional collapse: (a) 30-day Framework Preservation Hold activates immediately; (b) JCC neutral chair assumes Compact administrative authority; (c) standard benefits freeze at current level — neither new releases nor reversals; **Humanitarian and Core Economic Trade Exemption (NEW v1.2):** the following flows are EXPLICITLY EXEMPT from the 30-day benefits freeze and continue uninterrupted: Tier 1 humanitarian banking channels (medicine, food, medical equipment); IAEA fuel supply arrangements for civilian reactors; active PSILP-certified commercial contracts; Fordow medical isotope production. Rationale: a 30-day freeze on humanitarian and essential economic flows during a fragile political transition can cause civilian harm that destabilizes the successor government the freeze is designed to protect. The exemption preserves civilian continuity while the political transition resolves; (d) all other core obligations continue automatically through institutional machinery; (e) upon emergence of recognized successor government, JCC convenes within 14 days for reaffirmation or renegotiation. If two or more Iranian signatories simultaneously incapacitated, JCC neutral chair coordinates with Guardian Council as provisional authenticating body. 90-day implementation pause; treaty remains in force.

B-3: Third-Party Disruption Attribution Protocol (TPDAP)

Third-party third-party disruption actions designed to force bilateral retaliation receive specialized treatment. Phase 1 (72 hours): JCC emergency attribution panel — one expert per affected party plus two neutral experts; preliminary classification. Phase 2 (10 days): joint investigation with forensic evidence, sanitized intelligence sharing, open-source review. Default Rule: if inconclusive after 10 days, event classified as Non-Attributable Third-Party Event. Binding consequence: zero penalties, zero WBI, zero bilateral escalation; response limited to joint threat mitigation. Both parties commit to no unilateral escalation during investigation. This provision specifically targets the primary historical mechanism by which disruption actors collapse bilateral agreements.

B-4: Compact-Adverse Actor Protocol (CAAP)

To prevent domestic hawkish factions from sabotaging the Compact: (a) Both parties commit to investigating and disciplining individuals conducting unauthorized military actions contrary to Compact obligations; (b) Narrative Alignment Protocol prevents escalatory official rhetoric; (c) 18-month FURC lock prevents any new administration from unilaterally withdrawing Core Frame within its first term; (d) DPDC insulates against political transitions; (e) PSSS creates commercial constituencies that politically oppose breach; (f) WBI penalties apply to the state, creating institutional incentive to control internal actors — governments bear the cost of their factions' actions.

B-5: Loophole Prevention & Living Precedent Registry

JCC maintains a Living Loophole Register (LLR): any provision found gamed, misinterpreted, or exploited is flagged and patched within one Crescent Cycle through emergency Rapid Panel ruling. All interpretations published in binding Precedent Registry within 14 days. Subject to 5-year mandatory review; old precedents operative until replacement is issued. Any party identifying genuine ambiguity in good faith receives 0.5 WBI credit — creating incentive to disclose loopholes rather than exploit them.

B-6: Financial System Disruption Protocol (FSDP)

SWIFT disruption, correspondent banking collapse, or major third-party sanctions: (a) pre-agreed backup payment channels activate automatically within 24 hours; (b) humanitarian flows route through UNOCHA-administered alternative corridors with no political authorization required; (c) 30-day commercial wind-down grace period; (d) JCC issues coordinated statement within 48 hours identifying disruption as technical, not political.

B-7: Mass Casualty / WMD Event Protocol

Any mass casualty event involving suspected chemical, biological, or nuclear material in the region: (a) JCC Emergency Session within 4 hours; (b) UN Secretary-General notification within 8 hours; (c) OPCW/IAEA rapid deployment; (d) automatic 14-day Crisis Lock — all sanctions changes, nuclear pacing adjustments, and escalation steps frozen; (e) attribution investigation proceeds under TPDAP rules; (f) no party may invoke treaty suspension during Crisis Lock period.

B-8: Narrative Alignment Protocol (NAP)

Agreements fail not only in reality but in narrative space. NAP formalizes narrative discipline: (a) Coordinated statements within 48 hours of each Crescent Cycle close; (b) JCC co-chairs hold monthly media briefing alternating Washington/Tehran; (c) Authorized Terminology Registry defines agreed language for sensitive concepts; (d) Dispute Gag Rule: active disputes under formal resolution may not be publicly escalated before final ruling; (e) Narrative Monitoring: JCC monitors international media monthly; systematic misrepresentation triggers correction request; non-compliance triggers WBI penalty.

ANNEX C: Verification Architecture — Five-Channel System

The Compact employs five independent verification channels. Failure of any single channel activates the Verification Fallback Ladder (VFL) before any political escalation — preventing accidental crisis from technical malfunction.

Channel 1: IAEA	Continuous monitoring at all declared facilities; environmental sampling; challenge inspections (10–15/year standard, 25/year Stage 2 VFL); quarterly IAEA Board reports
Channel 2: National Technical Means	Satellite imagery, signals intelligence, open-source monitoring declared as reciprocal transparency measure; both parties share NTM access rights under defined protocols
Channel 3: Challenge Inspections	24-hour rapid / 7-day extended / 45-day absolute max notice. Any site with plausible nuclear activity. Rapid Panel resolves disputes within 72 hours. Iran may declare 30 sensitive days/year with 72-hour notice. FACILITY PERIMETER BUFFER RULE (NEW v1.2): if Iran invokes the 72-hour interior-access delay for any challenged site, the IAEA may immediately and without further notice conduct soil sampling, air sampling, and environmental monitoring within a 500-meter perimeter buffer zone outside the facility boundary. This prevents the 72-hour delay from being used to sanitize a facility before interior inspection, while preserving Iran's procedural right to prepare for interior access.
Channel 4: Supply Chain Tracking (Phased Implementation — NEW v1.2)	Blockchain-verified custody chain implemented in two phases: YEAR 1 — mandatory integration at high-enrichment nodes only (enrichment facilities, conversion plants, Fordow, fuel fabrication, declared storage). YEAR 3 — full chain extended down to uranium mining, milling, and waste disposal. Paper/audit bridge in Years 1–2: interim chain-of-custody maintained through IAEA-certified paper documentation and quarterly physical audits at mining and milling nodes, preventing the Year 1–3 gap from being exploited as a diversion window. Customs cooperation for dual-use imports; IRGC facility reporting through Liaison Office.
Channel 5: Financial Monitoring	SWIFT tracking, correspondent banking surveillance, FATF compliance for all Compact-related financial flows; quarterly IMF/World Bank certification of no external military funding reaching proxies

Verification Fallback Ladder (VFL)

Stage	Name	Actions
Stage 1 (Days 1–7)	Technical Remediation	Joint technical team dispatched within 48 hours; sensor repair; data reconstruction from backup sources; alternative access routes; daily JCC reporting
Stage 2 (Days 8–14)	Substituted Verification	Alternative methods: satellite, environmental sampling, 3rd-party logistics; expanded challenge inspections; neutral advisor deployment

Stage	Name	Actions
Stage 3 (Days 15–30)	Limited Compliance Assumption	Assumed compliance within established bounds; 75% benefits continue; 30-day hard deadline before WBI escalation. CUMULATIVE ANNUAL CAP: a party may not accumulate more than 30 Stage 3 days in any rolling 12-month period (reduced from 45 in v1.1 to 30 in v1.2 per red-team recommendation). Once the 30-day annual cap is reached, any further verification blackout triggers Stage 4 WBI escalation immediately, without re-running Stages 1–2. Days accumulate regardless of the stated cause (technical, weather, administrative). CYCLING PENALTY: if Stage 3 is invoked in two consecutive Crescent Cycles by the same party, a Pattern of Verification Disruption (PVD) designation is issued automatically. PVD effect: the Stage 3 benefit floor drops from 75% to 50% for the remainder of the calendar year, and the WBI accumulates 1 point per PVD designation. Three PVD designations in 12 months triggers the same consequence as a WBI 8.0 threshold breach.
Stage 4 (Day 31+)	WBI Escalation	Verification not restored: automatic WBI accumulation begins; CDRM response per Compact provisions

ANNEX D: Domestic Ratification Pathways

D-0: Modular Ratification Pathways — Core Frame Track Independence (NEW v1.7):

The Core Frame's three parts — Part I (Iran–U.S.), Part II (Israel–Lebanon–Hezbollah), and Part III (JCC architecture) — may be ratified and enter into force independently of one another. A party may ratify Parts I and III without Part II, or Parts II and III without Part I. This Modular Ratification Pathway is designed to address the political reality that requiring all five major conflicts to move in lockstep creates an impossibly heavy entry ticket for signature. Modular ratification rules: (a) Part III (JCC governance) must be ratified by any party ratifying either Part I or Part II — the governance architecture is the non-severable foundation; (b) Benefits under a ratified Part do not accrue to a party that has not ratified the corresponding Part — no free-riding; (c) A party may ratify additional Parts at any time after initial signature without renegotiating the Parts already ratified; (d) Progressive Arches (Parts IV–VIII) require at least two Parts of the Core Frame to be jointly ratified by the relevant parties before the Arch activates; (e) The full Compact's integrated compliance machinery (WBI, Crescent Cycles, Goodwill Credits) applies to each party only in respect of the Parts it has ratified. Rationale: a party can enter the Compact at its own level of political readiness without blocking other parties from beginning implementation. The entry ticket is sized to each party's domestic political capacity.

D-1: Islamic Republic of Iran

(a) Supreme National Security Council review (21 days). (b) Guardian Council constitutional compliance review with conformity presumption (14 days). (c) Majlis vote: simple majority for economic and humanitarian provisions; two-thirds for security provisions. (d) Supreme Leadership notification with 14-day conformity presumption unless explicit written objection. The Compact is executed jointly by President, Speaker, and SNSC Secretary — no single individual bears sole political responsibility. Iranian instrument of ratification may be deposited by any signatory without public identification of which official executed the signature (sealed authentication, 10-year confidentiality).

D-2: United States of America

Presidential signature with 60-day Congressional review. If no Congressional resolution of disapproval: agreement enters force via executive agreement authority. If Congressional resolution adopted: Presidential veto; 2/3 both houses required to override. Quarterly compliance certification reports to Senate Foreign Relations and House Foreign Affairs Committees. The 18-month FURC lock provides Core Frame stability independent of domestic political cycles.

D-3: State of Israel

Cabinet majority vote for all security provisions plus Knesset notification within 14 days. Executive agreement authority sufficient for economic and humanitarian provisions. Knesset majority required for any territorial withdrawal commitments under Part II. Attorney General review for compliance with Israeli Basic Laws.

D-4: Lebanese Republic

Council of Ministers approval by two-thirds plus Parliamentary majority vote. Constitutional Court review for sovereignty provisions. National unity government formation encouraged prior to ratification to maximize political durability.

D-5: Kingdom of Saudi Arabia, Republic of Iraq & Other Parties

Saudi Arabia: Royal Decree with Council of Ministers endorsement and Shura Council consultation. Iraq: Cabinet approval plus Parliamentary majority. UAE and Qatar: Ruler Decree. Pakistan and Oman as guarantors: formal guarantor instruments deposited with UN Secretary-General. All parties notify JCC upon ratification. Compact enters force on the 30th day following the sixth principal party notification.

ANNEX E: Implementation Sequencing Matrix

Period	Phase	Key Actions
Days 1–30	Foundation	Ceasefire enters force; IAEA deployed; JCC inaugurated; IMCA hotline activated; humanitarian channels open immediately; Tranche 1 assets released (25%); JSRZ transition notified; 123 Agreement negotiations launch Day 1
Days 31–90	Verification Baseline	IAEA baseline inspection complete; enrichment cap verified; 60% uranium Tranche 1 exported/diluted; SWIFT reconnection begins; Cycle 1 closes; Tranche 2 assets (20%); JSRZ weapons registration begins; LAF capacity building Phase 1 notified
Days 91–180	Cap & Convert	Fordow conversion initiated; stockpile cap verified; Tranche 3 (20%); Tier 2 banking clearance; JSRZ weapons registration complete; LAF Phase 1 launches; YSD invitation issued to Ansar Allah
Days 181–360	Consolidation	Fordow 50% converted; sanctions relief 50% complete; Tranches 3–4; PMF transition framework activates; non-proliferation legislation Majlis vote; Part IV viability assessment at 6 cycles
Year 2	Normalization	Full Additional Protocol; legislation enacted; complete nuclear sanctions lifted; Fordow conversion complete; MEIZ framework; Saudi-Israel talks commence; LAF Phase 2 deployment; Kfar Shouba withdrawal complete
Year 3–5	Progressive Arches	Parts IV–VIII Progressive Arch activation based on cycle performance; MNBPF enters force; regional economic integration deepens; RATP declarations begin; Palestinian horizon negotiations; Syria Golan discussions (Year 3)
Year 5–7	Deep Normalization	Full Israeli withdrawal from southern Lebanon (PSTF Phase 4); Shebaa Farms Phase 3 complete; Yemen transitional elections; MEIZ operational; RATP second-generation arms framework negotiation begins

ANNEX F: Humanitarian & Refugee Framework

The Core Humanitarian Guarantee is non-suspendable: all humanitarian operations through regional corridors continue unobstructed regardless of political or military developments in any Compact provision. This obligation applies with equal force to all parties at all times, in all Crescent Cycle status conditions.

Syrian Refugees (6.5M+)	SRRA coordinates voluntary return; \$10B fund for returning families and host communities equally; Turkey, Lebanon, Jordan co-administration; return always voluntary, never coerced
Palestinian Refugees	UNRWA structural reform; EU/Gulf funding; coordinated with GRA (Part IV-2); two-state pathway preservation; parallel UNRWA mandate modernization
Yemeni Crisis	Joint Saudi-Iran-IMCA humanitarian corridor via Hudaydah and Aden; \$5B emergency fund independent of YSD political progress; ICRC-administered distribution
Iraqi IDPs (1.2M+)	ISTF allocates \$3B for IDP return; RCIC security corridor assurance; provincial reconstruction incentives; community host support
Stateless Persons	JCC maintains statelessness registry; member states encouraged to accept voluntary resettlement; 5-year pathway to documentation for long-term stateless persons
Core Guarantee	NON-SUSPENDABLE. Any party obstructing humanitarian access = double-weight WBI accumulation + immediate UNSC notification. No political condition may be applied to life-saving humanitarian operations under any circumstances.

ANNEX G: Interpretive Registry & Pre-Agreed Definitions

JCC maintains a binding Interpretive Registry. All key terms are pre-agreed to prevent unilateral reinterpretation — the mechanism by which prior agreements most frequently collapsed. Any unauthorized use of terminology contradicting Registry definitions in official government statements accumulates 0.5 WBI points per incident, capped at 2 points per cycle.

'Sovereign right'	State prerogative over internal security and economic policy, subject only to explicit treaty obligations. Cannot be invoked to override Compact provisions.
'Material breach' — Consolidated Definition (see §G.8 below)	Any violation designated in §G.8 as a Category A or Category B breach. A 'material breach' is never self-declared by the alleging party; it requires certification by the IAEA Director General (for nuclear provisions) or JCC majority determination (for all other provisions). The term 'material breach' in all Compact provisions refers to this consolidated definition. A 'technical lapse' is never a material breach regardless of duration.
'Technical lapse'	Delay up to 45 days in a scheduled milestone where core obligations are still implemented in good faith. Freeze at current level; no rollback; JCC convenes within 14 days.
'Non-interference'	Prohibition on operations designed to destabilize constitutional order. Explicitly excludes: intelligence collection; diplomatic pressure; public criticism; academic research; journalism; human rights documentation.
'Compliance parity'	Iran's IAEA obligations are equivalent in scope to those voluntarily accepted by Brazil, Argentina, South Africa, Japan. Not exceptional or punitive. This framing is mandatory in all official communications.
'Violation' vs. 'dispute'	Violation = confirmed breach with JCC or IAAT certification. Dispute = active disagreement under formal resolution procedures. Media allegations do not constitute violations.
'Escalation'	WBI threshold breach or PEDM designation. Rhetorical criticism, diplomatic protest, and public statements are not escalation under the Compact.
'Good faith'	Active, demonstrable effort to comply including timely notification of obstacles, cooperation with technical assistance, and proactive disclosure of ambiguities.
'Proxy' (for wind-down purposes)	Non-state armed group receiving Iranian operational command, weapons, or funding for military activities against U.S. or allied partners. Political and cultural relationships explicitly excluded from this definition.
'Core obligations'	Non-suspendable provisions that continue regardless of DPDC, force majeure, or any other pause mechanism: ceasefire, IAEA monitoring, fissile custody, civilian protection command, maritime passage, crisis hotline operations.
'Material breach' (see §G.8 below)	Any violation designated in §G.8 as Category A or Category B. Never self-declared by the alleging party; requires IAEA Director General certification (nuclear) or JCC majority determination (all other provisions). Technical lapses, Goodwill Credits, and active Consultation Stays are explicitly excluded regardless of duration.

§G.8: Consolidated Material Breach Definition & Cross-Reference Table

A material breach is a violation fundamentally undermining the Compact's core purpose, organized in two categories. **Category A (Automatic):** violations so severe that consequences proceed algorithmically without JCC deliberation. **Category B (JCC-Determined):** violations requiring JCC majority vote plus independent technical certification. Material breach is never self-declared; never derives from media allegations or unverified intelligence; technical lapses, Goodwill Credits, and active Consultation Stays are explicitly excluded. The Goodwill Credit may not be applied to Category A breaches. The Consultation Stay does not delay Category A consequences.

Category	Breach Type	Determination Authority	Consequence
Category A	Uranium enrichment above 3.67% cap	IAEA Director General certification	Immediate: CEMS/ZKPEV alert + JCC emergency + VFL Stage 4
Category A	Fissile material diversion to undeclared site or weapons activity	IAEA Director General certification	Immediate: WBI +8 pts + Enhanced Review + UNSC referral pathway
Category A	Maritime blockade of Hormuz or Red Sea commercial lanes	IMCA Council within 4 hours	Immediate: IMCA emergency + oil moratorium suspension + graduated response
Category A	Cross-border armed attack (IAAT 7-day preliminary attribution)	IAAT preliminary finding	Response Cascade Phases 1–2 on preliminary; Phases 3–6 on final ruling
Category B	Sanctions reimposition without 150-day JCC process	JCC majority + 30-day Congressional notification	Compliance Restoration friction ladder; Mutual Pain Index activates
Category B	Systematic verification obstruction (3+ denied accesses per cycle)	IAEA technical assessment + JCC majority	VFL Stage 4 immediate; WBI +2 pts/incident; Enhanced Review
Category B	CNOC dissolution/modification without 90-day JCC notice	JCC majority	WBI +3 pts; Institutional Integrity Breach classification
Category B	Proxy military weapons transfer above threshold (SWIFT + satellite verified)	JCC majority + financial intelligence	WBI +2 pts per instance; sanctions tranche review
EXCLUDED	Technical lapse (delay up to 45 days, good-faith implementation ongoing)	N/A	Crescent Cycle hold; JCC at Day 14; no WBI
EXCLUDED	Goodwill Credit invocation (either party)	N/A	Breach reclassified as Forgiven Technical Variance; zero WBI
EXCLUDED	Consultation Stay active (consequences stayed 14 days)	N/A	If remediation agreed: Remediated Technical Variance at 50% WBI

Cross-reference: every use of ‘material breach’ in all Compact Parts and Annexes refers to this table. In case of conflict between a provision’s contextual description and this table, this table governs. Disputes over classification go to the Rapid Panel (7-day for nuclear; 72-hour for all others). Rapid Panel determinations enter the Precedent Registry.

§G.9: JCC Voting Authority Matrix — Consolidated Reference

This table consolidates all JCC decision thresholds, invoking authority, time limits, and appeal paths. In case of conflict with narrative provision descriptions, this table governs. JCC seated membership: Iran (2), U.S. (2), Israel (1, security matters only), Lebanon (1), Saudi Arabia (1), Iraq (1), UN Chair (1). Total: 9 seats.

Decision Category	Threshold	Who May Invoke	Time Limit	Appeal Path
Core Frame Amendment	Unanimity (9/9)	Any party	90-day advance notice	Full treaty amendment process
Progressive Arch Activation	Supermajority (6/9)	Any party	Per provision	UN arbitration if disputed

Decision Category	Threshold	Who May Invoke	Time Limit	Appeal Path
Technical Implementation Decision	Simple majority (5/9)	Any party or Chair	Per provision	Rapid Panel 72hr
Emergency Measure	UN Chair cert. + majority (5/9)	Any party or Chair	24-hour convening	JCC majority may reverse within 48hr
Material Breach Determination (Cat. B)	JCC majority (5/9) + certification	Any party	7-day deliberation max	UN arbitration
Sanctions Full Reimposition (Step 3)	Unanimity (9/9) + IAEA certification	U.S. only	150-day interval min.	Rapid Panel 72hr (process)
Sanctions Partial Restriction (Step 2)	JCC majority (5/9)	U.S. only	45-day process	Rapid Panel 72hr
Compliance Restoration Warning (Step 1)	JCC majority (5/9)	Any party	48-hour notice	No formal appeal
Challenge Inspection Authorization	IAEA Director General	IAEA or any party	Per Channel 3 notice	Rapid Panel 7-day nuclear / 24hr other
VFL Extension Beyond Stage 3	JCC majority (5/9)	Chair or any party	Before 30-day deadline	No appeal — Stage 4 auto-activates
Goodwill Credit Invocation	Unilateral (notifying party)	Either principal party	Immediate, written JCC notice	No appeal
Consultation Stay	Automatic on breach logging	N/A	14-day maximum	N/A
Annual Calibration Summit Change	Unanimity (9/9)	Any party, 90-day advance	Annual Summit only	No change without unanimity
DPDC Political Stabilization Hold	Unilateral (invoking party)	Either principal party	30–60 day max	JCC majority may reject extension beyond 60 days
IAM Acceleration Award	JCC majority certification	JCC Chair	After 3 green cycles	Rapid Panel if disputed
Rapid Panel Nuclear Dispute	5-expert panel (3/5)	Any party	7-day binding	Final and binding
Rapid Panel Non-Nuclear Dispute	5-expert panel (3/5)	Any party	72-hour binding	Final and binding
Israel Blue Line Arms Control Veto	Israel + one other (equal-weighting)	Israel only, 150km Blue Line scope	Per RATP decision timeline	JCC majority override with 30-day notice
Missile CBDE Pilot Submission	Unilateral voluntary (Iran)	Iran only	Year 2 onward	No appeal — fully voluntary

§G.10: Interpretive Buffer Zones (NEW v1.7)

Where operational ambiguity is required to preserve political feasibility, the JCC may designate specific provisions as Interpretive Buffer Zones (IBZs), allowing discretionary implementation within defined bounds without automatic WBI penalty. IBZ designation rules: (a) requires JCC majority vote (60% of seated members); (b) the designation is published in the public JCC record within 14 days — IBZs are not confidential derogations; (c) the IBZ specifies the provision affected, the bounds of discretionary implementation permitted, and the duration (maximum 90 days, renewable by majority vote); (d) Category A

material breach triggers cannot be IBZ-designated — only Category B provisions and narrative/procedural provisions are eligible; (e) any party may challenge an IBZ designation to the Rapid Panel within 14 days. IBZ purpose: allows the JCC to handle provisions where rigid application would cause a walkout — the IBZ creates a bounded safe zone for flexible implementation without collapsing the entire provision. It is the system’s acknowledgment that diplomacy sometimes requires space for ambiguity.

ANNEX H: Calibration Summary & Strategic Balance Assessment

The Crescent Compact's calibration architecture ensures no single party dominates the agenda and that every party can demonstrate domestic political wins at every stage. The 3-3-3-3-2-1 structure (mirroring the source frameworks) creates genuine mutuality in a high-stakes negotiation.

Party	Level	Core Wins
Iran	MAXIMALIST	Permanent cessation of hostilities; force-use restraint compact; non-interference covenant; 100% frozen asset return with irreversibility; IMCA permanent seat; sovereign nuclear energy recognition; missile sovereignty preserved
U.S.	MAXIMALIST	Non-proliferation legislation with 20-year penalties; enrichment suspension with full IAEA verification; challenge inspections anywhere; fissile material disposition; 15-year oil market access; proxy wind-down milestones
Iran	MODERATE	Front-loaded asset release schedule; civilian energy guarantee independent of Senate; Fordow medical isotope revenue stream; proxy wind-down 3-year timeline (not instant); MNBP (not normalization) with Israel
U.S.	MODERATE	Sanctions compliance restoration friction ladder; PSSS commercial anchor; regional security dialogue; Houthi shipping anti-disruption actor enforcement; Saudi defense cooperation pact
Israel	MAX/MOD	PNAT attack prohibition + IAAT attribution; 7-year LAF capacity building; MNBP with Iran; formalized Hezbollah operational constraints; Saudi normalization pathway
Lebanon/Hezbollah	MAX/MOD	Phased territorial restoration (5-year verified); Hezbollah institutional legitimacy; JSRZ governance role; social services funding; Israeli overflight prohibition; LAF capacity building; amnesty for pre-Compact activities
Saudi Arabia	MOD	Civilian nuclear 123 Agreement; U.S. defense cooperation pact; Iranian proxy wind-down; IMCA permanent seat; Yemen reconstruction fund; normalization pathway on sovereign terms

Party	Level	Core Wins
Iraq / Syria / Yemen	MOD	ISTF \$15B transition fund; RCIC counterterrorism cooperation; reconstruction funds; sovereignty restoration support; political participation frameworks for armed actors; PMF transition options

ANNEX I: MODULAR VERIFICATION SYSTEMS — FIVE TECHNOLOGY MODULES

Verification Architecture for Nuclear & Non-Nuclear Obligations

The Compact's verification architecture is designed around a core principle: Iran's cooperation is a sovereign choice, not an imposed surveillance regime. The five modules below are structured to be minimally intrusive in terms of physical presence while providing maximum technical confidence. Most monitoring is passive, remote, or cryptographic — conducted without requiring continuous physical inspector presence. Each module is designated as either **Core** (mandatory upon Compact entry into force) or **Supplemental** (activated by JCC majority upon verified compliance concerns). Sovereignty Tightrope Principle: Iran's verification obligations are framed as 'compliance parity' with Brazil, Argentina, South Africa, and Japan — not as exceptional surveillance. Each module is described in terms available for public release; technical specifications are contained in classified annexes accessible only to JCC technical working groups.

V-1 CORE

Module V-1: Centrifuge Embedded Monitoring System (CEMS) — CORE

Overview: CEMS consists of tamper-evident sensor packages physically attached to centrifuge cascade infrastructure at declared enrichment facilities (Natanz, Fordow R&D;). Sensors transmit encrypted telemetry to a neutral-state relay node (Switzerland or Singapore) in near-real time, without requiring continuous physical inspector presence on-site.

Technical Architecture: Each sensor package measures: (a) rotational frequency and vibration signature of centrifuge rotors — enabling detection of undeclared operating states; (b) electromagnetic emission profiles — consistent with declared centrifuge type and generation; (c) thermal signatures — correlated against declared cascade operating parameters; (d) tamper-indication — cryptographic hash of sensor integrity transmitted with each data packet. Data is encrypted using a split-key architecture: Iran holds one key (sovereign privacy), the IAEA holds the second (verification authority). Neither party can access raw data without the other's key. Data is decrypted only at the neutral relay node during scheduled verification windows.

Sovereignty Design: Iran's sensitive centrifuge design parameters are never transmitted — only operational state signatures (running/idle, speed range, thermal output). Inspection teams do not need to be present for routine monitoring. Physical access for sensor calibration: twice per year, scheduled in advance, with Iranian technical staff present throughout. **Cost profile:** After initial installation, ongoing manpower requirement is approximately 4 IAEA technical staff (remote monitoring) + 2 annual calibration visits. Significantly lower than continuous physical inspection regimes.

Existing precedent: CEMS builds directly on IAEA continuous monitoring cameras and tamper-indicating devices used during the JCPOA (2015–2021). The upgrade is encrypted real-time telemetry replacing periodic camera downloads, and the split-key architecture addressing Iranian sovereignty concerns about design data exposure.

■ CEMS Anti-Tampering Protocol

If any CEMS sensor reports a tamper event or goes dark, the Verification Fallback Ladder (Annex C, VFL) activates immediately — Stage 1 Technical Remediation deploys within 48 hours. Iranian government is notified simultaneously with IAEA. The default assumption during a sensor outage is technical failure (not intentional interference) unless the Concurrent Pattern Detector (part of Module V-2) identifies correlated suspicious activity at the same facility during the same window.

V-2 CORE

Module V-2: AI Satellite & Pattern Analysis Network (ASPAN) — CORE

Overview: ASPAN is a continuous, passive, fully remote verification system requiring zero physical presence in Iran. It applies machine-learning change-detection algorithms to multi-source satellite imagery and open-source data streams, generating automated anomaly alerts that are reviewed by a small team of human analysts at a neutral-state facility.

Data Sources: (a) Commercial satellite imagery (Planet Labs, Maxar, Airbus Defence) — daily 50cm-resolution coverage of all declared and suspect facilities; (b) Synthetic Aperture Radar (SAR) imagery — penetrates cloud cover, operates at night, detects subsurface construction and vehicle movement patterns; (c) Multispectral/hyperspectral imaging — detects thermal signatures, vegetation stress (indicative of underground facility exhaust), and soil disturbance; (d) Open-source signals — shipping manifests, customs declarations, procurement databases cross-referenced against known dual-use equipment suppliers.

AI Analysis Layer: A purpose-built machine learning model (trained on historical IAEA site data and publicly available nuclear facility imagery) performs: (a) automated change detection — flags structural changes, new construction, excavation, or equipment movement within 24 hours of imagery acquisition; (b) pattern-of-activity analysis — detects anomalous vehicle traffic, personnel movement, or delivery patterns inconsistent with declared facility operations; (c) thermal signature correlation — cross-references facility heat output against declared enrichment levels and CEMS telemetry (Module V-1). All alerts are flagged for human review before any formal finding is issued — the AI generates hypotheses; human analysts determine findings.

Sovereignty Design: ASPAN requires zero physical presence in Iran and observes only from publicly available or commercially licensed satellite data. It cannot distinguish individuals or read documents. Iran is notified within 24 hours of any ASPAN alert that triggers human review, allowing it to provide explanatory information before any formal JCC notification. **Cost profile:** Approximately 6–8 analysts at neutral facility + commercial satellite subscriptions. No in-country personnel. Dramatically lower cost-per-facility than physical inspection regimes.

V-3 CORE

Module V-3: Zero-Knowledge Proof Enrichment Verification (ZKPEV) — CORE

Overview: ZKPEV is a cryptographic verification protocol that allows the IAEA to confirm that Iran is not enriching uranium above the 3.67% threshold — without ever accessing, transmitting, or storing Iran’s sensitive centrifuge design parameters, cascade configurations, or classified operational data. It is the verification equivalent of proving you know a password without revealing the password itself.

Technical Architecture: Based on zero-knowledge proof (ZKP) cryptographic protocols (specifically adapted zk-SNARK or equivalent systems): (a) Iranian technical operators generate a cryptographic ‘proof’ from their own enrichment data that can be mathematically verified as consistent with $\leq 3.67\%$ enrichment without revealing the underlying data; (b) the proof is transmitted to the IAEA verification node; (c) the IAEA verification software confirms or rejects the proof — ‘confirmed’ means enrichment is provably within bounds; ‘rejected’ triggers escalation. The system is designed with open-source verification software audited by neutral technical experts (Swiss Federal Institute of Technology, Singapore’s NUS, Brazilian IPEN) to ensure neither party can manipulate the proof generation.

Sovereignty Design: ZKPEV directly addresses Iran’s most persistent verification objection: that intrusive inspection reveals sensitive industrial and military data beyond what is needed for non-proliferation purposes. Under ZKPEV, the IAEA learns exactly one binary fact: whether enrichment is above or below the threshold. Nothing else is transmitted. This is the minimum necessary disclosure for maximum verification confidence. **Cost profile:** One-time software development and installation cost; ongoing operation requires approximately 2 IAEA cryptographic technicians for routine proof verification. Near-zero marginal cost per verification event.

■ ZKPEV Fallback

If Iran’s ZKPEV system generates an invalid or unverifiable proof, it does not automatically constitute a breach. The VFL Stage 1 Technical Remediation activates for 7 days to diagnose whether the failure is a technical malfunction in the proof system or a genuine enrichment anomaly. If a valid proof cannot be generated within 7 days, Module V-1 (CEMS) telemetry is used as primary verification for that cycle. If CEMS is also inconclusive, the Challenge Inspection Protocol (Channel 3, Annex C) activates. The ZKPEV failure is not itself a WBI event; it is a verification system failure requiring remediation.

V-4 SUPP.

Module V-4: Antineutrino Passive Reactor Monitor (APRM) — SUPPLEMENTAL

Overview: APRM deploys antineutrino detectors at or near Iranian reactor facilities (Bushehr, and any future civilian reactors). Antineutrinos are emitted during nuclear fission and pass through all physical barriers unimpeded — meaning a detector placed outside the facility boundary, with no access to the reactor building itself, can continuously monitor reactor power level and estimate plutonium production rates.

Technical Architecture: (a) Detector units are installed at the facility perimeter or in adjacent civilian structures (with host-government consent) — no access to restricted areas required; (b) antineutrino flux measurements provide a continuous, passive, tamper-resistant record of reactor thermal power; (c) deviations from declared power levels flag potential undeclared operations or undisclosed fuel cycles; (d) data transmitted via encrypted satellite link to neutral-state analysis facility. Iran is informed of detector placement locations and may request relocation if a proposed site creates sovereign security concerns —

alternative sites providing equivalent measurement capability are jointly agreed.

Sovereignty Design: APRM detectors are entirely passive — they emit nothing and observe only naturally occurring antineutrino flux. They cannot be used for intelligence gathering on facility operations beyond reactor power levels. No Iranian personnel are required to operate or interact with them. Detector placement does not require access to any restricted or classified area. **Status:** Antineutrino monitoring is an emerging technology with working prototypes demonstrated at operating reactors. The Compact’s technical annex specifies a joint R&D; program (Years 1–3) to develop APRM units to operational readiness concurrently with Compact implementation. **Cost profile:** Moderate hardware cost; minimal ongoing manpower (remote monitoring).

V-5 SUPP.

Module V-5: Distributed Environmental Sensing Array (DESA) —
SUPPLEMENTAL

Overview: DESA addresses the hardest verification problem: detecting undeclared nuclear facilities or material that Iran might choose not to disclose. It is a standoff, multi-modal environmental detection system that operates without physical access to any facility, using passive physics to detect signatures that are impossible to conceal.

Component A — Muon Tomography: Cosmic-ray muons penetrate hundreds of meters of rock and concrete. Dense nuclear materials (uranium, plutonium) produce distinctive scattering signatures. Muon detector arrays placed near suspect sites (at the surface, in existing structures, or in dedicated monitoring facilities on Iranian soil with Iranian host consent) can image the interior of buildings and underground structures without any access to those structures. Detection capability: uranium stockpiles above threshold mass within approximately 50-meter depth. Scan duration: 30–90 days of passive exposure per site. No active emissions; purely passive detection.

Component B — Ultra-Trace Environmental Sampling Network: A network of automated air and soil sampling stations distributed across the region (including in neutral adjacent states with host consent) continuously collects environmental samples. Samples are analyzed using ultra-trace mass spectrometry capable of detecting femtogram-level uranium particle concentrations — the equivalent of detecting a single grain of enriched uranium in an Olympic swimming pool. Isotopic fingerprinting identifies the processing history of any detected particles, enabling attribution even from particles dispersed by wind over hundreds of kilometers. Sampling stations are fully automated and transmit data remotely; no human presence required after installation.

Component C — Airborne Hyperspectral Survey (Periodic): Unmanned aerial platforms (high-altitude, long-endurance) conducting periodic hyperspectral surveys of Iranian territory to detect surface thermal anomalies, vegetation stress patterns (indicative of underground exhaust), and soil disturbance consistent with subsurface construction. Flights conducted with advance notification and within internationally agreed overflight corridors, at altitude above 15,000 feet. Iran may designate no-fly buffer zones around acknowledged military facilities unrelated to nuclear programs — provided alternative coverage achieving equivalent detection capability is agreed.

Sovereignty Design: DESA’s three components operate entirely from outside facility boundaries or from agreed monitoring stations. None require access to restricted areas. The muon tomography stations require host-territory deployment but not access to any facility. Iran has full visibility into all DESA deployment locations; no covert monitoring occurs. **Activation:** DESA is a Supplemental module, activated by JCC majority vote when ASPAN (V-2) or CEMS (V-1) anomalies suggest the need for additional verification. It is not continuously active at all sites. **Cost profile:** Moderate hardware and initial deployment cost; low ongoing manpower (automated sampling, remote data analysis, periodic flight operations).

Module Integration & Cost Comparison: Together, the five modules replace a continuous physical inspection regime with a layered passive/cryptographic/AI-driven system. Total ongoing manpower estimate: approximately 20–25 dedicated staff across all five modules (vs. 80–100 staff in a traditional continuous physical inspection program). Cost reduction: approximately 60–70% versus the JCPOA-era monitoring regime. Hardline satisfaction: the combination of CEMS physical sensors, ZKPEV cryptographic proof, ASPAN satellite analysis, APRM passive reactor monitoring, and DESA environmental detection provides multi-layer redundancy that no single facility masking strategy can defeat. Iran sovereignty satisfaction: no module requires continuous physical presence, no module transmits sensitive design data, and no module operates covertly.

Module V-1 CEMS	Core — Centrifuge telemetry, split-key encrypted, ~4 staff ongoing
Module V-2 ASPAN	Core — AI satellite analysis, fully remote, ~6-8 analysts
Module V-3 ZKPEV	Core — Zero-knowledge cryptographic proof, ~2 technicians

Module V-4 APRM	Supplemental — Passive antineutrino reactor monitoring, minimal staff
Module V-5 DESA	Supplemental — Muon tomography + env. sampling + aerial, moderate hardware
Total manpower	~20-25 dedicated staff across all modules (vs. 80-100 traditional)
Cost reduction	~60-70% vs. JCPOA-era physical inspection regime

Tiered Transparency Protocol for Verification Data (NEW v1.5): Not all verification data is equally appropriate for public disclosure. The following three-tier classification governs all data produced by the Annex I Modular Verification Systems:

Tier	Contents	Access
Tier 1 — Public	JCC compliance determination (Green/Amber/Yellow/Red per cycle); IAEA formal compliance findings; WBI current score and trend direction; material breach determinations and their category; ZKPEV binary finding ('enrichment within threshold' or 'anomaly detected'). All Tier 1 data is published in the public JCC Cycle Report within 7 days of cycle close.	JCC Cycle Report (public, 7 days post-cycle)
Tier 2 — JCC Members Only	CEMS telemetry trend data (aggregated, not raw); ASPAN anomaly alert logs and analyst assessments; VFL stage history per facility; APRM reactor power trend data; DESA environmental sampling results above threshold. Accessible to all 9 JCC seated members plus IAEA Director General. Not disclosed to media, parliaments, or third parties without JCC majority vote.	JCC Secure Portal (members + IAEA only)
Tier 3 — Technical Working Group Only	Raw CEMS sensor telemetry streams; ZKPEV cryptographic proof components; ASPAN raw satellite imagery and precise anomaly coordinates; DESA muon tomography imaging data; all data that could reveal sensitive facility design, centrifuge specifications, or military installation details. Accessible only to the JCC Technical Verification Working Group (neutral-state technicians; no access by any party's national intelligence services without JCC unanimous vote). This data is never shared with any party's government.	JCC Technical Working Group (classified, sealed)

Sovereignty Protection: Tier 3 data protection ensures that Iran's sensitive centrifuge design parameters, facility architecture, and military installation details are never accessible to any party's national intelligence services through the verification system. The verification system learns what it needs to learn (compliance or non-compliance); it does not become an intelligence collection mechanism for any signatory. This directly addresses Iran's historically legitimate concern that IAEA access has been exploited for national intelligence gathering beyond non-proliferation purposes.

ANNEX J: STRATEGIC NARRATIVE PROTOCOL — PARALLEL COMMUNICATIONS

Agreements fail not only in technical compliance but in public narrative. A technically successful Crescent Cycle can collapse politically if the domestic narrative in one party frames it as a humiliation. The Strategic Narrative Protocol addresses this by giving each party a structured, JCC-published platform to tell its own story of each cycle — without requiring agreement on a shared truth.

J-1: Cycle Narrative Statements

Within 7 days of each Crescent Cycle close, each Core Frame party may submit a Cycle Narrative Statement (CNS) of up to 500 words to the JCC Secretariat. The CNS describes, from that party's own perspective, what was achieved in the cycle, what concessions were made and why they serve national interests, and what the party expects from the next cycle. The JCC publishes all submitted CNS statements simultaneously alongside the technical Cycle Report — not one joint statement, but parallel individual statements. Parties may not block, edit, or delay each other's CNS. Parties may not directly contradict the JCC's technical findings in their CNS (doing so accumulates 0.5 WBI points for narrative breach); they may contest the interpretation or political significance of findings without disputing the technical facts.

Political Win Architecture: The CNS is explicitly designed as a domestic political tool. A diplomat negotiating a difficult concession can draft their CNS in advance, framing the concession as a strategic achievement before it becomes public, with JCC-published attribution. The JCC's simultaneous publication of all CNS statements ensures that no party's domestic narrative is undermined by the other party's statement before it reaches its own audience.

J-2: Annual Compact Review Statement

At the Annual Calibration Summit, each party delivers a public Annual Compact Review Statement (ACRS): a formal address to the JCC and international observers in which the party's head of state or foreign minister personally assesses the Compact's progress, claims credit for their government's contributions, and reaffirms commitment. The ACRS is broadcast in each party's language. The DAP (Distinguished Advisors Panel) attends as honored guests, lending international prestige to the domestic political performance.

J-0: Public Wins Ledger (NEW v1.7)

The JCC publishes and maintains a continuously updated **Public Wins Ledger (PWL)**, accessible to domestic audiences in all participating states via a publicly available JCC web portal in all six official UN languages plus Farsi and Hebrew. The PWL documents, per party: verified benefits delivered (asset tranches released, sanctions lifted, reconstruction funds disbursed, territorial withdrawals completed); verified obligations fulfilled (enrichment caps verified, weapons registered, proxy wind-down milestones achieved); and Crescent Cycle performance score history. The PWL is updated within 48 hours of any verified milestone completion. Political utility: the PWL gives every leader a real-time, JCC-certified answer to 'what have we actually gotten from this deal?' — framed in domestically accessible language for each party's audience. It turns compliance into ongoing political capital rather than technical progress. Critically, the PWL is symmetric: every party's wins are documented, not just one. No party's concessions appear on another party's wins page without also appearing as a win on the conceding party's own page (reframed as sovereign action).

J-3: Joint Communication Windows

For major milestones (Arch activations, tranche releases, territorial transitions), the JCC coordinates Joint Communication Windows: pre-agreed 48-hour periods in which all parties publish their milestone narratives simultaneously, preventing any single party's framing from dominating the initial news cycle. The Authorized Terminology Registry (Annex G) governs factual claims; the CNS governs political interpretation. This structure allows each government to claim its own version of success while the technical facts remain undisputed.

HARDENING AMENDMENTS — VERSION 1.1 & 1.2 PATCH LOG

Structural Vulnerabilities Identified & Remediated

The following three structural vulnerabilities were identified through adversarial red-team analysis of the Compact. Each represents a plausible bad-actor exploitation pathway that, if left unpatched, could systematically undermine a core enforcement mechanism without triggering any formally recognized breach. Patches are surgical: they close the specific loophole while preserving the mechanism for good-faith participants. All amendments are incorporated into the operative text of their respective sections; this log serves as the transparent record of vulnerability, exploitation pathway, and structural remedy applied.

PATCH HA-1

HA-1: VFL Stage 3 Cycling Exploit — Annex C Hardening

Vulnerability Identified: Annex C's Verification Fallback Ladder (VFL) allows Stage 3 ('Limited Compliance Assumption') for days 15–30 of any disruption event, maintaining 75% benefit continuation without triggering Stage 4 WBI escalation. The original text contained no cumulative limit on Stage 3 invocations across multiple cycles.

Exploitation Pathway: A bad actor could initiate a 'technical malfunction' lasting 29 days, restore access on day 30 (just before Stage 4 triggers), then repeat in the next cycle. Across 12 months this could produce ~116 days of inspector blindness (4 cycles × 29 days) while accumulating zero WBI points and receiving near-full benefits. The inspection regime would be rendered functionally meaningless without any formal breach occurring.

Remedy Applied (operative in Annex C, VFL Stage 3):

- [1] **30-Day Annual Cap (reduced from 45 in v1.2):** A party may not accumulate more than 30 Stage 3 days in any rolling 12-month period. Once the cap is reached, any further verification blackout triggers Stage 4 WBI escalation immediately, bypassing Stages 1–2. Days accumulate regardless of stated cause.
- [2] **Consecutive-Cycle Cycling Penalty (PVD):** Stage 3 invocation in two consecutive Crescent Cycles by the same party automatically generates a Pattern of Verification Disruption (PVD) designation. Effects: Stage 3 benefit floor drops from 75% to 50% for the calendar year; 1 WBI point per PVD designation; three PVD designations in 12 months triggers WBI 8.0 consequences.

Effect on Good-Faith Participants: Legitimate malfunctions resolve in Stage 1 (7 days) or Stage 2 (14 days), never reaching Stage 3 in sufficient frequency to approach the 30-day annual threshold. The cap exclusively penalizes the deliberate, repeated, cycling exploitation pattern.

PATCH HA-2

HA-2: LAF Rubber-Stamping Risk — Part II-3 Hardening

Vulnerability Identified: Hezbollah's initial 60-day weapons registration was conducted by the LAF, with independent verification deferred to an annual audit. The most consequential moment in the JSRZ weapons regime — the initial inventory establishing the baseline against which all future compliance is measured — relied entirely on LAF integrity during a period of maximum political pressure.

Exploitation Pathway: A compliant or intimidated LAF command could quietly certify a registration omitting prohibited heavy weapons categories during the 60-day window. Once the baseline is set, the annual audit can only compare against it — not against an independently derived ground truth. A corrupted baseline renders all subsequent compliance monitoring structurally meaningless. Prohibited weapons never declared simply never appear in any future audit.

Remedy Applied (operative in Part II-3):

- [1] **Concurrent Independent Verification of Initial Registration (CIVIR):** The independent technical team (Norwegian, Swiss, Singaporean) must be physically present and co-sign the initial 60-day registration alongside LAF. The LAF may not complete registration alone. The independent team conducts its own parallel physical inventory concurrently, using separate documentation.
- [2] **Dual-Inventory Reconciliation:** Divergence greater than 5% on any weapons category is automatically referred to the JCC Rapid Panel within 72 hours. Registration is not legally effective until both inventories are certified and discrepancies resolved.

- [3] **Institutional Accountability:** Any LAF-certified registration found to have omitted weapons categories constitutes a WBI-accumulating institutional breach (2 points) attributed to Lebanon. Lebanon bears the cost of LAF institutional failures, creating structural incentive for Lebanese political leadership to ensure LAF independence.

Effect on Good-Faith Participants: A cooperative Hezbollah and LAF experience no additional burden — the independent team's concurrent presence accelerates rather than complicates genuine registration. CIVIR only imposes costs when discrepancies exist.

PATCH HA-3

HA-3: IAM Reserve Fund Drain Trap — Annex A Hardening

Vulnerability Identified: The original IAM allowed 15% acceleration of benefit tranches for three consecutive green cycles. The Reserve Fund (10% of total frozen assets, Tranche 6) was not explicitly excluded from IAM eligibility, and no provision addressed what happens to compliance incentives once the bulk of frozen assets are released ahead of schedule.

Exploitation Pathway: If Iran overperforms on early, relatively straightforward technical steps (enrichment suspension, initial fissile transfer) and uses IAM to accelerate all tranches including the Reserve Fund, it could drain 100% of frozen assets by Month 15–18. The primary material incentive for the hardest late-stage obligations — Fordow full conversion (Month 24), non-proliferation legislation, Year 2–3 proxy wind-down — is fully consumed. A rational bad actor then slow-walks or abandons these obligations with no remaining financial consequence.

Remedy Applied (operative in Annex A, IAM section):

- [1] **Reserve Fund IAM Exclusion:** The 10% Reserve Fund (Tranche 6) is structurally excluded from IAM eligibility under all circumstances. It releases automatically at Month 24 if and only if the full 24-month compliance record is clean. It cannot be front-loaded, accelerated, or reached by any IAM pathway.
- [2] **Late-Cycle Compliance Anchor (LCCA):** If cumulative asset releases reach 85% or more of total eligible tranches before Month 18, the JCC activates a Compliance Continuity Review (CCR). If incentive structures are found insufficient, the JCC introduces non-asset incentives — MEIZ membership, PSLP certification, enhanced oil services licensing, Fordow research access — to sustain compliance motivation through the final phase.
- [3] **Structural Logic:** The Reserve Fund's value to the Compact is not as a cash transfer but as an ongoing compliance stake that remains at risk throughout the implementation period. Accelerating it eliminates the instrument; the Reserve Fund IAM Exclusion preserves it regardless of early-cycle performance.

Effect on Good-Faith Participants: A genuinely overperforming party receives full IAM benefit on Tranches 1–5 (90% of total released assets) and receives the Reserve Fund at Month 24 on clean compliance. The exclusion costs a good-faith actor nothing — it merely prevents the specific exploit of draining all financial leverage before the hardest obligations come due.

All three patches are reflected in the operative text of their respective sections. This Hardening Amendments log constitutes the authoritative record of identified vulnerabilities and precise structural remedies. Future red-team findings are incorporated in subsequent patches following the same format: vulnerability, exploitation pathway, remedy, and effect on good-faith participants.

HARDENING AMENDMENTS — VERSION 1.2 PATCH LOG

27 Structural Improvements — Financial, Security, Institutional & Verification

Version 1.2 incorporates 27 targeted structural improvements across six categories. All amendments are incorporated into the operative text of their respective sections. Three amendments were rejected with explanation; the remaining 27 are applied. This log records each amendment with its category, structural rationale, and any modifications from the original suggestion.

REJECTED AMENDMENTS (3) — WITH EXPLANATION

REJECT: Iran ratification — SNSC replaces Majlis 2/3 vote	The SNSC route is faster but creates a domestic legitimacy deficit making the treaty politically fragile to successor governments. The theater of parliamentary debate is also the process that builds domestic ownership. Majlis vote retained.
REJECT: Reserve Fund IAM Exclusion	Already patched in v1.1 (HA-3). Duplicate suggestion — operative text already contains this provision. No further action required.
REJECT: Replace 15-yr moratorium with Rolling 5-yr Certification	Replacing the moratorium eliminates the commercial certainty that creates the U.S. business constituency. The Presidential Certification is added ON TOP of the moratorium as a supplementary Congressional bypass mechanism (HA-15), not as a replacement.

FINANCIAL & COST OPTIMIZATION (5 patches)

HA-4: Yemen 1:1 Matching Fund	Yemen Reconstruction Fund restructured as strict 1:1 milestone-verified matching fund. Gulf state funds release only upon World Bank Verification Cell certification of completed infrastructure milestones. Caps donor exposure at \$15B until earned. Applied without modification.
HA-5: BEZDF Reframe	Israel \$2B reparations reframed as ‘Border Economic Zone Development Fund’, jointly financed 50/50 by Israel and Gulf states. Removes Knesset-lethal ‘reparations’ framing while preserving full economic value. Applied without modification.
HA-6: Syria Anti-Diversion Audit	World Bank Syria Reconstruction Verification Cell (SRVC) added with Real-Time Beneficial Ownership Registry, quarterly EITI reports, and automatic freeze trigger at 5% diversion to Assad inner-circle affiliates. Applied without modification.
HA-7: IMCA Tier 4 Premium Security Transit	\$0.50/ton Tier 4 added for high-value/military-adjacent cargo with dedicated naval escort, 12-hour priority clearance, and tamper-evident AIS tracking. Revenue estimate increases from \$400M to \$475M; Maritime Safety allocation increases from 20% to 25%. Applied without modification.
HA-8: ISTF PMF Clawback Provision	5-year re-arming clawback mechanism added: pension freeze + land grant reversion within 90 days of verified re-arming. ISTF Verification Cell maintains biometric registry cross-checked against ISF arrest records. Applied without modification.

ISRAEL–LEBANON–HEZBOLLAH HARDENING (5 patches)

HA-9: SIWST Confiscation Protocol	Prohibited heavy weapons confiscation transferred from LAF to a Specialized International Weapons Seizure Team (SIWST: Swiss/Norwegian/Singaporean military engineers + UNIFIL EOD). Eliminates both kinetic-confrontation risk and rubber-stamping risk. Applied without modification.
HA-10: IAAT Revised Timeline	IAAT timeline revised from 72-hour ruling to: 4-hour Freeze Declaration + 7-day Preliminary Attribution + 21-day Final Ruling. Phases 1-2 activate on preliminary; Phases 3-6 activate on final ruling only. The Freeze Declaration prevents the attribution window from becoming a war window. Applied without modification.

HA-11: Israeli Overflight Post-Flight Notice	4-hour advance notice replaced with 1-hour post-flight notification for intelligence reconnaissance. Humanitarian corridor flights (pre-planned 24+ hours) retain advance notice as exception. Monthly aggregate JCC reporting preserved. Applied without modification.
HA-12: Ghajar 5-Year Cooling-Off	Immediate referendum upon Phase 3 replaced with 5-year UN administrative cooling-off period. UN civil administration, no political campaigning, reconciliation programs. Referendum occurs after cooling-off period only. Applied without modification.
HA-13: UCPC 12-Hour Emergency Cap	Hezbollah delay veto on UCPC operations tiered: 48-hour cap for standard operations; 12-hour mandatory non-extendable cap for life-saving emergencies. UCPC UN Chair makes emergency classification within 2 hours of contested request. Applied without modification.

U.S.–IRAN NUCLEAR & SANCTIONS REALISM (5 patches)

HA-14: Fordow 10-Year Timeline + Bridge	Market capture target extended 5→10 years. European Capacity Bridge Agreement negotiated within 12 months with NRG/SCK-CEN/CEA. Fordow ramps: 10% by Year 3, 20% by Year 6, 35% by Year 10. No global isotope supply disruption during transition. Applied without modification.
HA-15: Presidential Certification Bypass	Rolling 5-Year Presidential Certification added ON TOP of (not replacing) the 15-year moratorium. Certification based on JCC compliance reports provides executive override of Congressional obstruction. Moratorium retained as commercial certainty anchor. Modified: kept moratorium; added certification as supplementary mechanism.
HA-16: Tranche Restructure	Tranche 1 (25% on IAEA deployment) + Tranche 2 (20% on enrichment cap) merged into: 5% immediate liquidity bridge (Day 30, no nuclear conditions) + 40% on verified 60% uranium dilution/export completion (Day 90). Prevents 25% disbursement for mere IAEA arrival. Liquidity bridge preserves Iranian economic stability during negotiation window. Applied without modification.
HA-17: NIC Deepfake Specification	Propaganda clause explicitly extended to: AI-generated synthetic media (deepfakes) targeting electoral candidates; algorithmically amplified disinformation targeting electoral infrastructure; fabricated intelligence dossiers triggering political/military responses. Routine state media and political commentary remain permitted. Applied without modification.
HA-18: Neutral Dilution Contractor	In-country fissile dilution physically executed by neutral third-party contractor (from JCC roster: Swiss, Swedish, Canadian, Japanese, South Korean firms). Iranian staff may observe but not control. IAEA + contractor + JCC chair co-sign chain-of-custody. Eliminates cameras-only verification ambiguity. Applied without modification.

REGIONAL PROXIES & TRANSITION MECHANICS (5 patches)

HA-19: Yemen Month 48 Elections + YTPC	Yemen Transitional Power-Sharing Council (YTPC) with guaranteed proportional seats replaces 24-month election timeline. Elections deferred to Month 48: 12M ceasefire consolidation + 12M civil registry reconstruction + 12M pre-election setup + 12M contingency. YTPC provides interim governance legitimacy. Applied without modification.
HA-20: Yemen Disruption Actor Targeted Sanctions	Blanket reconstruction fund suspension replaced with targeted personal sanctions on named Houthis decision-makers: travel bans + asset freezes. New fund tranches pause 30 days; existing disbursed funds and humanitarian operations continue uninterrupted. Preserves civilian incentives while imposing direct cost on decision-makers. Applied without modification.
HA-21: PMF Geographic Dispersion Caps	Agricultural land grants subject to: max 50 ISTF recipients per qada; max 100 combined in 3 adjacent districts; no adjacent land acquisition within 5 years; quarterly ISTF monitoring of geographic clustering. Prevents militia-run territory concentration. Applied without modification.

HA-22: HTS AQ Veteran Registry Precondition	Full HTS entity-level delisting requires as strict precondition: extradition or domestic trial proceedings for top-tier AQ veterans on JCC-maintained AQVR (compiled within 90 days of Part VII activation with UN Counter-Terrorism Committee input). Individual-level delisting for non-AQVR members proceeds on standard track. Applied without modification.
HA-23: RCIC Cryptographic No-Targeting Wall	One-way hash architecture mandated for all RCIC intelligence flows. Technical Sanitization Cell (Norway/Singapore operators) processes intelligence before distribution; location data hashed to prevent targeting precision. Annual cybersecurity audit; 12-month suspension + 2 WBI points for attempted reverse-engineering. Applied without modification.

INSTITUTIONAL & DISPUTE ARCHITECTURE (5 patches)

HA-24: Israel Blue Line Equal-Weighting Veto	Israel granted equal-weighting co-vote on Part VIII RATP decisions directly affecting weapons systems, deployment limits, or air defense within 150km of the Blue Line or Israel-Lebanon border. Geographically scoped — does NOT apply to Yemen, Iraq, Gulf, or Red Sea decisions. Modified: narrowed from all of Part VIII to border-adjacent decisions only, to prevent inappropriate Israeli influence over unrelated domains.
HA-25: WBI Good-Faith Credit Caps	Good-faith self-disclosure credit capped at –1.0 WBI per cycle (max 2 disclosures credited per cycle) AND –2.0 WBI in any rolling 3-cycle window. Prevents stockpiling credits across cycles to offset future major breach. Applied without modification.
HA-26: Rapid Panel Nuclear 7-Day	Nuclear/fissile disputes (Part I) moved from 72-hour to 7-day Rapid Panel ruling, reflecting scientific laboratory verification requirements. Non-binding 72-hour Preliminary Findings statement available for provisional measures. All other disputes retain 72-hour binding ruling. Applied without modification.
HA-27: LSP Humanitarian Exemption	30-day benefits freeze during Leadership Succession Protocol explicitly exempts: Tier 1 humanitarian banking; IAEA civilian reactor fuel supply; active PSILP contracts; Fordow isotope production. Prevents civilian harm from transitional freeze. Applied without modification.
HA-28: CAAP Rhetoric Scope Limitation	WBI penalties for escalatory official rhetoric limited to statements by Head of State, Foreign Minister, and Chiefs of Staff only. Legislators, former officials, media, and civil society explicitly excluded, avoiding First Amendment and Knesset free-speech conflicts. Applied without modification.

VERIFICATION & IMPLEMENTATION LOGISTICS (4 patches)

HA-29: Facility Perimeter Buffer Rule	If Iran invokes 72-hour interior-access delay during a Challenge Inspection, IAEA may immediately conduct soil, air, and environmental sampling within a 500-meter perimeter buffer outside the facility boundary. Prevents the delay from being used to sanitize a facility before interior inspection. Applied without modification.
HA-30: VFL Stage 3 Cap Reduced to 30 Days	Cumulative annual Stage 3 cap reduced from 45 days (v1.1) to 30 days (v1.2). Consecutive-cycle PVD designation mechanism retained from v1.1 patch. Applied without modification.
HA-31: Blockchain Supply Chain Phasing	End-to-end blockchain tracking phased: Year 1 mandatory at high-enrichment nodes only (enrichment facilities, conversion plants, storage). Year 3 extended to uranium mining and waste disposal. Interim paper/audit bridge for Years 1-2 at mining/milling nodes prevents exploitation of the implementation gap. Applied without modification.
Note: IAM Reserve Fund Exclusion	This suggestion duplicates HA-3 (v1.1 patch). Already operative in the document. No further action required in v1.2.

AMENDMENTS — VERSION 1.3 LOG

Diplomatic Flexibility, Verification Innovation & Terminology Sanitization

Version 1.3 addresses three categories of improvement: (1) four diplomatic flexibility mechanisms that soften the Compact’s machine-like rigidity without compromising its structural integrity; (2) five modular verification systems that dramatically reduce physical inspection burden while maintaining or exceeding technical verification confidence; and (3) terminology sanitization replacing alarmist or politically charged language with neutral diplomatic equivalents throughout the document.

DIPLOMATIC FLEXIBILITY MECHANISMS (4 amendments)

Political Circuit Breaker — 14-Day Consultation Stay	When a technical breach occurs, automatic consequences are stayed for 14 days to allow diplomatic resolution. If remediation is agreed within 14 days, breach reclassified as ‘Remediated Technical Variance’ at 50% WBI points. Exclusions: WBI 8.0+, nuclear enrichment breaches, fissile custody breaches, and cross-border attacks proceed immediately without Stay. Transforms ‘compliance failure’ into ‘compliance recovery’ in the political narrative.
WBI Goodwill Credit — 1.0 Annual Discretionary Credit	Each party receives 1.0 WBI Goodwill Credit per 12-month period to formally forgive a minor violation without triggering the standard penalty ladder. Non-stackable. Prohibited for nuclear enrichment, fissile custody, cross-border attacks, and WBI 5.0+ situations. Public notification required — transforms forgiveness into active diplomatic currency and builds trust through visible reciprocity.
Constructive Ambiguity Doctrine — Progressive Arches	Progressive Arches (Parts IV–VIII) use aspirational operative language: ‘good-faith effort toward defined outcomes, subject to technical feasibility and domestic political conditions.’ Good-faith floor defined as: implementation plan within 90 days, two substantive working-group sessions per cycle, no unilateral obstruction. Failure below floor accumulates 1 WBI/cycle. Core Frame operative language unchanged.
Annual Calibration Summit	12-month recurring diplomatic event at which parties may by unanimous JCC consent re-calibrate WBI weights, cycle durations, VFL thresholds, and Arch good-faith floors. No re-calibration may reduce verification requirements or increase benefits without reciprocal adjustment. Core Frame obligations excluded from re-calibration entirely. Summit is also a public diplomatic performance venue: joint assessment, political statements, and annual Complexity Transparency Summary release.

MODULAR VERIFICATION SYSTEMS (Annex I)

V-1 CEMS (Core)	Centrifuge Embedded Monitoring System: tamper-evident sensors on cascade infrastructure, split-key encrypted telemetry, ~4 staff ongoing. Replaces continuous physical inspection for routine enrichment monitoring. Built on JCPOA camera precedent with encrypted upgrade.
V-2 ASPAN (Core)	AI Satellite & Pattern Analysis Network: ML change-detection on multi-source commercial satellite imagery, fully remote, ~6-8 analysts. 24-hour anomaly detection. No physical presence in Iran required. Iran notified within 24 hours of any alert before JCC filing.
V-3 ZKPEV (Core)	Zero-Knowledge Proof Enrichment Verification: cryptographic proof that enrichment is $\leq 3.67\%$ without transmitting any sensitive centrifuge design data. ~2 technicians. Directly addresses Iran’s sovereign objection to design-data exposure.
V-4 APRM (Supplemental)	Antineutrino Passive Reactor Monitor: standoff detection of reactor power and plutonium production rates from outside facility boundary. Fully passive, no facility access needed. Joint R&D; program in Years 1–3 to reach operational readiness.

V-5 DESA (Supplemental)	Distributed Environmental Sensing Array: muon tomography (hidden stockpile detection), ultra-trace air/soil sampling (femtogram-level uranium detection), and periodic aerial hyperspectral survey. Activated by JCC majority on anomaly confirmation. All components operate from outside facility boundaries.
Total system cost	~20-25 dedicated staff across all 5 modules vs. 80-100 in traditional physical regime. Estimated 60-70% cost reduction vs. JCPOA-era monitoring.

TERMINOLOGY SANITIZATION

‘Black Swan’ → ‘Low-Probability High-Impact Event (LPHIE)’	The term ‘black swan’ carries alarmist connotations in diplomatic contexts and may be read as implying the Compact anticipates catastrophic failure. LPHIE is neutral, technical, and internationally recognized in risk management literature.
‘War Hawk’ → ‘Compact-Adverse Actor’	‘War hawk’ is a politically charged domestic term that could be read as targeting specific political factions in the U.S. or Iran. ‘Compact-Adverse Actor’ is behaviorally defined and politically neutral.
‘Snapback’ → ‘Compliance Restoration Protocol’	‘Snapback’ implies sudden punitive reversal and is associated with failed JCPOA dynamics. ‘Compliance Restoration Protocol’ frames the mechanism as constructive rather than punitive.
‘Spoiler’ → ‘Third-Party Disruption Actor’	‘Spoiler’ implies active malicious intent that may be contested in attribution disputes. ‘Third-Party Disruption Actor’ is causally descriptive without prejudging intent, reducing grounds for diplomatic objection.

DESIGN PHILOSOPHY NOTE: HARDENED BUT NOT BRITTLE

A key tension in the Compact’s design is the tradeoff between algorithmic reliability (which prevents gaming) and diplomatic flexibility (which enables signature). Version 1.3 resolves this tension by applying flexibility at the right layer: the Core Frame remains fully algorithmic for obligations where human judgment is dangerous (nuclear verification, ceasefire, fissile custody); flexibility is introduced at the consequence layer (Consultation Stay), the forgiveness layer (Goodwill Credit), the aspirational layer (Progressive Arches), and the calibration layer (Annual Summit). The structural integrity of the framework is preserved where it matters most while giving diplomatic teams genuine agency in how the framework is experienced day-to-day. The goal is not a train track (one deviation = derailment) but a bumper-car architecture: parties can bounce, adjust, and recover, but the track always keeps them moving in the same direction.

AMENDMENTS — VERSION 1.4 LOG

Five Surgical Refinements — Definitions, Governance & Sellability

Version 1.4 addresses five surgical refinements identified as polish points: consolidated definitions, institutional completeness, governance clarity, and diplomatic sellability improvements. None of these amendments alter the Compact’s structural architecture; they sharpen what is already there.

Refinement 1: Humanitarian Corridor Exception Completed	The Israeli overflight humanitarian corridor exception (v1.2 HA-11) was incompletely scoped. v1.4 adds: applies only to named active humanitarian operations under UNOCHA/ICRC/UCPC; maximum 2 advance-notice flights per corridor per week; advance notice must specify flight path, altitude, duration, and named operation; Lebanon may convert any advance-notice flight to post-flight within 2 hours by flagging operational sensitivity. Prevents the exception from becoming a blanket advance-notice workaround.
Refinement 2: CNOC Institutional Charter	The Civilian Nuclear Oversight Council lacked composition rules. v1.4 adds: 7 members on staggered 4-year terms with 2-year gap between consecutive terms; appointment split among Majlis Science Committee (2), Guardian Council (2), IAEA/AEOI joint appointment (2), Assembly of Experts chair (1); explicit conflict-of-interest exclusions for IRGC personnel, enrichment facility employees, and sanctioned-entity contractors; 5/7 quorum for standard decisions, 6/7 for IAEA Board or UNSC referrals; dissolution or structural modification requires Majlis supermajority with 90-day JCC notice (3 WBI points if violated).
Refinement 3: Missile Transparency Voluntary CBDE Pilot	The missile sovereignty clause correctly preserved Iran’s prerogative but offered U.S. negotiators nothing to show Congress. v1.4 adds a voluntary Year-2 Confidence-Building Data Exchange: Iran may submit a sealed Missile Confidence Declaration (range-category inventory summary, general basing regions only — no guidance data, no coordinates, no warhead specs). Reviewed by a neutral 3-person technical panel who issue only one public finding: ‘Declaration received.’ No verification inspections, no caps, no penalties for non-participation. Gives U.S. a Congressional ‘missile transparency’ deliverable without binding Iran to any limitation.
Refinement 4: Material Breach Consolidated in §G.8	‘Material breach’ appeared in 10+ provisions with varying contextual descriptions. v1.4 consolidates the definitive definition in Annex G §G.8 with a full cross-reference table distinguishing Category A (automatic, algorithmic: enrichment breach, fissile diversion, maritime blockade, attributed attack) from Category B (JCC-determined: sanctions reimposition, systematic verification obstruction, CNOC dissolution, proxy weapons transfer). Technical lapses, Goodwill Credits, and active Consultation Stays are explicitly excluded from material breach classification. All Compact uses of the term now reference this table.
Refinement 5: JCC Voting Matrix Consolidated in §G.9	JCC voting rules were described narratively across multiple sections, creating misinterpretation risk. v1.4 adds Annex G §G.9: a 19-row consolidated authority matrix covering every JCC decision category — Core Frame amendments (unanimity), Arch activation (6/9), technical implementation (5/9), emergency measures, material breach determination, sanctions steps, inspection authorization, compliance restoration ladder, Goodwill Credit, Consultation Stay, Calibration Summit changes, Rapid Panel timelines, DPDC, IAM, and Israel’s Blue Line veto — with threshold, invoking authority, time limit, and appeal path for each. Table governs over narrative in case of conflict.

AMENDMENTS — VERSION 1.5 LOG

Diplomatic Agency Restoration — From Algorithm to Decision-Support System

Version 1.5 addresses the central diplomatic anxiety about the Compact: that it is a machine that replaces diplomats rather than a tool that empowers them. Eight amendments restore genuine human agency at the appropriate layers — consequence timing, narrative framing, discretionary funding, graduated rhetoric, earned autonomy, and prestige architecture — while leaving the algorithmic core intact where it matters. Two proposals were rejected to protect the structural integrity of the framework.

ACCEPTED AMENDMENTS (8)

#1 Ambassador's Override (modified)	72-hour consequence suspension by unanimous principal ambassador vote. Critical modification from original proposal: the Override never suppresses or delays the factual breach log entry — only the public announcement and automatic escalation trigger of the consequence. The record is always permanent; only the timing of public consequence is stayed. One Override per party per cycle. Unavailable for Category A breaches. Restores the secret diplomatic channel while preserving the auditable record.
#2 Strategic Narrative Protocol (modified)	Annex J added: parallel Cycle Narrative Statements (up to 500 words per party per cycle), published simultaneously by JCC alongside the technical report. Annual Compact Review Statements at the Calibration Summit. Joint Communication Windows for major milestones. Critical modification: not a joint narrative (which would require agreement on a shared truth) but parallel individual statements. Parties tell their own story; the JCC publishes both. Prevents either party's framing from dominating before the other reaches its audience.
#3 Tiered Transparency for Verification Data	Three-tier classification added to Annex I: Tier 1 (public — compliance determinations, WBI, binary ZKPEV finding); Tier 2 (JCC members + IAEA only — aggregated trend data, anomaly logs); Tier 3 (Technical Working Group only — raw telemetry, centrifuge signatures, precise satellite coordinates). No party's national intelligence service may access Tier 3 without unanimous JCC vote. Addresses Iran's legitimate concern that IAEA access has historically been exploited for intelligence gathering beyond non-proliferation purposes.
#4 Diplomatic Innovation Fund	5% of IMCA maritime tolls (~\$24M/year) allocated to Diplomatic Innovation Fund, administered by principal ambassadors by simple majority. Funds discretionary local stability projects outside Progressive Arch structure. DIF projects co-named for proposing ambassador. Restores diplomatic artistry — the ability to use targeted resources to grease local cooperation in ways no algorithm can prescribe.
#5 Sunset of Automation (modified)	After 48 consecutive months of green/amber cycles with no Red, no Category A breach, and no lapsed Override, JCC may by supermajority (7/9) transition Category B breach consequences to 'JCC-Recommended Response' (14-day deliberation before execution). Modified from original: 48 months (not 36); Category A remains permanently algorithmic (not transferred); automatic execution reinstates immediately if any Red cycle or Category A breach occurs after Sunset activation and 48-month clock resets. Training wheels that can be earned back — and taken back.
#7 Distinguished Advisors Panel (modified)	5–7 former heads of state/foreign ministers appointed by unanimous JCC consent to staggered 3-year terms. Issues non-binding annual political assessments; provides good offices in deadlocked situations; proposes Calibration Summit re-calibrations. Critical modification: zero authority to modify, delay, override, or countermand any JCC technical determination, Rapid Panel ruling, or automatic consequence. Currency is prestige and persuasion, not legal authority. Restores the 'grandmaster' dimension without recreating the political override of scientific findings that destroyed the JCPOA.

#8 Yellow/Red Card Rhetoric System	First offense per rolling 90-day window: Yellow Card — private JCC written notice only, zero WBI. Diplomats may use tough domestic rhetoric once without machine consequences. Second offense within same 90 days: Red Card — 0.5 WBI (publicly logged). Third offense: 1.0 WBI + mandatory Joint Communication Window within 48 hours. Slate resets at start of each new 90-day window. Gives domestic political theater its safe zone while ensuring sustained escalation has consequences.
#10 Legacy Provision + Ceremonial Signature	Preamble addition: explicit statement that the Compact is a tool of state authority, not a replacement for it; history will credit the diplomats who used it, not the framework. Ceremonial Signature Architecture: physical in-person signing at neutral host state, international press and diplomatic observation, personal head of state/FM statements in own language, UN Treaty Series registration with full signatory attribution. No digital-only or proxy signature valid for Core Frame entry into force.

REJECTED AMENDMENTS (2) — WITH EXPLANATION

#6 Face-Saving Terminology (Rejected)	The document already underwent full terminology sanitization in v1.3 (Black Swan → LPHIE; Snapback → Compliance Restoration; War Hawk → Compact-Adverse Actor; Spoiler → Disruption Actor). Further replacing ‘breach’ with ‘Technical Variance’ across the board would create dangerous definitional collision: ‘Technical Variance’ is already a specific defined term in the document (a minor, remediated lapse that accumulates 50% WBI points). Conflating it with serious violations undermines the §G.8 Material Breach consolidated table built in v1.4. The document is already diplomatically worded; a second round of euphemism risks making it legally unenforceable.
#9 Positive WBI / Stability Credits (Rejected)	This function is already served by two existing mechanisms: the Incentive Acceleration Mechanism (IAM, v1.1) awards performance dividends (15% tranche acceleration or 15-day timeline advancement) for three consecutive green cycles; and the Goodwill Credit (v1.3) allows each party to formally forgive one minor breach per year. Adding a third ‘Stability Credits’ system that offsets future breaches would duplicate existing architecture while creating a new accounting system susceptible to gaming: overperforming in low-stakes areas to accumulate credit for a future high-stakes breach. The existing two-mechanism incentive architecture is sufficient; a third layer adds complexity without adding structural value.

AMENDMENTS — VERSION 1.6 LOG

Non-State Actor Modular Additions — Derived from Demand Document Analysis

Version 1.6 closes four structural asymmetries identified through analysis of the uploaded demand documents for Yemen (Houthi + PLC/Coalition), Hezbollah, Lebanon, Israel, and Iraq (Sadrist). In each case the gap was not a failure of the Compact’s existing architecture but an asymmetry: the Compact addressed one side of a bilateral dynamic while leaving the other side’s structural requirements implicit. These additions make the implicit explicit.

1. Yemen: PLC/Coalition Module	Four explicit PLC conditions added as structural requirements for YTPC formation: (A) Hudaydah Stockholm Agreement compliance verified by UNMMY within 90 days; (B) child soldier prohibition with UNICEF verification, non-waivable; (C) UN arms embargo (UNSCR 2216) compliance linked to Iran’s Part I proxy wind-down; (D) Yemen territorial unity guarantee with automatic YTPC suspension for unilateral partition. YTPC structural symmetry: no single faction above 35% of seats; 20% civil society minimum; 60% qualified majority for decisions; UN Special Envoy as procedural chair.
2. Hezbollah: Political Party Rights Pathway	Formal party registration within 60 days of Part II activation with full electoral rights; electoral non-interference guarantee (no Compact conditions on electoral outcomes provided military SLGA constraints are maintained); JSRZ Governance Credits converting military compliance into political capital. Structural logic: military compliance becomes the price of political legitimacy, not an imposed cost. Framework derived from analysis showing Hezbollah accepts operational constraints only when paired with formal institutional legitimacy.
3. Ghajar: Referendum Neutrality Clause	Explicit outcome non-predetermination added to the 5-year cooling-off period: all three options (reunification under Lebanon, divided administration, joint governance) are equally valid; no Compact provision conditions any benefit on a particular outcome; UN administrator prohibited from advocating for any option. Derived from Lebanese-Israeli negotiation failure mode analysis: frameworks that appear to predetermine outcomes produce performative engagement rather than genuine community participation.
4. Iraq: Sadrist Political Reintegration Module (VI-3)	New module addressing Iraq’s largest political bloc’s parliamentary boycott since 2022 — a structural gap separate from PMF militia integration. Three phases: (1) Independent Electoral Integrity Commission with Sadrist-nominated representation; (2) conditional parliamentary return commitment upon IEIC certification; (3) Arab League Political Stability Mission in Baghdad with graduated symmetric response for both-side violations. Critical design principle: Sadrist political track (Ahrar bloc) and Saraya al-Salam militia track (ISTF VI-1) are entirely separate — conflating them has historically caused both to fail simultaneously.

AMENDMENTS — VERSION 1.7 LOG

Political Realism Edition — Structural + Surgical + Complementary Refinements

Version 1.7 is the most comprehensive revision since v1.0, addressing the central critique that the Compact, while structurally advanced, risked being ‘politically unbreathable.’ The amendments fall into three categories: five structural changes that alter constitutional profiles and institutional weight; ten surgical edits that add psychological safety valves, legal clarity, and domestic political machinery; and eleven complementary additions that fill specific gaps identified through negotiation analysis. Four proposals were rejected to preserve structural integrity.

BIG 5 STRUCTURAL CHANGES

B1: FURC → FURP (Presidential Policy Directive)	Force-Use Restraint Compact reframed as a Presidential Policy Directive-based restraint protocol, grounded in the President’s own statutory authority rather than treaty text. 180-day renewable upon JCC compliance certification. Non-renewal triggers proportional Iranian economic suspension right (not breach). 18-month continuity lock preserved via Congressional Continuity Shield. Same operational effect; constitutional profile that avoids Senate consent and Pentagon veto triggers.
B2: Dual-Key Dilution	Neutral-contractor-only execution replaced with dual-key oversight: Iranian technical staff operate equipment; IAEA inspector (Key A) and neutral technical observer (Key B) provide real-time material accountancy and independent chain-of-custody certification. Co-signed by AEOL, IAEA, and neutral observer. Equivalent verification confidence; directly addresses Iranian sovereignty objection.
B3: CNOC Simplified	Detailed 7-member composition, staggered terms, quorum rules, and budget protections replaced with broad mandate + three composition principles (civilian, scientifically literate, IAEA-reportable) + domestic implementing legislation requirement within 18 months. Iran negotiates institutional design domestically, not in treaty text. 2 WBI points for failure to enact within 18 months.
B4: Modular Ratification	Core Frame Parts I, II, and III may be ratified and enter into force independently. Part III (JCC) is non-severable prerequisite for either. No free-riding: benefits accrue only to ratified Parts. Progressive Arches require two ratified Core Frame Parts by relevant parties. Reduces entry ticket from ‘all five conflicts simultaneously’ to ‘one conflict at a time.’
B5: Partial Automatics → JCC Recommendations	Three Category B trigger categories converted from automatic to JCC Default Recommendations: narrative/rhetoric WBI penalties (48-hour contest window before logging); VFL Stage 2 escalation (7-day alternative proposal before confirmation); proxy weapons transfer WBI (14-day factual challenge). Category A remains permanently algorithmic. Retains deterrence where speed matters; adds human review where false positives are most likely.

10 SURGICAL EDITS

S1: Supreme National Interest Waiver	One-time per 12 months, 21-day maximum suspension of one specific obligation. Requires written justification + automatic Rapid Panel 72-hour review. Obligation resumes Day 22 regardless. Category A excluded. Failed threshold invocation: 1.5 WBI points. Psychological safety valve that prevents walkouts without enabling systematic non-compliance.
S2: Israel Fast-Track Self-Defense Carve-Out	24-hour proportional response authority during active multi-vector attacks before IAAT preliminary classification. Triggers 1-hour JCC Crisis Hotline notification. Post-action IAAT review mandatory. Disproportionate invocation: 3 WBI points. Aligns with Israeli doctrine; preserves IAAT for all other scenarios.

S3: Congressional Continuity Shield	All executive Compact authorities designated continuity-critical national security measures by concurrent executive order. Supermajority (two-thirds both chambers) required to override. Works within existing constitutional authority. Raises political cost of Congressional sabotage without requiring upfront Congressional approval.
S4: Interpretive Buffer Zones (SG.10)	JCC may designate specific provisions as IBZs by 60% majority vote: discretionary implementation within defined bounds, up to 90 days renewable. Published (not confidential). Category A excluded. Creates bounded safe zones for political flexibility without collapsing provisions.
S5: Narrative Sovereignty Clause	Explicit right to domestic narrative framing of Compact provisions, provided framing does not materially contradict verified obligations or incite breach-triggering behavior. Yellow/Red Card rhetoric system applies to externally-directed escalation; Narrative Sovereignty Clause protects domestic parliamentary communication.
S6: Shadow Compliance Channel	Confidential JCC channel for disclosing near-breaches: 30-day Preemptive Remediation Window, zero WBI during window, 0.25 WBI credit for proactive disclosure. Prevents small problems from becoming public crises.
S7: Military-to-Military Deconfliction Lines	Four direct military channels: U.S. CENTCOM – Iran (2-hour response), IDF – LAF – UNIFIL (1-hour), Saudi SANG – Houthi through Oman (4-hour), IMCA Maritime Operations (30 minutes). Privileged communications, not discoverable in JCC proceedings.
S8: Hezbollah Framing Softened	‘Legitimate governance participant’ replaced with ‘recognized political actor within the Lebanese constitutional framework for purposes of Compact implementation.’ Same function; significantly lower political friction for Israel and U.S. domestic audiences.
S9: Phased Complexity Activation	Three-cycle ramp: Entry (core obligations only, no WBI); Cycle 1 (basic WBI: nuclear/fissile/maritime/attack); Cycle 2 (full WBI + Consultation Stay + Ambassador Override + Shadow Channel); Cycle 3 (full verification stack + Goodwill Credit + IBZ authority). Reduces signing-moment cognitive overload.
S10: Public Wins Ledger	JCC-maintained, publicly accessible, continuously updated ledger of verified benefits delivered to each party. Updated within 48 hours of milestone completion. Available in all UN languages plus Farsi and Hebrew. Symmetric: every party’s wins are documented. Turns compliance into ongoing domestic political capital.

11 ADDITIONAL ADDITIONS

A2: 90-Day Stabilization Window	Only Category A breaches accumulate WBI during first 90 days of each party’s initial participation or new modular track ratification.
A3: Joint Legal Interpretation Panel (JLIP)	3-person neutral legal scholars panel; non-binding opinions within 21 days; entered as persuasive Precedent Registry authority; precludes WBI for conduct within JLIP-interpreted scope.
A5: Quiet Diplomacy Channel (QDC)	Confidential JCC channel for sensitive soundings; no formal outcomes, no binding commitments, no public record. Facilitated by UN Chair.
A6: Congressional Consultation Clause	Quarterly classified Gang of Eight briefings + 7-day notification of Category A breach + 48-hour notification of Override invocations. Consultative, not approval-seeking.
A7: Iranian Sovereignty Affirmation	Explicit recognition of Iran’s sovereign NPT right to peaceful nuclear energy; enrichment limits are sovereign choices for reciprocal benefits, not imposed constraints; right to resume on Compact termination or U.S. default.
A9: Targeted Individual Sanctions Snap-Forward	U.S. may impose targeted sanctions on named individuals without triggering full Compliance Restoration Protocol; JCC notification within 24 hours; 14-day Rapid Panel challenge right.

A10: Cyber Non-Escalation Protocol	Mutual prohibition on offensive cyber against critical infrastructure or Compact operational infrastructure during active JCC disputes. Confirmed violation: 4 WBI points.
A11: Blue Line Demarcation Roadmap	Three-phase parallel cartographic process (UNCSM) running concurrent with territorial restoration phases; definitive Blue Line registered with UN Secretariat by Phase 3.
A15: UNIFIL Modernization	UAV surveillance fleet, ground sensor network (acoustic/seismic/motion), maritime AIS upgrades, Chapter VI+ mandate with direct UNSC reporting authority for weapons violations.
A16: Saudi-Iran Bilateral Stabilization Annex (V-4)	Direct hotline through Omani facilitation; Hajj coordination protocol; Persian Gulf maritime deconfliction; bilateral trade/investment channel reopening + diplomatic mission exchange within 90 days.
A18: Iraq Sovereignty Guarantee	Explicit affirmation of Baghdad's exclusive authority over PMF transition pace, options, and enforcement. External parties fund but do not direct. Sovereignty violation WBI: 2 points.

REJECTED PROPOSALS (4)

#1 Strip Israel-Lebanon-Hezbollah from Core Frame	Rejected in favor of Modular Ratification (B4). Completely removing ILH from the Core Frame would create a JCPOA redux — a nuclear deal without maritime/proxy provisions that already proved insufficient. Modular Ratification achieves the same entry-ticket reduction without making ILH optional.
#4 Reduce mandatory public statements	Strategic Narrative Protocol (Annex J) already handles this correctly. The Annual Compact Review Statement is the diplomatic performance venue that makes the Calibration Summit politically valuable. Reducing it further removes the prestige architecture that serves the Legacy Provision.
#13 Lebanese domestic ratification clause	Already in Annex D-4 (Cabinet + Parliament approval for sovereignty provisions). Duplicate.
#14 Israeli 2-year review mechanism	Already built into the 7-year PSTF conditionality structure with Technical Lapse Protocol. An additional 2-year review layer would create redundant veto points without adding protection.

CLOSING STATEMENT — COMPACT RESILIENCE CERTIFICATION

At Version 1.7, the Crescent Compact is:

- [1] **Structurally Viable:** All obligations paired with reciprocal benefits of equal political value; no party exposed alone at any stage; political wins front-loaded for every domestic constituency.
- [2] **Behaviorally Hardened:** Eight Contingency Protocols pre-engineer responses to the full range of foreseeable disruption scenarios; WBI scoring prevents gaming through incremental violations; Living Loophole Register patches exploited provisions in real time.
- [3] **Politically Explainable:** 60-day Crescent Cycle public reporting makes the framework legible to domestic constituencies; Complexity Transparency Summaries; Pre-Agreed Definitions prevent narrative manipulation.
- [4] **Commercially Anchored:** PSSS, MEIZ, 15-year oil moratorium, and PSLP create commercial constituencies in every signatory state with financial opposition to treaty collapse — the most durable peace constituency is an economic one.
- [5] **Layered and Flexible:** Core Frame provides minimum viable peace without requiring commitment to Progressive Arches; each Progressive Arch unlocks voluntarily as conditions allow; no party locked into commitments beyond current political capacity.
- [6] **Regionally Comprehensive:** Iran–U.S. nuclear normalization; Israel–Lebanon–Hezbollah trilateral architecture with formal political party rights; Saudi–Israeli normalization; Palestinian Horizon Architecture; Yemen YSD with full YTPC symmetry and PLC/Coalition conditions; Iraq PMF transition and Sadrist political reintegration module; Syria reconstruction; Maritime

corridor governance; regional economic integration; arms transparency; counterterrorism cooperation; humanitarian coordination across four concurrent crises; and five modular verification systems.

- [7] **Non-State Actor Architecture:** The Compact addresses non-state political-military organizations not as obstacles to be removed but as institutional actors requiring structured pathways to legitimacy. Hezbollah’s political rights are formally guaranteed alongside its military constraints. Yemen’s YTPC provides all factions with proportional governance roles and explicit PLC conditions. Iraq’s Sadrist movement receives a political reintegration pathway separate from militia disarmament. Durable peace requires non-state actors to have a stake in the peace’s success, not merely a cost for its violation.

“The crescent does not illuminate all at once. It grows. Each completed step illuminates the next, until what was darkness is made plain.”

The Crescent Compact — Version 1.7 — April 2026
