

The Pan-Regional Accord for Integrated Stability

PRAIS Version 1.0 — May 2026

A Comprehensive Multi-Actor Framework for the Middle East and Gulf Region

Covering: U.S.–Iran Bilateral Stabilization • Israel–Lebanon–Hezbollah Trilateral Security
Yemen Conflict Resolution • Iraq Stabilization • Syria De-escalation
Regional Economic Integration • Counterterrorism Cooperation
Humanitarian Architecture • Multi-Domain Arms Control

Negotiation Reference Document — Working Draft

DRAFT

Table of Contents

Preamble: The Distributed Motion Philosophy

Part I: Core Bilateral Architecture — United States and Iran

- Article 1: Foundational Commitments and Scope
- Article 2: The Parity Ladder and 45-Day Review Cycles
- Article 3: Nuclear Stabilization and Sovereign Dignity Protocol
- Article 4: Sanctions Modulation and Economic Gravity Well
- Article 5: The Verification Integrity Fortress (VIF)
- Article 6: The Black Swan Shield and Crisis Architecture

Part II: Trilateral Security Compact — Israel, Lebanon, and Non-State Actor Integration

- Article 7: The Blue Line to Green Line Transition
- Article 8: Capabilities-Based Restraint and Monitored Storage
- Article 9: The Silent Partnership Track for Regional Normalization

Part III: Regional Conflict Resolution — Yemen, Iraq, and Syria

- Article 10: Yemen De-escalation and Reconstruction Architecture
- Article 11: Iraq Stabilization and Militia Integration Timeline
- Article 12: Syria De-escalation and Territorial Integrity Guarantee

Part IV: Regional Economic Integration and Infrastructure

- Article 13: The Regional Economic Gravity Well
- Article 14: Infrastructure Corridors and Energy Bridges

Part V: Counterterrorism and Security Cooperation

- Article 15: The Regional Counterterrorism Lattice
- Article 16: Intelligence-Sharing Architecture and Attribution Protocols

Part VI: Humanitarian and Refugee Stabilization

- Article 17: The Humanitarian Firewall and Untouchable Corridors
- Article 18: Refugee Return and Reintegration Architecture

Part VII: Multi-Domain Arms Control

- Article 19: Naval Security and Maritime Governance
- Article 20: Cyber Deterrence and Digital Security Architecture
- Article 21: Air Defense and Missile Transparency

Part VIII: Governance, Verification, and Institutional Resilience

Article 22: The Joint Stability Commission (JSC)

Article 23: The Distributed Enforcement Lattice

Article 24: The Domestic Continuity Anchor and Election Shock Absorbers

Article 25: Graduated Reversibility and Orderly Exit Protocols

Annexes

Annex A: Compliance Indicator Matrix (CIM)

Annex B: Rapid Results Layer — First 60 Days

Annex C: The Quarantine Protocol for Non-State Actor Spoilers

Annex D: Pre-Agreed Interpretation Registry

Annex E: Dispute Exhaustion and Binding Arbitration

Annex F: The Mutual Pain Index and Sanctions Inertia Buffer

Annex G: Public Narrative Framework and Authorized Terminology

Annex H: Regional Burden-Sharing and Normalization Acceleration

The Pan-Regional Accord for Integrated Stability (PRAIS)

Preamble: The Distributed Motion Philosophy

We, the undersigned states and designated institutional representatives, recognizing that durable peace in the Middle East and Gulf region cannot be imposed by any single power upon dozens of actors with divergent interests, hereby establish this Pan-Regional Accord for Integrated Stability (PRAIS). Our guiding philosophy is **Distributed Motion**: all actors advance together through small, verified, reciprocal steps. Each movement produces a corresponding unlock, so no party is exposed, rushed, or forced into weakness.

This Accord is designed to be simultaneously comprehensive and modular. It addresses the full spectrum of regional stabilization—bilateral nuclear constraints, trilateral border security, proxy demobilization, economic integration, counterterrorism, humanitarian access, and multi-domain arms control—while permitting any party to adopt only those modules relevant to its interests. No module creates legal dependency on any other module, except where explicitly linked through the Joint Stability Commission.

The architecture of PRAIS is built upon five foundational principles:

1. **Synchronized Reciprocity**: No obligation is front-loaded. Every commitment is paired with a contemporaneous reciprocal commitment, verified within the same 45-day review cycle.
2. **Reversible Graduation**: Each step can be paused, rolled back, or re-entered without catastrophic collapse. The Graduated Reversibility Protocol ensures that partial implementation remains politically and economically viable.
3. **Institutional Binding**: All commitments attach to state institutions and designated offices, not to named individuals. Leadership transitions do not void obligations; they activate the Domestic Continuity Anchor.
4. **Distributed Enforcement**: No single enforcer dominates. Peer enforcement through the Distributed Enforcement Lattice creates compliance pressure through the self-interest of adjacent actors.
5. **Humanitarian Immunity**: Humanitarian and refugee corridors are protected by the Humanitarian Firewall. They may not be used as leverage in any compliance dispute.

This Accord is presented as a time-limited, reversible, experimental arrangement entered into without prejudice to the established legal positions, rights, or future negotiating positions of any party. It is

designed to produce immediate, visible benefits within the first sixty days while building the institutional architecture for long-term regional transformation.

Executive Summary: What This Accord Does and Does Not Do

What PRAIS Does:

- Provides verified constraints on Iranian nuclear activity through a sovereign-dignity-preserving framework certified by independent international monitors.
- Establishes a trilateral security architecture for the Israel-Lebanon border that converts military contestation into monitored restraint and eventual economic cooperation.
- Creates structured de-escalation pathways for Yemen, Iraq, and Syria with defined milestones, verification metrics, and reconstruction incentives.
- Unlocks regional economic integration through infrastructure corridors, energy bridges, and a private-sector lock-in protocol that makes reversal cost-prohibitive.
- Maintains humanitarian access corridors that are framework-protected and independently managed by UN-designated agencies.
- Establishes multi-domain arms control covering naval security, cyber deterrence, and air-defense transparency.

What PRAIS Does Not Do:

- It does not require any party to normalize diplomatic relations beyond the specific commitments set out herein.
- It does not resolve the Israeli-Palestinian conflict definitively, though it creates conditions for a two-state horizon.
- It does not eliminate any state's military capabilities or require abandonment of security alliances.
- It is not permanent and irreversible; it includes sunset, review, and exit provisions that give all parties ongoing sovereign choice.

Single Source of Truth Layer (SSOT)

The following definitions are operative throughout the entire PRAIS framework. No annex may redefine these terms without explicit divergence notation and JSC acknowledgment:

- **Breach:** A confirmed failure to perform a specific obligation on its due date, verified by the JSC. Distinct from a Technical Lapse and from a Pattern-of-Concern designation.
- **Material Breach:** A breach that fundamentally undermines the purpose of the specific provision. Requires JSC determination, not unilateral characterization.
- **Technical Lapse:** A delay of up to 45 days where core obligations are still performed and the delay is logistical or administrative. Governed exclusively by Annex D. Does not constitute

breach.

- **Pattern-of-Concern:** Three or more indicators of concerning activity across two consecutive review cycles, demonstrating coordinated intent. Diagnostic, not punitive.
- **Stabilization Hold:** A time-limited pause in new obligation activation, not existing obligation performance. Up to 45 days, renewable to maximum 150 consecutive days. After 120 days, Minimal Compliance Mode activates.
- **Quiet Implementation Mode:** Public announcements reduced or batched without altering substance. Active for maximum 60 consecutive days without renewal.
- **Proportionate Response:** A consequence limited in scope to the domain and severity of the triggering event. Disproportionate responses require JSC supermajority and neutral chair concurrence.

Part I: Core Bilateral Architecture — United States and Iran

Article 1: Foundational Commitments and Scope

Section 1.1: Parties and Binding Character

The Parties to this bilateral module are the United States of America and the Islamic Republic of Iran. All obligations, commitments, and benefits under this module attach to the designated institutions and offices of the respective states, not to the individuals who currently hold those offices. For the United States, commitments bind the Office of the President and the Department of State as institutions. For Iran, commitments bind the Islamic Republic as a constitutional entity, executed collectively by the Presidency, the Majlis, the Supreme National Security Council, and the Atomic Energy Organization of Iran. No single institution's removal incapacitates the framework; the remaining institutions continue. This institutional distribution is protective for Iran as well as for the framework: it prevents any single political faction from unilaterally abandoning the arrangement.

Section 1.2: Depositary and Legal Standing

This framework is deposited with the UN Secretary-General upon entry into force and constitutes a binding instrument of international law independent of the political continuity of any signatory government. Deposition creates legal standing for enforcement claims in international forums, including the UN Security Council and the International Court of Justice for states accepting its jurisdiction. The UN Secretary-General's depositary function is technical and administrative; substantive dispute resolution remains with the Joint Stability Commission.

Section 1.3: Scope and Limitations

This module establishes a phased framework for (a) verified limitations on uranium enrichment and stockpiles; (b) sequenced, reciprocal sanctions modulation; (c) release of blocked Iranian sovereign assets; and (d) continuous multi-source international verification. The module is designed to function as a confidence-building mechanism and a foundation for broader regional negotiation, not as a comprehensive resolution of all bilateral disputes.

Crucially, this module does not require Iran to abandon enrichment entirely. Recognizing that the United States has articulated a preference for "zero enrichment" while Iran has declared enrichment a "non-negotiable sovereign right," this Accord introduces the **Regional Consortium Compromise**: Iran retains limited, capped, continuously monitored enrichment to 3.67% on Iranian soil for a defined confidence-building period of 36 months. Upon successful completion of Phase II, a regional civilian enrichment consortium is established on neutral soil (the UAE or Oman), with Iranian scientific participation and equity share, and Iran's domestic enrichment transitions to a monitored storage and research posture. This architecture gives the United States its verification-driven "no weapons pathway" outcome while preserving Iran's sovereign dignity and technical employment.

Section 1.4: Without Prejudice and Non-Precedent

Participation in this module shall not be construed as recognition of any other party's government, institutions, or territorial claims beyond the specific commitments set out herein. This agreement establishes bilateral arrangements specific to Iran and the United States. It does not create precedent for other nuclear-capable states, other regional conflict dyads, or multilateral non-proliferation frameworks beyond the specific verification mechanisms established herein. Neither party may cite this agreement in proceedings concerning other states without mutual consent. The JSC maintains a "Precedent Firewall Register" documenting any external citation attempts.

Article 2: The Parity Ladder and 45-Day Review Cycles

Section 2.1: The 45-Day Cycle Architecture

Implementation occurs in discrete 45-day review cycles. Each cycle consists of Days 1–40 (continuous monitoring and implementation) and Days 41–45 (compliance certification by the Joint Stability Commission). The 45-day cycle balances operational responsiveness with bureaucratic reality, allowing meaningful implementation progress between reviews while maintaining regular accountability checkpoints. If defection occurs, it is detected within six weeks, not years. This reduces the incentive for defection because getting caught is swift and certain.

Section 2.2: Synchronized Movement Rules

Every obligation is paired with a reciprocal obligation from the other side, performed simultaneously within each 45-day cycle. Neither party moves alone. This eliminates the "I moved first and was betrayed" trap that destabilized previous frameworks. The Parity Ladder operates as follows:

Cycle Phase	Iranian Obligation	U.S. Obligation
Cycle 1 (Days 1–45)	Enrichment cap at 3.67%; complete facility declaration; IAEA baseline inspection	Humanitarian banking channel activation; \$2B frozen asset release; civil aviation parts licensing
Cycle 2 (Days 46–90)	Stockpile reduction to 300 kg UF ₆ ; Fordow conversion planning begins	Second \$2B asset tranche; agricultural equipment licensing; pharmaceutical trade authorization
Cycle 3 (Days 91–135)	Arak reactor modification plan submitted; 20% stockpile downblending begins	Third \$2B asset tranche; oil export licensing for medical and food sectors
Cycle 4 (Days 136–180)	Fordow cascade sealing verified; IAEA continuous monitoring operational at all sites	Fourth \$2B asset tranche; technology cooperation pilot (medical isotopes)

Cycle 5 (Days 181–225)	Full compliance certification; Pattern-of-Concern score at zero	Fifth \$2B asset tranche; sanctions modulation review for Phase II expansion
------------------------	---	--

Section 2.3: The Incentive Acceleration Mechanism

Positive reinforcement is built into the architecture. If a party completes two consecutive cycles with zero Compliance Indicator adjustments, no Pattern-of-Concern designations, and on-time delivery of all obligations, it unlocks the **Incentive Acceleration Mechanism**: a 15% acceleration of the next benefit tranche or an early activation of a Phase II benefit. This creates momentum beyond penalty avoidance and rewards consistent compliance. Conversely, if a party triggers two consecutive Pattern-of-Concern designations, benefit tranche timing is reviewed and may be delayed by up to 30 days pending remediation.

Article 3: Nuclear Stabilization and Sovereign Dignity Protocol

Section 3.1: The Never-Weapons Commitment

The Islamic Republic of Iran shall never seek, develop, or acquire nuclear weapons under any circumstances, nor permit the manufacture or deployment of nuclear weapons within its territory. Iran reaffirms its obligations under the NPT and confirms that all nuclear activities shall remain exclusively peaceful and subject to continuous international verification. To operationalize this commitment, Iran shall enact domestic legislation criminalizing nuclear weapons acquisition, development, or deployment, with penalties of not less than twenty years imprisonment. Iran shall also establish an independent Oversight Council of civilian nuclear experts and jurists with authority to inspect any facility and report directly to the Majlis.

Section 3.2: The Three-Pillar Nuclear Architecture

Pillar One — Enrichment Cap: Iran shall limit uranium enrichment to a maximum of 3.67% U-235 at all facilities for the duration of Phase I (Cycles 1–12, approximately 18 months). Iran shall cease all enrichment above 20% immediately upon signature. No additional centrifuge capacity shall be installed. These measures ensure Iran's enrichment program remains below proliferation thresholds and subject to continuous international verification.

Pillar Two — Stockpile Management: Iran shall reduce its uranium hexafluoride stockpile to no more than 300 kg UF₆-equivalent by the end of Cycle 3, through dilution to 3.67%, transfer to IAEA custody, or conversion to medical isotope precursors. All stockpile reductions shall be irreversible by design and conducted under continuous IAEA observation. Stockpile reductions are measured by IAEA and reported to the JSC at the end of each cycle.

Pillar Three — Fordow Transformation: The Fordow Fuel Enrichment Plant shall be permanently converted to the International Medical Isotope Research Center, producing molybdenum-99 and other medical-grade radioisotopes for regional healthcare. Iran's existing stockpile of uranium enriched above 20% shall be progressively downblended to below 20% LEU and redirected to medical target fabrication. Full operational conversion targets completion within 36 months. This transforms proliferation-relevant

infrastructure into humanitarian infrastructure, preserving Iranian technical employment and providing visible, durable evidence of Accord success that survives political transitions.

Section 3.3: The Regional Consortium Compromise

Upon successful completion of Phase II (Cycle 24, approximately 36 months), the Parties shall establish the **Gulf Civilian Nuclear Consortium**, a jointly governed enrichment facility on neutral territory (the United Arab Emirates or the Sultanate of Oman), with Iranian scientific participation, equity share, and permanent board representation. Iranian domestic enrichment capacity shall then transition to a monitored research and storage posture only, with all commercial-scale enrichment conducted through the Consortium under IAEA safeguards. This compromise preserves Iran's "right to enrich" in a multilateral, non-proliferation-compliant framework while giving the United States and regional partners confidence that no single state controls the full fuel cycle unilaterally. The Consortium is designed to be a model for regional scientific cooperation, not a concession imposed on Iran.

Section 3.4: Cumulative Minor Breach Trigger

To prevent gaming through incremental violations, three or more minor breaches in a single cycle shall be treated as equivalent to one major breach for purposes of Compliance Indicator scoring. A minor breach is defined as a deviation of less than 10% from an agreed quantitative obligation, or a delay of 7–14 days in meeting a procedural deadline. This cumulative trigger prevents the strategy of "death by a thousand cuts" where a party technically complies while systematically eroding the framework.

Article 4: Sanctions Modulation and Economic Gravity Well

Section 4.1: Graduated Sanctions Modulation

Sanctions relief is not front-loaded. It is released in tranches synchronized with verified Iranian compliance, creating mutual exposure and mutual benefit. The United States shall modify or suspend sanctions in the following categories in alignment with the Parity Ladder:

- **Cycle 1:** Humanitarian financial channels; civil aviation safety parts; agricultural equipment; medical device trade.
- **Cycle 2:** Petroleum refining equipment for domestic fuel supply; pharmaceutical and food trade banking access.
- **Cycle 3:** Limited oil export licensing for humanitarian-correlated revenue; technology cooperation pilot in medical isotopes.
- **Cycle 4:** Banking channel expansion; SWIFT reconnection for designated correspondent relationships; insurance and reinsurance for trade.
- **Cycle 5:** Comprehensive review for Phase II expansion of sanctions relief categories, including academic and cultural exchange licensing.

Section 4.2: The Economic Gravity Well

To prevent sudden reversal of sanctions relief from collapsing the framework, this Accord establishes the **Economic Gravity Well**: a private-sector lock-in protocol that makes commercial re-engagement durable. Multinational contracts signed under PRAIS-authorized channels retain legal protection for 36 months regardless of sanctions status. Exit penalties are built into consortium agreements. Major energy, infrastructure, and pharmaceutical contracts signed during Phase I remain valid during any Stabilization Hold or Minimal Compliance Mode, creating commercial constituencies in both states that actively lobby for framework continuation. The Gravity Well ensures that economics becomes a stabilizing force, not a hostage to politics.

Section 4.3: The Snapback Friction Ladder

No sanctions snapback is instantaneous. If compliance deteriorates, re-imposition follows a three-step friction ladder: **Step 1** Warning Designation (30-day notice, published by JSC); **Step 2** Partial Restriction (targeted sectoral re-imposition, 44-day minimum interval from Warning); **Step 3** Full Snapback (only after JSC determination and 90-day total interval from initial Warning). This friction ladder prevents emotional or politically driven instant escalation and preserves diplomatic space for remediation. If the United States reimposes sanctions, Iran may proportionately suspend nuclear obligations and invoke commercial countermeasures under the Mutual Pain Index (Annex F).

Section 4.4: Sovereign Asset Release Schedule

Frozen Iranian sovereign assets are released in five tranches totaling \$50 billion over 360 days, linked to verified compliance milestones: Tranche 1 (Day 30, 25%, initial IAEA baseline); Tranche 2 (Day 90, 20%, enrichment cap verified); Tranche 3 (Day 180, 20%, stockpile limit plus Fordow conversion commencement); Tranche 4 (Day 270, 20%, full compliance certification); Tranche 5 (Day 360, 15%, sustained 12-month compliance). This schedule front-loads enough capital to generate visible economic relief while back-loading enough to incentivize sustained compliance.

Article 5: The Verification Integrity Fortress (VIF)

Section 5.1: Multi-Source Verification Requirement

No compliance determination, breach classification, or triggering of consequences shall rely solely on any single verification data source. Compliance assessments shall be based on corroboration across multiple independent modalities:

- **IAEA Sensor Data:** Real-time automated sensor streams from continuous monitoring equipment at Iranian facilities.
- **Independent Sampling:** IAEA-conducted environmental sampling, physical inventories, and unannounced inspections independent of continuous monitoring.
- **Redundant Measurement Modalities:** Environmental monitoring cross-checked against physical inventory measurements and automated sensor data.

- **Human Verification Layer:** IAEA inspectors' direct observations, facility access reviews, and expert assessment of data patterns.

If one stream is compromised by cyber attack or malfunction, divergence is detected through other streams and triggers integrity investigation rather than automatic breach classification. The IAEA shall explicitly identify the verification sources supporting each compliance determination.

Section 5.2: The Verification Integrity Uncertain (VIU) Safe Harbor

If data anomalies, inconsistencies, or ambiguities appear, a mandatory **Verification Integrity Review** occurs before any consequence is triggered: (1) Initial anomaly detection (Hours 0–24): IAEA detects anomaly and notifies JSC; (2) Cross-source validation (Hours 24–48): IAEA analysts compare anomalous data against all other sources; (3) Iran's technical response (Hours 48–72): Iran may provide technical explanation or invite independent verification; (4) Integrity assessment (Days 3–4): JSC and IAEA jointly assess whether the anomaly is consistent with compliance, non-compliance, or ambiguous.

If the anomaly remains unresolved, the matter is classified as **Verification Integrity Uncertain (VIU)**. VIU status: (a) does NOT permit escalation to breach procedures; (b) does NOT permit asset release reversal; (c) DOES trigger automatic Stabilization Hold for up to 30 days; (d) DOES trigger emergency re-verification using alternative methods; (e) DOES trigger forensic audit of data pipelines. A VIU designation may not remain in effect for more than 60 days; at the conclusion, if ambiguity persists, the status quo is preserved and the Accord continues. This prevents attackers from weaponizing data ambiguity to force false escalation.

Section 5.3: Cyber Resilience Clause

If cyber interference with verification systems is detected, such interference is treated as non-attributable anomaly by default. Cyber interference cannot assign blame to either party without corroboration. Detection automatically triggers integrity investigation and may result in VIU classification, but shall not result in breach classification absent additional independent evidence of actual non-compliance. The Parties shall cooperate in forensic analysis and system hardening to prevent recurrence. If either party detects cyber interference, it shall notify the other and the JSC immediately. Failure to disclose detected cyber interference constitutes a Pattern-of-Concern procedural violation but not material breach.

Section 5.4: Out-of-Band Verification Authority

IAEA retains unlimited authority to conduct physical inspections of Iranian nuclear facilities independent of any digital monitoring systems. Physical inspections may be conducted at any time, with or without notice. IAEA shall maintain independent verification records in air-gapped systems not connected to live digital networks. These records serve as a permanent, tamper-resistant archive. Baseline measurements are established and updated through physical measurement, not solely through continuous monitoring, serving as ground truth against which sensor data is validated.

Article 6: The Black Swan Shield and Crisis Architecture

Section 6.1: Stabilization Hold

Either party may call a **Stabilization Hold** for up to 45 days (renewable to maximum 150 consecutive days) without being deemed in breach. Grounds include: ambiguous verification data requiring assessment time; acute domestic political events (elections, legislative votes, internal security incidents); third-party military incidents threatening framework assumptions; or technical implementation barriers. During a Hold: new cycle obligations are suspended; existing enrichment caps and stockpile limits remain in force; IAEA monitoring continues at routine levels; the JSC remains in standby mode. If a Hold extends beyond 120 days, the Accord automatically enters **Minimal Compliance Mode**: Iran maintains enrichment cap and monthly IAEA verification; the United States maintains current sanctions relief levels without expansion or reduction. Neither party may use Minimal Compliance Mode to improve its negotiating position relative to the other.

Section 6.2: Third-Party Spoiler Event Categories

Regional escalation does not automatically collapse the Accord. Third-party or proxy events are categorized by severity with graduated default responses:

- **Minor Spoiler:** Localized, limited-duration incident with no sustained effect on regional stability. Default response: optional information exchange; optional JSC technical meeting; no automatic obligation suspension.
- **Serious Spoiler:** Sustained incident with measurable regional impact but not threatening Accord survival. Default response: automatic JSC convening within 5 days; automatic short Stabilization Hold (up to 30–60 days); IAEA and guarantor technical review; joint assessment with Designated Guarantors.
- **Critical Spoiler:** Major escalation threatening core Accord assumptions. Default response: emergency JSC and guarantor convening within 24 hours; option for extended Hold (up to 150 days) or partial rollback of discretionary measures; presumption that core nuclear verification and enrichment obligations remain in force during crisis assessment; structured decision-making regarding whether Accord continuation is viable.

Section 6.3: The Leadership Reset Protocol

If the framework process stalls due to political crisis, leadership impasse, or cascading compliance concerns, either party may invoke the **Leadership Reset Protocol**. A Reset Request triggers: (a) emergency summit within 72 hours at Secretary of State / Foreign Minister level (neutral venue: Geneva, Muscat, or Islamabad); (b) structured reset session agenda with factual summary by neutral chair; (c) 14-day Remediation Window during which escalation actions are suspended and JSC meets daily at working level. Maximum one Reset per 6-month period per party. A dedicated leader-to-leader hotline operates with 4-hour response commitment for messages marked "Reset Protocol." Reset does not override material breach findings; genuine compliance failures continue through normal enforcement channels.

Section 6.4: The 21-Day Proxy Crisis Lock

If a confirmed major proxy attack (50+ casualties or critical infrastructure damage) occurs, the **21-Day Proxy Crisis Lock** activates automatically: no military response above pre-authorized proportionate packages may be executed for 21 days. During this period, a full attribution process operates through the Third-Party Spoiler Attribution Protocol (Annex C): 72-hour preliminary classification; 10-day joint investigation; default non-attributable classification if inconclusive. This prevents emotional escalation and ensures that retaliation is based on verified attribution, not assumption. The Lock may be overridden only by unanimous JSC vote with neutral chair concurrence, or by a party's Article 51 self-defense claim subject to 48-hour UNSC reporting.

Part II: Trilateral Security Compact — Israel, Lebanon, and Non-State Actor Integration

Article 7: The Blue Line to Green Line Transition

Section 7.1: Border Demarcation and Stabilization Zone

The Parties to this trilateral module are the State of Israel, the Lebanese Republic, and the designated non-state actor (Hezbollah), with the Lebanese Armed Forces (LAF) as the sovereign anchor. This module establishes a **Stabilization Zone (SZ)**: a 30-kilometer geofenced buffer extending from the Blue Line into Lebanese territory and a corresponding 5-kilometer buffer into Israeli territory. Within the SZ, offensive weapons systems are banned: ballistic missiles, precision-guided munitions, armed drones with range exceeding 150km, and crew-served anti-tank systems above 82mm.

The SZ is not a demilitarized zone; it is a **capabilities-restricted zone**. LAF and UNIFIL+ (Enhanced UN Interim Force) maintain patrol authority. Light arms for border defense remain permitted within 5km of the Blue Line on both sides. This architecture gives Israel security against short-range rocket threats while preserving Lebanese sovereignty and avoiding the politically toxic framing of "demilitarization." The SZ is verified through satellite imagery, UNIFIL+ ground patrols, and electronic surveillance, not through intrusive inspections of non-state actors.

Section 7.2: Three-Phase Border Pathway

Phase A (Months 1–6): Blue Line stabilization. Cessation of cross-border kinetic operations; LAF deployment to southern Lebanon checkpoints; UNIFIL+ electronic surveillance installation; weekly tripartite technical meetings (Israel, Lebanon, UNIFIL+). No requirement for Hezbollah disarmament during Phase A; only cessation of cross-border attacks.

Phase B (Months 7–18): Functional Border Management. Joint technical committee addresses disputed boundary points (Shebaa Farms, Kfar Shouba, Ghajar) without prejudicing final sovereignty claims; LAF assumes primary security responsibility in southern Lebanon; Israeli phased withdrawal from captured Lebanese territory to agreed lines; cross-border economic pilot projects (agricultural trade, water cooperation).

Phase C (Months 19–36): Full Normalization Option. Upon certification by the JSC that Phases A and B are sustained for 12 consecutive months, the Parties may elect to advance to: permanent border demarcation; establishment of cross-border economic zones; formal peace treaty negotiations; and Israeli commitment to withdraw from all Lebanese territory except mutually agreed security arrangements. Phase C is optional and requires affirmative election by both Israel and Lebanon.

Section 7.3: The Tripartite Monitoring Mechanism (TMM)

The TMM is the operational verification body for the trilateral module. It comprises: one Israeli military representative; one Lebanese Armed Forces representative; one UNIFIL+ commander; and one JSC

neutral observer. The TMM conducts weekly patrol coordination, monthly compliance assessments, and ad hoc investigations of reported violations. TMM findings are reported directly to the JSC and to the respective governments. No TMM finding triggers automatic military response; all findings are channeled through the JSC dispute architecture.

Article 8: Capabilities-Based Restraint and Monitored Storage

Section 8.1: The Capabilities-Based Verification Approach

Rather than demanding politically unachievable immediate disarmament, this module employs **Capabilities-Based Verification**: heavy weapons are repositioned to declared storage sites, sealed, and placed under continuous monitoring. They are not destroyed or seized at this stage. "Heavy weapons" are defined as: missiles and rockets above 85mm caliber; crew-served anti-tank systems; artillery above 82mm; armed drones with range exceeding 40km; and anti-aircraft systems. Light arms and defensive weapons below these thresholds may remain in designated locations. This approach transforms the political problem of "disarmament" into the technical problem of "monitoring," which is more achievable and less humiliating for the non-state actor while giving Israel confidence that offensive capabilities are neutralized.

Section 8.2: Monitored Storage Protocol

Repositioned weapons are stored in sites declared to UNIFIL+ and the LAF, sealed with IAEA-style tamper-evident tags, and subject to monthly unannounced inspection. Satellite imagery (open-source and national technical means from neutral states) provides continuous monitoring. Any seal breach triggers a 7-day technical investigation before escalation. Storage sites are located at least 15km from the Blue Line. The state of Lebanon assumes responsibility for site security; UNIFIL+ verifies seal integrity. If weapons are moved without authorization, the TMM issues a compliance notice and the JSC convenes within 7 days.

Section 8.3: LAF Capacity Building and Integration Pathway

As Hezbollah heavy weapons are repositioned to monitored storage, the Lebanese Armed Forces receive capacity-building support: equipment and training funded by a \$2 billion international security assistance fund; doubling of LAF troop strength in southern Lebanon over 24 months; and integration of Hezbollah personnel who elect to transition into LAF command structure (rank and salary preservation). This creates a structural incentive for Hezbollah fighters to transition to state employment rather than remain in non-state formations.

Article 9: The Silent Partnership Track for Regional Normalization

Section 9.1: Normalization as Structural Spine

For key actors, especially Saudi Arabia and the Gulf states, normalization with Israel is the prize that makes the entire regional package worth pursuing. For the United States, normalization is the headline deliverable that makes the framework politically sellable domestically and to Congress. This module

therefore elevates normalization from a downstream result to a structural element that is visible, incentivized, and explicitly progressing from Day 1. Previous frameworks erred by treating normalization as the dessert after the meal; PRAIS treats it as an ingredient in the stew, visible and aromatic from the first day of cooking.

Section 9.2: The Silent Partnership Mechanism

Recognizing that full diplomatic normalization may be politically impossible in the short term, this Accord introduces the **Silent Partnership Track**: a structured pathway for functional cooperation without formal diplomatic recognition. Elements include:

- **Silent Overflight:** Civilian aircraft overflight rights confirmed through third-party air traffic control (ICAO-mediated), without requiring formal bilateral aviation agreements.
- **Silent Commerce:** Trade representation offices operating under third-country diplomatic cover (Jordan, Oman, or UAE as host), handling commercial disputes and customs facilitation without formal embassy status.
- **Silent Coordination:** Joint technical working groups on water, energy, and health security, hosted by the United States or European Union, with participants attending in "personal capacity" rather than official delegations.
- **Silent Intelligence:** Counterterrorism intelligence sharing on ISIS and al-Qaeda successor networks through the Regional Counterterrorism Lattice, without formal intelligence agreements.

Silent Partnership creates functional normalization that generates economic and security benefits while allowing domestic political constituencies to claim that "no formal recognition has occurred." Over time, functional normalization builds the trust and institutional habits that make formal normalization achievable.

Section 9.3: Abraham Accords Integration

Existing Abraham Accords relationships (UAE, Bahrain, Morocco, Sudan) are explicitly consolidated and expanded within this framework. Saudi-Israeli Silent Partnership activates from Day 1: overflight rights; economic chamber-of-commerce observer status; joint U.S.-Saudi-Israeli technical working groups. Full Saudi-Israeli normalization remains available when both parties elect it, subject to their domestic political conditions. The framework explicitly does not require Palestinian statehood as a condition for Saudi-Israel normalization; it does require Saudi Arabia to publicly confirm its commitment to Palestinian humanitarian and development interests, a lower bar that is achievable within current political conditions. The Palestinian dimension is addressed through Phase IV humanitarian and reconstruction commitments, not as a blocking condition for regional progress.

Section 9.4: Turkey Contingency Inclusion

Turkey is not a central party but has significant influence over Syria, refugee flows, and regional energy architecture. An optional engagement channel is maintained: Turkey may participate as an observer in Syria consultations; Turkey's Gaziantep-based humanitarian infrastructure is coordinated with OCHA for Syrian corridor management; if Turkey requests deeper engagement, the JSC may create a Turkey-specific

consultation track by weighted majority vote. Turkey's inclusion is designed to prevent a major regional actor from becoming a spoiler by exclusion.

Part III: Regional Conflict Resolution — Yemen, Iraq, and Syria

Article 10: Yemen De-escalation and Reconstruction Architecture

Section 10.1: The Three-Modular Halt Options

The Yemen module offers three independent pathways for the Saudi-led Coalition and the Houthi movement, any of which may be selected without requiring the others:

- **Option Alpha — Cessation of Hostilities:** Immediate halt to cross-border missile and drone strikes; halt to Coalition airstrikes; maritime interdiction pauses in the Red Sea. Verified by UN monitoring mission field presence in border governorates and declared storage sites. This option is designed to be selectable within 30 days and requires no political recognition.
- **Option Beta — Political Transition Framework:** Houthi recognition as a political party (not a government) with proportional legislative representation; Saada governorate autonomous administration; national unity government with Houthi ministerial participation; and a Saada autonomous referendum at Year 5 if stability is sustained. This option requires Houthi commitment to cease armed operations outside Saada.
- **Option Gamma — Economic Reconstruction:** \$35 billion reconstruction trust fund (Gulf-funded, UN-administered); port rehabilitation at Hodeidah; Sanaa airport reopening; civil service salary payment mechanism; and preferential hiring of former Houthi fighters in reconstruction projects. This option is available regardless of political status and is designed to create economic constituencies for peace.

Section 10.2: The Red Sea Maritime Safety Commission

A permanent **Red Sea Maritime Safety Commission** is established with membership from Egypt, Saudi Arabia, Yemen, Jordan, Eritrea, Sudan, and the United States as observer. The Commission operates: a shared AIS vessel-tracking data pool; coordinated naval patrol scheduling to prevent confrontation; a dispute-resolution hotline for maritime incidents; and a deconfliction protocol for military and commercial vessels. Houthi maritime activity is monitored but not automatically treated as state-directed Iranian action; the Third-Party Spoiler Attribution Protocol governs all attribution claims. The Commission does not require intelligence sharing between adversaries; it requires operational coordination to prevent accidental escalation.

Section 10.3: The FTO Pathway

The United States maintains the legal option to delist the Houthis from the Foreign Terrorist Organizations (FTO) registry in exchange for verified compliance with Option Alpha (Cessation of Hostilities) for 12 consecutive months. Delisting is not automatic; it requires U.S. executive certification and Congressional notification under INARA procedures. If Houthi compliance deteriorates after delisting, re-listing follows the Snapback Friction Ladder (30-day warning, 44-day partial restriction interval). This creates a positive

incentive for Houthi restraint without requiring immediate political concessions and without binding future U.S. administrations.

Section 10.4: Saudi-Coalition Off-Ramp

The Saudi-led Coalition receives explicit security guarantees: Yemen reconstruction is structured and conditioned on Houthi compliance, not on Saudi unilateral concession; Coalition airstrikes end as a reciprocal obligation when Houthi cross-border strikes cease; GCC-Iran de-escalation channel is formalized through the JSC; and Saudi Vision 2030 risk premium is reduced through regional stability certification. Saudi Arabia's role as a framework stakeholder, not merely a funder, is institutionalized through permanent seats on the Reconstruction Trust Fund board and the Red Sea Maritime Safety Commission.

Article 11: Iraq Stabilization and Militia Integration Timeline

Section 11.1: The Three-Pathway Integration Architecture

Iraqi Popular Mobilization Units (PMU) and affiliated militias are given three modular pathways, with 90 days from framework entry to elect their route:

- **Pathway One — Iraqi Security Forces Integration:** PMU units transition to formal Iraqi Army or Border Guard Force command structure, with ranks, salaries, and chain of unity under the Ministry of Defense. Iranian advisors transition to bilateral training agreements under Iraqi sovereignty. Integration is verified by the UN Iraq mission and the JSC Iraq working group.
- **Pathway Two — Civilian Reintegration:** PMU fighters elect civilian transition with vocational training, pension guarantees, and preferential hiring in infrastructure projects funded by the Regional Economic Gravity Well. Reintegration support is funded by a \$3 billion international capacity-building fund.
- **Pathway Three — Monitored Political Party Status:** Armed formations that elect political transition disarm to light-weapons status, register as political parties under Iraqi electoral law, and participate in parliamentary politics. Heavy weapons are transferred to monitored storage under LAF/ISF supervision. This pathway preserves political representation while removing heavy weapons from the street.

Section 11.2: U.S. Force Protection and Redeployment

The United States commits to a phased, condition-based redeployment from Iraq: 25% reduction within 6 months of PMU integration commencement; 50% within 12 months; full transition to advisory presence within 24 months. This redeployment is conditioned on: (a) verified reduction in attacks on U.S. facilities; (b) Iraqi government assumption of base security responsibility; (c) maintenance of counter-ISIS intelligence cooperation. If conditions deteriorate, redeployment pauses automatically through the Dynamic Stabilization Buffer. The redeployment is framed as transition from occupier to guarantor, preserving U.S. influence without maintaining costly troop presence.

Section 11.3: Iran-Iraq Security Channel

Iran commits to a gradual drawdown of IRGC Quds Force advisory presence in Iraq, phased over 24 months and linked to PMU integration progress. Drawdown is framed as transition to bilateral training agreements under Iraqi sovereignty, not as forced withdrawal. Iran retains the right to maintain cultural and religious ties with Iraqi Shia communities, which are not subject to framework restrictions. The Iran-Iraq security channel is managed through the JSC, not through bilateral confrontation.

Section 11.4: Kurdistan Regional Government Compact

A separate but linked **Kurdistan Regional Government Autonomous Governance Compact** addresses: budget transfer automation from Baghdad with transparent formula; oil management authority with revenue sharing through an escrow mechanism; Article 140 implementation timeline for disputed territories with UN monitoring; Peshmerga integration into Iraqi Security Forces command structure; and Kirkuk interim power-sharing arrangement. This Compact is negotiated bilaterally between Baghdad and Erbil with JSC facilitation, not imposed externally. The Compact is designed to prevent Kurdish secessionist pressure from destabilizing Iraq while addressing legitimate Kurdish autonomy demands.

Article 12: Syria De-escalation and Territorial Integrity Guarantee

Section 12.1: The De-escalation Architecture

This module establishes three de-escalation zones in Syria, each with distinct verification mechanisms and stakeholder configurations:

- **Northwestern Zone (Idlib/Aleppo):** Ceasefire between Turkish-backed and Syrian government forces; humanitarian corridor from Gaziantep to Aleppo; no offensive military operations without 14-day JSC notification; UN monitoring mission field presence.
- **Northeastern Zone (Kurdish-administered areas):** Security buffer along the Syria-Turkey border; Syrian government revenue-sharing for oil production in northeast (60% government, 40% local administration); counter-ISIS coordination between SDF and Syrian Army through JSC liaison; no Turkish cross-border military operations without 72-hour notification.
- **Southern Zone (Daraa/Sweida):** Israeli-Syrian disengagement commitment; no Iranian military infrastructure within 50km of the Golan Heights; Russian monitoring presence maintained; UN UNDOF mission expanded.

Section 12.2: Territorial Integrity and Reconstruction

All parties affirm respect for Syrian territorial integrity and reject partition. Reconstruction funding is conditioned on: (a) release of political detainees; (b) safe refugee return with property restitution guarantees; (c) non-militarization of reconstruction sites; (d) international monitoring of detention facilities. The European Union and Gulf states lead reconstruction financing; the United States provides targeted sanctions waivers for reconstruction materials. Syrian normalization with regional states proceeds through the Silent Partnership Track, not formal diplomatic recognition, until a permanent political

settlement is achieved. This creates a "normalization without recognition" pathway that rewards Syrian stability without legitimizing the current government beyond the specific commitments made.

Section 12.3: The Syria-Jordan Border Stability Protocol

Jordan receives explicit guarantees: economic support buffers for refugee hosting costs (\$500 million annual fund); U.S. consultation commitment before any Syria policy change affecting Jordan's border; water security technical assistance including Red-Dead Sea conduit project acceleration; and preferential trade access for Jordanian goods entering Syria through the Levant-Gulf Rail Corridor. The Jordanian border is designated a priority humanitarian and trade corridor, with customs pre-clearance and infrastructure investment. Jordan's quiet cooperation is essential and cannot be assumed; these guarantees are designed to secure it.

Section 12.4: Refugee Return and Property Restitution

Syrian refugees receive a structured return pathway: voluntary return with no coercion; property restitution commission with international arbitration for disputed claims; temporary housing reconstruction grants; and amnesty for non-violent political opposition (excluding UN-designated terrorist organization membership). Return is monitored by UNHCR and the JSC humanitarian working group. Host states (Lebanon, Jordan, Turkey) receive proportional economic support for each verified return, creating an incentive for host-state cooperation rather than obstruction.

Part IV: Regional Economic Integration and Infrastructure

Article 13: The Regional Economic Gravity Well

Section 13.1: The Gravity Well Concept

The Economic Gravity Well is designed to make framework reversal economically painful by creating commercial constituencies with vested interests in stability. It operates through three mechanisms: (1) **Contract Sanctity Shield** — multinational contracts retain legal protection for 36 months regardless of sanctions status; (2) **Private-Sector Lock-In Protocol** — energy and infrastructure contracts include exit penalties tied to compliance; (3) **Regional Investment Guarantee Facility** — multilateral insurance against political risk for investments in framework-compliant zones, capitalized at \$10 billion.

Section 13.2: The \$300 Billion Decade Impact

The Regional Economic Dividend is structured in tranches, with each tranche unlocking only when the preceding phase is verified:

Phase	Timeline	Unlock	Estimated Value
Phase 0 Quick Wins	Days 1–60	Humanitarian banking; medical isotopes; aviation parts; desalination tech	\$15B+
Phase 1 Boom	Months 3–18	Energy Bridge activation; IMESI infrastructure tranches; trade corridor licensing	\$58B+
Phase 2 Lock-In	Months 19–36	Gulf Civilian Nuclear Consortium; regional power grid; Red-Dead Sea conduit; Iraq-Jordan-Gulf rail	\$120B+
Phase 3 Transformation	Years 4–10	Full regional free trade zone; technology transfer hub; tourism corridor normalization; digital connectivity backbone	\$300B+ cumulative

Section 13.3: The International Hormuz Transit Authority (IHTA)

The IHTA is established as an independent maritime governance body with a three-tier tolling system for Hormuz transit: Tier 1 (humanitarian and medical goods, zero toll); Tier 2 (regional trade partners in good standing, reduced toll at 40% of standard); Tier 3 (third-party commercial shipping, standard toll). Iranian civilian reconstruction fund receives 40% of IHTA toll revenue, creating a direct economic interest for Iran in maintaining open transit. The IHTA operates a joint incident response protocol: 2-hour notification, 6-hour joint assessment, 24-hour coordinated response. IHTA board membership includes all Gulf littoral states, with rotating neutral chair from Oman or Pakistan.

Section 13.4: The MEFTA Precedent and Congressional Constituency

The United States commits to exploring a Middle East Free Trade Agreement (MEFTA) framework for PRAIS-compliant states, creating a congressional constituency for framework continuation. MEFTA is not a binding obligation of this Accord; it is a declared policy aspiration that requires separate legislative authorization. However, its inclusion as an unlockable Phase 3 benefit creates a long-term economic incentive for regional actors to maintain compliance.

Article 14: Infrastructure Corridors and Energy Bridges

Section 14.1: The Iraq-Jordan-Gulf Energy Bridge

A regional power grid interconnection protocol enables electricity sharing across the Levant-Gulf corridor. Iraq's renewable and gas generation feeds Jordan's grid; Jordan's solar capacity supplements Gulf peak demand; Iranian electricity connects through Iraq with IAEA-monitored civilian nuclear output. This creates physical infrastructure interdependence that reinforces political stability. The Energy Bridge is administered by a consortium of national utilities with World Bank technical assistance and is designed to be operational within 24 months of Phase I entry.

Section 14.2: The Levant-Gulf Rail and Road Corridor

A priority infrastructure project connecting Beirut, Damascus, Amman, Baghdad, and the Gulf states through standardized customs pre-clearance, joint security patrols, and preferential tariff rates for framework-compliant states. The corridor is administered by a consortium of participating states with UN technical assistance. Land bridges across Syria and Iraq are prioritized for reconstruction, with security provided by mixed patrols (national forces plus UN monitors). The corridor is designated a "protected economic zone" under the Humanitarian Firewall — it may not be blocked for political reasons.

Section 14.3: Water Security Architecture

The Red Sea–Dead Sea Conduit is accelerated with international financing (\$2 billion initial capitalization). Desalination technology sharing is authorized for Gaza, Yemen, and Jordan. The Tigris-Euphrates water-sharing agreement between Iraq, Syria, and Turkey is facilitated through the JSC water working group. Water security is designated a "human security" priority, exempt from trade disputes and sanctions conditionality. The Water Security Fund, capitalized at \$1 billion, provides emergency drought and desalination support to framework signatories.

Section 14.4: Digital Connectivity Backbone

A regional fiber-optic and 5G corridor is planned, connecting major cities across the framework zones. Digital infrastructure is designated as protected critical infrastructure under the Cyber Non-Escalation Protocol. Technology transfer for civilian digital infrastructure (not military or surveillance systems) is authorized under Phase II sanctions relief. This creates a "digital Silk Road" that generates commercial value while reinforcing interdependence.

Part V: Counterterrorism and Security Cooperation

Article 15: The Regional Counterterrorism Lattice

Section 15.1: Threat Assessment and Shared Targeting

The Regional Counterterrorism Lattice addresses ISIS, al-Qaeda successor networks (including Jabhat al-Nusra derivatives and HTS splinters), and other UN-designated terrorist organizations. It does not target state militaries, politically recognized armed formations, or groups engaged in legitimate national liberation struggles as defined by UN General Assembly resolutions. Participating states commit to: (a) intelligence sharing on active terrorist networks; (b) no provision of safe passage or logistical support to designated terrorist organizations; (c) active participation in the PRAIS counterterrorism working group; and (d) cooperation on terrorist financing disruption.

Section 15.2: The CT-Compliance Integration

A dedicated Counterterrorism Compliance Indicator is added to the Compliance Indicator Matrix with a weight of 1 point per indicator. Indicators include: cooperation with intelligence-sharing on active ISIS networks in Iraq and Syria; no confirmed provision of safe passage by Iranian-affiliated actors to designated terrorists; active participation in PRAIS CT working group; and no safe haven for terrorist financing in framework-compliant territories. Confirmed CT violations by proxy forces are attributed to the patron state where direct operational direction is established through JSC-accepted evidence. This prevents the fiction of clean hands through proxy management.

Section 15.3: Positive Incentive for CT Cooperation

Active CT intelligence sharing between the U.S. and Iran through the JSC channel is an unlockable Phase 1 benefit — Iran's security services gain access to U.S. assessments of adversarial networks in return for reciprocal sharing. This creates a positive incentive for CT cooperation rather than only compliance pressure. The CT working group meets quarterly and is hosted on a rotating basis by Oman, Pakistan, and Jordan. Shared targeting packages on ISIS leadership are distributed through encrypted JSC channels.

Article 16: Intelligence-Sharing Architecture and Attribution Protocols

Section 16.1: The Third-Party Spoiler Attribution Protocol (TSAP)

All third-party attacks are subject to structured attribution: 72-hour preliminary classification by the JSC technical panel; 10-day joint investigation with both parties' intelligence representatives and neutral verifiers; default **non-attributable classification** if investigation is inconclusive. Non-attributable events do not trigger automatic framework consequences. This prevents either side from exploiting ambiguity to escalate or evade obligations. If attribution is confirmed, the responsible party has a 30-day cure window before consequences activate. The TSAP applies to all framework zones: Persian Gulf, Red Sea, Levant, Iraq, and Syria.

Section 16.2: The No-Surprises Protocol

Parties shall provide 14-day advance notice through the JSC of any action reasonably expected to affect framework implementation, including: sanctions actions; force posture changes; nuclear activity modifications; domestic legislative action affecting implementation; leadership transitions of designated framework officers; and regional actions toward third parties that could escalate into framework-affecting conflict. Good-faith exceptions exist for immediate self-defense under Article 51 of the UN Charter, classified intelligence operations (with 14-day post-operation notification of framework-affecting consequences), emergency humanitarian responses, and routine administrative actions with no reasonable expectation of framework impact.

Section 16.3: The Israel Notification Channel

Israel is not a formal party to the bilateral U.S.-Iran module. However, Israel's quiet cooperation or active opposition is determinative for framework survival. The United States maintains a confidential notification channel to Israel through which: major JSC decisions relevant to regional security are communicated within 48 hours; Iran compliance assessments are shared periodically; and Israel may raise security concerns that the United States assesses and, where appropriate, raises in the JSC. Israel appoints a permanent participant to the JSC with full speaking rights on security-relevant matters but no formal vote on sanctions or asset release. This addresses Israel's core concern about being bypassed without granting it veto authority over U.S. diplomacy.

Part VI: Humanitarian and Refugee Stabilization

Article 17: The Humanitarian Firewall and Untouchable Corridors

Section 17.1: Untouchable Status

Humanitarian access is locked to UN autonomous management and may not be weaponized in any compliance or political dispute. The following channels are managed exclusively by UN-designated agencies (OCHA, WFP, UNICEF, WHO, UNHCR, ICRC) and are not subject to suspension, reduction, or conditionality by any state party for any reason: Gaza emergency food and medicine corridors; Lebanon emergency fuel and healthcare supply; Syrian civilian return pathway support; Yemen port and airport humanitarian access; Fordow-derived medical isotope supply chains; and desalination equipment for drought-affected zones.

Section 17.2: UN Agency Autonomy

UN agency autonomy in these channels includes: independent procurement authority (agencies procure directly; neither party's approval required for specific purchases); independent access negotiation authority (agencies may negotiate directly with relevant parties, including non-state actors, without JSC authorization); and independent public reporting authority (agencies publish access reports without JSC clearance). If any party attempts to use humanitarian access as leverage in a compliance dispute, the JSC is empowered to issue an immediate public statement that the channel is framework-protected. The statement does not require consensus; the neutral chair may issue it unilaterally if the situation is urgent.

Section 17.3: The Humanitarian Surge Protocol

Within 72 hours of framework entry into force, a coordinated humanitarian surge activates across all zones: Gaza corridor opens with 500 tons daily capacity; Lebanon fuel and medicine pipeline activates; Syrian return pathway assessment missions deploy; Yemen Hodeidah port humanitarian lane opens; and medical isotope export restrictions are lifted. This surge is not conditional on any other framework element. It proceeds regardless of the status of nuclear, sanctions, or security provisions. The surge is designed to create immediate, visible, life-saving impact that generates public goodwill for the framework across all constituencies.

Article 18: Refugee Return and Reintegration Architecture

Section 18.1: The Regional Refugee Compact

A **Regional Refugee Compact** addresses the 14 million+ displaced persons in the region. The Compact establishes: safe return pathways for Syrian refugees from Lebanon, Jordan, and Turkey; Gaza reconstruction-linked return for Palestinian displaced persons; Yemeni internal displacement resolution through reconstruction districting; and Iraqi IDP return with property restitution mechanisms. Return is voluntary, not coerced. Host states receive economic support buffers proportional to refugee population:

\$2,000 per verified returnee for host-state infrastructure support; \$5,000 per returnee for reintegration grants.

Section 18.2: Reintegration Incentives

Returning refugees are eligible for: housing reconstruction grants (\$10,000 per family); vocational training tied to infrastructure projects; preferential hiring in PRAIS-funded reconstruction; and citizenship or residency pathway acceleration. The Reintegration Fund is capitalized at \$5 billion, with Gulf states contributing 60%, the European Union 25%, and the United States 15%. The Fund is administered by UNHCR with JSC oversight. A separate **Right-of-Return Commission** is established for Palestinian refugees, with a \$5 billion fund and international arbitration for property claims. The Commission does not predetermine political outcomes; it addresses individual property and compensation claims.

Section 18.3: Host State Burden-Sharing

Lebanon, Jordan, and Turkey receive explicit host-state guarantees: economic support buffers for refugee hosting costs; U.S. and EU commitment to consult host states before any refugee policy change affecting their borders; infrastructure investment in host-state communities with high refugee density; and preferential trade access as compensation for hosting burden. This prevents host states from becoming spoilers by obstruction or premature refugee return.

Part VII: Multi-Domain Arms Control

Article 19: Naval Security and Maritime Governance

Section 19.1: The Gulf Maritime Coordination Center

The **Joint Maritime Coordination Center (JMCC)** is established in Muscat with participation from all Gulf littoral states, the United States, and Iran. The JMCC operates: a 24/7 incident response hotline with 2-hour initial response commitment; shared maritime domain awareness through fused AIS and radar data; coordinated naval patrol scheduling to prevent confrontation; and a deconfliction protocol for military vessels operating in proximity. The JMCC does not require intelligence sharing between adversaries; it requires operational coordination to prevent accidental escalation. The JMCC is funded by proportional contributions from member states and is designated as protected infrastructure.

Section 19.2: Vessel Seizure and Interdiction Protocol

Any vessel seizure or interdiction in the Persian Gulf or Red Sea must be reported to the JMCC within 2 hours. Seizures for sanctions enforcement are permitted under international law but must follow the JMCC notification protocol to prevent misidentification. The IHTA operates a separate, transparent tolling and inspection regime for Hormuz transit; toll revenue funds regional civilian reconstruction. If a seizure is disputed, the JMCC convenes within 24 hours to assess whether it was conducted under recognized legal authority or constitutes maritime piracy.

Section 19.3: Naval Force Reduction Architecture

The United States commits to a phased reduction of carrier presence in the Persian Gulf: 25% reduction within 12 months of sustained Hormuz open transit; 50% within 24 months; transition to rotational presence (not permanent stationing) within 36 months. This reduction is conditioned on verified Iranian commitment to uninterrupted commercial shipping and JMCC operational cooperation. If Hormuz transit is disrupted, reduction pauses automatically. This gives the U.S. a visible, domestically sellable "bringing ships home" narrative while preserving escalation dominance if compliance deteriorates.

Article 20: Cyber Deterrence and Digital Security Architecture

Section 20.1: The Cyber Non-Escalation Protocol

Cyber operations against critical infrastructure (energy, water, financial, nuclear verification systems) are designated as **Category Red** actions that automatically trigger the 21-Day Crisis Lock. No retaliatory cyber or kinetic response may be executed for 21 days, during which the JSC convenes a forensic investigation with participation from neutral cybersecurity firms. This prevents the "cyber attack → instant retaliation → regional war" escalatory ladder. The Lock may be overridden only by unanimous JSC vote with neutral chair concurrence.

Section 20.2: Critical Infrastructure Shield

Designated critical infrastructure in all parties' territories is placed under a mutual recognition of protected status: civilian nuclear facilities, desalination plants, major electrical grids, hospital networks, and water treatment facilities. Attacks on these targets are treated as escalatory regardless of the method (kinetic, cyber, or sabotage). The Protected Infrastructure Registry is maintained by the JSC and published quarterly. Any attack on registered infrastructure triggers automatic JSC convening within 12 hours and may invoke the 21-Day Crisis Lock.

Section 20.3: Verification System Cyber Hardening

All verification data transmission systems are required to implement: end-to-end encryption; air-gapped backup records; independent audit trails; quarterly penetration testing by neutral cybersecurity firms; and fail-safe protocols that default to "no breach" if data integrity cannot be verified. Compromised verification data does not trigger breach classification; it triggers integrity investigation and VIU status. This prevents sophisticated state or non-state actors from weaponizing cyber intrusion to force false escalation.

Section 20.4: Regional Cyber Cooperation Working Group

A working group on civilian cybersecurity is established under the JSC, focusing on: protection of financial infrastructure; healthcare system resilience; and election integrity. The working group does not address military cyber capabilities or offensive operations; it addresses shared vulnerability reduction. Participation is voluntary and does not imply intelligence sharing on offensive cyber programs.

Article 21: Air Defense and Missile Transparency

Section 21.1: Missile Transparency Framework

Iran commits to a phased missile transparency regime: Phase 1 (Months 1–6): full declaration of missile inventory, ranges, and basing; test notifications 72 hours in advance through the JSC. Phase 2 (Months 7–18): range freeze — no testing or deployment of missiles exceeding 2,000 km. Phase 3 (Months 19–36): conditional reductions in deployed inventory with monitored storage of excess missiles under IAEA-style seals. This framework addresses U.S. and Israeli concerns about Iranian missile proliferation while preserving Iran's defensive deterrent and conventional strike capability against regional threats. The 2,000 km cap preserves Iran's ability to deter regional adversaries while removing intercontinental-range threat perception.

Section 21.2: Regional Air Defense Deconfliction

A **Regional Air Defense Deconfliction Protocol** is established to prevent accidental engagement of civilian aircraft and unintended escalation. All parties commit to: transponder requirements for military aircraft in designated corridors; advance notification of major air exercises (72 hours); and hotline protocols for unidentified aircraft incidents. This does not create integrated air defense; it creates accident

prevention. The protocol is particularly relevant for Israeli, Iranian, and U.S. military aircraft operating in proximity over Syria and the Persian Gulf.

Section 21.3: Drone Proliferation Control

Armed drones with range exceeding 150km are subject to the same monitored storage requirements as heavy missiles. Drone production facilities are declared to the JSC and subject to quarterly inspection. This addresses the growing threat of drone warfare in the region while permitting defensive drone capabilities for border monitoring and counter-terrorism.

Part VIII: Governance, Verification, and Institutional Resilience

Article 22: The Joint Stability Commission (JSC)

Section 22.1: Composition and Authority

The Joint Stability Commission is the central governance body governing PRAIS. Its authority derives from the Accord itself and cannot be suspended, overridden, or dissolved by any party unilaterally. Composition: two co-chairs (Foreign Ministry level for Iran; Deputy Secretary level for the United States); a neutral chair from a standing pool (Oman, Pakistan, Switzerland, Brazil, Singapore, Sweden); permanent working-level staff of 40 persons; and regional representatives from Israel, Lebanon, Saudi Arabia, and Iraq as non-voting participants with speaking rights on matters affecting their security. The neutral chair is appointed for 18-month terms and may be replaced by unanimous co-chair vote or by rotation from the standing pool if a conflict of interest arises.

Section 22.2: Decision Rules

Operational decisions require weighted majority (60%); compliance determinations require weighted majority plus neutral chair concurrence; consequential decisions (structural changes, new annexes, treaty termination) require near-consensus (75%); framework termination requires unanimity plus 12-month notice period. The neutral chair may not cast deciding votes on escalation; only designated member parties vote. This prevents any single actor from manufacturing ambiguity to freeze collective progress. Emergency sessions may be convened within 72 hours without unanimous agreement if a genuine crisis exists, as determined by the neutral chair.

Section 22.3: The Transparency Summary

The JSC publishes a quarterly **Complexity Transparency Summary**: one page per cycle containing current Compliance Indicator Score with trend assessment; active mechanisms and their status; current phase and days remaining; benefit flow summary; compliance snapshot for all parties; next milestone; and risk register (top three risks with mitigation status). The Summary is published in English, Persian, Arabic, Hebrew, and French within 10 days of each review cycle close. A public briefing by JSC co-chairs is conducted quarterly. The Summary is designed to make the framework politically explainable to domestic audiences and to prevent narrative-driven collapse when mechanical compliance is sound.

Section 22.4: Secretariat and Budget

The JSC Secretariat maintains a 40-person neutral professional staff; nationals of Switzerland, Brazil, Singapore, Sweden, and Oman are preferred. The budget is shared equally between the United States and Iran for the bilateral module, with proportional contributions from other parties for regional modules. The Secretariat maintains the Master Implementation Calendar, identifying all concurrent deadlines and flagging potential conflicts 30 days in advance.

Article 23: The Distributed Enforcement Lattice

Section 23.1: Peer Enforcement Logic

Traditional frameworks depend on a single enforcer (usually the United States), creating resentment and asymmetric leverage. PRAIS replaces this with the **Distributed Enforcement Lattice**: the self-interest of Jordan, the UAE, Qatar, Iraq, and Saudi Arabia actively enforces compliance by Iran and its proxies — and simultaneously, the self-interest of Lebanon, Palestine, and Yemen actively enforces compliance by Israel and the Coalition. No single enforcer. Distributed enforcement through distributed incentive. If Jordan benefits from open trade corridors, Jordan actively monitors and reports violations that threaten those corridors. If Lebanon benefits from reconstruction funding, Lebanon actively restrains spoilers who would jeopardize that funding.

Section 23.2: The Group Grade Rule

Each regional zone receives a **Group Grade** on a scale of 0–100, calculated from the Weighted Breach Index scores of all actors in that zone. A Group Grade of 70+ constitutes PASS: the zone advances with full benefits. 50–69 constitutes AMBER: reduced benefits (80%). Below 50 constitutes FAIL: the Chaser activates after a 14-day remediation window. Critical anti-veto rule: no single actor can unilaterally veto the Group Grade. If one actor claims another is in violation, a 7-day technical review occurs by the RSC neutral chair and at least one independent verifier from outside the disputed zone. Default rule: if inconclusive after 7 days, the benefit of the doubt goes to forward progress (Group Grade calculated without the contested event). This prevents any actor from manufacturing ambiguity to freeze the entire zone.

Section 23.3: The Quarantine Protocol for Non-State Spoilers

When a non-state actor violates a zone condition without state backing — as verified by TSAP — that actor's access to framework benefits is frozen. The state actor associated with the group continues receiving its own benefits. The state then has 14 days to: (a) demonstrate active steps to curb the group; (b) assume joint liability and commit to remediation; or (c) disclaim responsibility and accept that the group remains Quarantined indefinitely. If the state assumes liability and acts, the zone retains a modified Group Grade (75%). If the state disclaims, the Quarantined actor's violations are excluded from zone calculation. This isolates rogue actors without penalizing their patrons or collapsing the entire framework.

Section 23.4: The Chaser Mechanism

If a zone's Group Grade falls below 50 and the failure is not corrected within the 14-day remediation window, the **Chaser** activates: all actors in that zone regress to the previous "Landing." A Landing is a step with permanently released economic benefits already paid out. Regression to a Landing means the zone loses access to the NEXT unlock but keeps all benefits already released. This is the key design principle: collapse costs are real but bounded. Example: A zone in Step 4 (Economic Engine) that fails Group Grade falls back to Step 3 Landing (Security Landing). The Energy Bridge (\$5B already flowing) is

NOT clawed back. The zone loses access to Peace Corridor tariff reductions until it re-qualifies at the next 90-day review cycle.

Article 24: The Domestic Continuity Anchor and Election Shock Absorbers

Section 24.1: Institutional Binding Across Elections

Each party shall maintain a minimum implementation team of three designated framework officers registered with the JSC Secretariat: one principal negotiator (ministerial/deputy level); one technical implementation officer; and one legal/compliance officer. These positions must be maintained through election transitions. Outgoing officers brief incoming officers within 14 days. If any position becomes vacant, replacement is required within 14 days. Benefits continue during vacancy. If a party fails to maintain at least two of the three designated officers for more than 30 days, the JSC may issue a formal notice requiring compliance within 14 days. Persistent failure constitutes a procedural concern under the Dispute Exhaustion Rule.

Section 24.2: Election Shock Absorber Mode

During an Election Window (defined as 60 days before a national election and 30 days after completion), either party may activate Election Shock Absorber Mode: no escalation to higher phases; already-scheduled obligations continue; new discretionary measures may be slowed or deferred without constituting bad faith; cycle durations may be extended by up to 15 days. Core verification and compliance obligations continue throughout Election Windows; only discretionary expansions are deferred. This prevents political transition from automatically triggering framework collapse while respecting each party's domestic electoral dynamics.

Section 24.3: The Preliminary Instrument of Stabilization

The Accord may be provisionally implemented for up to 180 days before full legislative ratification. During provisional implementation, all Phase 0 obligations and benefits apply in full. Neither party may invoke the other's failure to complete domestic ratification as grounds for non-compliance, provided good-faith ratification proceedings are ongoing. If ratification is not completed within 180 days, a 60-day consultative review period follows with benefits continuing at 75%. If ratification is completed during the review period, full benefits are restored retroactively. Provisional implementation is explicitly not a signal of bad faith; domestic legislative processes operate on their own timelines.

Section 24.4: Fallback Institutional Chains

If the primary institutional representative of any party becomes unavailable (incapacitation, removal, or succession dispute), the following fallback chains apply: **United States:** Primary: Secretary of State; First Fallback: Deputy Secretary of State; Second Fallback: Under Secretary for Political Affairs; Emergency: National Security Advisor (crisis decisions only). **Iran:** Primary: President plus Speaker plus SNSC Secretary (joint execution); First Fallback: Any two of the three primary signatories; Second Fallback: Guardian Council as constitutional arbiter; Emergency: Senior surviving signatory with AEOI Governor

certification. **JSC:** If neutral chair becomes unavailable, remaining guarantor states (Oman and Pakistan) jointly appoint an interim chair from the standing pool within 72 hours.

Article 25: Graduated Reversibility and Orderly Exit Protocols

Section 25.1: Costed Withdrawal

Withdrawal from any module is permitted and does not constitute bad faith, but it is not consequence-free. Withdrawal suspends benefits associated with that module effective from the date of notice. Benefits accrued up to the date of notice are retained. Withdrawal triggers a 30-day JSC review assessing whether the withdrawal reflects a compliance concern, political will gap, or operational failure, and whether adjustments could address concerns. Minimum notice: 30 days for module withdrawal; 12 months for full framework withdrawal. A party that withdraws may re-enter after a 30-day re-baseline period with JSC certification that the conditions prompting withdrawal have been addressed.

Section 25.2: The Orderly Failure Protocol

If the framework enters terminal collapse despite all remediation mechanisms, the Orderly Failure Protocol activates: (a) 90-day transition period before any party returns to pre-Accord positions; (b) enrichment caps remain in force during transition unless a party explicitly repudiates; (c) existing IAEA monitoring agreements continue; (d) humanitarian corridors remain open; (e) no automatic authorization of military action or sanctions escalation beyond pre-Accord baseline; (f) dispute resolution mechanisms regarding performance under the expired Accord remain active. Orderly Failure ensures that even if political will evaporates, the region does not immediately return to maximum confrontation.

Section 25.3: Sunset and Renewal Architecture

This Accord is in force for an initial period of five years from the date of Activation. The Parties may renew for successive five-year periods by mutual written agreement at least 90 days before expiration. Absence of mutual renewal does not constitute breach; upon expiration without renewal, obligations cease except for provisions addressing past verification data and dispute resolution. If the Parties have not affirmatively agreed to non-renewal at least 90 days before the five-year anniversary, the Accord automatically continues for successive one-year periods until either party provides 90 days' written notice of intent to terminate. This default continuation prevents inadvertent lapse due to bureaucratic delay.

Section 25.4: The Mutual Pain Index

If either party escalates disproportionately (economic consequences for a technical nuclear deviation; military responses for economic non-performance), the Mutual Pain Index activates. The injured party may proportionately suspend obligations in the breached domain and invoke commercial countermeasures. Both sides feel cost. This symmetry prevents either party from using the framework as a one-way leverage tool. The Index is administered by the JSC and published in the quarterly Transparency Summary.

Annexes

Annex A: Compliance Indicator Matrix (CIM)

Domain	Indicators	Weight	Thresholds
Nuclear and Verification	Enrichment compliance; IAEA access; stockpile status; Fordow conversion; supply chain transparency	3 pts each	5.0 = enhanced review; 8.0 = formal assessment; 12.0 = snapback consideration
Security and Proxy	Proxy operational levels; maritime incidents; militia compliance; IRGC deployment status	2 pts each	As above
Economic and Sanctions	Sanctions relief delivery; asset release; banking functionality; IHTA status; oil reintegration	2 pts each	As above
Humanitarian and Regional	Humanitarian access metrics; reconstruction disbursement; ceasefire trends; governance legitimacy	1 pt each	As above
Counterterrorism	Intelligence sharing on ISIS networks; no safe passage to terrorists; CT working group participation	1 pt each	As above

Annex B: Rapid Results Layer — First 60 Days

Day	Deliverable	Political Value
Day 3	Humanitarian Surge: all corridors open; 200+ tons delivered; UN OCHA verified	Immediate life-saving visibility; reputational gain for all parties
Day 7	Pilot Asset Release: \$50M humanitarian escrow to Iranian Central Bank	Tangible economic proof-of-concept; domestically defensible framing
Day 14	Medical Isotope Research Exchange: first U.S.-Iranian nuclear medicine scientist meeting	Civilian, technical, non-threatening optics
Day 21	Banking Channel Activation: Tier 1 humanitarian corridor operational	Visible financial system reconnection

Day 30	JSC Inaugural Session publicly confirmed; Phase 0 formally begins	Institutional legitimacy; momentum signal
Day 45	First Cycle Certification: compliance assessment published	Accountability demonstration; trust-building
Day 60	Second Cycle Launch + Lebanon-Israel technical meeting	Regional expansion signal; trilateral engagement

Annex C: The Quarantine Protocol for Non-State Actor Spoilers

Step 1 — Verification: JSC technical panel, within 72 hours, assesses whether the non-state actor acted with state backing using TSAP standards.

Step 2 — Classification: If no state backing is verified, the actor is designated **Quarantined**. Its benefits freeze. State benefits continue.

Step 3 — State Response Window: 14 days for the associated state to: (a) demonstrate active curbing steps; (b) assume joint liability with remediation plan; or (c) disclaim responsibility.

Step 4 — Zone Grade Adjustment: If state assumes liability, zone retains 75% Group Grade. If state disclaims, Quarantined actor's violations are excluded from zone calculation.

Step 5 — Re-entry: Quarantined actor may be de-Quarantined after 90 days of verified non-violation and JSC certification.

Annex D: Pre-Agreed Interpretation Registry

The following terms are pre-defined and may not be unilaterally reinterpreted:

- **Breach:** Confirmed failure to perform a specific obligation on its due date, verified by the JSC. Distinct from Technical Lapse and Pattern-of-Concern.
- **Material Breach:** Breach that fundamentally undermines the purpose of the provision. Requires JSC determination.
- **Technical Lapse:** Delay up to 45 days where core obligations are still performed and delay is logistical/administrative. Does not constitute breach.
- **Pattern-of-Concern:** Three or more related compliance indicators in the same domain across two consecutive cycles. Diagnostic, not punitive.
- **Proportionate Response:** Consequence limited in scope to the domain and severity of the triggering event.
- **Stabilization Hold:** Time-limited pause in new obligation activation, not existing obligation performance. Up to 45 days, renewable to 150 days.

Annex E: Dispute Exhaustion and Binding Arbitration

Tier 1 — Working-Level Consultation: Designated liaison officers meet within 14 days. Documented to JSC Secretariat.

Tier 2 — JSC Working-Level Meeting: Formal convening with both parties' representatives and neutral chair.

Tier 3 — Joint Technical Panel Advisory Determination: Non-binding advisory determination within 21 days.

Tier 4 — JSC Ministerial Review: Formal compliance assessment at ministerial level. Neutral chair concurrence required for adverse determinations.

Tier 5 — Binding Arbitration (Mutual Opt-In): If both parties agree within 30 days of Tier 4, a three-person panel is constituted: one Iranian-appointed; one U.S.-appointed; one neutral chair. Decisions are final and binding on core obligations.

Emergency Bypass: The exhaustion requirement may be bypassed only for: discovery of weapons-program diversion; imminent armed attack threat; verified humanitarian corridor blockade; or complete loss of IAEA monitoring.

Annex F: The Mutual Pain Index and Sanctions Inertia Buffer

Mutual Pain Index: If the United States reimposes sanctions without following the Snapback Friction Ladder, Iran may proportionately suspend nuclear obligations and invoke commercial countermeasures. Both sides feel cost. The Index is administered by the JSC and published quarterly. The purpose is not to encourage retaliation but to ensure that unilateral escalation is symmetrically expensive, preserving the incentive for graduated response.

Sanctions Inertia Buffer: Reimposition of sanctions requires a 90-day JSC process plus 60-day commercial wind-down. No snapback without 150-day total interval. During the wind-down period, existing contracts remain valid and protected by the Contract Sanctity Shield. This buffer prevents emotionally driven instant escalation and preserves commercial predictability.

Dynamic Stabilization Buffer (DSB): If one party suspends or accelerates obligations asymmetrically (at a rate exceeding 150% of the other party's pace for 2 consecutive cycles), the DSB automatically activates: freeze on further unilateral escalation; partial continuation of existing benefits; mandatory JSC review within 72 hours. The DSB prevents either party from exploiting the other's good faith to extract unilateral advantage.

Annex G: Public Narrative Framework and Authorized Terminology

The JSC maintains an "Authorized Terminology Registry" defining agreed language for sensitive concepts:

- "Compliance" = verified fulfillment of specific obligations per monitoring protocols
- "Violation" = confirmed breach with JSC certification (not media allegation)

- "Dispute" = active disagreement under formal resolution procedures
- "Escalation" = enforcement ladder step activation (not rhetorical criticism)
- "Normalization" = progressive achievement of agreed end-state conditions
- "Snapback" = graduated friction ladder activation (not immediate reimposition)

Unauthorized terminology in official statements triggers a CIM procedural adjustment of 0.5 points per incident, capped at 2 points per cycle. Active disputes under formal resolution may not be publicly escalated by either party before final ruling. Both parties commit to: no media statements framing dispute before resolution; no legislative testimony using dispute for partisan purposes; no third-party advocacy encouraging escalation.

Annex H: Regional Burden-Sharing and Normalization Acceleration

Gulf States as Stakeholders: Saudi Arabia and the UAE jointly chair the Gaza Reconstruction Fund board. Qatar maintains its Gaza mediation role and holds a permanent seat on the Ceasefire Sustainability Commission. Kuwait and Bahrain contribute to the Yemen Reconstruction Fund and hold observer status in the Red Sea Maritime Safety Commission. Converting funders into stakeholders with governance roles creates durable political commitment.

Egypt and Jordan Stabilization Guarantees: Egypt receives: annual U.S. economic support reinforced during framework period; U.S. commitment to consult Egypt before any Gaza governance change affecting the Egyptian border; Sinai security cooperation enhanced. Jordan receives: economic support buffers for refugee hosting costs; U.S. consultation commitment before any Syria policy change affecting Jordan's border; water security technical assistance; and preferential access to Levant-Gulf Rail Corridor.

Normalization Acceleration Track: Saudi-Israeli Silent Partnership activates from Day 1. Full normalization remains available when both parties elect it. The framework provides infrastructure; it does not set a timeline. Palestinian statehood is not a condition, but Saudi commitment to Palestinian humanitarian interests is required.

Signature Page

IN WITNESS WHEREOF, the undersigned, being duly authorized by their respective governments and institutions, have signed this Pan-Regional Accord for Integrated Stability.

This Accord is deposited with the United Nations Secretary-General upon entry into force and constitutes a binding instrument of international law independent of the political continuity of any signatory government.

Done at _____, this ____ day of _____, 2026.
