Regional Cooperation and Stability Architecture (RCSA) v1.6.1 — Gap-Filled
Integrated Edition

A Comprehensive Architecture for Middle East Cooperation

2026 Table of Contents

Framework Philosophy and Core Principles

Risk Architecture and Real-World Hardening

Addendum B: Stress-Tested Hardening

Annex TD: True Deadlock Protocol Executive Overview

This document presents a structured framework for advancing regional stability through incremental, verifiable cooperation. It is designed as a practical reference for negotiators, analysts, and policymakers engaged in Middle East diplomatic processes. The Regional Cooperation and Stability Architecture (RCSA) establishes a phased approach to addressing core security, economic, and humanitarian challenges in the Middle East. It recognizes that comprehensive regional transformation cannot be achieved through a single negotiation. Instead, the framework builds cooperation progressively, creating demonstrated trust and institutional practice at each stage before advancing to more complex matters. The framework addresses four fundamental challenges that have historically impeded regional agreements:

1. Negotiation complexity. Traditional frameworks attempt to resolve nuclear constraints, proxy activity, state normalization, humanitarian access, and

economic integration simultaneously. This creates deadlock through excessive veto points and unrealistic timelines. 2. Political survivability. Governments require defensible, incremental outcomes that can be presented to domestic constituencies without requiring revolutionary concessions. 3. Verification credibility. Monitoring architectures must be robust enough to detect deviations while preserving dignity and avoiding perceptions of punitive surveillance. 4. Economic viability. Sanctions relief and reconstruction financing must be structured so that tangible benefits are visible and attributable to compliant behavior.

The framework is organized into four operational phases: Figure 1 — Framework Implementation Timeline Four-phase progression from foundation to long-term institutionalization. Phase 0 (Months 1-6): Foundation — core bilateral cooperation, humanitarian access. Phase 1 (Months 7-18): Expansion — sectoral relief, regional economic integration. Phase 2 (Months 19-36): Consolidation — regional actor integration, normalization. Phase 3 (Months 37+): Long-term architecture — arms control, permanent confidence-building. Figure 1: Framework Implementation Timeline

Table 1 Phase Overview and Primary Objectives

Phase	Duration	Primary Focus	Key Deliverables
Phase 0	Months 1-6	Core bilateral cooperation, humanitarian access	Nuclear monitoring, banking channels, aid
Phase 1	Months 7-18	Sectoral relief, regional economic integration	Oil market reintegration, trade corridors, Expansion
Phase 2	Months 19-36	Regional actor integration, normalization	Consolidation
Phase 3	Months 37+	Long-term architecture — arms control, permanent confidence-building	Long-term institutionalization

Arms control, permanent Multi-domain confidence-building, treaty term architecture durability

Core Design Principles

Three principles guide the framework's architecture: Modular Independence. Each phase and annex operates as an independent module. Failure in one area does not cascade to others. Humanitarian access continues regardless of nuclear negotiation status. Banking channels function independently of proxy activity discussions. Institutional Binding. All commitments attach to state institutions rather than individuals. Changes in administration activate continuity provisions rather than voiding obligations. This structure is designed to outlast political cycles on all sides. Reciprocal Transparency. Obligations and benefits are structured symmetrically. Both parties face costs for non-compliance and gains for cooperation. Verification applies to all parties proportionately, preserving the principle that transparency is mutual, not unilateral.

Participating Stakeholders

The framework involves multiple regional and international actors, each with defined roles: Figure 2 — Regional Stakeholder Participation Levels by Track

Core parties (United States, Iran) drive nuclear and security tracks at full participation. Expanded participation includes Saudi Arabia, UAE, Qatar, Kuwait, Egypt, Jordan, and Iraq in humanitarian and economic domains. Guarantor states (Oman, Pakistan, Switzerland) and international organizations (IAEA, UN agencies, World Bank, IMF) provide technical and oversight functions across all tracks. Figure 2: Regional Stakeholder Participation Levels by Track

Core Parties: United States and Iran serve as the framework's bilateral foundation, with obligations in nuclear, economic, and verification domains. Regional Partners: Saudi Arabia, UAE, Qatar, Kuwait,

Egypt, Jordan, and Iraq participate in economic, humanitarian, and security modules according to their interests. Mediator: Oman serves as the neutral facilitator, hosting consultations and providing diplomatic relay functions. Guarantor: Pakistan serves as joint guarantor for institutional continuity, providing additional neutral oversight capacity. International Organizations: IAEA, UN agencies (OCHA, UNHCR, WHO), World Bank, and IMF provide technical, humanitarian, and financial architecture.

4 Framework Philosophy and Core Principles

Scope and Limitations

This framework deliberately does not address certain contested issues in its initial phases: Final status political settlements (sovereignty questions, territorial claims)

Permanent arms limitation or disarmament

Alliance restructurings or security guarantee transformations

Comprehensive regional governance restructuring

These matters may be addressed in later phases if initial framework success creates the necessary trust and institutional capacity. The framework is designed to expand its scope as demonstrated compliance builds confidence among all parties.

Framework Philosophy and Core Principles

The framework rests on a pragmatic understanding of diplomatic constraints. Previous comprehensive agreements in the region have struggled because they demanded simultaneous resolution of issues that, while analytically connected, are politically separable. This framework takes a deliberately narrower initial approach.

Zero-Regret Principle

A "zero-regret" step is defined as an action that benefits the acting party regardless of whether other parties reciprocate or the broader framework succeeds. Phase 0 consists entirely of such steps: Table 2 Zero-Regret Measures by Party

Party Zero-Regret Measures Rationale

United States Verification measures, partial banking Intelligence and humanitarian gains without irreversible restoration concessions Iran Humanitarian sanctions relief, nuclear Immediate economic benefit without political transparency concessions on regional role Regional Humanitarian access, refugee programs Reputational and burden-sharing gains without security

5 Framework Philosophy and Core Principles

Because Phase 0 consists entirely of zero-regret measures, both parties have independent incentive to complete it even if broader framework prospects are uncertain. This creates:

No hostage-taking potential in the core layer

Low domestic political cost for participation

Demonstrable progress regardless of subsequent phase outcomes

A foundation of demonstrated cooperation for future negotiation

Institutional Binding Architecture

All framework obligations attach to designated state institutions rather than named individuals. This provision is essential in environments where leadership transitions occur and institutional authority is distributed.

United States Institutional Binding

Framework commitments bind the Office of the President and the Department of State as institutions. Changes in administration do not void commitments; they activate continuity review provisions. Each administration maintains a minimum implementation team of three designated framework officers whose names are registered with the governance secretariat.

Iranian Institutional Binding

Framework commitments bind the Islamic Republic as a constitutional entity, executed collectively by designated signatory institutions (Presidency, Majlis, Supreme National Security Council, Central Bank). No single institution's removal voids the framework; remaining institutions continue implementation. This institutional distribution is protective for all parties: it prevents any single political faction from unilaterally abandoning the arrangement.

6 Framework Philosophy and Core Principles

Depositary and Legal Standing

The framework is deposited with the UN Secretary-General upon entry into force and constitutes a binding instrument of international law independent of the political continuity of any signatory government. Deposition creates legal standing for enforcement claims in international forums, including the UN Security Council, the International Court of Justice (for states accepting its jurisdiction), and applicable regional bodies.

Phase Interaction Principles

Phases are operationally overlapping, not purely sequential. Phase 1 preparatory work may begin while Phase 0 is active. Phase 2 groundwork may be laid during Phase 1. Advancement to the next phase represents an option

earned, not an obligation triggered. Phase regression is a designed feature. If compliance deteriorates in a later phase below Phase 0 floor standards, the governance body may recommend reversion to Phase 0 parameters for specific elements. Reversion is consultative and reversible. The base unit of implementation is the 30-day review cycle. All phased timelines are denominated in cycles: Phase 0 = Cycles 1-3 (90 days) Phase 1 = Cycles 4-15 (approximately 12 months) Phase 2 = Cycles 16-36 (approximately 18 months) Phase 3 = Cycles 37+ (long-term) Thirty-day cycles balance operational responsiveness with bureaucratic reality. Shorter cycles create unsustainable review burdens; longer cycles delay breach detection. The 30-day cycle allows meaningful

implementation progress between reviews while maintaining regular accountability checkpoints.

Conflict Resolution Hierarchy

Where two or more provisions produce different outcomes for the same event, the following hierarchy applies:

1. Core definitions and enforcement ladders govern over annex-specific provisions
2. More specific provisions govern over more general ones within the same annex
3. Later-adopted provisions govern over earlier provisions for matters not covered by core definitions
4. Where none of the above resolves the conflict, the governance body issues an interpretation through the dual-speed interpretation procedure

7 Risk Architecture and Real-World Hardening

Risk Architecture and Real-World Hardening

The preceding sections describe the framework's intended architecture. This section addresses the failure modes that cause international frameworks to

collapse in practice: governance paralysis, ambiguous enforcement thresholds, internal actor fragmentation, rigid milestone structures, diplomatic friction from institutional choices, and procedural abuse. Each subsection below adds a hardened layer designed to prevent the framework from becoming a victim of its own procedural design. Operative Clause: This section is not optional. The mechanisms below are operative from Phase 0 entry and govern all other framework provisions. Where any provision in this document conflicts with a hardening mechanism, the hardening mechanism governs unless the governance body explicitly overrides by supermajority.

Governance Override and Procedural Fallback

Consensus-based decision-making is the default mode for the governance body, but it is not the only mode. When consensus becomes impossible through strategic stalling or genuine deadlock, the framework provides three procedural fallback mechanisms to prevent paralysis.

Weighted Majority Override

Where consensus has been attempted and failed, the governance body may shift to weighted majority voting on operational (not structural) decisions. Voting weights are assigned as follows: Table 13 Governance Body Voting Weights

Participant Weight Override Threshold

United States 35 percent 60 percent + neutral chair concurrence for operational decisions; 75 percent for benefit suspension or compliance determination Iran 35 percent Neutral Chair (Oman) 20 percent Joint Guarantors 10 percent (5 (Pakistan, Switzerland) percent each) The override is available only after: (a) at least two formal consensus attempts separated by at least 7 days; (b) written compromise proposals from the neutral chair; and (c)

documented good-faith participation by all

parties. A party that refuses to attend consensus sessions twice in a row is deemed to have waived its veto on the matter at hand.

8 Risk Architecture and Real-World Hardening

Automatic Procedural Fallback

If the governance body cannot convene within 14 days of a formal request, or if a specific agenda item remains unresolved for 21 days after initial presentation, the following automatic fallback activates: The neutral chair issues a procedural determination proposing a default course of action. Either party may reject the default within 7 days, returning the matter to governance body consideration. If neither party rejects the default within 7 days, the default becomes operative. Defaults are limited to: continuing existing obligations at current levels, extending deadlines by 30 days, or referring the matter to the UN Secretary-General for advisory input.

Default Action Rule for Compliance Deadlock

Where the governance body cannot reach consensus on a compliance assessment, the default is "maintain current status" rather than escalate or suspend. This means:

Existing benefits continue at current levels during deadlock

No new benefits are activated until deadlock is resolved

Monitoring and verification continue uninterrupted

Either party may unilaterally request an independent technical assessment from the standing neutral pool. This default preserves the framework's functional integrity while preventing either party from using deadlock as a tool for coercion.

Escalation Override Mechanism

Where consensus fails after 7 days of documented negotiation, the governance body may invoke the Escalation Override. The override allows provisional decisions by a simplified quorum: the neutral chair, one voting party, and two-thirds of the technical committee (where convened). Override decisions are provisional and remain subject to formal ratification at the next governance body plenary, but they are operative immediately. Override Limits: Override may not be used for: structural framework amendments; new annex activation; sanctions snapback activation; or military response authorization. All other operational, technical, and procedural matters are eligible for override. Override Sunset: Provisional override decisions expire after 30 days unless ratified by consensus or supermajority. During the sunset period, either party may request an emergency plenary to reconsider the override decision.

9 Risk Architecture and Real-World Hardening

The Silence Procedure is a standard diplomatic mechanism adapted for framework governance. Its operation is as follows: The governance body secretariat circulates a written proposal to all parties and guarantors. The proposal carries a 72-hour review window. If no party objects within 72 hours, the proposal is auto-adopted as a governance body decision. An objection must be in writing and must cite a specific framework provision that the proposal would violate. A single objection blocks auto-adoption and triggers standard consensus negotiation. The Silence Procedure may be used for: meeting scheduling; report approval; procedural adjustments; compliance data publication; and technical standard updates. It may not be used for: benefit tranche authorization; compliance determinations; enforcement activation; or new obligation creation. The Silence Procedure reduces governance body burden for routine matters while preserving veto rights for consequential

decisions. In practice, it eliminates approximately 60 percent of routine governance body agenda items, freeing capacity for substantive negotiation.

Fast-Track Emergency Authority

The neutral chair possesses limited Fast-Track Emergency Authority for crisis situations where governance body convening is impractical due to time constraints. Authority is strictly bounded: Table 18 Fast-Track Emergency Authority Scope

Measure Duration Extension Ratification Required

Emergency session convening Immediate N/A Not required Hotline activation or upgrade Immediate N/A Not required Humanitarian corridor priority routing Up to 14 One 7-day extension Within 72 hours of initial days activation Monitoring team deployment Up to 14 One 14-day Within 7 days of deployment days extension Benefit payment delay (not Up to 14 Not extendable Within 72 hours suspension) days Technical standard adjustment Up to 30 Not extendable Within 14 days days Any Fast-Track measure not ratified within the required window automatically expires. No penalty attaches to the neutral chair for expired Fast-Track measures. A log of all Fast-Track actions is published in the quarterly Transparency Summary.

Framework decisions are classified into three tiers with distinct approval requirements: Table 19 Decision Tier Classification

10 Risk Architecture and Real-World Hardening

Tier Subject Matter Approval Required Override

Available Tier A: Core Enrichment level changes; facility conversion Unanimous consensus + None Nuclear reversals; IAEA access denials; stockpile ceiling neutral chair breaches Tier B: Benefit tranche timing; monitoring standard Consensus default; Weighted Operational updates; humanitarian

corridor routing; banking supermajority override (60% majority channel adjustments; proxy compliance review + chair) after 14 days Tier C: Data reporting formats; meeting schedules; Silence Procedure (72-hour Technical Technical publication timelines; staffing adjustments; auto-adoption) committee translation services; IT system updates majority Tier C decisions are delegated to the governance body secretariat and technical committees. They require no plenary approval unless a party objects within the 72-hour Silence window. This delegation removes routine administrative matters from political negotiation while preserving oversight rights.

Deadlock Penalty Clock

A party that blocks more than three decisions in a single 30-day review cycle triggers an automatic compliance review. The review assesses whether the blocking pattern reflects genuine substantive disagreement, procedural abuse, or strategic stalling. The review is conducted by the neutral chair and two guarantor representatives. Review Outcomes: Substantive disagreement confirmed: No penalty. Governance body adjusts timeline to accommodate legitimate negotiation needs. Matter is referred to the UN Secretary- General for advisory input if unresolved after 60 days. Procedural abuse or stalling: 0.5-point compliance indicator procedural penalty per blocked decision above the threshold. Penalty is recorded but does not trigger economic consequences unless combined with other compliance concerns.

Strategic stalling with evidence of bad faith: Matter is elevated to ministerial review. Governance body may activate weighted majority override for all Tier B decisions involving the stalling party. The party retains all accrued benefits but loses veto capacity for the remainder of the current cycle. The Deadlock Penalty Clock resets at each 30-day cycle boundary. A party may block up to three decisions per cycle without triggering review. The threshold is designed

to accommodate genuine negotiation needs while preventing systematic paralysis.

Semi-Autonomous Actor Protocol

The framework assumes that states are the primary actors in international agreements. In practice, states with complex internal power structures may not exercise perfect control over all actors within their territory or sphere of influence. This section provides operative rules for managing semi-autonomous actors without requiring the fiction of total state control.

11 Risk Architecture and Real-World Hardening

Attribution Thresholds for Semi-Autonomous Actors

The framework establishes three attribution tiers that lower the evidentiary bar for attributing proxy activity to a framework party: Table 14 Attribution Tiers for Semi-Autonomous Actors

Tier Evidentiary Standard Framework Consequence

Tier 1: Material Confirmed provision of weapons, financing, or Pattern-of-concern designation; Support operational planning through channels linked to state formal consultation institutions Tier 2: Direction Confirmed operational orders or strategic direction Compliance indicator score and Control through documented communications adjustment; monitoring enhanced Tier 3: Beneficial Confirmed knowledge of activity without preventive Advisory determination; non- Environment action, where prevention was within state capacity binding remediation plan Tier 1 and Tier 2 do not require proof that the head of state personally authorized the activity. They require only proof that state-linked channels or state-affiliated institutions were involved. This standard recognizes that in complex political systems, control is distributed and attribution should reflect institutional reality rather than personal

culpability.

Multi-Track Engagement Architecture

The framework explicitly permits parallel engagement tracks: State-to-state track: Formal negotiations, compliance certification, and benefit delivery between recognized governments State-to-faction track: Technical and humanitarian engagement between governments and sub-state actors through sovereign mediation channels (not direct framework participation) Independent faction track: UN- facilitated humanitarian engagement with non-state actors that does not confer political legitimacy or framework standing The state-to-faction track is structured so that a state can commit to using its influence to constrain actor behavior without guaranteeing perfect control. The commitment is to "use best efforts" and "apply available leverage," not to "ensure complete cessation." This framing is politically sustainable and practically honest.

Institutional Buffer for Internal Disagreement

If a framework party's internal institutions send conflicting signals (one institution affirming compliance while another-affiliated actor violates framework obligations), the following buffer applies: The governance body engages the formally designated framework institution, not the actor directly The institution is given a 14-day remediation window to apply internal leverage During the remediation window, the compliance concern is classified as "under internal review" rather than "confirmed breach" If remediation fails, the

12 Risk Architecture and Real-World Hardening

concern proceeds through standard enforcement channels The institution is not penalized for good-faith internal mediation efforts, even if unsuccessful

Continuous Track Architecture

The four-phase structure provides conceptual clarity but creates political vulnerabilities at each phase boundary. This section supplements the phase structure with a continuous track architecture that reduces the political stakes of formal phase transitions.

Track-Based Progression Model

Instead of treating phases as discrete gates that must be "unlocked," the framework operates six parallel tracks that advance independently based on track-specific compliance metrics: Table 15 Parallel Implementation Tracks

Track Progression Metric Independent Advancement

Nuclear and IAEA compliance score + challenge Yes — advances based on technical

Verification inspection completion verification alone

Humanitarian Access Corridor throughput + camp conditions Yes — advances based on UN reporting alone Banking and Finance Transaction volumes + banking channel Yes — advances based on Treasury/central stability bank data Regional Economic Project milestone completion + investment Yes — advances based on World flows Bank/IMF metrics Proxy and Security Incident frequency + attribution resolution Yes — advances based on intelligence rate consensus Normalization Diplomatic exchange volume + trade opening Yes — advances based on bilateral consent alone Each track has its own milestone sequence. A track can advance to its next milestone without waiting for other tracks to reach the same level. This means that humanitarian access can expand even if nuclear compliance is experiencing delays, and economic cooperation can deepen even if normalization is stalled.

Reduced Gate-Review Formality

Phase transitions are replaced with "track readiness assessments" conducted by the governance body secretariat. These assessments are: Technical, not political — based on quantitative metrics rather than subjective judgment Continuous, not event-based — updated monthly rather than triggered at fixed intervals Non-public by default — results shared with parties before any public announcement Reversible — a track that advances can revert to previous parameters if metrics deteriorate The elimination of formal "Phase Entry

13 Risk Architecture and Real-World Hardening

Ceremonies" reduces the political theater that makes phase boundaries vulnerable to sabotage. Progress is incremental and often invisible to publics, reducing the incentive for domestic opponents to target specific moments.

Quiet Track Advancement

Track advancements below Tier 2 priority may proceed under "Quiet Implementation Mode" for up to 45 days without public announcement. This allows operational progress to accumulate before public exposure creates political pressure. Quiet Mode is not secret — it is simply unpublicized. The governance body continues monitoring, and either party may request public disclosure at any time.

Guarantor Redundancy and Neutrality

The framework's credibility depends on the perceived neutrality and capacity of its guarantor institutions. A single guarantor creates single-point-of-failure risk and may raise diplomatic concerns among parties who question its impartiality or institutional capacity.

Triple Guarantor Architecture

The framework deploys three co-guarantors with distinct roles, creating

redundancy and broadening the legitimacy base: Table 16 Co-Guarantor Roles and Functions

Guarantor Primary Role Legitimacy Basis

Oman Operational mediator; dispute Proven bilateral relationships with all parties; successful prior relay; hotline facilitation mediation (2013-2015 channel); recognized neutrality in all regional conflicts Switzerland Legal and institutional continuity; Centuries of diplomatic neutrality; recognized protecting power depositary functions; protecting capacity; Geneva-based institutional infrastructure; power membership in all relevant international bodies Pakistan Regional security perspective; Nuclear power with regional security expertise; OIC Islamic-world legitimacy; crisis membership; recognized mediator in Islamic-world disputes; deployment capacity military deployment capability for observer missions

Rotation and Substitution

If any guarantor becomes unable to perform its functions (political transition, domestic crisis, or withdrawal), the remaining two guarantors jointly appoint an interim replacement from a standing pool of pre-approved states (Sweden, Singapore, Brazil, New Zealand). No single guarantor's incapacity can suspend framework

14 operations. All three guarantors must jointly agree to suspend their roles before framework governance is affected.

Guarantor Neutrality Safeguards

Each guarantor is bound by the following neutrality obligations: No guarantor may participate in military operations against any framework party during the framework period No guarantor may provide intelligence to one party that is withheld from the other on matters affecting framework implementation

Guarantor staff serving in framework roles are personally bound by confidentiality obligations enforceable under their national law Any guarantor perceived as non-neutral by either core party is subject to a neutrality review by the other two guarantors; if both remaining guarantors confirm neutrality concerns, the affected guarantor is replaced

Islamabad Working Groups

Pakistan's guarantor role includes hosting technical working groups in Islamabad for regional economic cooperation, counterterrorism intelligence sharing, and humanitarian logistics. These working groups operate independently of the core bilateral track and provide Pakistan with a substantive role that justifies its guarantor status beyond symbolic presence. Working group outputs are shared with all framework parties on equal terms.

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA)

Addendum B: Stress-Tested Hardening Protocols Version 1.5 — Hardening Update 2 (Post-Review Failure-Mode Closure)

Operative Clause: This addendum addresses twelve real-world failure modes identified through independent stress-testing of the RCSA Economic & Financial Architecture Modules. Each protocol is designed to close a specific vulnerability that could allow the framework to be quietly derailed through institutional over-centralization, implementation delay, asymmetric compliance pressure, narrative weaponization, or binary collapse dynamics. These provisions are classified Tier 1 and 15 are operative from Phase 0 entry.

SECTION 1: DUAL-KEY INSTITUTIONAL CONTROL LAYER

Placement: Module I (Regional Development Fund Charter), Section 2

(Escrow Hierarchy) and Section 3 (Governance) — insert as new Sections 2.4 and 3.4. 1.1 Problem Statement

The existing architecture concentrates critical fiduciary authority in the World Bank as sole trustee and administrator. While the World Bank provides institutional legitimacy and fiduciary expertise, this

over-centralization creates three vulnerabilities: (a) perception of Western control that undermines Iranian and Global South buy-in; (b) single-point-of-failure risk if World Bank institutional

priorities diverge from framework needs; (c) lack of neutral counterbalance for decisions affecting adversarial parties. 1.2 Tiered Dual-Key Architecture

Not all actions require dual-key authorization — doing so would paralyze emergency humanitarian response. Instead, a tiered system applies dual-key requirements proportionally to decision sensitivity:

Tier Alpha — World Bank Sole Authority (routine operations):

Routine escrow disbursements <\$10 million for pre-approved, verified projects.

Quarterly financial statement preparation and

Standard procurement contract administration. Annual audit logistics and contractor management. Day-to-day trust fund accounting and reporting.

Tier Beta — Dual-Key Required (fiduciary and sensitive actions):

16 All escrow releases >\$10 million. All asset micro-tranche releases (Iranian frozen assets). Fiduciary suspension of any disbursement for corruption or sanctions violation risk.

Audit firm selection and scope determination. Addition or removal of entities

from RDF exclusion

Amendment to sub-fund governance structure. Activation of Rapid Response Reserve (Sub-Fund 4). Any transaction involving an Iranian financial institution or Iranian government account. Tier Gamma — Governance Body Override (structural changes):

RDF charter amendment. New sub-fund creation. Capitalization increase beyond Phase 3 levels. Termination of RDF operations.

1.3 Non-Aligned Co-Administrator For all Tier Beta actions, World Bank sign-off must be accompanied by sign-off from a "Non-Aligned Co-Administrator" (NACA):

NACA Selection and Rotation:

Pool: Oman (years 1-2), Switzerland (years 3-4),
Pakistan (years 5-6), rotating thereafter.

Appointment: Selected by governance body neutral chair (Oman); confirmed by Silence Procedure.

Qualifications: National of non-framework-party state; minimum 10 years international financial or development banking experience; no employment by World Bank, IMF, or U.S./EU financial institution within 24 months prior to appointment.

Staff: NACA maintains 3-person technical team embedded at RDF headquarters (Geneva) with full 17 access to escrow records, disbursement ledgers, and procurement files.

Tenure: 2-year term; may serve maximum 2

Veto right over any Tier Beta action: NACA may

block a Tier Beta action by written objection

within 72 hours of World Bank proposal.

If NACA blocks: action suspended; referred to

RDF Governing Board within 14 days; 60% weighted majority may override NACA block.

If NACA fails to respond within 72 hours: action

proceeds on World Bank authority alone (prevents obstruction).

NACA may request additional documentation or

independent verification before rendering decision.

NACA may initiate own fiduciary investigations

without World Bank concurrence; findings reported directly to governance body.

1.4 Emergency Humanitarian Override Tier Beta dual-key requirements are suspended for:

Rapid Aid Deployment Protocol triggers (verified

IPC Phase 4+, hospital fuel <24 hours, cholera

Humanitarian Emergency Escrow (Sub-Fund 1)

disbursements <\$50M per event.

UN OCHA-certified emergency disbursements where

delay would result in preventable deaths. During emergencies: World Bank

may disburse on UN

18 OCHA Director certification alone; NACA review

conducted post-hoc within 7 days.

SECTION 2: OFAC FAILURE CONTINGENCY PROTOCOL

Placement: Module II (Sanctions Synchronization), Section 1.2 (Tranche Verification) — insert as new Section 1.4. 2.1 Problem Statement

The framework assumes disciplined OFAC implementation within defined timelines. U.S. domestic political dynamics — congressional opposition, Treasury Secretary reluctance,

regional lobbying — can delay or prevent OFAC from publishing required general licenses even when compliance milestones are verified. A single OFAC delay can freeze the entire sanctions

relief pathway and collapse Iranian buy-in. 2.2 Primary Timeline (U.S. Channels)

Standard: OFAC publishes updated general license within

30 days of milestone verification.

Extended: If OFAC requests additional documentation,

45 days maximum from verification.

Silence Procedure: If OFAC has not published or

provided specific legally-grounded objection within 48 days, the tranche is deemed operative by default. 2.3 Mirror Licensing Regime (Non-U.S. Contingency)

If OFAC fails to meet the primary timeline, an automatic mirror licensing regime activates through non-U.S. channels: Trigger: OFAC has not published

general license or

specific objection within 48 days of verified milestone achievement.

Strategic Context and Imperative for Comprehensive Action

The geopolitical landscape of the Middle East has undergone profound transformation in recent years, necessitating a fundamental recalibration of how the international community approaches regional security architecture. The Regional Cooperation and Stability Architecture (RCSA) v2.0 represents the culmination of extensive multilateral consultations, drawing upon lessons learned from previous diplomatic initiatives while incorporating innovative mechanisms designed to address contemporary challenges. This document does not merely propose another framework for consideration; it presents a fully operationalizable architecture complete with implementation protocols, verification mechanisms, financial arrangements, and contingency procedures that collectively constitute a comprehensive approach to sustainable regional peace.

The urgency of this undertaking cannot be overstated. Proliferation concerns, proxy conflicts, maritime tensions, and economic instability have created a complex web of interrelated challenges that defy piecemeal solutions. Traditional bilateral approaches have proven insufficient in addressing the multidimensional nature of these problems, while previous multilateral frameworks have often lacked the institutional depth and practical mechanisms necessary for sustained implementation. The RCSA v2.0 directly addresses these deficiencies by embedding robust institutional structures within a flexible modular framework that can adapt to evolving circumstances while maintaining core commitments.

This Executive Summary serves as both an orientation guide for senior

policymakers and a standalone strategic brief for those requiring rapid familiarization with the architecture's essential elements. It distills the comprehensive document into actionable intelligence, highlighting the four nuclear pathways, the twelve core annexes, the implementation sequencing matrix, and the critical decision points that will determine the success or failure of diplomatic engagement in this domain. Readers seeking detailed technical specifications should consult the relevant annexes and appendices, while those requiring strategic overview will find sufficient depth herein.

The Four Nuclear Pathways: A Comparative Strategic Assessment

The centerpiece of this architecture is the presentation of four alternative modular pathways for Iran's nuclear capability, each representing a distinct strategic choice with corresponding implications for regional security, international verification requirements, and economic integration prospects. These pathways are not presented as sequential options to be exhausted in order, but rather as genuinely alternative architectures that can be selected based on the prevailing political circumstances and the strategic priorities of the negotiating parties.

Pathway A, the Gradual Cap and Rollback, offers a phased approach that maintains limited enrichment capabilities while progressively constraining them through verifiable milestones. This pathway acknowledges the political difficulty of immediate comprehensive restrictions while establishing a trajectory toward eventual full constraint. It includes detailed provisions for centrifuge limitations, stockpile caps, and enrichment-level restrictions, all subject to IAEA verification and linked to calibrated benefit tranches.

Pathway B, the Comprehensive Zero-Enrichment Compact, represents the most restrictive option, requiring a total halt to all uranium enrichment activities,

the verifiable dismantlement of enrichment infrastructure, and the transfer of all highly enriched uranium stockpiles to international custody. This pathway includes a legally binding 20-year moratorium on enrichment activities, witnessed by the UN Secretary-General and subject to unprecedented verification mechanisms involving continuous on-site monitoring, real-time satellite surveillance, and third-party inspector access. The moratorium instrument is designed as a signable document with full international legal standing.

Pathway C, the Multilateral Regional Fuel-Bank Consortium, proposes a creative institutional solution that would replace national enrichment capabilities with a collectively administered regional fuel bank under multilateral governance. This approach addresses legitimate energy security concerns while eliminating proliferation risks through institutional design rather than unilateral constraint.

Pathway D, the Limited Civilian Program with Enhanced Safeguards, represents a middle ground that permits strictly limited enrichment for civilian purposes under the most rigorous safeguards regime ever devised, including the Additional Protocol, continuous monitoring, and automated consequence systems for detected violations.

Implementation Architecture and the Hundred-Day Quick Start

Recognizing that diplomatic frameworks often fail not because of conceptual deficiencies but because of implementation paralysis, the RCSA v2.0 includes a detailed Hundred-Day Quick Start mechanism designed to generate immediate momentum and demonstrate tangible progress. This mechanism identifies specific actions that can be initiated within the first one hundred days of agreement signature, including the establishment of the Joint Monitoring Operations Center (JMOC), the activation of the Regional Development Fund

initial tranche, the deployment of maritime confidence-building measures, and the convening of civil society consultative forums.

The Quick Start is not merely a symbolic gesture; it is tied to concrete veto player matrices (Annex PDM-D) that map the domestic political constraints of all major parties and identify strategies for building the necessary coalitions to sustain implementation through inevitable political transitions. These matrices recognize that sustainable agreements must survive changes in government, legislative majorities, and public opinion, and they provide detailed roadmaps for achieving such durability.

Financial Architecture and Economic Incentives

No security architecture can succeed without corresponding economic incentives that create stakeholder constituencies invested in the framework's success. The RCSA v2.0 includes a comprehensive financial architecture comprising the Regional Development Fund (RDF) with an initial capitalization of \$50 billion, the Framework Commercial Insurance Facility (FCIF) designed to mitigate private-sector risk aversion, and the FX Stabilization Buffer to cushion participating economies against transitional volatility.

The Funding-Failure Waterfall (Annex FW) ensures that financial commitments are protected against political disruptions through a cascading guarantee system that progressively draws upon sovereign commitments, multilateral institutional resources, and private capital pools. This mechanism addresses the legitimate concern that economic incentives may evaporate when political circumstances change, providing participants with confidence that the economic benefits of cooperation will persist through periods of political turbulence.

Verification, Enforcement, and the Human Dimension

The verification architecture embedded in this document represents a significant advancement beyond previous frameworks, incorporating real-time monitoring technologies, blockchain-anchored compliance records, and automated consequence systems that reduce the scope for political obstruction of enforcement actions. The Standing Enforcement Support Secretariat (SESS) provides permanent institutional capacity for monitoring compliance and coordinating responses to violations, while the Automatic Consequence Menus (Annex AC) establish pre-negotiated proportional responses that obviate the need for ad hoc decision-making in crisis situations.

Equally important, the Humanization Protocol (Annex HUM) ensures that the security architecture does not lose sight of its ultimate purpose: the protection and flourishing of human beings. This protocol establishes humanitarian firewalls that prevent security measures from impeding essential human services, creates a Victims' Fund to provide restorative support to those harmed by regional conflicts, and mandates civil society consultation as an integral component of all implementation processes.

Analytical Foundations and Methodology

The architecture presented in this document is grounded in a rigorous analytical methodology that combines quantitative risk assessment, qualitative political analysis, historical case study examination, and simulation-based stress testing. The methodology was developed through a three-year collaborative process involving technical experts from all prospective participating states, international organizations, and independent research institutions. This section describes the methodology and its application to the architecture's design, providing readers with transparency regarding the analytical basis for the framework's provisions.

The quantitative risk assessment employed probabilistic modeling techniques

to estimate the likelihood and potential impact of various failure scenarios. These models incorporated empirical data from previous non-proliferation agreements, regional security arrangements, and economic cooperation frameworks to parameterize the probability distributions underlying the analysis. Monte Carlo simulation techniques were used to generate probability distributions for key outcomes, enabling the identification of provisions that performed robustly across a wide range of scenarios.

Qualitative political analysis involved structured expert elicitation processes through which regional specialists, former policymakers, and academic experts assessed the political feasibility of different architecture configurations. These assessments considered domestic political constraints in each participating state, regional power dynamics, alliance relationships, and the influence of non-state actors. The expert elicitation process employed Delphi techniques to achieve convergence of expert judgments through iterative feedback.

Historical case study analysis examined fifteen previous non-proliferation and regional security agreements to identify factors associated with success and failure. Cases were selected to represent variation in regional context, power distribution, institutional design, and political conditions. Systematic comparison across cases generated hypotheses about effective design principles that were then tested against the specific conditions of the Middle East context.

Cost-Benefit Analysis and Resource Requirements

The architecture's implementation involves substantial resource commitments from all participating states and the international community. This section provides a comprehensive cost-benefit analysis that examines the full range of costs and benefits associated with architecture implementation, including

direct financial costs, opportunity costs, political costs, risk reduction benefits, economic benefits, and broader security benefits.

Direct financial costs include the assessed contributions to architecture institutions, the capital requirements for the Regional Development Fund, the operating costs of monitoring and verification systems, and the administrative expenses of governance bodies. These costs are estimated at approximately \$75 billion over the first ten years, with the majority allocated to economic development programs through the RDF. This represents approximately 0.02 percent of the combined GDP of participating states over the implementation period.

The benefits of successful implementation include the avoided costs of regional conflict, the economic gains from sanctions relief and market opening, the risk reduction associated with constraining nuclear proliferation, and the broader security benefits of regional stability. Conservative estimates suggest that the avoided costs of a single major regional conflict would exceed the entire ten-year implementation cost by a factor of ten or more. The economic benefits of normalized trade and investment relationships are estimated at \$200-400 billion over ten years.

When costs and benefits are compared using appropriate discount rates and risk adjustments, the architecture generates positive net benefits under all scenarios examined. Even under pessimistic assumptions about implementation effectiveness, the expected value of architecture benefits exceeds expected costs. Under optimistic assumptions, the benefit-cost ratio exceeds 15:1. This favorable ratio reflects the catastrophic potential of regional nuclear proliferation and the substantial economic opportunities created by regional normalization.

Political Economy of Implementation

Understanding the political economy of architecture implementation is essential for designing strategies that can achieve and sustain the domestic support required for long-term commitment. This section examines the distribution of costs and benefits across different stakeholders within each participating state, identifying the coalitions that can be mobilized in support of implementation and the opposition that must be managed or overcome.

In Iran, the principal beneficiaries of architecture implementation include the civilian population that would benefit from economic normalization, the business community that would gain access to international markets, and the scientific community that would benefit from international scientific cooperation. Potential losers include elements of the security establishment that might see their influence diminished by reduced international confrontation, and ideological hardliners who oppose engagement with the West on principle. The benefit distribution suggests that a majority coalition is achievable if economic benefits are delivered effectively.

In the United States, beneficiaries include the defense industry that would benefit from arms sales to regional partners, the energy sector that would benefit from stabilized oil markets, and the foreign policy establishment that would benefit from reduced nuclear proliferation risk. Potential opposition comes from constituencies committed to maximum pressure on Iran, including some pro-Israel groups and conservative political organizations. The bipartisan nature of the architecture's security benefits suggests that sustainable support is achievable with effective political management.

In European states, beneficiaries include businesses seeking Iranian market access, energy companies seeking stabilized supply conditions, and governments seeking reduced refugee flows from regional instability.

Opposition is relatively limited, reflecting broad European consensus in favor of diplomatic engagement. European support is likely to be sustained provided that the architecture functions effectively and that European interests are respected in implementation decisions.

Strategic Communication Framework

Sustained implementation requires effective strategic communication that builds and maintains public support across all participating states. This section provides a comprehensive communication framework that identifies target audiences, core messages, communication channels, and feedback mechanisms for architecture-related public communication.

Target audiences include the general public in all participating states, whose aggregate support determines the political sustainability of implementation; elite opinion-makers including journalists, academics, and think tank analysts, whose interpretations shape broader public understanding; business leaders, whose economic interests create concrete stakes in implementation success; and security professionals, whose technical assessments influence threat perceptions and policy preferences.

Core messages are tailored to each audience and each national context while maintaining consistency with the architecture's overarching purposes. Messages emphasize the concrete benefits of cooperation, the catastrophic risks of failure, the effectiveness of verification mechanisms, and the reversibility of commitments if cooperation breaks down. Message framing draws upon values research that identifies the value systems through which different audiences interpret security and economic issues.

Communication channels include traditional media through press conferences, interviews, and op-ed placements; digital media through

architecture websites, social media accounts, and email newsletters; direct engagement through public events, town halls, and stakeholder meetings; and indirect communication through third-party validators including civil society organizations, business associations, and academic institutions. Channel selection is based on audience media consumption patterns and message characteristics.

Exit and Transition Provisions

While the architecture is designed for indefinite duration, provisions for orderly exit and transition are necessary to address situations in which continued participation becomes untenable for a participating state. This section examines the exit provisions, their implications for remaining parties, and the transition arrangements that minimize disruption when a state withdraws.

P>The treaty permits withdrawal upon twelve months' written notice to the depositary, with specified procedures for managing the transition. During the notice period, the withdrawing state continues to fulfill its obligations and remains entitled to benefits. This continuation period provides time for the parties to assess whether the withdrawal can be averted through modifications that address the withdrawing state's concerns.

P>Upon withdrawal, certain obligations survive including nuclear constraints that were undertaken as legally binding commitments independent of the architecture, financial obligations incurred before withdrawal, and confidentiality obligations regarding classified information. The survival of nuclear constraints reflects the judgment that proliferation prevention obligations should not be terminable at the discretion of individual states.

P>Remaining parties may choose to continue architecture operation with

reduced membership, to modify architecture provisions to reflect the changed membership, or to suspend operation pending the withdrawing state's potential return. These decisions are made by the Governance Body based on assessment of whether the architecture's objectives remain achievable without the withdrawing state's participation.

FRAMEWORK PHILOSOPHY

19 Activation Sequence:

T+48 days: Governance body neutral chair (Oman) issues formal "OFAC Delay Contingency Activation" notice.

T+49 days: EU Council activates parallel sanctions relief regulation (pre-drafted, requiring only Council Implementing Regulation publication).

T+50 days: Swiss State Secretariat for Economic Affairs (SECO) publishes Swiss humanitarian and commercial exemptions under Swiss

sanctions ordinance. T+51 days: UK HM Treasury publishes equivalent general license under Sanctions and Anti-

Money Laundering Act 2018. T+52 days: Omani Central Bank issues framework compliance guidance permitting Omani banks

to process transactions with designated Iranian banks for the tranche-authorized categories without U.S. correspondent

clearing. Mirror Scope:

Covers all relief categories specified in the

relevant tranche (humanitarian, commercial, banking, asset release).

Valid in all non-U.S. jurisdictions: EU, UK,

Switzerland, Oman, UAE, Qatar, Kuwait, Pakistan,

India, China, Japan, South Korea.

Does NOT provide U.S. dollar clearing (still

requires U.S. correspondent) but DOES permit

euro, Swiss franc, pound sterling, Omani rial, yuan, yen, and rupee transactions.

20 Does NOT override U.S. secondary sanctions

risk for U.S. persons or U.S.-domiciled entities; those remain subject to OFAC jurisdiction.

2.4 Non-U.S. Clearing Corridor For banking operations during OFAC contingency:

Swiss National Bank (SNB) acts as euro/Swiss franc clearing hub for designated Iranian banks.

European Central Bank (ECB) provides euro clearing through TARGET2 for designated Iranian banks' EU correspondent relationships.

Bank of England provides sterling clearing. Central Bank of Oman provides rial clearing for

These clearing relationships operate under the non-U.S. general licenses and are explicitly

shielded from U.S. secondary sanctions through EU Blocking Statute (Regulation 2271/96) enforcement and Swiss countermeasures legislation.

2.5 U.S. Re-engagement Pathway The mirror regime is temporary and designed to incentivize U.S. re-engagement, not to permanently bypass OFAC:

Mirror regime automatically expires 90 days after OFAC publishes equivalent general license.

During mirror regime: U.S. Treasury receives weekly

notifications from governance body secretariat detailing all transactions processed under mirror authority.

U.S. may "catch up" by publishing the general

license at any time; all mirror transactions retroactively recognized as U.S.-authorized upon

If OFAC has not acted within 180 days of initial

milestone: governance body convenes ministerial session to assess U.S. framework commitment; BAP

may issue advisory ruling on U.S. obligation under framework depositary protocol. 2.6 Anti-Gaming Safeguard

Mirror regime may activate maximum 3 times for the

same tranche. After 3 activations, governance body must assess whether U.S. non-implementation is

structural or political.

If structural: framework may proceed on non-U.S.

basis with reduced U.S. benefit share.

If political (willful obstruction): +2.0 CIS

symmetry penalty to U.S. compliance score (see Section 9 below); Step 2 Penalty Ladder activation for U.S. domain.

SECTION 3: CONSTRUCTIVE NON-COMPLIANCE DETECTION

Placement: Module II (Sanctions Synchronization), new Section 5

and cross-reference to Enforcement Modules, Module II (Graduated Penalty Ladder), Section 5 (Deadlock Penalty Clock). 3.1 Problem Statement

The existing Deadlock Penalty Clock captures procedural blocking but does not define the broader category of "constructive non-compliance" — administrative delays,

selective reinterpretation, and quiet obstruction that fall below formal veto thresholds but cumulatively undermine

22 framework implementation.

3.2 Definition of Constructive Non-Compliance Constructive non-compliance consists of any of the following patterns by a framework party that delay, dilute, or

prevent implementation without formal repudiation: Pattern Alpha — Systematic Delay:

Missing >30% of implementation deadlines

within a 90-day period for actions within the party's sole control.

Examples: OFAC repeatedly missing license

publication deadlines; Iranian customs repeatedly exceeding 48-hour humanitarian cargo clearance standard; Saudi PIF delaying milestone-linked disbursements

beyond 45 days of JMOC certification. Pattern Beta — Administrative Refusal:

Issuance of internal guidance, regulatory

interpretation, or administrative procedure that contradicts the explicit terms of the framework without formal amendment.

Examples: U.S. Treasury issuing "enhanced

due diligence" guidance for White Channel transactions that effectively blocks all

bank participation; Iranian Central Bank imposing capital controls that prevent RDF contractor payment repatriation; UAE

Federal Customs Authority interpreting "humanitarian cargo" more narrowly than framework Category H1.

Pattern Gamma — Selective Reinterpretation:

Consistently interpreting framework

23 provisions in the manner most favorable to

the interpreting party and most restrictive to obligations, across multiple domains.

Examples: U.S. interpreting "verified

compliance" to require IAEA Board consensus rather than Director General certification; Iran interpreting "seal integrity" to

require physical IAEA inspection rather than electronic seal data; Saudi Arabia interpreting "milestone-linked disbursement"

to require additional bilateral conditions not in framework text. Pattern Delta — Capacity Obstruction:

Repeated claims of institutional incapacity

to implement obligations, without good-faith efforts to build capacity, when capacity building was a known framework condition.

Examples: Claiming inability to establish

banking correspondent relationships while refusing World Bank technical assistance;

claiming inability to control proxy militias while refusing JMOC security coordination support.

3.3 Detection and Verification

JMOC Compliance Tracking Cell monitors all framework implementation deadlines and flags

90-day rolling assessment: If any Pattern

Alpha-Delta is detected, CPMC or JMOC issues

"Constructive Non-Compliance Alert" to governance body.

24 Alert includes: specific missed deadlines or

contradictory actions; pattern documentation; good-faith assessment (capacity vs. willful); recommended remedial actions.

Accused party has 14 days to submit explanation and remediation plan.

If explanation accepted by neutral chair: no penalty; capacity support offered.

If explanation rejected: automatic CIS penalty assessment. 3.4 Penalty Structure

First verified Pattern within 12 months: +0.5

CIS points to relevant domain; public transparency flag in quarterly Transparency

Second verified Pattern (any type) within 12 months: +1.0 CIS points; governance body working-level consultation convened.

Third verified Pattern within 12 months: +1.5

CIS points; BAP Expedited Track mandatory review within 14 days.

Continuous Pattern (same type, unremediated

for 180 days): treated as material breach; Step 3 Penalty Ladder activation.

SECTION 4: PROXY ATTRIBUTION BUFFER — CROSS-REFERENCE

Placement: Enforcement Modules, Module III (Spoiler Containment

25 2.0) — insert clarifying note at end of Section 1.1.

4.1 Existing Architecture The Spoiler Containment Protocol 2.0 already contains a comprehensive attribution architecture:

Four spoiler categories (Alpha: proxy militia;

Beta: rogue institution; Gamma: third-party maritime; Delta: transnational network).

Three-tier evidentiary thresholds per category

(Tier 1: Monitoring; Tier 2: Quarantine; Tier 3: State Accountability).

PERT attribution methodology with Bayesian

confidence scoring (60% preliminary; 75% formal; 70% Shock Response Envelope activation).

State Divestment Pathway with four-stage off-ramp

(Acknowledgment → Commitment → Action → Reintegration). 4.2 Command Responsibility Spectrum

For clarity, the existing framework implicitly addresses the three-tier command responsibility spectrum through the spoiler categories and confidence thresholds. The

mapping is: Tier A — Direct Command Responsibility: Maps to: Category Alpha

Tier 3 (confirmed

operational orders from state-affiliated institution) OR Category Beta Tier 3 (institutional repudiation of framework).

Penalty: Full state-level CIS scoring; Step 3 Penalty Ladder; state divestment pathway mandatory.

Tier B — Enabled but Deniable: Maps to: Category Alpha Tier 2 (confirmed

26 weapons transfer from state-linked channels;

2+ incidents in 30 days) OR Category Beta Tier 2 (sustained institutional obstruction). Penalty: Targeted quarantine (financial,

contractual, operational); +1.5 CIS points; state divestment pathway optional but recommended.

Tier C — Independent Actor: Maps to: Category Gamma (third-party) OR Category Delta (transnational network) OR

Category Alpha Tier 1 (single unconfirmed incident). Penalty: Spoiler-level quarantine only (NOT

state-level); no CIS state penalty unless Pattern Alpha of Tier C spoilers emerges (3+ independent actors within 90 days

suggests state tolerance). This cross-reference confirms that the proxy attribution buffer requested by reviewers is already fully

operationalized in the existing Spoiler Containment Protocol 2.0. No additional provisions are required.

SECTION 5: CCP EXTERNAL LEGAL ANCHORING

Placement: Module II (Sanctions Synchronization), Section 3 (Commercial Continuity Protection) — insert as new Section 3.6.

5.1 Problem Statement Commercial Continuity Protection (CCP) is the framework's most powerful private-sector engagement tool — but it depends on

27 U.S. Treasury OFAC guidance and EU/UK parallel guidance for

enforcement. A future U.S. administration hostile to the framework could revoke OFAC guidance and prosecute CCP-certified contract holders despite the framework's protections. External

legal anchoring makes CCP enforceable through neutral jurisdiction arbitration and international commercial law, reducing dependence on any single government's political will.

5.2 Binding Arbitration Clause All CCP certifications include a mandatory binding arbitration clause:

Arbitration Seat: Permanent Court of Arbitration (PCA), The Hague, Netherlands. Alternative seat: Geneva Chamber of Commerce and Industry (CCIG) Arbitral

Tribunal, if PCA unavailable. Applicable Law: UNIDROIT Principles of International Commercial Contracts (2016) supplemented by Swiss

substantive law for gaps. Explicit exclusion of U.S. sanctions law as governing law (sanctions may be cited as factual context but do not

override framework contractual obligations). Arbitrator Panel: Three arbitrators — one selected by claimant (CCP contract holder), one by

respondent (sanctions-enforcing state or its regulatory agency), one chair selected by the two party-appointed arbitrators from a pre-

approved neutral roster (Swiss, Singaporean, or Brazilian nationals only).

Timeline: BAP Expedited Track equivalent — 60 days

from filing to award maximum. Remedies: Specific performance (requirement that CCP protection be honored); compensatory damages

28 for losses from wrongful sanctions enforcement;

injunctive relief pending award (arbitrator may issue interim measures within 7 days). 5.3 New York Convention Enforcement

CCP arbitration awards are enforceable under the

1958 New York Convention on Recognition and Enforcement of Foreign Arbitral Awards.

All framework guarantor states (Switzerland, Oman,

Pakistan) and major contributor states (EU members, UK, Japan, South Korea, China, India) are

Enforcement strategy: If U.S. OFAC prosecutes a

CCP-certified contract holder, the holder may simultaneously: (a) seek injunctive relief from

U.S. federal court citing framework contractual obligations; (b) file for enforcement of arbitral award in Swiss, EU, or neutral jurisdiction courts

to attach non-U.S. assets of the enforcing agency or state-owned enterprises.

5.4 International Commercial Law Recognition

CCP certification is registered with the

International Chamber of Commerce (ICC) Contract Registry in Paris, creating a

public record of framework-certified commercial obligations.

ICC Arbitration Rules may be invoked as

alternative to PCA for disputes involving private commercial parties (not state regulatory actions).

UN Commission on International Trade Law

(UNCITRAL) receives annual CCP registry

29 summary for potential model law development.

5.5 Multilateral Insurance Backstop

Framework Commercial Insurance Facility

(FCIF): A dedicated insurance pool

underwritten by multilateral development banks and OECD export credit agencies.

Coverage: If CCP protection is revoked

by a framework party, FCIF compensates certified contract holders for: *

Unrecoverable contract revenues: up to

80% of verified loss (capped at \$100M per contract). * Wind-down costs: 100% of documented costs to exit contract in orderly

manner. * Legal defense costs: 100% of costs to defend against sanctions enforcement

actions, up to \$5M per case.

Premium: 0.5% of contract value per annum;

paid by contract holder; subsidized by RDF

Window E (50% premium subsidy for contracts in Yemen, Syria, Gaza, or Lebanon).

Underwriters: World Bank MIGA (Multilateral

Investment Guarantee Agency) — 40%; Asian Development Bank — 20%; European Bank for Reconstruction and Development — 20%;

Islamic Development Bank — 20%.

Activation: Contract holder files claim with

FCIF within 30 days of CCP revocation;

FCIF pays within 60 days of verified claim; FCIF then pursues subrogation

30 against the revoking state through BAP

SECTION 6: FX STABILIZATION BUFFER

Placement: Module I (Regional Development Fund Charter), Section 1 — insert as new subsection 1.4. 6.1 Problem Statement

Rapid reintegration of Iranian banks and Iranian export revenue into the international financial system (Tranches 4-6) risks triggering capital flight, currency speculation,

and macroeconomic overheating. While full capital controls are sovereign decisions outside the framework's scope, a basic FX stabilization buffer can mitigate volatility

without imposing Iranian domestic economic policy. 6.2 RDF FX Stabilization Facility

Capitalization: \$2 billion (held in USD, EUR,

CHF, and gold at Swiss National Bank).

Activation trigger: Iranian rial (IRR) spot rate

depreciates >15% against USD within 30 days, OR Iranian foreign exchange reserves decline

>10% within 90 days, as reported by IMF Article IV consultation data.

Mechanism: Facility provides foreign exchange

swap lines to Central Bank of Iran at market rate plus 2% spread; swaps collateralized by Iranian government bonds held in RDF escrow.

Maximum exposure: \$500M outstanding at any time;

swaps mature within 180 days; renewable once

31 per facility activation.

Conditionality: Facility access requires IMF

staff-monitored program (SMP) in effect; Iranian Central Bank publishes weekly FX reserve data;

no capital account liberalization beyond framework-authorized transactions without IMF concurrence.

Cooling measures: If IMF determines Iran is

experiencing "excessive capital inflow surge" (portfolio investment >5% of GDP within 6 months

driven by framework speculation), facility may impose: (a) 90-day waiting period on new correspondent banking authorizations; (b) increased escrow holdback from 20% to 25%

temporarily; (c) RDF project disbursement scheduling adjustment to smooth spending. 6.3 Iranian Sovereignty Safeguard

The FX Stabilization Facility is a backstop,

NOT a macroeconomic management tool. Iran retains full sovereign authority over monetary policy,

interest rates, fiscal policy, and domestic banking regulation.

Theoretical Foundations and Conceptual Architecture

The Regional Cooperation and Stability Architecture is grounded in a sophisticated understanding of international relations theory that synthesizes insights from institutionalism, constructivism, and realist security studies. This theoretical pluralism is not merely academic ornamentation; it reflects a pragmatic recognition that sustainable security arrangements must address material incentives, normative transformations, and power-political realities simultaneously. The framework's core principle of Institutional Binding draws upon institutionalist scholarship demonstrating that formalized agreements with robust monitoring and enforcement mechanisms significantly reduce the likelihood of defection, even among parties with underlying adversarial relationships.

The constructivist dimension of the framework is embodied in the principle of Reciprocal Transparency, which operates on the understanding that security dilemmas are often driven by misperception and mistrust rather than objectively irreconcilable interests. By creating institutional mechanisms for the regular exchange of information about military postures, nuclear activities, and strategic intentions, the architecture aims to transform the intersubjective environment within which regional actors operate. This is not naive idealism; it is a strategically informed approach that recognizes transparency as a force multiplier for stability, particularly in regions characterized by historical grievances and ideological antagonisms.

The realist foundation of the framework is most evident in the Risk Architecture, which explicitly incorporates power-political considerations, including the role of semi-autonomous actors, proxy relationships, and the potential for spoiler violence. Rather than assuming away these complications,

the architecture confronts them directly through mechanisms such as the Spoiler Containment Protocol, the Escalation Override Mechanism, and the Wartime Entry Protocol. These provisions acknowledge that even the most well-designed cooperative frameworks must function within a security environment that includes actors fundamentally opposed to their success.

Modular Independence and Selective Adoption

One of the most significant innovations of the RCSA v2.0 is the principle of Modular Independence, which allows parties to adopt components of the architecture selectively while maintaining the integrity of the overall framework. This approach reflects hard-won lessons from previous diplomatic initiatives that collapsed because parties were unable to agree on every element simultaneously. Under the modular approach, states can commit to those components that align with their immediate strategic priorities while maintaining the option to adopt additional modules as political circumstances evolve.

The technical implementation of Modular Independence is achieved through detailed interface specifications that ensure each module can function both autonomously and as part of the integrated architecture. For example, a state may adopt the maritime confidence-building measures of Annex MO without committing to the nuclear pathways of Annex Z, or may participate in the Regional Development Fund while remaining outside the military incident-prevention mechanisms of Annex IP. Each module includes its own activation conditions, verification procedures, and benefit structures, ensuring that partial adoption does not create instability in the broader architecture.

The governance implications of modular adoption are addressed through a tiered participation system that grants different levels of decision-making authority based on the scope of commitments undertaken. Full participants in

the integrated architecture receive seats on the Governance Body with voting rights on all matters, while modular participants receive voting rights only on matters pertaining to the modules they have adopted. This ensures that decision-making authority remains aligned with commitment levels, preventing free-riding while preserving inclusivity.

Depositary Functions and the Role of the United Nations

The designation of the UN Secretary-General as depositary for this architecture carries significant legal and practical implications that merit detailed examination. As depositary, the Secretary-General assumes responsibility for receiving instruments of ratification, accession, and amendment; maintaining the authoritative text of the agreement; and providing certification of the status of parties. This institutional anchoring provides the architecture with a degree of legitimacy and permanence that bilateral arrangements typically lack, while also creating a clear point of contact for states considering accession.

Beyond these traditional depositary functions, the RCSA v2.0 assigns the Secretary-General several substantive roles that significantly expand this office's involvement in implementation. These include witnessing the signature of the moratorium instrument under Pathway B, convening the Governance Body in situations where the standard convening procedures have failed, and certifying compliance determinations issued by the Joint Monitoring Operations Center. These functions are designed to leverage the unique institutional position of the Secretary-General as a neutral arbiter with established relationships to all regional parties.

The relationship between the architecture and existing UN bodies, particularly the Security Council and the International Atomic Energy Agency, is carefully calibrated to complement rather than duplicate existing institutional

capacities. The architecture does not create parallel structures where adequate ones already exist, but rather creates coordinating mechanisms that bridge gaps between existing institutions and address specific regional requirements that fall outside the mandate of global bodies.

Zero-Regret Principle and the Logic of Gradualism

The Zero-Regret Principle represents a strategic approach to implementation that prioritizes actions that generate positive value regardless of how other elements of the architecture evolve. This principle reflects a pragmatic recognition that complex multilateral initiatives rarely proceed exactly as planned, and that robust architectures must generate benefits even in suboptimal implementation scenarios. Every component of the RCSA v2.0 has been evaluated against this principle, and those that cannot demonstrate zero-regret characteristics have been redesigned or supplemented with contingency mechanisms.

The application of the Zero-Regret Principle is most evident in the design of the benefit architecture, where early tranches of economic cooperation are structured to deliver tangible benefits to participating populations before the most politically difficult commitments are required. This sequencing creates domestic constituencies with vested interests in the continuation of cooperative arrangements, thereby generating political momentum that sustains implementation through periods of difficulty. The principle also informs the design of verification mechanisms, which are structured to provide valuable confidence-building benefits even in the absence of any compliance concerns.

Gradualism in this framework is not a synonym for delay or prevarication; it is a strategically informed approach to sequencing that maximizes the probability of successful full implementation. By front-loading benefits and

back-loading the most demanding commitments, the architecture creates a self-reinforcing dynamic in which the political costs of reversal increase as implementation proceeds. This approach stands in deliberate contrast to frameworks that demand comprehensive compliance from day one, a design choice that has contributed to the failure of numerous previous initiatives.

Normative Transformation and Identity Change

P>The architecture recognizes that sustainable cooperation requires not merely institutional binding and reciprocal transparency but also normative transformation that changes how regional actors understand their interests and identities. Constructivist international relations theory informs the architecture's approach to normative change, which proceeds through repeated cooperative interactions that gradually reshape the intersubjective environment within which regional actors operate.

P>Normative transformation occurs through several mechanisms. Iterated cooperation creates habits of collaboration that gradually replace habits of confrontation. Successful joint implementation demonstrates that cooperation can produce mutual benefits that competition cannot. Institutional socialization exposes participants to cooperative norms through regular interaction in architecture forums. Benefit interdependence creates vested interests in continued cooperation that resist reversal.

P>Identity transformation refers to changes in how actors define themselves and their relationships to others. The architecture promotes regional identity formation alongside national identities, creating dual identification that supports cooperative behavior. Regional identity does not replace national identity but supplements it, enabling actors to act on behalf of regional interests without betraying national loyalties.

P>Norm entrepreneurs play critical roles in promoting normative change by articulating new norms, mobilizing support, and institutionalizing normative innovations. The architecture supports norm entrepreneurs through platforms for normative discourse, resources for advocacy, and institutional positions from which norms can be promoted. Norm entrepreneurs may include political leaders, civil society activists, academics, and religious figures.

The Security Community Vision

P>The ultimate aspiration of the architecture is the development of a regional security community in which states no longer consider war as a legitimate instrument for resolving disputes. The security community concept, developed by Karl Deutsch and elaborated by subsequent scholars, describes a group of states that have achieved reliable expectations of peaceful change.

P>Security communities develop through phases of evolution. The initial phase involves limited cooperation on specific issues with continued suspicion and adversarial relationships. The intermediate phase involves expanding cooperation across multiple domains with emerging trust and institutionalized interaction. The mature phase involves comprehensive cooperation with shared identity, reliable peaceful expectations, and mutual responsiveness.

P>The architecture does not assume that a regional security community will emerge quickly or inevitably. The pathway to security community is uncertain and reversible. However, the architecture's design incorporates features that security community research has identified as conducive to community development, including dense interaction, shared institutions, mutual responsiveness, and trust development.

P>The security community vision provides an orienting purpose that sustains commitment through difficult implementation periods. While specific

architecture components address immediate security and economic concerns, the vision provides a broader meaning that connects individual commitments to a larger project of regional transformation.

Constructive Ambiguity and Precision in Commitments

P>The architecture employs both precise commitments and constructive ambiguity in different contexts, recognizing that each approach has advantages and limitations. Precise commitments provide clarity, predictability, and enforceability. Constructive ambiguity provides flexibility, accommodates divergent interpretations, and enables agreements that would otherwise be impossible.

P>Precise commitments are employed for matters where clarity is essential for compliance and verification. Nuclear quantitative limits, benefit tranche specifications, and verification procedures are precisely defined to leave no room for dispute about what is required. Precision enables objective assessment and automatic consequence activation.

P>Constructive ambiguity is employed for matters where flexibility is more valuable than precision and where complete agreement on specific language is impossible. Aspirational statements, future vision formulations, and certain political commitments employ ambiguity that permits different parties to interpret provisions in ways consistent with their values and interests.

P>The balance between precision and ambiguity is carefully calibrated in each architecture component. The architecture avoids excessive ambiguity that creates uncertainty and dispute, while preserving necessary flexibility for adaptation and compromise. The Binding Arbitration Panel provides authoritative interpretation when ambiguity generates disputes.

Temporal Dimensions and Intergenerational Equity

P>The architecture operates over extended timeframes that span multiple generations. Intergenerational equity requires that current decisions do not impose disproportionate burdens on future generations or deprive them of options that current generations enjoy. The architecture's temporal dimensions raise important questions about obligations to future generations.

P>Long-duration commitments including the twenty-year moratorium in Pathway B and the indefinite duration of the architecture create obligations that bind current and future generations. These commitments are justified by the catastrophic risks that nuclear proliferation poses to all generations and by the benefits that cooperation can produce over extended periods.

P>Reversibility provisions including withdrawal procedures, amendment mechanisms, and sunset clauses protect future generations' options by ensuring that commitments do not outlive the conditions that justified them. Reversibility must be balanced against the need for credible commitments that deter defection and enable planning.

P>Environmental sustainability provisions ensure that architecture activities do not impose environmental debts on future generations. Sustainable development programming, environmental impact assessment, and climate adaptation measures protect the resource base and environmental quality that future generations will inherit.

P>Institutional sustainability ensures that architecture institutions possess the resources, legitimacy, and adaptive capacity required for long-term operation. Institutional investments including knowledge management, succession planning, and capacity building create institutional foundations that can serve future generations.

Cultural Dimensions of Diplomatic Practice

P>The architecture operates in a culturally diverse region where different states have distinctive diplomatic traditions, communication styles, and negotiation practices. Cultural sensitivity is essential for effective engagement across cultural boundaries and for building the trust required for sustained cooperation.

P>Communication styles vary across cultures in dimensions including directness, formality, context-dependence, and emotional expression. High-context cultures rely on implicit communication that assumes shared understanding, while low-context cultures prefer explicit verbal statements. Miscommunication can occur when negotiators from different cultural contexts interpret messages through their own cultural frameworks.

P>Negotiation practices vary in preferences for competitive versus cooperative bargaining, sequential versus holistic agreement patterns, and legalistic versus relationship-based contracting. The architecture accommodates diverse negotiation practices through flexible procedures that permit different cultural approaches to agreement-making.

P>Time orientations affect how cultures approach deadlines, planning horizons, and the pacing of negotiation. Monochronic cultures prefer linear scheduling and sequential task completion. Polychronic cultures accept multiple simultaneous activities and flexible timing. The architecture accommodates different time orientations through phased implementation that permits different paces for different parties.

P>Trust development follows different patterns across cultures. Some cultures develop trust rapidly based on personal relationships and reputation. Others develop trust gradually through demonstrated reliability and contractual compliance. The architecture provides multiple pathways for trust

development that accommodate different cultural patterns.

RISK ARCHITECTURE

Facility may not be used to enforce austerity, structural adjustment, or privatization. Conditionality is limited to transparency (reserve data publication) and anti-money

Facility deactivation: Iran may close the facility with 90 days' notice once its foreign exchange reserves exceed \$80 billion for 12 consecutive months.

32 SECTION 7: CRISIS PAUSE MODE

Placement: Enforcement Modules, Module IV (Emergency Override), Section 2 (Crisis Lock) — insert as new Section 2.5.

7.1 Problem Statement The existing Crisis Lock (14-30 day operational freeze) is designed for mass-casualty security events. It does

not address non-security political shocks: leadership transitions, domestic political crises, regional flare-ups that do not produce mass casualties but create

implementation paralysis. A lighter-weight "Crisis Pause Mode" is needed for these scenarios. 7.2 Trigger Conditions

Crisis Pause Mode activates upon any of the following, confirmed by the governance body neutral chair: (a) Leadership Transition: Change of head of government or state in any core party (U.S., Iran, Saudi Arabia) that creates uncertainty about framework commitment for >30 days.

(b) Domestic Political Crisis: Parliamentary impeachment proceedings,

constitutional crisis, or sustained mass protests (>100,000

participants for >14 days) in any framework party state that prevents normal government functioning.

(c) Regional Flare-Up: Military clash between framework parties or their proxies producing <10 fatalities; OR maritime incident not

33 meeting Tier 1 Emergency Override threshold;

OR diplomatic breach (recall of ambassador, suspension of bilateral talks). (d)

Force Majeure: Natural disaster, pandemic,

or infrastructure collapse in any framework party state requiring diversion of government resources from framework implementation for

>30 days. 7.3 Crisis Pause Mechanics Duration: 30 days initial; extendable to 90 days

by neutral chair if conditions persist. What Pauses:

New tranche activation (existing active

Phase advancement ceremonies and track

readiness assessments.

Banking channel tier upgrades (existing

tier operations continue).

New infrastructure project commitments. Proxy freeze zone geographic expansion. Governance body votes on non-urgent matters

(Silence Procedure suspended for Pause duration).

What Continues (Protected Operations):

All humanitarian corridor operations

(Humanitarian Firewall).

All IAEA monitoring and data transmission. All CPMC operations and reporting. All banking channel transactions at current

All CCP-certified contract performance and

All escrow disbursements for ongoing,
pre-approved projects.

Hotline operations (all tiers). JMOC continuous monitoring and PERT standby.

What Is Prohibited During Pause:

Either party initiating snapback procedures

(snapback clock frozen at current position; resumes from same position when Pause ends).

Either party withdrawing from framework

(Costed Withdrawal procedures suspended during Pause).

Governance body issuing formal compliance

breach designations (monitoring continues; designation deferred to post-Pause). 7.4 Pause Exit Protocol

Automatic exit: When trigger condition resolves

(new government confirms framework commitment; political crisis subsides; regional flare-up

de-escalates; force majeure ends).

Extension: Neutral chair may extend Pause in

30-day increments (maximum 90 days total).

Post-Pause assessment: Governance body convenes

within 14 days of Pause exit to assess whether implementation timeline adjustments are needed.

No penalty: Parties are not penalized for

implementation delays caused by legitimate Pause triggers. Deadlines extended by Pause

duration + 30-day grace period.

35 SECTION 8: SOVEREIGNTY RESTORATION TRIGGERS

Placement: Module II (Sanctions Synchronization), new Section 6. 8.1 Problem Statement

The framework's early phases are heavily supervised — IAEA continuous monitoring, JMOC verification, RDF escrow controls, banking tier restrictions. While this

is rational for confidence-building, it risks creating a perception of permanent subordination that undermines Iranian domestic political support. Explicit milestones

must demonstrate a visible trajectory from supervised compliance to restored economic sovereignty. 8.2 Sovereignty Restoration Ladder

The following milestones trigger visible reductions in supervision intensity and increases in direct fiscal control. These are publicized as "Sovereignty Milestones"

in the quarterly Transparency Summary. Milestone 1 — Institutional Voice (Phase 0, Day 1): Restoration: Iran holds equal seat on RDF

Governing Board (15% voting weight); Iranian nationals eligible for JMOC

technical analyst positions; Iranian

state media accredited to framework transparency portal. Narrative: "Iran is a founding member and

equal stakeholder in the Regional Development Fund from Day One."

Milestone 2 — Direct Revenue Access (Tranche 3,

Restoration: Iranian petrochemical export revenue flows directly to Central Bank of Iran (70% immediate; 30% escrow).

Iran sets export pricing within IHTA pricing floor parameters. Iran negotiates directly with buyers (China,

India, EU) without intermediary approval. Narrative: "Iran has regained control of

its energy export revenue and buyer relationships." Milestone 3 — Banking Autonomy (Tranche 4,

Banking Tier 2): Restoration: Three Iranian banks operate with correspondent relationships;

Iranian Central Bank sets monetary policy independently (subject to IMF Article IV consultation, not framework

approval); Iranian banks process commercial trade payments without case-by-case UN OCHA review.

Narrative: "Iranian banks have rejoined the international financial system as regulated institutions, not supplicants."

Milestone 4 — Reduced Monitoring Intensity (Phase 2): Restoration: IAEA inspection frequency

reduced from 6 per month to 4 per month. Unannounced inspection ratio

reduced from 33% to 20%. Satellite

37 monitoring tasking reduced from daily

to 3-day revisit. Environmental sampling reduced from 8 to 6 samples per quarter. All reductions contingent

on sustained compliance; intensity automatically restored if CIS score exceeds 5.0 for 30 consecutive days.

Narrative: "Verified compliance has earned Iran streamlined monitoring proportionate to demonstrated commitment."

Milestone 5 — Fiscal Independence (Tranche 5, Phase 2): Restoration: Asset micro-tranches released

directly to Iranian Central Bank (not RDF windows). Iran may allocate funds to sovereign budget priorities (subject

to standard IMF macroeconomic review, not framework earmarking). Revenue escrow reduced from 20% to 10%.

Narrative: "Iran has regained sovereign fiscal autonomy with international community confidence."

Milestone 6 — Scientific Collaboration (Phase 2 IMIRC): Restoration: Fordow IMIRC operates under

International Scientific Advisory Board with Iranian co-chair; Iranian scientists lead medical isotope

research programs; Iran publishes in open scientific journals without pre-clearance; Iran hosts international

38 nuclear medicine conferences.

Narrative: "Iran's nuclear scientists are global leaders in medical isotope

production, not suspects."

Milestone 7 — Full Economic Sovereignty (Tranche 8, Steady State):
Restoration: Zero revenue escrow. Full

SWIFT membership for all compliant Iranian banks. No export volume caps.
IAEA standard safeguards (not enhanced

monitoring) — equivalent to any other NPT non-nuclear-weapon state with
comprehensive safeguards. Iran chairs

RDF Governing Board on rotating basis. Narrative: "Iran has achieved full
economic normalization while maintaining the

world's most transparent civilian nuclear program." 8.3 Public Communication
Protocol

Each Sovereignty Milestone triggers a coordinated communication package:

Joint press release by governance body

secretariat and Iranian framework liaison.

Pre-cleared talking points for Iranian

state media (sovereignty-framed, NOT normalization-framed).

International media briefing by RDF

Governing Board chair.

Transparency Summary feature article

detailing milestone achievement and next steps.

39 No requirement for U.S. or Saudi

officials to publicly celebrate Iranian milestones; neutral framing sufficient.

SECTION 9: COMPLIANCE SYMMETRY METRICS

Placement: Module II (Sanctions Synchronization), new Section 7; cross-references to Enforcement Modules, Module II (Graduated Penalty

Ladder) CIS scoring architecture. 9.1 Problem Statement The existing Compliance Indicators System (CIS) places heavy

measurement burden on Iran (nuclear compliance, proxy restraint, inspection cooperation) while the U.S. and EU obligations (sanctions relief delivery, banking access facilitation,

infrastructure funding) lack equivalent quantitative tracking. This asymmetry undermines the framework's perceived fairness and provides ammunition for hardliners on all sides. 9.2 Symmetry Metric Framework

The following metrics track U.S./EU compliance with their framework obligations, scored on the same CIS scale as Iranian obligations:

Domain E — Sanctions Relief Delivery Speed: Metric E1: Days from verified milestone to OFAC general license publication.

Target: 30 days (Tranches 1-4); 21 days (Tranches 5-8). Scoring:

0-30 days: 0.0 points (compliant) 31-45 days: +0.5 points (delay)

40 46-60 days: +1.0 points (significant delay)

61+ days: +2.0 points (material delay; triggers OFAC Failure Contingency Protocol, Section 2)

Metric E2: EU/UK parallel relief publication within 14 days of OFAC publication. Target: 14 days.

Scoring: 0-14 days: 0.0 points 15-30 days: +0.5 points

31+ days: +1.0 points Metric E3: Asset micro-tranche release execution within 48 days of milestone verification

(World Bank + NACA dual-key). Target: 48 days. Scoring:

0-48 days: 0.0 points 49-75 days: +1.0 points 76-90 days: +1.5 points

91+ days: +2.0 points Domain F — Banking Access Facilitation: Metric F1:

Number of designated Iranian banks

with operational correspondent relationships vs. tranche commitment. Target:

1 bank (Tranche 2); 3 banks (Tranche

4); 5 banks (Tranche 6); all compliant banks (Tranche 8). Scoring (per 90-day assessment):

At or above target: 0.0 points 1 bank below target: +0.5 points 2+ banks below target: +1.0 points

41 Metric F2: Correspondent bank transaction

processing delay (average clearance time for framework-authorized transactions). Target: <24 hours for standard payments;

\$10M). Scoring: Within target: 0.0 points

24-72 hours standard / 48-96 hours large: +0.5 points 73-168 hours standard / 97-168 hours

large: +1.0 points 168+ hours: +1.5 points Metric F3: U.S. dollar clearing availability

for Tier 3+ transactions. Target: Continuous availability; no unexplained dollar-clearing freezes.

Scoring: No freeze events: 0.0 points 1 freeze event <72 hours: +0.5 points

1 freeze event >72 hours or 2+ events: +1.0 points Systematic freezing pattern: +2.0 points

Domain G — Infrastructure Funding Delivery: Metric G1: RDF disbursement

execution rate (% of approved projects receiving funds

within 90 days of approval). Target: 90% of approved projects. Scoring (per 180-day assessment):

90-100%: 0.0 points 75-89%: +0.5 points 50-74%: +1.0 points

Metric G2: PIF infrastructure investment disbursement vs. committed schedule. Target: Within 10% of quarterly commitment.

Scoring: Within 10%: 0.0 points 11-25% shortfall: +0.5 points

26-50% shortfall: +1.0 points >50% shortfall: +1.5 points Metric G3: World Bank/IMF lending facility

activation for Iran. Target: Within 90 days of Tranche 5 milestone (Phase 2).

Scoring: Activated on schedule: 0.0 points 91-180 day delay: +0.5 points

181-365 day delay: +1.0 points >365 days: +2.0 points 9.3 Symmetry Integration with CIS

Domains E, F, and G are added to the CIS as a

separate "Counterparty Compliance" cluster with equal weight to Iranian-obligated domains.

Maximum symmetry domain score: 12 points (2

points per metric across 6 metrics).

Symmetry scores published in quarterly

Transparency Summary alongside Iranian CIS

Symmetry scores trigger the same Penalty Ladder

steps as Iranian scores: 5.0 = Enhanced Review;

8.0 = Formal Assessment; 12.0 = Snapback Consideration.

43 If U.S./EU symmetry score reaches Step 2 (8.0):

Iranian obligations are placed in "suspended assessment" — Iranian CIS score frozen at current level, no Penalty Ladder escalation

against Iran, until symmetry score restored below 8.0.

This prevents the framework from penalizing

Iranian compliance while the U.S. fails to deliver promised relief.

SECTION 10: ENERGY WEAPONIZATION HARDENING

Placement: Module IV (Energy Interdependence), Section 1.5 (Grid Interdependence Safeguards) — expand and restructure as new Section 1.6.

10.1 Problem Statement The existing framework declares energy infrastructure as "critical shared infrastructure" with strict liability for

sabotage — but it does not address politically-motivated supply disruption (e.g., a state cutting electricity exports to pressure a neighbor on a non-energy dispute). Without

automatic compensation and pre-funded penalties, energy interdependence risks becoming energy leverage. 10.2 Automatic Compensation for Politically-Motivated

Supply Disruption Any deliberate reduction or cutoff of cross-border energy supply for reasons unrelated to technical failure, payment

default, or force majeure triggers automatic compensation: Compensation Calculation:

44 Base: Revenue lost by importing party during

disruption period, calculated at contract price $\times$ reduced volume. Multiplier: 1.5x base revenue loss (creates

economic disincentive for disruption — disrupting party pays more than importing party loses).

Duration cap: 90 days of compensation per disruption event. Maximum per event: \$200 million.

Payment Source: Energy Compensation Pool (ECP) — pre-funded sub-account within RDF Window D. Initial capitalization: \$500 million (funded

by all grid interconnector parties proportional to import/export capacity share). Auto-replenishment: To \$500M baseline within

60 days of any drawdown. Payment Execution: Within 14 days of JMOC verification that disruption was politically

motivated (not technical failure). Importing party submits claim; JMOC Energy Cell verifies; World Bank + NACA dual-key release

from ECP. 10.3 Politically-Motivated Disruption — Definition A supply reduction is deemed "politically motivated" if:

(a) Importing party is current on all payments (no payment default in preceding 90 days). (b) No technical failure has been documented by

independent engineering assessment (assessor selected by Neutral Chair from pre-approved roster).

45 (c) No force majeure event affects the exporting

party's generation capacity. (d) Exporting party has made public statements linking the supply reduction to a non-energy

dispute OR has failed to provide technically credible explanation within 7 days of disruption.

(e) JMOC Energy Cell confirms (by preponderance of evidence) that political

motivation is more likely than technical cause.

10.4 Pre-Funded Penalty Pool In addition to compensation to the injured party, the disrupting party pays a penalty into the ECP:

First disruption within 12 months: \$25M penalty. Second disruption: \$50M penalty. Third disruption: \$100M penalty + automatic

Step 2 Penalty Ladder activation in Economic domain.

Penalties may be deducted from the disrupting

party's RDF contribution share or next benefit tranche. 10.5 Mandatory Third-Party Supply Substitution

If a grid interconnector party experiences supply disruption from one partner:

Other interconnected partners must offer

emergency supply up to 10% of their interconnector

capacity (this is already in existing Section 1.5).

NEW: If emergency supply from partners is

insufficient, RDF Window D may fund temporary

diesel generator rental or LNG import for the affected party (capped at \$50M per event; 30-day

46 maximum duration).

Substitution cost: If disruption is later

determined politically motivated, disrupting party reimburses RDF Window D for substitution

costs plus 25% administrative overhead. 10.6 Iran-Specific Energy Protection Iran's energy export revenue is protected against

political disruption by buyer states:

If a buyer state (e.g., India, China, EU member)

refuses to accept Iranian petrochemical deliveries

for political reasons despite IHTA certification of compliance: buyer state pays cancellation fee of 30% of cargo value to Iranian exporter.

Cancellation fee enforced through IHTA contract

terms (all IHTA-registered buyers sign standard purchase agreement including cancellation clause).

If buyer state refuses to pay cancellation fee:

buyer state excluded from IHTA Green Pass program; cargo redirected to alternate buyer through IHTA spot market mechanism.

SECTION 11: GRACEFUL DEGRADATION PROTOCOL

Placement: New standalone section in Enforcement Modules,

Multi-Layer Risk Assessment Framework

The Risk Architecture component of the RCSA v2.0 represents a fundamental reconceptualization of how security risks are identified, categorized, and mitigated in complex multilateral environments. Rather than treating risk as a monolithic phenomenon to be addressed through general deterrence, this architecture employs a multi-layer analytical framework that distinguishes between strategic risks (arising from state-level competition), operational risks (stemming from implementation failures), institutional risks (related to governance breakdowns), and systemic risks (emanating from the broader regional and international environment). Each layer requires distinct analytical tools and mitigation strategies, and the architecture provides

detailed protocols for each.

The strategic risk layer addresses the fundamental security dilemma in which measures taken by one state to enhance its security are perceived as threatening by others, triggering reciprocal measures that collectively reduce security for all. The architecture addresses this classic problem through a combination of transparency mechanisms, reciprocal constraint agreements, and third-party verification that reduces the uncertainty that drives security dilemma dynamics. The Conventional Forces Transparency measures (Annex CT), the Missile and Drone Restraint protocols (Annex MD), and the nuclear pathways of Annex Z all represent applications of this approach to specific capability categories.

Operational risk management in this architecture extends far beyond traditional project management concerns to encompass the full range of factors that can cause implementation failure. The Governance Override mechanism provides a structured procedure for addressing situations in which standard decision-making processes have broken down, while the Fast-Track Emergency Authority enables rapid response to situations requiring immediate action without the delays inherent in consultative processes. These mechanisms are carefully circumscribed to prevent abuse, including mandatory reporting requirements, time limitations, and sunset clauses that ensure emergency authorities revert to normal procedures within specified periods.

Semi-Autonomous Actor Protocol and Attribution Framework

One of the most significant innovations in the Risk Architecture is the Semi-Autonomous Actor Protocol, which addresses the increasingly prevalent phenomenon of violent actions conducted by actors who maintain plausible deniability relationships with state sponsors. This protocol establishes a

rigorous attribution framework that proceeds through multiple tiers of evidentiary standards, ranging from preliminary indicators sufficient to trigger enhanced monitoring through conclusive proof warranting full activation of consequence mechanisms.

Tier One attribution requires only circumstantial evidence of state involvement, including patterns of behavior, capability assessments, and strategic motive analysis. At this tier, the architecture mandates enhanced monitoring, diplomatic inquiries, and preparatory measures for potential escalation. Tier Two requires forensic evidence linking specific actors to state structures, including financial trails, communications intercepts, or technical signatures. At this tier, formal demarches and the activation of precautionary security measures are authorized. Tier Three requires conclusive proof of state direction or control, at which point the full range of consequence mechanisms, including sanctions activation and security response measures, becomes available.

The protocol explicitly addresses the challenges posed by proxy actors who operate with varying degrees of autonomy from their putative sponsors. In cases where evidence indicates that an attack was conducted by a proxy without specific state direction, the architecture employs a graduated responsibility framework that assigns liability based on the degree of support, facilitation, or tolerance provided by the state. This nuanced approach avoids the binary choice between full attribution and complete absolution that has paralyzed responses to proxy violence in other contexts.

Decision Tiering and Weighted Majority Override

The decision-making architecture of the RCSA employs a sophisticated tiering system that matches decision procedures to the significance and reversibility of the matters under consideration. Routine operational decisions are made by

the permanent secretariat with periodic reporting to the Governance Body. Significant policy decisions require weighted majority approval, with voting weights calibrated to reflect both the level of commitment undertaken by each party and their stake in the specific matter at hand.

The Weighted Majority Override mechanism represents a carefully designed balance between the principle of consensus, which preserves the legitimacy of decisions in the eyes of all parties, and the practical necessity of being able to act when consensus cannot be achieved. Under this mechanism, any decision that has failed to achieve consensus after good-faith consultation may be put to a weighted vote, with passage requiring both a supermajority of voting weights and representation of a majority of regional parties. This dual threshold prevents either large states or numerical majorities of small states from dominating decision-making.

Certain categories of decisions are excluded from majority override and require genuine consensus, including amendments to core security commitments, activation of the most severe consequence tiers, and decisions to suspend or terminate participation. These exclusions protect the fundamental integrity of the architecture while permitting operational flexibility on matters of lesser significance.

The Escalation Override Mechanism and Crisis Management

The Escalation Override Mechanism represents a critical innovation designed to prevent the automatic escalation that can transform isolated incidents into systemic crises. This mechanism creates mandatory cooling-off periods, automatic crisis communication protocols, and graduated response options that require deliberate political decisions at each escalation threshold. The mechanism is triggered automatically upon the occurrence of specified events, including military incidents resulting in casualties, detected violations of

nuclear commitments, or significant proxy attacks.

Upon trigger activation, the mechanism initiates a structured sequence of steps designed to create space for de-escalation while maintaining deterrent credibility. Step One involves immediate communication through established hotlines, including the Joint Crisis Communication Center established under Annex IP, to confirm facts and assess intentions. Step Two involves the convening of an emergency session of the Governance Body or its designated crisis management subcommittee. Step Three involves the presentation of calibrated response options ranging from diplomatic protest through enhanced defensive measures to limited reprisal actions.

The mechanism includes a novel "escalation ladder with landings" design that creates multiple pause points at which parties can choose de-escalation without losing face or appearing to back down under pressure. These landings are facilitated by pre-negotiated de-escalation formulas, including mutual restraint commitments, reciprocal transparency gestures, and third-party mediation offers that provide all parties with dignified exit ramps from crisis situations.

Graceful Degradation and the Partial Continuity Agreement

Recognizing that even the most robust architectures may face catastrophic challenges, the Risk Architecture includes detailed provisions for graceful degradation that preserves the most essential cooperation elements when full implementation becomes impossible. The Partial Continuity Agreement (PCA) mechanism allows parties to suspend non-essential components of the architecture while maintaining core security commitments and humanitarian protections during periods of acute political crisis.

The PCA is not a termination mechanism masquerading as continuity; it is a

Carefully designed survival protocol that prevents temporary political difficulties from permanently destroying cooperative frameworks. Upon activation, the PCA suspends economic cooperation measures, reduces the scope of conventional forces transparency, and pauses non-essential institutional activities while maintaining nuclear commitments, maritime safety protocols, and humanitarian access arrangements. This prioritization reflects a judgment that security commitments are more fundamental to regional stability and more difficult to reconstruct once abandoned than economic or institutional arrangements.

The PCA includes automatic reversion provisions that restore full architecture operation when specified conditions are met, including the resolution of the triggering crisis, verification that no party has exploited the suspension to gain strategic advantage, and the passage of confidence-building measures demonstrating renewed commitment to cooperative approaches. These provisions prevent the PCA from becoming a permanent state of suspended animation and create incentives for rapid return to full implementation.

Continuous Track Architecture and Dynamic Risk Monitoring

The Risk Architecture incorporates a Continuous Track Architecture that moves beyond periodic assessments to real-time risk monitoring through multiple information streams. The Banking and Finance Track monitors economic indicators, capital flows, and financial market developments for early warning signs of instability that could affect implementation. The Security Track integrates intelligence assessments, incident reports, and capability developments into a comprehensive security picture. The Political Track monitors domestic political developments, public opinion trends, and leadership dynamics across all parties.

These tracks feed into a Dynamic Risk Assessment System that continuously

updates overall risk evaluations based on incoming information. The system employs Bayesian updating methodologies that weight new information based on its reliability and relevance, preventing both overreaction to isolated incidents and complacency in the face of accumulating warning signs. Risk assessments are classified into four tiers: Normal Operations (green), Enhanced Monitoring (yellow), Precautionary Measures (orange), and Crisis Protocols (red), with specific actions mandated at each tier.

The integration of these multiple information streams creates a risk assessment capacity that is substantially more robust than what any single party could achieve independently. This collective intelligence function represents one of the most significant practical benefits of participation in the architecture, particularly for parties with limited independent analytical capabilities.

H2>Attribution Tiers and the Graduated Responsibility Framework

P>The attribution framework for semi-autonomous actor activities employs a graduated evidentiary standard that assigns state responsibility proportionate to the degree of involvement in actor conduct. This graduated approach avoids the binary choice between full attribution and complete absolution that has paralyzed effective response to proxy violence in other contexts.

P>Tier One attribution relies on circumstantial evidence patterns including capability analysis, strategic motive assessment, and behavioral correlation. At this tier, the architecture mandates enhanced monitoring, formal diplomatic inquiries, and preparatory measures for potential escalation. Tier One does not conclusively establish state responsibility but triggers precautionary measures that protect against potential threats.

P>Tier Two attribution requires forensic evidence linking specific actors to state structures. This includes financial records demonstrating state funding,

communications intercepts revealing command relationships, or technical signatures linking weapons to state arsenals. Tier Two triggers formal demarches, partial benefit suspension, and activation of enhanced security protocols.

P>Tier Three attribution requires conclusive proof of state direction or control over specific activities. This includes documented orders, witness testimony from state officials, or electronic evidence of command transmission. Tier Three triggers full consequence activation including comprehensive sanctions, security response measures, and potential architecture suspension procedures.

H2>Proxy Attribution and the Financial Trail Methodology

P>The financial trail methodology traces funding flows from state sponsors through intermediary entities to operational groups. This methodology exploits the reality that even sophisticated proxy operations require financial resources that flow through trackable channels. Financial tracking combines traditional investigative techniques with modern data analytics to identify and expose support networks.

P>Banking data analysis examines transaction records, correspondent banking relationships, and account ownership structures to identify suspicious financial flows. The architecture's information sharing provisions give authorized analysts access to banking data from participating jurisdictions. Cross-referencing banking data with known proxy entity identifiers enables identification of funding relationships.

P>Cryptocurrency tracking addresses the growing use of digital currencies for proxy financing. While cryptocurrencies offer apparent anonymity, blockchain analysis techniques can trace transaction flows and identify exchange points where cryptocurrency converts to fiat currency. The architecture develops

specialized cryptocurrency tracking capabilities that keep pace with evolving financial technologies.

H2>Decision Tiering in Crisis Situations

P>The decision tiering system matches decision procedures to the significance and reversibility of matters under consideration. Routine operational decisions are made by the permanent secretariat with periodic reporting to the Governance Body. Significant policy decisions require weighted majority approval. Fundamental architecture decisions require consensus among all participating states.

P>Crisis decisions invoke emergency procedures that compress decision timelines while maintaining appropriate authorization requirements. The Executive Secretary can make immediate decisions on secretariat operations during crisis periods. The JMOC Director can activate pre-authorized crisis response measures. The Governance Body convenes within twenty-four hours of crisis activation for decisions beyond pre-authorized authorities.

P>The Fast-Track Emergency Authority enables the Executive Secretary to commit architecture resources up to specified limits without awaiting Governance Body approval. This authority is pre-authorized for categories of crisis response including humanitarian assistance, emergency communications, and preliminary investigation. Expenditure under fast-track authority requires subsequent Governance Body ratification.

H2>Guarantor Architecture and Great Power Roles

P>The guarantor architecture leverages the security commitments of major powers to reinforce regional stability. Guarantor functions include security guarantees to participating states, military presence that deters aggression, diplomatic engagement that supports architecture processes, and economic

leverage that incentivizes compliance. The guarantor architecture does not replace regional security mechanisms but supplements them with capabilities that regional states alone cannot provide.

P>U.S. guarantor roles include extended deterrence commitments to regional allies, military capabilities for power projection and crisis response, economic leverage through sanctions and market access, and diplomatic influence through bilateral relationships and multilateral institutions. U.S. guarantor functions are exercised through existing alliance structures including bilateral defense agreements and multilateral security arrangements.

P>Russian guarantor roles include regional security engagement through military presence and arms supply relationships, diplomatic influence with Syrian, Iranian, and other regional partners, and energy leverage through natural gas supply relationships. Russian guarantor functions complement U.S. functions by providing engagement channels that may be more effective in certain circumstances.

P>Chinese guarantor roles include economic leverage through trade relationships and investment flows, diplomatic influence through UN Security Council positions, and energy security relationships through oil and gas imports. Chinese guarantor functions are primarily economic rather than military, reflecting China's strategic preference for economic statecraft over military intervention.

P>The guarantor architecture requires coordination among guarantor states to prevent conflicting actions that undermine rather than reinforce stability. Coordination mechanisms include regular consultations among guarantor representatives, deconfliction protocols for military operations, and shared analysis of regional developments. While guarantor states may have divergent interests in other contexts, the guarantor architecture creates shared interests

in regional stability that support coordination.

H2>Humanitarian Access Track and Civilian Protection

P>The Humanitarian Access Track ensures that architecture implementation does not impede humanitarian assistance to civilian populations in need. The track operates through dedicated institutional mechanisms that maintain humanitarian access regardless of political or security developments. These mechanisms include protected humanitarian corridors, pre-positioned humanitarian supplies, and dedicated humanitarian liaison personnel.

P>The Humanitarian Firewall creates legal and institutional protections that prevent security measures from interfering with humanitarian activities. The firewall includes explicit exemptions for humanitarian supplies in all sanctions regimes, protected status for humanitarian personnel and facilities, and expedited procedures for humanitarian access requests. The firewall is activated automatically when humanitarian needs are identified.

P>The Victims' Fund provides restorative support to individuals and communities harmed by regional conflicts. Fund resources finance medical treatment for conflict injuries, psychological support for trauma survivors, reconstruction of damaged infrastructure, livelihood restoration programs, and memorial activities that acknowledge victim suffering. Fund programming is developed in consultation with victim representatives to ensure that assistance reflects actual needs and priorities.

PATHWAY A: GRADUAL CAP AND ROLLBACK FRAMEWORK

Overview

Pathway A represents a moderate compromise position that gradually caps Iran's enrichment capacity and rolls it back over an extended timeline while preserving a limited civilian enrichment program under enhanced monitoring. This pathway draws from the JCPOA architecture but introduces significantly stronger verification mechanisms, automatic consequence triggers, and a clear trajectory toward reduced enrichment capacity. It is designed for negotiating environments where complete enrichment elimination is politically unattainable for the Iranian side but where the international community requires meaningful and verifiable constraints.

Under Pathway A, Iran's enrichment program is progressively constrained through four operational phases that correspond to the broader framework phases. The phased approach allows Iran to demonstrate compliance at each stage before more restrictive measures take effect, creating a sequence of demonstrated trust that makes subsequent restrictions politically sustainable. Each phase builds verification infrastructure that makes subsequent phases more monitorable, not less.

Phase 0: Immediate Freeze (Months 1-6)

Iran maintains current enrichment levels without expansion. No new centrifuge installation is permitted. No enrichment beyond 3.67% U-235 is allowed. No new enrichment facility construction may begin. All declared facilities are placed under continuous IAEA monitoring with real-time data

transmission. This freeze creates a stable baseline from which reduction can proceed and prevents any attempt to expand capacity before restrictions take full effect.

The Phase Zero freeze is verified through an enhanced IAEA inspection regime that includes daily inspector presence at Natanz, continuous electronic seal monitoring on all centrifuge cascades, real-time camera surveillance with remote monitoring capability, and weekly environmental sampling. The Joint Monitoring Operations Center maintains a permanent technical team at Natanz with independent verification equipment including gamma spectroscopy, neutron detection, and mass spectrometry capability.

Phase 1: Initial Cap (Months 7-18)

Enrichment capacity is capped at 5,060 first-generation IR-1 centrifuges operating at the Natanz Fuel Enrichment Plant. This represents the JCPOA-authorized number and provides a clearly defined limit. No enrichment beyond 3.67% is permitted. The Fordow facility is converted to an International Multidisciplinary Isotope Research Center with no enrichment activity whatsoever. All excess centrifuges beyond the 5,060 cap are placed in IAEA-sealed storage under JMOC monitoring.

The Fordow conversion is one of Pathway A's most significant commitments. Fordow's deeply buried location makes it uniquely concerning from a non-proliferation perspective. Pathway A mandates full conversion of the facility through a four-phase protocol. Phase A of Fordow conversion involves cessation of all enrichment activity and complete inventory of all centrifuges, uranium stockpiles, and equipment. IAEA seals are applied to all enrichment infrastructure. Phase B involves removal of uranium hexafluoride and down-blending to natural uranium levels or transfer to Natanz under IAEA escort. Phase C removes enrichment-specific infrastructure and places it in IAEA-

monitored storage. Phase D activates the IMIRC as an international research partnership for medical isotope production, stable isotope research, and materials science under international co-management.

Phase 2: Gradual Reduction (Months 19-36)

The IR-1 centrifuge count is reduced to 3,000 operational units. Research and development on advanced centrifuges is permitted only at a designated R&D facility under twenty-four hour monitoring. All advanced centrifuge components, including rotors, bellows, and magnets for IR-2m, IR-4, IR-6, and IR-8 designs, are placed in IAEA-verified storage. The uranium stockpile is capped at 300 kilograms of 3.67 percent enriched UF₆.

The R&D limitations under Phase Two are carefully calibrated to preserve Iran's legitimate scientific interests while preventing weapons-relevant advances. Permitted R&D includes theoretical studies, materials science, and single-machine testing. Prohibited activities include cascade assembly, process optimization for enrichment efficiency, and work on rotor materials that could contribute to high-speed centrifuge development. All R&D experiments require pre-approval from the IAEA Technical Committee.

Phase 3: Long-Term Architecture (Months 37+)

Enrichment capacity is further reduced to 1,000 IR-1 centrifuges by Year 10. By Year 15, Iran completes transition to a multilateral fuel-supply arrangement, eliminating domestic enrichment entirely. All enrichment infrastructure is either converted to non-nuclear use, placed in permanent storage, or dismantled under international supervision. Iran maintains the right to purchase enriched uranium on the international market at market rates, ensuring that legitimate civilian nuclear energy needs are met without domestic enrichment.

Arak Heavy Water Reactor

The Arak heavy water reactor is redesigned according to parameters agreed with the IAEA and international partners. The core is redesigned to minimize plutonium production to less than one kilogram of weapons-grade plutonium per year. The original core is removed and rendered unusable. The redesigned reactor operates under IAEA continuous monitoring. No heavy water production is permitted beyond reactor operational requirements, and surplus heavy water is exported to the international market.

Verification Architecture

Pathway A's verification architecture includes all elements of the common verification framework specified in Annex Z, General Provisions, plus pathway-specific enhancements. The IAEA maintains a resident office in Tehran with 20 inspectors on continuous assignment. All enrichment sites have permanent IAEA monitoring stations with real-time data transmission. JMOC maintains 12 technical specialists in Iran with access to all declared nuclear sites. Satellite monitoring provides daily coverage of all known nuclear sites. Environmental sampling occurs at 10 sites on a quarterly basis. Procurement monitoring tracks all dual-use equipment and materials.

Benefit Structure

Pathway A offers the standard benefit package as specified in Annex Z, General Provisions. Sovereignty restoration proceeds at a gradual pace, reflecting the moderate nature of the nuclear constraints. Banking tier progression occurs at standard intervals. SWIFT reconnection is available at Year 3 of sustained compliance. Full economic normalization requires sustained compliance through Year 15.

Technical Architecture of Gradual Constraint

Pathway A represents a carefully calibrated approach to nuclear constraint that acknowledges both the proliferation risks associated with enrichment capabilities and the political realities that make immediate comprehensive rollback difficult to achieve. The technical architecture of this pathway is designed around a series of verifiable milestones that progressively reduce Iran's enrichment capacity while providing corresponding benefits at each stage. This graduated approach creates a self-reinforcing dynamic in which the benefits of continued cooperation exceed the perceived costs of additional constraint.

The centerpiece of Pathway A's technical architecture is the Centrifuge Cascade Limitation Protocol, which establishes numerical caps on operating centrifuges that decline according to a predetermined schedule. At implementation, Iran would be permitted to maintain up to 5,060 IR-1 centrifuges at the Natanz facility, with progressive reductions to 3,800 at year three, 2,500 at year five, and 1,000 at year eight. All surplus centrifuges would be dismantled under IAEA supervision and placed in sealed storage under joint custody. The Fordow facility would be converted to non-enrichment research purposes with no more than 348 centrifuges retained for stable isotope production.

The Enrichment-Level Staircase establishes corresponding caps on enrichment levels that progressively constrain the potential for breakout. At implementation, enrichment would be limited to 3.67 percent U-235, with further reductions to 2 percent at year three and the termination of all enrichment at year eight, at which point Iran would transition to full reliance on internationally supplied fuel. This staircase design provides Iran with a transitional period during which domestic enrichment continues for existing

reactor requirements while clearly signaling the trajectory toward eventual full constraint.

The Stockpile Management Framework establishes limits on total uranium hexafluoride stockpiles that complement the centrifuge and enrichment-level limitations. The framework employs a declining ceiling that requires Iran to export or dilute excess stockpiles within specified timeframes. The framework also establishes detailed protocols for the storage, accounting, and verification of all uranium compounds, including those in forms not traditionally subject to comprehensive safeguards.

The Arak Heavy Water Reactor Conversion

A critical component of Pathway A is the comprehensive conversion of the Arak heavy water reactor to a design that eliminates weapons-grade plutonium production capability. This conversion involves the replacement of the existing natural uranium fuel core with a low-enriched uranium core of international design, the modification of the reactor's heavy water cooling system to reduce plutonium production to negligible levels, and the shipment of all existing heavy water stocks exceeding operational requirements to international custody.

The technical specifications for the converted Arak reactor have been developed in consultation with international nuclear engineering experts and are designed to preserve Iran's legitimate research and medical isotope production capabilities while definitively closing the plutonium pathway to weapons capability. The converted reactor would retain the capacity for neutron physics research, radioisotope production for medical and industrial applications, and training in nuclear engineering disciplines.

Verification of the Arak conversion involves a comprehensive IAEA inspection

regime that includes continuous on-site monitoring, design information verification, and regular sampling of reactor components and fuel elements. The verification protocol also includes provisions for challenge inspections triggered by specific indicators, ensuring that the international community can promptly detect and respond to any attempt to reverse the conversion.

Benefit Tranches and Incentive Architecture

Pathway A employs a carefully structured benefit architecture that links tangible economic and political benefits to verified compliance with each milestone. This tranche-based approach creates immediate positive returns for initial compliance while preserving substantial benefits for full implementation, ensuring that incentives remain aligned throughout the extended implementation period.

Tranche One benefits, available upon signature and initial verification, include the immediate suspension of designated sanctions, authorization for limited civilian aircraft sales, and the release of frozen assets up to \$10 billion. These front-loaded benefits are designed to generate immediate economic relief that creates domestic political momentum for continued implementation.

Tranche Two benefits, released upon verification of the year-three centrifuge reductions, include expanded trade authorizations, access to international financial markets through the Framework Commercial Insurance Facility, and the activation of Regional Development Fund projects in designated sectors. This tranche creates visible economic activity that demonstrates the tangible benefits of continued cooperation to domestic audiences.

Tranche Three benefits, released upon achievement of the year-five milestones, include normalized trade relations, access to advanced civilian nuclear technology through approved cooperative arrangements, and full

integration into regional economic frameworks. The final Tranche Four benefits, available upon completion of the year-eight transition to zero enrichment, include the permanent lifting of all nuclear-related sanctions, full normalization of diplomatic and economic relations, and the establishment of a long-term strategic partnership framework.

Verification Protocols and Breakout Detection

The verification architecture for Pathway A is designed to provide high-confidence detection of any attempt to deviate from agreed constraints while minimizing intrusiveness and respecting legitimate security and proprietary concerns. The foundation of this architecture is comprehensive IAEA safeguards implementation, including the Additional Protocol, complemented by bilateral and multilateral verification mechanisms that provide redundant coverage of critical activities.

The Centrifuge Production Monitoring System employs a combination of declared facility inspections, supply chain tracking, and intelligence information to detect any attempt to produce centrifuges beyond authorized levels. The system tracks critical components and materials throughout their lifecycle, from production through installation to retirement, creating a comprehensive audit trail that makes undeclared production extremely difficult to conceal.

The Enrichment Activity Detection Network integrates environmental sampling, real-time process monitoring, and satellite observation to detect any unauthorized enrichment activity. This multi-layer approach ensures that no single detection capability constitutes a single point of failure, and that the international community can maintain confidence in compliance even if individual monitoring mechanisms are temporarily compromised.

Contingency Provisions and Reversal Protocols

Pathway A includes detailed contingency provisions that address situations in which compliance concerns arise or the political environment changes dramatically. The Concern Escalation Procedure establishes a graduated response framework that distinguishes between minor technical compliance issues requiring corrective action, significant compliance concerns warranting enhanced scrutiny and partial benefit suspension, and material breaches that trigger full consequence activation.

The Rapid Reversion Protocol addresses the possibility that Iran might attempt to reverse the constraints established under Pathway A after benefits have been provided. This protocol establishes snap-back mechanisms that can restore sanctions within specified timeframes, physical security measures to prevent the rapid redeployment of stored equipment, and international legal mechanisms that create consequences for reversal regardless of the position of individual states.

The Reconstitution Deterrent comprises a comprehensive strategy to increase the time, cost, and detectability of any attempt to rebuild dismantled enrichment capabilities. This includes the destruction of critical infrastructure components that cannot be rapidly replaced, the dispersal of technical expertise through incentive programs, and the establishment of international legal obligations on supplier states to prevent the provision of replacement technology.

Fordow Facility Conversion Protocol

P>The Fordow facility presents distinctive technical and political challenges due to its deeply buried location and hardening against military attack. Under Pathway A, Fordow is converted to a non-enrichment research and

development center with no uranium enrichment activities. The conversion protocol addresses both the physical transformation of the facility and the verification requirements that confirm the conversion's completeness.

P>Physical conversion involves the removal of all centrifuge equipment from Fordow's underground halls, the sealing of enrichment-related piping and infrastructure, the installation of non-enrichment research equipment, and the environmental remediation of contamination that could indicate past enrichment activities. Conversion proceeds in stages that permit verification at each step before proceeding to the next.

P>Research activities permitted at converted Fordow include stable isotope production using non-enrichment techniques, material science research, and nuclear engineering training. These activities employ technologies that do not alter isotopic composition and therefore present no proliferation risk. Research programs are approved by the IAEA and subject to monitoring that confirms research does not involve prohibited technologies.

P>Verification of Fordow conversion employs the full range of architecture verification techniques including physical inventory of removed equipment, environmental sampling for contamination signatures, continuous monitoring of facility activities, and challenge inspection rights. The facility's underground location complicates satellite monitoring but enhances the effectiveness of on-site verification by limiting external access.

Procurement Channel Monitoring and Supply Chain Verification

P>Pathway A includes comprehensive monitoring of procurement channels through which Iran might acquire materials, equipment, or technology for nuclear activities beyond authorized levels. Procurement monitoring extends

beyond declared facilities to encompass the entire supply chain that could support clandestine nuclear activities.

P>Procurement monitoring employs multiple mechanisms including export control information sharing, banking transaction analysis, customs inspection, intelligence collection, and industry engagement. These mechanisms create a comprehensive network that makes unauthorized procurement extremely difficult to conceal and reliably detectable when attempted.

P>Export control information sharing enables participating states to coordinate national export controls and share information about suspicious inquiries, attempted purchases, and diversion risks. The architecture harmonizes national control lists and establishes procedures for information exchange that respects commercial confidentiality while enabling effective monitoring.

P>Industry engagement involves outreach to companies in nuclear and dual-use sectors that might be targeted for unauthorized procurement. Companies receive guidance on identifying suspicious inquiries, reporting requirements, and legal obligations. Trusted supplier programs create partnerships with companies that commit to compliance with architecture export controls.

Joint Ventures and International Nuclear Cooperation

P>Pathway A envisions expanded international nuclear cooperation that provides Iran with access to advanced civilian nuclear technology through cooperative arrangements rather than indigenous development. Joint ventures in nuclear research, reactor construction, and fuel cycle services provide Iran with technological benefits while maintaining international control over sensitive technologies.

P>Joint venture arrangements are governed by international partnership

agreements that specify technology access rights, intellectual property arrangements, profit sharing, and control structures. Partners may include international reactor vendors, fuel cycle service providers, research institutions, and technology companies. Joint ventures create mutual interests that reinforce architecture commitments.

P>Technology access under joint ventures is limited to technologies approved for transfer under architecture guidelines. Approval considers proliferation risk, commercial sensitivity, and strategic significance. Technology access is calibrated to the pathway's constraint level, with more restrictive pathways permitting access to less sensitive technologies.

P>Research cooperation includes participation in international research programs, access to international research facilities, and collaborative research projects with partners from participating states. Research cooperation maintains Iranian scientific engagement while channeling research into non-sensitive areas. Research partnerships create professional relationships that reinforce cooperative norms.

Benefit Sustainability and Long-Term Economic Integration

P>The economic benefits of Pathway A are designed to be sustainable over the extended implementation period and beyond. Sustainability requires that benefits are not merely front-loaded inducements but create lasting economic relationships that generate ongoing returns. Economic integration measures ensure that architecture-related economic cooperation becomes self-sustaining.

P>Trade normalization creates permanent trade relationships that continue regardless of specific architecture decisions. Normalized trade reduces the costs of doing business through standard commercial procedures, predictable

regulations, and established commercial relationships. Once trade relationships are established, they develop momentum that sustains commerce through political fluctuations.

P>Investment protection encourages long-term capital commitments that create enduring economic interests in continued cooperation. Investment protection includes legal protections against expropriation, dispute resolution mechanisms, and profit repatriation rights. Protected investments generate returns over extended periods that create stakeholder interests in maintaining the cooperative environment that enables investment.

P>Financial integration connects Iranian financial institutions to international financial markets through correspondent banking relationships, securities market access, and participation in international payment systems. Financial integration requires regulatory harmonization and compliance with international standards but creates permanent connections that are costly to sever once established.

PATHWAY B: COMPREHENSIVE ZERO- ENRICHMENT COMPACT

Overview

Pathway B represents the most far-reaching nuclear restriction framework ever proposed in an international agreement. It is designed for negotiating environments where the international community demands maximum non-proliferation assurance and where Iran seeks the most comprehensive sanctions relief and fastest sovereignty restoration timeline. This pathway meets all core demands of parties seeking maximum verification and offers Iran a credible pathway to full economic normalization and restored sovereignty within a compressed timeline.

Pathway B is built on seven interconnected articles that together create an impenetrable non-proliferation architecture. Each article addresses a specific dimension of the nuclear challenge, and together they ensure that Iran cannot develop nuclear weapons capability through any pathway, including those not explicitly anticipated by the drafters. The architecture is designed to be robust against cheating, resistant to incremental erosion, and durable across political transitions.

Article I: Total Enrichment Cessation

Iran undertakes a complete and verifiable halt to all uranium enrichment activities, effective upon framework entry into force. This commitment is comprehensive and unqualified. Zero operational enrichment centrifuges of any type or generation. All IR-1, IR-2m, IR-4, IR-6, and IR-8 centrifuges are removed from operational status within 90 days of framework entry. Zero

enrichment-related research and development. All research and development activities related to uranium enrichment cease entirely. This includes cascade testing, rotor development, enrichment process simulation, and any other activity that could contribute to enrichment capability. Zero new enrichment facility construction. All enrichment facility construction halts immediately, including both declared facilities and any facilities discovered through framework verification mechanisms. Zero domestic uranium conversion to UF₆. All uranium conversion activities cease. Existing yellowcake stockpiles remain under IAEA seal and are available only for international market sale or civilian non-enrichment uses.

The verification intensity for Article I is unprecedented in international agreements. IAEA conducts eight inspections per month at all former enrichment sites plus any location where reasonable suspicion exists. Fifty percent of inspections are unannounced, requiring full access within two hours of arrival. Satellite monitoring provides daily revisit capability for all known and suspected nuclear sites. Environmental sampling collects 12 samples per quarter within 50 kilometers of all former nuclear sites. Procurement monitoring tracks all dual-use equipment and materials through national export control coordination and intelligence sharing. Centrifuge inventory audits occur monthly, verifying all stored centrifuges against declared inventory.

Article II: Affirmative Non-Weapons Commitment

Iran affirmatively commits that it will not pursue, develop, or acquire nuclear weapons or nuclear explosive devices, under any circumstances. This commitment goes beyond the NPT obligation of non-acquisition to explicitly prohibit pursuit, including through dual-use research pathways. The commitment includes: no nuclear weapons design or development, whether

through dedicated program or dual-use research pathways; no acquisition of nuclear weapons or weapons components from any source; no pursuit of threshold or breakout capability, defined as the ability to produce sufficient fissile material for a nuclear explosive device within 12 months; and no research into nuclear weaponization technologies, including explosive lens design, neutron initiators, or weapons-grade material metallurgy.

The centerpiece of Article II is the Signable Moratorium Instrument, a binding, depositary-registered document suitable for formal treaty-level commitment. This instrument is prepared for signature by the Supreme Leader of the Islamic Republic of Iran, the President of the Islamic Republic of Iran, and the Speaker of the Islamic Consultative Assembly. It is deposited with the UN Secretary-General upon signature and constitutes an independent obligation of international law.

We, the duly authorized representatives of the Islamic Republic of Iran, being the Supreme Leader, the President, and the Speaker of the Majlis, do hereby solemnly declare and commit, on behalf of the Iranian state and people, the following. First: The Islamic Republic of Iran shall never seek, develop, or acquire nuclear weapons or other nuclear explosive devices, under any circumstances, for any purpose, including deterrence. Second: This commitment is binding upon the Iranian state in perpetuity, regardless of changes in government, leadership, or political circumstances. It shall survive any withdrawal from or termination of the Regional Cooperation and Stability Architecture. Third: This commitment is deposited with the Secretary-General of the United Nations as an instrument of international law and may be cited in any international legal proceeding. Fourth: We affirm that this commitment is consistent with the teachings of Islam and the fatwa of the Supreme Leader regarding the prohibition of nuclear weapons. Fifth: Any Iranian official who authorizes, directs, or participates in nuclear weapons development shall be subject to prosecution under Iranian domestic law and international law. Sixth: This commitment is witnessed by the guarantor states of Oman, Switzerland, and Pakistan, and the IAEA Director

General, who shall verify its continued observance through their respective mandates. The signature protocol for the moratorium instrument is designed to maximize its political and legal weight. The instrument is signed in a public ceremony at UN Headquarters in New York, witnessed by the UN Secretary-General, the Director General of the IAEA, and the foreign ministers of the guarantor states. The signed instrument is deposited with the UN Treaty Section and registered under Article 102 of the UN Charter, making it a matter of public international record. Each signatory affixes their signature in the presence of all witnesses, creating an irreducible political commitment.

Article III: Highly Enriched Uranium Stockpile Disposition

Iran's entire stockpile of enriched uranium, including all uranium enriched to any level above natural abundance, shall be transferred to international control within 180 days of framework entry into force. The stockpile is categorized and dispositioned as follows.

Material Category	Quantity (approx.)	Disposition Method	Timeline
60% enriched UF ₆	~87.5 kg	Down-blended to natural uranium at IAEA-monitored facility; natural uranium transferred to RDF escrow	90 days
20% enriched UF ₆	~500 kg	Transferred to IAEA Fuel Bank in Kazakhstan; Iran receives fuel supply guarantee	120 days
3.67% enriched UF ₆	~2,500 kg	50% down-blended to natural uranium; 50% transferred to Oman for secure storage	180 days
Enriched uranium oxide	~100 kg	Transferred to IAEA technical storage in France; available for medical isotope production	90 days

All disposition activities are monitored by IAEA inspectors with JMOC

technical support. Real-time video monitoring covers all down-blending operations. Continuous electronic seal monitoring is applied to all transfer containers. Mass spectrometry verifies isotopic composition before and after disposition. Quarterly inventory reconciliation is conducted by an independent audit firm with full access to all records.

Iran commits that no uranium transferred for down-blending or international storage shall be re-enriched by Iran or on Iran's behalf, in perpetuity. This commitment is verified through permanent IAEA monitoring of all former enrichment infrastructure, procurement monitoring to detect re-enrichment-related equipment acquisition, and environmental monitoring to detect any re-enrichment activity.

Article IV: Long-Term Enrichment Moratorium

The total enrichment moratorium shall remain in force for a period of twenty years from the date of framework entry into force. After Year 20, the moratorium may be extended by mutual agreement of all framework parties, subject to IAEA Board of Governors assessment of regional non-proliferation conditions.

During the moratorium period, Iran shall not operate any uranium enrichment facility whether declared or undeclared. Iran shall not possess operational enrichment centrifuges of any type or generation. Iran shall not conduct research into uranium enrichment processes or equipment. Iran shall not acquire enrichment technology, equipment, or expertise from any source. Iran shall not assist any other state or entity in acquiring enrichment capability.

Should the moratorium not be extended after Year 20, Iran may resume limited enrichment under the following conditions: maximum enrichment

level of 3.67 percent U-235; maximum of 1,000 IR-1 equivalent centrifuges at a single declared facility; all enrichment under IAEA comprehensive safeguards and Additional Protocol; all enriched uranium production subject to international partnership arrangement; and no stockpile exceeding 300 kilograms of 3.67 percent enriched UF₆.

Article V: Verification and Compliance Mechanisms

Pathway B employs the most intensive verification regime of any non-proliferation arrangement in history. The IAEA maintains a resident office in Tehran with 30 inspectors on continuous assignment. All former nuclear sites have permanent IAEA monitoring stations with real-time data transmission to Vienna and JMOC headquarters. The Joint Monitoring Operations Center maintains 15 technical specialists in Iran with access to all declared and formerly declared nuclear sites. JMOC operates independent verification equipment including gamma spectroscopy, neutron detection, and environmental sampling.

Pathway B includes automated consequence triggers that activate without governance body deliberation for specific violations. Any centrifuge operation detected triggers immediate suspension of Banking Tier 3 benefits and an IAEA Director General emergency report, with governance body convening within 48 hours. Enrichment activity above 3.67 percent detected triggers full sanctions relief suspension, RDF escrow freeze, and UN Security Council notification, with emergency plenary within 24 hours. Denial of IAEA access triggers all benefit tranches suspended and automatic UN Security Council referral under Chapter VII, with ministerial emergency session within 12 hours. Discovery of an undeclared nuclear facility triggers full framework benefits suspended, all guarantor protective functions activated, and automatic snapback, with UN Security Council notification within 24 hours.

Article VI: Rebuilding Prevention

Beyond monitoring current compliance, Pathway B includes active measures to prevent rebuilding of nuclear weapons-related capabilities. All IR-2m, IR-4, IR-6, and IR-8 centrifuge components are destroyed under IAEA supervision within 12 months. IR-1 components are placed in permanent storage under IAEA seal. The Natanz Pilot Fuel Enrichment Plant is converted to a non-nuclear technology research center. Fordow is fully converted to the International Multidisciplinary Isotope Research Center. All other enrichment facilities are decommissioned.

Iranian nuclear scientists are offered international research positions through the IMIRC and partner institutions. A career pathway is established for nuclear scientists transitioning to civilian research, ensuring that scientific talent is preserved and redirected rather than dispersed to unknown destinations. No publication of enrichment-related research is permitted. No training of new enrichment specialists is allowed. International oversight of nuclear engineering curricula ensures that education does not contribute to future proliferation capability.

Article VII: Benefit Structure

Pathway B offers the most comprehensive benefit package in recognition of the most restrictive nuclear commitments.

Timeline	Sovereignty Milestone	Economic Benefit
Month 1	Institutional Voice - equal RDF seat	Humanitarian relief; \$2B RDF Window A
Month 3	Stockpile disposition 50% complete	Banking Tier 1; partial asset release (\$1B)
Month 6	Full enrichment cessation verified	Oil exports to 2M bpd; full Banking Tier 2
Month 12	Stockpile disposition 100% complete; moratorium	Full Banking Tier 3; SWIFT limited reconnection; \$5B

Timeline	Sovereignty Milestone	Economic Benefit
	signed	asset release
Month 18	Facility conversion complete	Full SWIFT membership; IMF program; \$10B RDF access
Year 3	Continuous compliance certification	Zero escrow; sovereign fiscal autonomy; full trade normalization
Year 5	Mid-term review passed	RDF Governing Board rotation eligibility; technology transfer window opens
Year 10	Long-term compliance demonstrated	Permanent normalized status; IAEA standard safeguards; full economic sovereignty
Year 20	Moratorium completion	Automatic transition to Pathway C or D if parties agree; or permanent zero-enrichment status

Pathway B Commitments Summary

Commitment Area	Iran Obligation	Verification
Enrichment	Total halt; zero operational centrifuges	8 IAEA inspections/month; 50% unannounced
Stockpile	Full disposition within 180 days	Real-time monitoring; mass spectrometry
Weapons	Binding moratorium; no pursuit ever	All-source intelligence; scientific monitoring
R&D	No enrichment-related research	Facility monitoring; procurement watch
Facilities	Conversion or decommissioning	Permanent IAEA presence; satellite monitoring
Personnel	Scientific redirect program	Career tracking; international partnerships
Procurement	No dual-use acquisition	UN Panel of Experts; intelligence sharing
Duration	20-year moratorium; signable instrument	Depositary registration; perpetual monitoring

The Zero-Enrichment Commitment: Technical Specifications

Pathway B represents the most comprehensive approach to nuclear constraint among the four pathways, requiring the complete cessation of all uranium enrichment activities, the verified dismantlement of all enrichment infrastructure, and the transfer of all enriched uranium stockpiles to international custody. This pathway addresses the fundamental proliferation concern that any enrichment capability, regardless of its declared purpose, inherently provides a foundation for potential weapons program breakout. By eliminating enrichment entirely and replacing it with guaranteed international fuel supply, Pathway B provides the highest level of proliferation prevention while addressing legitimate energy security concerns through alternative means.

The technical specifications of Pathway B's zero-enrichment commitment are designed to leave no ambiguity about the scope of prohibited activities. The prohibition extends to all forms of uranium enrichment, including gas centrifuge, gaseous diffusion, electromagnetic separation, laser isotope separation, and any other technology capable of altering the isotopic composition of uranium. The prohibition applies to all locations, including declared facilities, suspected undeclared locations, and any future sites. This comprehensive scope ensures that the zero-enrichment commitment cannot be circumvented through technological substitution or geographic relocation.

The Dismantlement Protocol establishes detailed procedures for the progressive dismantlement of enrichment infrastructure at Natanz, Fordow, and any other locations where enrichment-related equipment is identified. Dismantlement proceeds through clearly defined stages: shutdown and securing of operating equipment, removal and storage of centrifuge components under IAEA seal, destruction of fixed infrastructure including cascade halls and support systems, and environmental remediation to remove contamination that could facilitate future reconstitution. Each stage is subject

to detailed verification procedures and must be certified complete before corresponding benefits are released.

HEU Stockpile Handover Protocol

The transfer of all highly enriched uranium stockpiles to international custody represents one of the most significant confidence-building measures in Pathway B. The HEU Handover Protocol establishes detailed procedures for the identification, accounting, packaging, and transfer of all uranium hexafluoride, uranium dioxide, and other uranium compounds containing enrichment levels above natural abundance. This protocol addresses both declared stockpiles and any additional materials discovered during comprehensive verification activities.

The protocol establishes the Joint Custody Arrangement under which transferred materials are held at internationally monitored storage facilities pending their final disposition. Under this arrangement, Iran retains formal title to the transferred materials but cannot access, relocate, or reprocess them without unanimous international approval. This approach addresses Iranian concerns about permanent loss of sovereign assets while ensuring that the materials cannot contribute to any weapons program.

The Final Disposition Plan addresses the long-term fate of the transferred stockpiles through a menu of options including downblending to natural or depleted uranium levels, transfer to third-country civilian reactor programs under appropriate safeguards, and use in internationally approved research programs. The selection among these options requires Iranian consent, ensuring that the disposition respects legitimate interests while definitively eliminating proliferation risk.

The Signable Moratorium Instrument

Article II of Pathway B establishes the Legally Binding Moratorium on Uranium Enrichment Activities, formalized as a standalone instrument with full international legal standing, witnessed by the UN Secretary-General and open for signature by all parties. This instrument represents a historic commitment that exceeds previous non-proliferation undertakings in both its comprehensiveness and its legal form. The decision to create a separate signable instrument rather than embedding the moratorium solely within the broader framework reflects the judgment that this commitment deserves distinctive recognition and enhanced institutional protection.

The moratorium instrument contains the following core provisions: Section 2.1 establishes the fundamental undertaking whereby Iran commits to a complete moratorium on all uranium enrichment activities for a period of twenty years from the date of entry into force. Section 2.2 specifies the scope of prohibited activities with exhaustive detail, including explicit references to specific technologies, materials, and locations. Section 2.3 establishes the verification mechanisms that will confirm compliance, including continuous IAEA presence, real-time monitoring systems, and challenge inspection rights. Section 2.4 specifies the consequences of violation, including automatic sanctions activation and the suspension of all framework benefits.

Section 2.5 addresses the question of moratorium extension, providing that the moratorium shall automatically renew for successive ten-year periods unless either party provides notice of non-renewal at least five years prior to expiration. This evergreen provision ensures that the commitment does not lapse due to diplomatic oversight or deliberate neglect, while preserving the theoretical possibility of eventual termination through proper procedures.

Section 2.6 establishes the Joint Moratorium Oversight Commission, comprising representatives from Iran, the United States, the European Union,

Russia, China, and the IAEA, with the UN Secretary-General serving as permanent chair. This commission meets quarterly to review compliance data, address technical concerns, and provide the diplomatic forum for maintaining the political conditions that sustain the moratorium. The commission's decisions on technical compliance matters are binding, with appeals limited to procedural irregularities.

The witnessing function of the UN Secretary-General carries both symbolic and practical significance. Symbolically, it places the authority of the United Nations behind the commitment, creating reputational costs for violation that extend beyond bilateral relationships. Practically, it provides a neutral institutional home for the moratorium's administrative functions, including document custody, certification of compliance determinations, and facilitation of communications between parties. The Secretary-General's role is specified in a separate Witnessing Protocol that defines the scope and limits of this function.

U.S. Verification Mechanisms and Bilateral Oversight

Pathway B includes an unprecedented bilateral verification mechanism that supplements multilateral IAEA safeguards with direct U.S. technical verification capabilities. This mechanism reflects the judgment that the unique technical capabilities of U.S. intelligence and monitoring agencies can provide additional confidence in compliance, particularly with respect to activities at undeclared locations or using novel technologies not subject to standard safeguards.

The Bilateral Verification Protocol establishes procedures for U.S. technical experts to participate in IAEA inspection activities, to operate independent monitoring equipment at key locations, and to review data from U.S. national technical means as part of the overall compliance assessment. This protocol

includes strict procedures for protecting the sources and methods of U.S. intelligence capabilities, ensuring that enhanced verification does not compromise unrelated security interests.

The Joint Analysis Center, co-located with the IAEA in Vienna, serves as the focal point for integrating multilateral and bilateral verification data into comprehensive compliance assessments. Staffed by technical experts from all parties, the center produces quarterly compliance reports that provide the evidentiary foundation for political decisions regarding the continuation or suspension of framework benefits. These reports are subject to rigorous quality control procedures and must achieve consensus among the technical staff before publication.

International Fuel Supply Guarantee

The elimination of domestic enrichment under Pathway B is accompanied by a comprehensive international fuel supply guarantee that ensures Iran's access to nuclear fuel for its civilian reactor program regardless of future political circumstances. This guarantee is structured as a legally binding international commitment, backed by fuel reserves physically located in Iran under international custody, and supplemented by a supplier diversification requirement that prevents any single state from interrupting supply.

The Guaranteed Fuel Reserve establishes a strategic stockpile of low-enriched uranium equivalent to twenty-five years of projected reactor requirements, stored at the Bushehr facility under IAEA seal. This reserve provides Iran with complete energy security against any conceivable supply disruption, addressing the most frequently cited justification for domestic enrichment. The reserve is owned by an international fuel bank entity with Iran as the sole beneficiary, ensuring that Iran's rights to the material are legally protected.

The Fuel Supply Diversity Requirement mandates that all fuel deliveries to Iran must be sourced from at least three different supplier countries, with no single country providing more than fifty percent of annual requirements. This diversity requirement prevents any supplier from using fuel supply as political leverage, while also encouraging Iran to develop constructive relationships with the full range of nuclear supplier states.

Draft Text of the Signable Moratorium Instrument

The following text constitutes the legally binding moratorium instrument that is annexed to Pathway B and is witnessed by the UN Secretary-General. This instrument is executed as a standalone document with full international legal effect, separate from but complementary to the broader architecture treaty. The instrument is open for signature by the Islamic Republic of Iran and by representatives of the witnessing states.

PREAMBLE: The Parties to this Instrument, Recognizing that the proliferation of nuclear weapons poses a grave threat to international peace and security, Recalling the obligations of all States under the Nuclear Non-Proliferation Treaty, Bearing in mind the relevant resolutions of the United Nations Security Council, Desiring to build confidence and promote stability in the Middle East region, Have agreed as follows:

ARTICLE I: FUNDAMENTAL UNDERTAKING. The Islamic Republic of Iran undertakes not to engage in any uranium enrichment activities for a period of twenty (20) years from the date of entry into force of this Instrument. This undertaking is comprehensive and applies to all forms of uranium enrichment, all locations, all uranium isotopes, and all enrichment technologies, whether existing or hereafter developed.

ARTICLE II: SCOPE OF PROHIBITED ACTIVITIES. For the purposes of this

Instrument, enrichment activities include but are not limited to: (a) the operation of gas centrifuges, gaseous diffusion equipment, electromagnetic separation equipment, or laser isotope separation equipment for the purpose of altering the isotopic composition of uranium; (b) the research, development, testing, or demonstration of any technology capable of uranium enrichment; (c) the construction, modification, or operation of facilities designed or capable of being used for uranium enrichment; (d) the production, acquisition, or stockpiling of equipment, materials, or components specifically designed for uranium enrichment; (e) the provision of technical assistance, training, or technology to any other state or entity for uranium enrichment purposes.

ARTICLE III: ENRICHMENT INFRASTRUCTURE DISMANTLEMENT. Iran shall dismantle all uranium enrichment infrastructure in accordance with the Dismantlement Protocol annexed hereto. Dismantlement shall proceed through the stages specified in the Protocol, with each stage subject to verification by the International Atomic Energy Agency and the Joint Monitoring Operations Center.

ARTICLE IV: ENRICHED URANIUM STOCKPILE TRANSFER. Iran shall transfer all stocks of enriched uranium to the Joint Custody Arrangement established under the HEU Handover Protocol. Transfer shall be completed within twelve months of the entry into force of this Instrument, subject to verification procedures that confirm the completeness of the transfer.

ARTICLE V: VERIFICATION. Compliance with this Instrument shall be verified through: (a) comprehensive IAEA safeguards including the Additional Protocol; (b) continuous physical presence of inspectors at all former enrichment facilities; (c) real-time monitoring of declared nuclear facilities; (d) environmental sampling and wide-area monitoring; (e) challenge inspections of suspected undeclared enrichment activities; (f) national technical means

and satellite surveillance; (g) such other verification measures as may be agreed by the Parties.

ARTICLE VI: JOINT MORATORIUM OVERSIGHT COMMISSION. A Joint Moratorium Oversight Commission is hereby established, comprising representatives of Iran, the United States, the European Union, Russia, China, and the IAEA, with the UN Secretary-General serving as permanent chair. The Commission shall meet quarterly to review compliance data, address technical concerns, and promote the objectives of this Instrument.

ARTICLE VII: CONSEQUENCES OF VIOLATION. In the event of a violation of this Instrument, the following consequences shall apply automatically: (a) suspension of all architecture benefits to which Iran is entitled; (b) restoration of all sanctions previously suspended under the architecture; (c) referral to the UN Security Council for further action; (d) such additional consequences as may be specified in the architecture's Automatic Consequence System.

ARTICLE VIII: DURATION AND RENEWAL. This Instrument shall remain in force for twenty (20) years from the date of its entry into force. Upon expiration, it shall automatically renew for successive periods of ten (10) years unless either Party provides written notice of non-renewal at least five (5) years prior to the expiration of the then-current term.

ARTICLE IX: WITHDRAWAL. Withdrawal from this Instrument requires twelve (12) months' written notice to the depositary. During the notice period, all obligations continue in full force. Withdrawal does not affect obligations that survive termination under international law.

ARTICLE X: WITNESS. The United Nations Secretary-General witnesses this Instrument as an independent guarantor of its authenticity and as a depositary for the original signed text.

ARTICLE XI: ENTRY INTO FORCE. This Instrument shall enter into force on the date when Iran and all P5+1 states have deposited instruments of ratification or acceptance with the depositary.

IN WITNESS WHEREOF, the undersigned, being duly authorized by their respective governments, have signed this Instrument.

Done at [Location], on this [Date] day of [Month], 2026, in a single original in the English language, deposited in the archives of the United Nations.

Legal Commentary on the Moratorium Instrument

The moratorium instrument creates legally binding obligations under international law that are enforceable through the architecture's dispute resolution mechanisms and potentially through the International Court of Justice. The instrument's standalone character means that it survives even if the broader architecture is terminated, providing a lasting constraint on Iranian enrichment regardless of the fate of other architecture components.

P>The witnessing function of the UN Secretary-General carries both symbolic and legal significance. Symbolically, it places the authority of the United Nations behind the commitment. Legally, it creates an institutional connection to the UN system that facilitates Security Council engagement if violations occur. The Secretary-General's role as witness does not create liability for the United Nations but does create a moral and political obligation to take note of compliance or violation.

P>The automatic consequence provisions are designed to ensure that violations trigger responses without requiring political decisions that could be delayed or blocked. The automaticity is limited to consequences within the architecture's control, primarily benefit suspension and sanctions restoration. Referral to the Security Council requires Council procedures but is mandated by the instrument rather than left to discretion.

P>The evergreen renewal provision ensures that the moratorium does not lapse due to inattention or deliberate neglect. The requirement for affirmative notice of non-renewal creates a default in favor of continuation, reflecting the judgment that the moratorium's constraints serve enduring interests regardless of changes in political circumstances. The five-year notice period provides ample time for diplomatic engagement if non-renewal is contemplated.

PATHWAY C: MULTILATERAL REGIONAL FUEL-BANK CONSORTIUM

Overview

Pathway C addresses Iran's stated need for energy sovereignty while eliminating domestic enrichment through the creation of an internationally administered regional fuel bank. Iran receives guaranteed, legally binding access to enriched uranium for civilian purposes without maintaining domestic enrichment capability. This pathway transforms the enrichment sovereignty question into a cooperative international arrangement that benefits all regional parties.

The Regional Nuclear Fuel Consortium (RNFC) is established as an independent international organization headquartered in Abu Dhabi, UAE, with operational facilities in Oman and Kazakhstan. RNFC is governed by a Board of Governors comprising Iran (20% voting weight), GCC states collectively (20%), other framework regional parties (15%), IAEA (15% non-voting except on safeguards matters), neutral guarantor states (15%), and nuclear supplier states (15%).

Fuel Supply Guarantee

Iran receives a legally binding, perpetual fuel supply guarantee under the following terms: quantity of up to 500kg per year of 3.67% enriched uranium hexafluoride sufficient for Bushehr-1 reactor and planned civilian reactors; price fixed at indexed rate with 10-year price stability guarantee; just-in-time delivery to Iranian fuel fabrication facility under IAEA monitoring; emergency reserve of 2-year operational reserve maintained at RNFC Oman facility

available with 30-day notice; and dispute resolution through BAP Expedited Track with fuel supply continuing during dispute resolution.

Iran's Commitments

In exchange for the fuel supply guarantee, Iran undertakes: complete cessation of domestic enrichment within 180 days of framework entry; transfer of all enriched uranium stockpiles to RNFC or IAEA Fuel Bank within 180 days; conversion of Natanz and Fordow facilities to non-enrichment uses under agreed timelines; no acquisition of enrichment technology, equipment, or expertise from any source; non-weapons commitment equivalent to Pathway B (binding, depositary-registered); and full Additional Protocol implementation without condition.

Verification

Pathway C verification includes all Pathway A verification elements plus RNFC independent monitoring of Iranian nuclear fuel cycle, real-time tracking of all fuel deliveries from enrichment to reactor loading, and annual RNFC Board certification of Iranian compliance.

Benefit Structure

Pathway C offers the enhanced benefit package with moderate sovereignty restoration timeline. SWIFT reconnection at Year 2, full sovereignty restoration at Year 12.

Institutional Design of the Regional Fuel Bank

Pathway C addresses the fundamental tension between non-proliferation objectives and energy security concerns through an innovative institutional design that replaces national enrichment capabilities with a collectively

administered regional fuel bank. This approach recognizes that states' resistance to abandoning enrichment often stems less from technical requirements than from concerns about dependence on potentially unreliable external suppliers. By creating a fuel bank under genuine multilateral governance with physical presence in the region, Pathway C provides energy security assurance while eliminating proliferation risk.

The Regional Nuclear Fuel Bank (RNFB) is established as an international organization with legal personality, treaty-based governance structures, and independent technical capabilities. The RNFB's headquarters and primary fuel storage facility are located on the territory of a mutually agreed host state, with secondary storage locations in additional participating states to ensure supply resilience. The organization's governance structure ensures that no single state or group of states can control fuel supply decisions, while providing all participants with meaningful voice in policy-making.

The RNFB's Board of Governors comprises representatives from all participating states plus designated representatives from the IAEA and major nuclear supplier states. Decision-making employs a dual-key system in which fuel supply requests must be approved by both a technical assessment confirming legitimate civilian use and a political determination that supply would not contravene international non-proliferation obligations. This dual-key approach prevents both purely political denials of legitimate supply and technically unjustified approvals that could facilitate proliferation.

Enrichment as a Multilateral Service

Under Pathway C, all enrichment activities within the region are conducted exclusively by the RNFB or its designated agents, with the output distributed to participating states according to established entitlement formulas. States that currently possess enrichment technology, including Iran, transfer their

enrichment infrastructure and technical expertise to the RNFB, receiving in return equity shares in the organization and guaranteed access to its services. This transformation of enrichment from a national capability to an international service fundamentally alters the proliferation dynamics of the region.

The technology transfer arrangements address the legitimate concern that states contributing enrichment capabilities should receive fair value for their contributions. Iran's transfer of its centrifuge program to the RNFB is compensated through a combination of equity shares, guaranteed fuel entitlements, preferential employment of Iranian technical personnel, and technology access rights for approved civilian applications. These compensation mechanisms ensure that Iran's investment in enrichment technology yields ongoing benefits even as the technology's governance structure changes.

The Multilateral Enrichment Technology Oversight Board ensures that sensitive enrichment technology remains under appropriate control while permitting legitimate research and development. The board oversees all enrichment-related R&D conducted under RNFB auspices, approves modifications to enrichment processes, and establishes security standards for the protection of technology and materials. This oversight prevents the diversion of enrichment technology to unauthorized purposes while preserving the scientific and economic benefits of continued technological development.

Supply Guarantee Architecture and Backup Mechanisms

The fuel supply guarantee under Pathway C employs multiple redundant mechanisms to ensure that participating states never face supply interruption due to technical failures, political disputes, or institutional breakdowns. The

primary supply mechanism involves regular deliveries from the RNFB's enrichment facilities based on pre-agreed schedules linked to reactor requirements. These scheduled deliveries are supplemented by strategic reserves, emergency protocols, and international backup arrangements.

The Strategic Fuel Reserve maintained by the RNFB provides a buffer equivalent to three years of regional reactor requirements, physically stored at multiple locations to prevent single-point vulnerabilities. This reserve is released only upon determination by the Board of Governors that scheduled supply has been or will be interrupted, with automatic triggers that prevent political obstruction of emergency releases. Participating states maintain proportional entitlements to the reserve based on their contribution levels and consumption patterns.

The International Fuel Supply Backup Protocol establishes arrangements with fuel banks operated by the IAEA and other international entities to provide supply if the RNFB faces catastrophic disruption. These backup arrangements are financed through mandatory insurance contributions assessed on all participating states, ensuring that backup supply is available without requiring ad hoc political decisions during crisis situations.

Regional Participation and Expansion Framework

Pathway C is designed as an expandable framework that initially includes the core parties to the RCSA but is open to accession by other regional states with nuclear energy programs or interests. The accession process involves technical assessment of the applicant's safeguards compliance history, political review by existing participants, and the negotiation of contribution and entitlement terms. This open architecture transforms the fuel bank from a narrow bilateral mechanism into a regional institution with broader significance for Middle East non-proliferation.

Participation tiers accommodate states at different stages of nuclear energy development. Full participants with active reactor programs receive full fuel supply guarantees and voting rights on RNFB governance. Associate participants with planned or research-scale programs receive limited supply commitments and observer status. This tiered structure encourages wider participation while ensuring that governance authority remains aligned with stake in the fuel bank's operations.

The eventual aspiration of Pathway C extends beyond fuel supply to encompass a comprehensive Regional Nuclear Cooperation Organization that addresses the full range of civilian nuclear activities, including research, waste management, and safety. This expanded vision provides a positive institutional goal that can sustain political commitment to the fuel bank through periods when immediate supply concerns are not salient.

Regional Nuclear Cooperation Organization Vision

P>Pathway C envisions evolution from a fuel bank consortium toward a comprehensive Regional Nuclear Cooperation Organization (RNCO) that addresses the full range of civilian nuclear activities. This expanded vision provides a positive institutional aspiration that sustains political commitment to the fuel bank through periods when fuel supply concerns are not salient.

P>The RNCO would encompass nuclear research cooperation, shared research reactor facilities, collaborative waste management, joint regulatory standards, mutual assistance in nuclear emergencies, and shared training and capacity building. These functions create a comprehensive nuclear cooperation framework that serves regional needs while maintaining non-proliferation discipline.

P>Research cooperation under the RNCO would fund and coordinate regional

research in nuclear science, including reactor physics, materials science, radiation applications, and nuclear medicine. Research funding would be allocated through competitive processes that reward scientific merit and regional relevance. Shared research facilities would provide access to equipment and capabilities beyond what individual states could afford independently.

P>Waste management cooperation addresses the spent fuel and radioactive waste management challenges facing all states with nuclear programs. Cooperation could include regional waste storage facilities, reprocessing services, and waste transportation arrangements. Shared waste management reduces individual state burdens while ensuring that waste management meets international safety and security standards.

H2>Technology Holdback and Access Control

P>The fuel bank's governance includes technology holdback mechanisms that prevent the transfer of sensitive nuclear technologies through fuel bank activities. While the fuel bank provides fuel supply services, it does not transfer enrichment, reprocessing, or other sensitive technologies that could facilitate proliferation.

P>Access control procedures ensure that fuel bank services are available only for verified civilian purposes. Access requests undergo technical review confirming legitimate reactor requirements, political review confirming non-proliferation compliance, and financial review confirming payment capability. Access is denied for requests that do not meet all review criteria.

P>Technology compartmentalization ensures that personnel working in fuel bank enrichment operations do not have access to unrelated technologies or information that could facilitate proliferation. Compartmentalization limits the knowledge available to any individual, reducing insider threat risks.

Compartmentalization also protects proprietary technology from unauthorized access.

H2>Regional Safeguards and Monitoring Integration

P>Pathway C's regional approach creates opportunities for integrated safeguards and monitoring that go beyond standard IAEA safeguards to include regional cooperation on verification. Regional monitoring cooperation leverages regional presence, local knowledge, and shared interests to enhance verification effectiveness.

P>Regional inspectorate development trains inspectors from all participating states in safeguards techniques, creating a regional inspector cadre that supplements IAEA inspectors. Regional inspectors bring linguistic capabilities, cultural understanding, and local knowledge that enhance inspection effectiveness. Regional inspectors operate under IAEA or architecture authority rather than national authority.

P>Joint monitoring operations enable coordinated surveillance of regional nuclear activities through shared sensor networks, joint analysis centers, and cooperative investigation capabilities. Shared monitoring reduces duplication, fills coverage gaps, and generates mutual confidence that all regional activities are subject to appropriate scrutiny.

PATHWAY D: LIMITED CIVILIAN PROGRAM WITH ENHANCED SAFEGUARDS

Overview

Pathway D represents the position that preserves the largest civilian nuclear program while accepting unprecedented verification intensity. Iran maintains limited enrichment at 3.67% only, with automated consequence triggers for any deviation. This pathway offers the most limited benefit package and slowest sovereignty restoration timeline, reflecting the highest proliferation risk associated with retained enrichment capability.

Permitted Enrichment Parameters

Parameter	Limit	Verification
Enrichment level	3.67% U-235 maximum	Online enrichment monitoring (OLEM) real-time
Operating centrifuges	506 IR-1 only at Natanz	Daily physical inventory; electronic seal monitoring
Uranium stockpile	300kg UF ₆ at 3.67%	Monthly weigh-station verification
R&D	Single-machine testing only; no cascade assembly	R&D facility 24/7 monitoring; all experiments pre-approved
New facilities	None permitted	Construction monitoring via satellite and intelligence

Automated Consequence System (ACS)

Pathway D includes an Automated Consequence System that triggers immediate sanctions without governance body deliberation for specific technical violations.

Violation	ACS Trigger	Automatic Consequence
Enrichment above 3.67%	OLEM detection	Banking benefits suspended within 24 hours; IAEA emergency report
Centrifuge count exceeds 506	Physical inventory	RDF escrow freeze; additional inspectors deployed
Stockpile exceeds 300kg	Weigh-station alarm	Oil export reduction to 1M bpd; additional monitoring
Undeclared R&D detected	Intelligence or inspection	Full Tier 2 benefits suspended; BAP expedited review
Denial of access	IAEA report	Full framework benefits suspended; UN Security Council referral

Non-Weapons Commitment

Iran provides a binding non-weapons commitment, depositary-registered but without the full moratorium instrument of Pathway B. The commitment includes: no nuclear weapons pursuit; no breakout capability threshold; binding in perpetuity; and subject to enhanced verification including all-source intelligence.

Benefit Structure

Pathway D offers the most limited benefit package, reflecting the highest retained proliferation risk: slower banking tier progression (6 months between tiers vs. 3 months for Pathway B); no SWIFT reconnection until Year 5 of sustained compliance; no sovereign fiscal autonomy milestone until Phase 2 entry; continuous 20% revenue escrow (vs. 10% for Pathway B; 0% at steady state); permanent IAEA enhanced monitoring (never transitions to standard safeguards); and annual re-certification required for all benefit continuation.

Pathway Comparison Summary

Element	Pathway A	Pathway B	Pathway C	Pathway D
Enrichment retained	Yes (capped/declining)	No (zero)	No (fuel bank)	Yes (very limited)
Maximum level	3.67% -> 0%	0%	0% (domestic)	3.67%
Centrifuges	5,060 -> 1,000 -> 0	0	0	506 IR-1 only
Stockpile	300kg cap	Full disposition	Full transfer	300kg cap
Moratorium	Non-weapons pledge	20-year signable	Non-weapons pledge	Non-weapons pledge
Verification	Enhanced	Maximum	Enhanced+	Maximum+ (automated)
SWIFT access	Year 3	Year 1	Year 2	Year 5
Sovereignty restoration	Gradual (15yr)	Fast (10yr)	Moderate (12yr)	Slow (15yr)
RDF access	Standard	Maximum	Enhanced	Standard

The Limited Enrichment Authorization Framework

Pathway D represents a nuanced approach that permits strictly limited uranium enrichment for verified civilian purposes while subjecting such activities to the most rigorous safeguards regime ever implemented. This pathway acknowledges the legal basis for enrichment under the Nuclear Non-Proliferation Treaty while recognizing that the scope and conditions of enrichment activities must be carefully constrained to prevent weapons-relevant capabilities from developing. The result is a carefully circumscribed program that preserves a limited national enrichment capability while providing unprecedented transparency and automatic consequence mechanisms.

The Limited Enrichment Authorization specifies that Iran may maintain enrichment activities exclusively at the Natanz facility, with a maximum of 1,044 IR-1 centrifuges operating in a single cascade configuration. Enrichment is limited to 3.67 percent U-235, and total enriched uranium stockpiles are capped at 300 kilograms of UF₆. The Fordow facility is converted entirely to

non-enrichment purposes, with all enrichment equipment removed and the facility subject to continuous IAEA presence. These quantitative limits are supplemented by qualitative constraints that prohibit research and development on advanced centrifuge designs beyond specified parameters.

The R&D Constraint Protocol establishes detailed boundaries for permissible centrifuge research, permitting the testing of up to thirty advanced centrifuges simultaneously with strict limits on rotor materials, rotational speeds, and separative work capacity. All R&D activities must be conducted under continuous IAEA monitoring, with real-time data transmission to the Joint Analysis Center. This constrained R&D preserves Iran's legitimate interest in maintaining technical competence while preventing the development of capabilities that could significantly reduce breakout timelines.

The Enhanced Safeguards Architecture

The safeguards regime under Pathway D goes significantly beyond the Additional Protocol to incorporate cutting-edge monitoring technologies and unprecedented inspector access rights. The architecture comprises four integrated layers: continuous physical presence, real-time process monitoring, environmental detection networks, and challenge inspection authority. The combination of these layers creates a safeguards system with detection probability approaching unity for any significant diversion or breakout attempt.

Continuous Physical Presence involves the maintenance of IAEA inspector teams at all declared nuclear facilities on a 24/7 basis, with authority to access any area of the facility without prior notice. These teams are equipped with secure communication systems that enable immediate reporting of any anomalies to the Joint Analysis Center. The physical presence requirement extends to all locations where nuclear materials are stored, processed, or

transported, creating a comprehensive coverage network.

Real-Time Process Monitoring employs advanced sensor technologies integrated directly into enrichment equipment that transmit operational data continuously to international monitoring centers. These sensors detect and report any deviation from declared operating parameters, including unexpected shutdowns, changes in rotor speeds, or modifications to cascade configurations. The data transmission employs cryptographic protections that prevent tampering, and the monitoring centers employ automated algorithms that flag anomalies for immediate human review.

Automated Consequence System (ACS) Integration

A distinctive feature of Pathway D is the integration of the Automated Consequence System (ACS), which provides immediate, pre-programmed responses to detected compliance concerns without requiring time-consuming political deliberation. The ACS addresses the critical vulnerability of traditional safeguards systems: the gap between detection and response, during which a determined violator could achieve significant breakout progress. By automating consequence activation, the ACS compresses this gap to near zero.

The ACS operates through a tiered trigger system in which different categories of compliance concerns activate different consequence levels. Level One triggers, activated by minor technical anomalies, initiate enhanced monitoring and require explanatory reports within specified timeframes. Level Two triggers, activated by more significant concerns, automatically suspend designated benefit tranches and convene emergency consultations. Level Three triggers, activated by clear evidence of significant non-compliance, activate full sanctions snap-back and security response measures.

The political acceptability of automated consequences is ensured through detailed pre-negotiation of trigger thresholds and response measures during the agreement's formation phase. All parties participate in calibrating the ACS parameters, ensuring that triggers are set at levels that minimize false positives while maintaining high detection sensitivity. The system includes override capabilities that can be activated by consensus of the Governance Body in situations where automated responses would be clearly disproportionate to the actual compliance concern.

The Breakout Timeline Extension Strategy

The fundamental security objective of Pathway D is to extend the breakout timeline, defined as the time required to produce sufficient weapons-grade uranium for a nuclear device, to a period that provides adequate warning and opportunity for international response. The architecture's quantitative limits on centrifuges, enrichment levels, and stockpiles are calibrated to achieve a minimum breakout timeline of twelve months, compared to estimates of two to three months under unconstrained conditions.

Multiple technical measures contribute to breakout timeline extension. The numerical limit on operating centrifuges directly constrains enrichment capacity. The prohibition on advanced centrifuge deployment prevents the substitution of higher-efficiency machines. The stockpile cap limits the amount of material available for quick enrichment to weapons grade. The Fordow conversion eliminates the hardened facility option for breakout. The R&D constraints prevent the development of leapfrog technologies. Together, these measures create a comprehensive constraint system.

The breakout detection architecture operates in parallel with the constraint system to ensure that any attempt to exceed authorized parameters is detected promptly. Detection triggers are calibrated to identify breakout attempts at

their inception, providing maximum response time. The combination of extended breakout timelines and rapid detection creates a security architecture in which the practical possibility of successfully achieving nuclear weapons capability without detection is effectively eliminated.

Limited Enrichment Facility Specifications

P>Pathway D permits strictly limited uranium enrichment exclusively at the Natanz facility, with comprehensive specifications that constrain both the quantity and quality of enrichment activities. The facility specifications are designed to provide verifiable boundaries that make unauthorized expansion detectable and to preserve the breakout timeline extension that constitutes the pathway's core security objective.

P>The Natanz specifications permit no more than 1,044 IR-1 centrifuges operating in a single cascade hall. All other cascade halls at Natanz are mothballed and sealed under IAEA custody. The permitted centrifuges are first-generation IR-1 machines with well-understood performance characteristics that limit separative work capacity.

P>Enrichment parameters are limited to 3.67 percent U-235 maximum enrichment level and total stockpile of 300 kilograms UF₆. These quantitative limits are supplemented by qualitative constraints including prohibition on advanced centrifuge deployment, prohibition on enrichment above 3.67 percent, and prohibition on reprocessing activities.

P>The Research and Development Protocol specifies exactly what centrifuge research may be conducted and under what conditions. R&D is limited to single-machine testing at declared R&D locations. Testing is limited to machines with specifications that do not significantly exceed IR-1 performance. Real-time monitoring of R&D activities ensures compliance with

declared parameters.

H2>Advanced Containment and Surveillance Measures

P>Pathway D employs advanced containment and surveillance measures that provide continuous awareness of nuclear material status and facility activities. These measures supplement traditional safeguards techniques with technologies that reduce opportunities for diversion and increase detection probability.

P>Containment measures physically protect nuclear materials against unauthorized removal. Measures include tamper-indicating seals on containers and facility access points, surveillance cameras that monitor material handling areas, radiation monitors that detect material movements, and physical barriers that control access to material storage areas.

P>Surveillance measures provide continuous monitoring of facility activities through unattended sensor systems. Systems include radiation detectors, motion sensors, temperature monitors, and door sensors that record all significant events at monitored locations. Data from surveillance systems is transmitted to the Joint Analysis Center for continuous review.

P>Unattended monitoring systems operate autonomously between inspections, providing continuity of monitoring that reduces opportunities for diversion during periods between inspector visits. Systems include automated accounting systems that track material movements, video surveillance that records activities in sensitive areas, and sensor networks that detect anomalous conditions.

Online Enrichment Monitoring and Data Authentication

P>Pathway D includes online enrichment monitoring systems that transmit enrichment process data continuously to international monitoring centers.

These systems provide real-time awareness of enrichment operations that enables prompt detection of deviations from declared parameters.

P>The online monitoring system employs sensors installed in enrichment equipment that measure uranium hexafluoride flow rates, pressures, temperatures, and isotopic composition. Sensor data is transmitted through secure communication channels to the Joint Analysis Center, where automated algorithms analyze data for anomalies.

P>Data authentication ensures that transmitted data genuinely represents facility conditions rather than simulated signals designed to conceal proscribed activities. Authentication employs cryptographic techniques that prevent data tampering, redundant sensors that cross-check readings, and physical inspections that verify sensor integrity.

P>Anomaly detection algorithms identify deviations from normal operating parameters that may indicate compliance concerns. Algorithms are calibrated to detect significant deviations while minimizing false alarms. Detected anomalies trigger immediate investigation by monitoring personnel who assess whether anomalies represent genuine concerns or explainable operational variations.

ADDENDUM B

cross-referencing to Costed Withdrawal procedures in Core Document. 11.1

Problem Statement

The existing framework is binary: compliance continues → full benefits; compliance fails → snapback → collapse.

47 This creates a "cliff edge" that makes political shifts

disproportionately destructive. A structured exit pathway that preserves core systems (humanitarian, infrastructure, IAEA monitoring) during partial or full disengagement

prevents total system destruction. 11.2 Degradation Levels The framework recognizes four levels of degradation,

each with specific protections for core systems: Level 1 — Partial Track Suspension: Trigger: Single domain breach (nuclear, security,

economic, or humanitarian) with Step 3 Penalty Ladder activation; OR governance body consensus that one track should be paused for

recalibration. Effects:

Affected domain benefits suspended; other

domain benefits continue at 100%.

Humanitarian operations: Continue fully

(Humanitarian Firewall).

IAEA monitoring: Continues at current

intensity (monitoring is not a bargaining chip).

CCP-certified contracts: Continue under

Banking channel: Continues at current tier;

no retroactive restrictions.

Infrastructure projects in execution:

Continue under World Bank administration.

Re-engagement pathway: Automatic governance

body review at 90-day intervals; full

restoration upon verified remediation.

48 Level 2 — Multi-Domain Freeze:

Trigger: Two or more domains at Step 3 simultaneously; OR CIS cumulative score ≥ 16.0 (Step 4); OR governance body

supermajority vote for multi-domain freeze. Effects:

All non-humanitarian benefit tranches

Banking channel frozen at current tier

(no new authorizations; existing

transactions continue).

Petrochemical export volume cap reduced

by 50% (NOT full ban).

Humanitarian operations: Continue fully. IAEA monitoring: Continues fully.

CCP-certified contracts: Continue under

shield; no new CCP certifications.

Infrastructure projects: Continue under

World Bank administration; no new project approvals.

RDF escrow: Frozen for non-humanitarian

purposes; humanitarian escrow (Sub-Fund 1) remains accessible.

Re-engagement pathway: 180-day automatic

review cycle; if CIS score falls below 8.0 for 90 consecutive days during freeze:

automatic Level 1 restoration (governance body may block restoration by weighted majority). Level 3 — Framework Suspension:

Trigger: Confirmed material breach of core

49 obligation; OR one party formally withdraws

(Costed Withdrawal); OR governance body unanimous vote for suspension.

Effects:

All framework benefits suspended except:

(a) Humanitarian Emergency Escrow (Sub-Fund 1) — continues for 12 months;

(b) IAEA standard safeguards (not enhanced monitoring) — continues under existing IAEA-Iran bilateral agreement;

(c) CCP-certified contracts — continue for remainder of 24-month shield; (d)

Physical infrastructure already built —

remains operational under host state management.

Banking channel: Suspended (reverted to

pre-framework correspondent status).

Petrochemical exports: Full ban restored

(pre-framework baseline).

Sanctions: Pre-framework U.S., EU, UK

sanctions fully reimposed.

Costed Withdrawal procedures activate for

formal withdrawal: 6-month withdrawal

window; orderly asset disposition; infrastructure handover to host states; personnel repatriation.

Partial Continuity Agreement (PCA):

Withdrawing party may negotiate bilateral PCA with governance body to maintain specific benefits (e.g., humanitarian

corridor access only; or IAEA monitoring

50 only). PCA does not require all parties'

consent — bilateral between withdrawing party and governance body only.

Level 4 — Full Collapse:

Trigger: All parties withdraw; OR military conflict between core parties; OR UN Security Council mandates termination.

No framework obligations survive. Humanitarian operations: Transition to

standard UN mandate (not framework-governed but not necessarily terminated).

IAEA monitoring: Continues under standard

NPT/Additional Protocol (if Iran remains party to NPT).

CCP contracts: 24-month shield expires;

contract holders assume full sanctions risk.

Infrastructure: Host states assume full

ownership and operational responsibility.

RDF residual funds: Distributed to

contributors proportional to unspent

contributions (after humanitarian obligations discharged). 11.3 Humanitarian and Monitoring Immunity

At ALL degradation levels (1 through 4), the following are protected and may not be suspended:

Gaza humanitarian corridor operations (Rafah,

Kerem Shalom, Erez, aid-by-sea).

Lebanon emergency fuel and medical supply

51 Yemen Hudaydah port humanitarian inspection

and Sana'a medical evacuation.

Syria humanitarian corridor operations. IAEA remote data mirroring to Vienna and Geneva. CPMC operations and reporting. Medical evacuation pathways. Detainee proof-of-life verification. ICRC access to all detention facilities. These protections are "immunity provisions" —

they survive even full framework collapse

because they are rooted in independent UN mandates and international humanitarian law, not framework political conditions.

SECTION 12: NARRATIVE LAYER / POLITICAL PACKAGING MODULE

Placement: New standalone module, cross-referencing to

RP-JOR Narrative Shielding (Addendum A), Humanitarian Firewall, and Sovereignty Restoration Triggers (Section 8). 12.1 Problem Statement

Frameworks do not fail only on technical or legal mechanics — they fail on how they are sold domestically. The JCPOA collapsed partly because Iranian hardliners

successfully framed it as capitulation, and U.S. hardliners framed it as appeasement. Each framework party needs a politically viable domestic narrative

that is factually consistent with the framework's actual provisions but framed for local political consumption. This module creates explicit, pre-approved

52 narrative architecture for each major actor.

12.2 Core Principle: Same Facts, Different Frames All narrative packages must be factually consistent with the framework text. No party may make claims

about the framework that contradict its operative provisions. However, each party may emphasize different aspects and use different vocabulary to

frame those facts for domestic audiences. 12.3 U.S. Narrative Package — "Enforcement Through Economic Integration"

"Maximum Pressure 2.0: Iran's nuclear program under the world's most intrusive

"Economic incentives tied to verified behavior change — not trust."

"Regional energy interdependence makes Iranian aggression economically suicidal."

"Humanitarian corridors demonstrate American values while maintaining strategic pressure."

Sanctions relief is NOT a gift — it is
earned through verified compliance milestones.

Every dollar of Iranian export revenue is
monitored, escrowed, and conditionally released.

IAEA inspectors have 72-hour challenge access
to any site — stronger than the original JCPOA.

Regional infrastructure investment builds
stability that reduces Iranian proxy leverage.

Energy interdependence creates structural
53 constraints on Iranian behavior.

Red Lines (Prohibited Claims):

Do NOT claim that Iran has "dismantled" its
enrichment program (it hasn't — it's capped

Do NOT claim that the framework eliminates
Iranian proxy capability (it constrains it
through caps and attribution).

Do NOT claim that Iranian frozen assets are
"returned" (they're released in micro-tranches for verified milestones).

Do NOT claim the framework is "permanent"

(it has 5-year renewal reviews). 12.4 Iranian Narrative Package — "Sovereign
Economic

Recovery Through Diplomatic Resistance" Approved Headlines:

"Iran regains control of its energy export
revenue and banking system through strategic patience."

"Fordow transformed from military target to
international medical isotope center — Iranian scientists lead global health
innovation."

"The Strait of Hormuz governed by a
multilateral authority with Iran as founding
member and equal stakeholder."

"Regional Development Fund: Iran holds 15%
voting weight from Day One — not a supplicant,
a shareholder." Approved Framing:

Iran's enrichment rights are recognized and
54 operational — capped at levels appropriate for
each phase, with clear pathway to full civilian nuclear program.

Frozen assets are released in structured
tranches that demonstrate international confidence in Iran's compliance.

The IHTA gives Iran institutional voice in
Hormuz governance for the first time — ending unilateral U.S. naval
dominance.

Banking reconnection proceeds through Iranian
banking reform — Iran builds capacity, not
Regional infrastructure investment creates

markets for Iranian goods, services, and

engineering expertise. Red Lines (Prohibited Claims):

Do NOT claim that Iran has "defeated" U.S.

sanctions (they're conditionally suspended, not abolished).

Do NOT claim that the framework eliminates

IAEA monitoring (it maintains continuous monitoring with intensity proportional to compliance).

Do NOT claim that Iran has "won" the proxy

conflict (proxy activity is capped and attributed, not endorsed).

Do NOT claim that the framework is a

"friendship treaty" with the U.S. (it's a transactional compliance framework).

12.5 Saudi/Gulf Narrative Package — "Regional Stability

Through Economic Diversification"

55 Approved Headlines:

"PIF-led infrastructure investment transforms

the region while reducing proxy conflict intensity."

"Hormuz toll revenue funds regional maritime

security and civilian development."

"Energy interdependence creates economic

incentives for Iranian restraint."

"Saudi Arabia leads regional reconstruction

as guarantor of stability." Approved Framing:

Saudi investment through PIF is institutionally
locked and automated — not dependent on any individual leader's goodwill.

IHTA revenue-sharing funds both Gulf security
and regional development simultaneously.

Iraq-Jordan-Saudi trade corridor reduces
Iranian economic isolation while building
alternative logistics networks.

Yemen ceasefire and reconstruction reduce
Houthi threat through economic incentives,
not just military pressure. Red Lines:

Do NOT frame as "containing Iran" (frame as
"integrating Iran into regional economic architecture").

Do NOT claim Saudi-Iran normalization (the
framework is institutional, not bilateral).

Do NOT minimize PIF financial commitment
(frame as investment, not cost).

56 12.6 Jordanian Narrative Package — "Sovereign Economic
Stabilization" (See RP-JOR Hardened Protocol, Addendum A, for full
vocabulary templates. This module confirms
and extends those provisions framework-wide.)

All framework benefits branded as "Sovereign
Economic Stabilization" — never "Regional

Integration" or "Normalization."

Hashemite Custodianship of Jerusalem holy sites

explicitly reinforced.

Refugee burden-sharing offsets framed as

"international responsibility-sharing" not "payment for political alignment."

12.7 Synchronized Announcement Strategy

Major framework milestones require coordinated announcement timing to prevent one party's domestic narrative from undermining another's:

Announcement Coordination Protocol:

All Tier 1 framework events (Phase

transitions, tranche releases, major

infrastructure launches) coordinated through governance body
Communications Cell.

Each party receives pre-cleared talking
points 48 hours before public announcement.

Staggered announcement window: Party A

announces at T+0 hours (domestic prime time); Party B at T+6 hours (their domestic prime time); Party C at T+12 hours. This prevents simultaneous contradictory framing.

Joint press conference format: Neutral

57 venue (Geneva or Muscat); neutral chair

(Oman) delivers factual statement; each party's representative delivers their narrative-framed statement; no joint

Section 1: Dual-Key Institutional Control Layer (Detailed Implementation)

The Dual-Key Institutional Control Layer addresses the fundamental vulnerability of concentrated fiduciary authority in international financial institutions. The existing architecture concentrates critical decision-making power in the World Bank as sole trustee and administrator of the Regional Development Fund. While the World Bank provides institutional legitimacy and fiduciary expertise that are essential for donor confidence, this over-centralization creates three specific vulnerabilities that could undermine framework implementation.

The first vulnerability is the perception of Western control. The World Bank's governance structure gives disproportionate influence to Western donor countries, which creates concerns among Iranian negotiators and Global South participants that financial decisions may be influenced by political considerations rather than technical merit. This perception undermines the trust that is essential for Iranian buy-in and broader framework participation.

The second vulnerability is single-point-of-failure risk. If the World Bank's institutional priorities diverge from framework needs, if the Bank faces its own governance challenges, or if U.S. influence over the Bank creates conflicts with framework implementation, the entire financial architecture could be compromised. The framework cannot afford to have its financial lifeline dependent on a single institution that may have competing priorities.

The third vulnerability is the lack of neutral counterbalance. For decisions affecting adversarial parties, having a single decision-maker creates an inherent conflict of interest. The World Bank, as a U.S.-influenced institution, cannot be perceived as neutral when making decisions about Iranian financial interests. A neutral counterbalance is essential for decisions that require the

confidence of all parties.

The Tiered Dual-Key Architecture addresses these vulnerabilities through a graduated system that applies dual-key requirements proportionally to decision sensitivity. This approach recognizes that not all actions require dual-key authorization, and that applying dual-key requirements to routine operations would paralyze emergency humanitarian response and impede efficient fund management.

Tier Alpha covers routine operations where the World Bank exercises sole authority. These operations include: routine escrow disbursements under \$10 million for pre-approved, verified projects; quarterly financial statement preparation and publication; standard procurement contract administration; annual audit logistics and contractor management; and day-to-day trust fund accounting and reporting. Tier Alpha operations represent approximately 70 percent of all RDF transactions by volume, and their efficient execution is essential for the fund's day-to-day functioning.

Tier Beta covers fiduciary and sensitive actions where dual-key authorization is required. These actions include: all escrow releases over \$10 million; all asset micro-tranche releases involving Iranian frozen assets; fiduciary suspension of any disbursement for corruption or sanctions violation risk; audit firm selection and scope determination; addition or removal of entities from the RDF exclusion list; amendment to sub-fund governance structure; activation of the Rapid Response Reserve; and any transaction involving an Iranian financial institution or Iranian government account. Tier Beta actions represent the most sensitive fiduciary decisions and require the oversight of a neutral co-administrator.

Tier Gamma covers structural changes that require governance body override. These changes include: RDF charter amendment; new sub-fund creation;

capitalization increase beyond Phase 3 levels; and termination of RDF operations. Tier Gamma decisions affect the fundamental architecture of the financial system and require the highest level of political authorization.

The Non-Aligned Co-Administrator is the institutional innovation that makes the dual-key system work. The NACA provides the neutral counterbalance that is essential for decisions affecting adversarial parties, while the rotating selection mechanism ensures that no single country or bloc can dominate the oversight function.

NACA selection follows a rotation schedule that ensures geographic and political diversity: Oman serves in years 1-2, Switzerland in years 3-4, Pakistan in years 5-6, rotating thereafter. This rotation ensures that the NACA function is not identified with any single country and that different perspectives are brought to bear over time. The selection is made by the governance body neutral chair and confirmed by the Silence Procedure, ensuring that the selection process itself is not subject to political manipulation.

NACA qualifications ensure that the co-administrator has the expertise and independence needed for the role. The NACA must be a national of a non-framework-party state, must have a minimum of 10 years international financial or development banking experience, and must not have been employed by the World Bank, IMF, or any U.S. or EU financial institution within 24 months prior to appointment. These qualifications prevent conflicts of interest and ensure that the NACA brings genuinely independent expertise to the role.

The NACA maintains a 3-person technical team embedded at RDF headquarters in Geneva with full access to escrow records, disbursement ledgers, and procurement files. This embedded presence ensures that the NACA has real-time visibility into RDF operations and can exercise the veto

right effectively. The NACA may block a Tier Beta action by written objection within 72 hours of World Bank proposal. If NACA blocks an action, it is suspended and referred to the RDF Governing Board within 14 days, where a 60 percent weighted majority may override the NACA block. If the NACA fails to respond within 72 hours, the action proceeds on World Bank authority alone, preventing obstruction while preserving the right of objection.

The Emergency Humanitarian Override ensures that dual-key requirements do not impede emergency response. Tier Beta dual-key requirements are suspended for Rapid Aid Deployment Protocol triggers, including verified IPC Phase 4 or higher food insecurity conditions, hospital fuel supplies below 24 hours, and cholera or other disease outbreaks. Humanitarian Emergency Escrow disbursements under \$50 million per event are also exempted. During emergencies, the World Bank may disburse on UN OCHA Director certification alone, with NACA review conducted post-hoc within 7 days. This design ensures that humanitarian needs are met promptly while preserving accountability.

Comprehensive Stress-Testing Methodology

The hardening protocols presented in this addendum have been subjected to rigorous stress-testing across twelve distinct failure scenarios, each designed to probe specific vulnerabilities in the architecture. The stress-testing methodology employs a combination of expert judgment, historical case analysis, game-theoretic modeling, and simulation techniques to assess how the architecture would perform under conditions significantly more challenging than the baseline scenario. This comprehensive approach ensures that the hardening measures address real vulnerabilities rather than theoretical ones.

The twelve stress scenarios include: Scenario Alpha (complete withdrawal of a

major power from the framework), Scenario Beta (discovery of covert nuclear activities in violation of pathway commitments), Scenario Gamma (major regional military conflict involving framework participants), Scenario Delta (severe economic crisis impairing benefit delivery), Scenario Epsilon (domestic political revolution in a participating state), Scenario Zeta (coordinated spoiler campaign by non-participating states), Scenario Eta (IAEA detection system failure or compromise), Scenario Theta (cyber attack on framework information systems), Scenario Iota (natural disaster disrupting monitoring infrastructure), Scenario Kappa (terrorist attack on nuclear facilities), Scenario Lambda (gradual erosion of compliance without clear violation), and Scenario Mu (simultaneous combination of multiple stressors).

Each scenario is analyzed through a structured framework that identifies the specific vulnerabilities activated, the cascading effects across different architecture components, the performance of existing hardening measures, and the residual risks requiring additional mitigation. The analysis produces a quantitative resilience score for each scenario, with scores below the acceptable threshold triggering mandatory hardening measure enhancement.

The Dual-Key Institutional Control Layer

The Dual-Key Institutional Control system represents a foundational hardening mechanism that prevents unilateral action by any single party while preserving operational effectiveness. Under this system, all significant decisions affecting the architecture require the concurrence of two independent institutional keys: one held by the international oversight body and one by the domestic implementing authority. This dual-key requirement ensures that neither international pressure nor domestic obstruction can alone paralyze or hijack implementation.

The international key is exercised by the Joint Monitoring Operations Center,

which maintains real-time awareness of all architecture-related activities and can withhold operational authorizations if compliance concerns arise. The domestic key is exercised by national implementing commissions established under each participating state's domestic law, ensuring that international obligations are translated into domestic legal requirements that bind future governments. The interaction between these keys creates a robust governance system resistant to both external manipulation and internal reversal.

The Non-Aligned Co-Administrator (NACA) role provides additional institutional balance by ensuring that a party without alliance ties to major powers participates in all significant oversight functions. The NACA serves as an integrity check on the monitoring and verification process, with authority to initiate independent inquiries, access all monitoring data, and appeal compliance determinations to the Governance Body. This role addresses concerns that verification might be manipulated for political purposes by ensuring that a genuinely neutral party has full visibility and voice.

Mirror Licensing Regime and OFAC Failure Contingency

The Mirror Licensing Regime addresses the specific vulnerability that framework implementation depends on the sustained cooperation of the U.S. Office of Foreign Assets Control (OFAC) in issuing licenses for sanctions relief. Under this regime, participating states establish mirror licensing authorities that can issue functionally equivalent authorizations if U.S. licensing becomes unavailable due to political changes, administrative dysfunction, or deliberate obstruction.

The regime operates through pre-negotiated substitute mechanisms that maintain the flow of essential transactions even if primary U.S. authorizations are withdrawn. These mechanisms include alternative payment channels through non-U.S. financial institutions, pre-approved trade frameworks that

minimize transaction-specific licensing requirements, and insurance arrangements that cover the additional costs of operating outside primary channels. While these substitutes may involve some efficiency loss compared to full U.S. participation, they prevent the architecture from collapsing due to single-point failures in the licensing system.

The OFAC Failure Contingency includes specific triggers and response protocols for situations in which U.S. licensing becomes unavailable. The contingency distinguishes between temporary disruptions, which activate expedited workarounds designed to minimize implementation impact, and permanent withdrawals, which trigger comprehensive alternative arrangements including the potential relocation of key financial infrastructure to jurisdictions outside U.S. regulatory reach.

Compliance Symmetry Metrics and the CIS

The Compliance Indicators System (CIS) provides a quantitative framework for assessing whether the burdens and benefits of the architecture are distributed equitably among all parties. The CIS tracks multiple indicator categories including sanctions relief implementation, economic benefit delivery, verification intrusiveness, security commitment performance, and institutional participation. These indicators are compiled into a composite symmetry score that identifies imbalances requiring corrective action.

The symmetry assessment employs both objective metrics and subjective evaluations. Objective metrics include the number of sanctions licenses issued, the value of trade transactions authorized, the frequency and intensity of inspections conducted, and the military posture adjustments implemented. Subjective evaluations capture perceptions of fairness and good faith that influence political sustainability even when objective metrics appear balanced. Both dimensions are necessary for a complete symmetry

assessment.

Corrective mechanisms are activated when symmetry assessments identify significant imbalances. These mechanisms include mandatory consultations, independent mediation, and in extreme cases, the temporary adjustment of commitment requirements to restore perceived balance. The symmetry framework recognizes that perfect equivalence is neither achievable nor necessary for political sustainability, but that gross imbalances generate resentment that corrodes cooperation over time.

Sovereignty Restoration Ladder and Constructive Non-Compliance

The Sovereignty Restoration Ladder addresses Iranian concerns that prolonged international oversight constitutes an infringement on national sovereignty by establishing a clear pathway through which oversight intensity is progressively reduced as confidence in compliance accumulates. Each rung on the ladder corresponds to verified compliance over specified periods, with each achievement reducing the intrusiveness and cost of verification while maintaining essential monitoring capabilities.

The ladder design ensures that sovereignty restoration is earned through demonstrated compliance rather than granted as a concession. This principle maintains non-proliferation assurance while providing Iran with a tangible trajectory toward normalized status. The specific provisions at each rung are calibrated to ensure that any reduction in verification intensity is matched by a corresponding increase in the time required for potential breakout, maintaining constant security assurance throughout the restoration process.

The Constructive Non-Compliance Framework provides structured procedures for addressing situations in which technical compliance concerns arise

without assuming bad faith. The framework distinguishes between willful violations, which activate consequence mechanisms, and implementation difficulties, which trigger cooperative problem-solving procedures. This distinction prevents the architecture from being derailed by technical problems that can be resolved through good-faith consultation, while maintaining robust responses to genuine violations.

The Narrative Layer and Perception Management

Recognizing that the political sustainability of the architecture depends critically on how it is perceived by domestic audiences, the hardening protocols include a comprehensive Narrative Layer that addresses communication strategy, perception management, and public diplomacy. This layer ensures that the architecture's benefits are visible and comprehensible to the populations whose political support sustains participating governments.

The narrative framework provides each participating state with tailored messaging strategies that explain the architecture in terms aligned with national values and political discourse. These strategies are not cynical manipulations but genuine translations of the architecture's purposes into locally meaningful frameworks. The international secretariat supports these national narratives through coordinated international communications that reinforce rather than undermine domestic messaging.

The perception management system includes rapid response protocols for addressing negative narratives, whether arising from genuine implementation problems, opposition political campaigns, or hostile disinformation. These protocols ensure that adverse developments are addressed promptly with accurate information, preventing the accumulation of negative perceptions that can create political momentum for withdrawal.

Mirror Licensing Regime Technical Specifications

The Mirror Licensing Regime addresses the specific vulnerability created by dependence on U.S. Office of Foreign Assets Control (OFAC) licensing for sanctions relief. Under the JCPOA experience, the uncertainty of U.S. licensing created substantial hesitation among international businesses despite the legal authorization for trade with Iran. The Mirror Licensing Regime creates substitute authorization mechanisms that can maintain trade flows even if U.S. licensing becomes unavailable.

The regime operates through three tiers of substitute authorization. Tier One involves pre-authorized general licenses issued by participating European states that cover categories of transactions likely to be affected by U.S. licensing unavailability. These general licenses are issued before any U.S. disruption occurs and remain available for immediate activation when needed. They cover categories including humanitarian trade, food and agricultural exports, medicine and medical device sales, and civilian aircraft parts.

Tier Two involves a special purpose financial vehicle (SPFV) established in a neutral jurisdiction with the legal capacity to process transactions outside U.S. financial system jurisdiction. The SPFV maintains correspondent banking relationships with non-U.S. banks, operates its own payment messaging system as backup to SWIFT, and holds currency reserves in euros and other non-dollar currencies. The SPFV can process architecture-related transactions when normal banking channels are unavailable.

Tier Three involves barter and countertrade arrangements that permit goods and services exchange without financial transfers through banking systems. While less efficient than conventional trade finance, barter arrangements can maintain essential trade flows during severe financial disruptions. The

architecture maintains a registry of potential barter transactions and matching services that facilitate countertrade when conventional mechanisms fail.

FX Stabilization Buffer and Currency Risk Management

The FX Stabilization Buffer provides foreign exchange intervention capability to cushion participating economies against currency volatility that could result from architecture implementation or external shocks. The buffer maintains reserves of major currencies that can be deployed to stabilize exchange rates, provide foreign exchange liquidity to domestic banking systems, and support import financing during balance of payments pressures.

Buffer resources are contributed by participating states and international financial institutions, with contributions calibrated to the vulnerability of each economy to exchange rate volatility. The buffer's governance ensures that intervention decisions are based on economic rather than political criteria, with independent technical assessment of intervention needs and effectiveness evaluation of intervention outcomes.

P>Currency risk management extends beyond stabilization intervention to encompass hedging facilities that enable businesses engaged in architecture-related trade to manage foreign exchange exposure. Hedging facilities include forward exchange contracts, currency options, and swap arrangements that provide predictable exchange rates for trade transactions. These facilities reduce the currency risk that might otherwise deter trade even when sanctions relief is available.

Compliance Symmetry Index and Weighted Metrics

P>The Compliance Symmetry Index (CSI) provides a quantitative measure of

whether the distribution of architecture burdens and benefits is perceived as equitable by all parties. The index combines multiple metrics into a composite score that identifies imbalances requiring corrective attention. The index is calculated quarterly and published in the architecture's annual implementation report.

P>The index comprises four component indices: the Sanctions Relief Index measures the pace and completeness of sanctions relief relative to commitments; the Verification Intensity Index measures the intrusiveness and cost of verification activities; the Economic Benefit Index measures the flow of trade, investment, and development benefits; and the Security Commitment Index measures the implementation of security-related commitments including conventional forces transparency and missile restraints.

P>Each component index is normalized to a scale of 0-100, with 100 representing full implementation of commitments. The composite CSI is calculated as a weighted average of component indices, with weights reflecting the relative importance of each dimension as determined by the Governance Body. A CSI below 60 triggers mandatory review and corrective action. A CSI below 40 triggers automatic activation of the compliance symmetry correction mechanism.

Narrative Layer and Strategic Communications Operations

P>The Narrative Layer addresses the information environment within which architecture implementation occurs. In contemporary international politics, the narratives that shape public understanding of diplomatic agreements can be as important as the agreements' substantive provisions. Adversarial narratives can undermine implementation by generating political opposition even when objective conditions support cooperation.

P>The Narrative Layer operates through several mechanisms. The Strategic Communications Unit within the secretariat monitors global and regional media coverage of architecture activities, identifies emerging narrative threats, and develops counter-narratives that provide accurate context and positive framing. The unit coordinates with national communications authorities to ensure consistent messaging across participating states.

P>The Facts First initiative maintains an authoritative, independently verified database of architecture implementation data that provides factual foundations for public communication. This database includes verified statistics on centrifuge dismantlement, trade flows, sanctions relief, verification activities, and economic indicators. Journalists, researchers, and policymakers can access this database to verify claims and counter misinformation.

P>The Voices of Implementation program amplifies authentic testimonies from individuals and communities who have benefited from architecture cooperation. These personal stories provide human faces for abstract policy frameworks and generate emotional connections that statistical data alone cannot achieve. The program identifies beneficiaries willing to share their stories and provides media training and platforms for their voices.

Graceful Degradation Sequence and Resilience Protocols

P>The Graceful Degradation Sequence provides structured procedures for maintaining essential architecture functions when normal implementation becomes impossible due to crisis, obstruction, or resource constraints. Degradation is not failure; it is a controlled reduction in scope that preserves core capabilities while reducing requirements to match available resources and political conditions.

P>The sequence comprises five degradation levels. Level One reduces non-essential activities including expanded monitoring, voluntary CBMs, and enhanced economic cooperation. Level Two suspends new program initiation while maintaining existing programs. Level Three reduces program scope to core activities only. Level Four maintains monitoring and communication while suspending active programs. Level Five preserves only the most essential communication channels and nuclear constraints.

P>Automatic reversion procedures restore full implementation when conditions permit. Reversion requires verification that triggering conditions have been resolved and that no party has exploited the degradation period to gain advantage. The reversion sequence mirrors the degradation sequence in reverse, with progressive restoration of suspended activities.

The OFAC Failure Contingency Technical Architecture

P>The OFAC Failure Contingency addresses the specific vulnerability that U.S. sanctions relief depends on continued OFAC licensing, which can be disrupted by changes in U.S. administration, legislative action, or executive decisions. The contingency creates alternative authorization mechanisms that can substitute for OFAC licenses when U.S. authorization is unavailable.

P>The Mirror Licensing Authority is established in a participating European state with the legal capacity to issue licenses functionally equivalent to OFAC licenses. The authority operates under delegated powers from participating states and issues general licenses covering categories of transactions likely to be affected by U.S. licensing disruption. These licenses are recognized by European banks and regulators as legally valid authorization for otherwise prohibited transactions.

P>The Special Purpose Financial Vehicle (SPFV) provides an alternative

payment channel that processes transactions without routing through U.S. financial institutions or U.S.-regulated entities. The SPFV maintains correspondent relationships with European, Asian, and Middle Eastern banks, operates its own payment messaging capability independent of SWIFT, and holds reserves in euros and other non-dollar currencies. The SPFV can process humanitarian transactions, architecture benefit payments, and approved commercial transactions.

P>Pre-Approved Trade Frameworks establish standardized trade arrangements that minimize transaction-specific licensing requirements. Frameworks specify approved product categories, eligible counterparties, maximum transaction values, and standard documentation requirements. Transactions within framework parameters can proceed without individual licensing, reducing dependence on case-by-case approvals that are vulnerable to administrative disruption.

Compliance Symmetry Metrics in Detail

P>The Compliance Symmetry Index (CSI) provides quantitative measurement of whether architecture burdens and benefits are distributed equitably across participating states. The index is calculated quarterly based on objective indicators and subjective assessments that capture both measurable outcomes and perceived fairness.

P>The Sanctions Relief Index measures the completeness of sanctions relief relative to commitments. Indicators include the number and value of licenses issued, the number of sanctioned entities delisted, the volume of trade transactions authorized, and the value of frozen assets released. The index compares actual relief to the relief anticipated under architecture commitments.

P>The Verification Intensity Index measures the intrusiveness and cost of verification activities relative to the proliferation risk of authorized activities. Indicators include the frequency of inspections, the number of inspectors deployed, the coverage of remote monitoring systems, and the cost of verification activities borne by each state. The index ensures that verification burden is proportionate to risk and equitably distributed.

P>The Economic Benefit Index measures the flow of economic benefits including trade expansion, investment inflows, development assistance, and financial market access. Indicators include trade volumes, foreign direct investment levels, development fund disbursements, and credit ratings. The index compares benefits received to commitments undertaken.

P>The Security Commitment Index measures implementation of security-related commitments including conventional forces transparency, missile restraints, and crisis management cooperation. Indicators include notification compliance rates, inspection cooperation levels, and exercise observation participation. The index ensures that security commitments are implemented alongside nuclear commitments.

Graceful Degradation and System Resilience

P>The Graceful Degradation Sequence provides structured procedures for reducing architecture scope when full implementation becomes impossible while preserving the most essential cooperation elements. Degradation is designed to be reversible, enabling rapid restoration when conditions improve.

P>Level One degradation reduces non-essential monitoring, voluntary transparency measures, and expanded economic programs. Core commitments including nuclear constraints and basic verification continue.

Level One is triggered by temporary resource constraints or minor political disruptions.

P>Level Two degradation suspends new program initiation while continuing existing programs at reduced scope. Core verification and basic communication continue. Level Two is triggered by more significant disruptions that require program consolidation.

P>Level Three degradation reduces all programs to minimum essential scope. Only nuclear monitoring, crisis communication, and humanitarian access continue. Level Three is triggered by severe crises that require radical scope reduction.

P>Level Four degradation maintains only crisis communication and nuclear monitoring under reduced protocols. Level Four is triggered by existential threats to architecture continuation.

P>Level Five degradation preserves only direct state-to-state communication channels. Level Five represents the absolute minimum below which the architecture ceases to function.

ANNEX PDM-D: PARTNER VETO PLAYER QUICK REFERENCE

Overview

This annex provides an operational quick-reference for identifying and mitigating domestic veto player activity during the critical 100-Day Quick Start window. The first 100 days represent the period of maximum vulnerability: early benefits have not yet materialized, opposition narratives have not yet been tested, and institutional habits of cooperation have not yet formed.

100-Day Vulnerability Matrix

Day Range	Primary Threat	Veto Actor Most Likely Active	Mitigation Action Required
Days 1-15	Initial implementation delay; procedural objections	U.S. Congress (oversight letters); Iranian Majlis (inquiry)	Immediate high-level engagement; guarantor reassurance missions
Days 16-30	First compliance review; opposition narrative formation	IRGC (proxy testing); Israeli government (intelligence campaign)	JMOC visible verification; sovereignty milestone announcement
Days 31-45	Humanitarian benefits begin; opposition counter-mobilization	U.S. lobbying groups; Iranian conservative clergy	Economic impact visibility; religious legitimacy reinforcement
Days 46-60	First tranche verification; OFAC license window	U.S. Treasury (slow-walking); Iranian Central Bank (caution)	OFAC Contingency Protocol activation if needed; banking channel visibility
Days 61-75	Opposition organizes substantive challenge	U.S. Congress (hearings); Iranian Guardian Council (review)	Bipartisan testimony; pre-cleared legislative language
Days 76-90	First 30-day cycle	All veto actors assess	Transparency

Day Range	Primary Threat	Veto Actor Most Likely Active	Mitigation Action Required
	review; momentum assessment	effectiveness of opposition	Summary publication; visible progress demonstration
Days 91-100	Critical juncture: framework survival determined	Coordinated opposition if prior challenges succeeded	High-level diplomatic engagement; guarantor summit if needed

Spoiler Activity Early Warning Indicators

The following indicators, if detected during the 100-Day window, trigger automatic escalation to guarantor-facilitated mitigation:

- IRGC: Increased proxy militia activity in Syria, Lebanon, or Yemen within first 60 days.
- U.S. Congress: Introduction of sanctions-blocking legislation with more than 50 co-sponsors.
- Israel: Public intelligence disclosures about Iranian nuclear activity.
- Iranian Majlis: Formation of special investigative committee on framework compliance.
- Saudi Arabia: Oil market moves inconsistent with framework economic integration.
- Any Party: Media campaigns featuring classified or sensitive framework information.

100-Day Mitigation Protocols by Actor

For IRGC Spoiler Activity: Immediate JMOC visible verification of Iranian nuclear compliance; Guarantor Action: Pakistan-mediated security channel engagement; Economic Lever: Accelerated sovereignty restoration milestone if compliance demonstrated; Narrative: Verified compliance earns accelerated benefits.

For U.S. Congressional Opposition: Immediate Bipartisan Economic Impact Assessment publication; Guarantor Action: European allies congressional

engagement; Economic Lever: Visible U.S. business interest mobilization; Narrative: American jobs and security enhanced by framework.

For Israeli Opposition: Immediate intelligence sharing through JMOC to address concerns; Guarantor Action: Swiss-facilitated security dialogue; Economic Lever: Regional security architecture visibility; Narrative: Strongest verification regime in history protects Israeli security.

For Iranian Conservative Opposition: Immediate sovereignty milestone achievement and public announcement; Guarantor Action: Omani diplomatic relay with conservative interlocutors; Economic Lever: Visible early economic benefits in conservative-voting regions; Narrative: Iranian dignity and strength enhanced, not diminished.

100-Day Quick Start Timeline

Day	Milestone	Benefit Visible	Veto Risk
1	Framework entry into force	Diplomatic announcement	Low
7	IAEA inspectors deploy	Visible international presence	Low
15	First humanitarian corridor opens	Aid flows begin	Low-Medium
30	First compliance review	Transparency Summary published	Medium
45	Banking Tier 1 activation	First Iranian bank reconnected	Medium
60	First RDF disbursement	Infrastructure project begins	Medium
75	Oil export increase realized	Revenue flows to CBI	Medium-High
90	First 30-day cycle certified	Compliance momentum established	High
100	100-Day Assessment	Comprehensive progress report	High

Escalation Protocol for Unmitigated Spoiler Activity

If spoiler activity is not mitigated through standard protocols, the following escalation sequence activates automatically: Level 1 (Days 1-30): Guarantor diplomatic engagement with identified veto actors. Level 2 (Days 31-60): Governance body special session with ministerial-level participation. Level 3 (Days 61-90): UN Secretary-General good offices engagement. Level 4 (Days 91-100): Emergency guarantor summit with framework suspension review if spoiler activity threatens survival.

At each escalation level, the framework preserves all functioning tracks while isolating the affected domain. This prevents spoiler activity in one area from cascading to framework collapse. The escalation protocol is designed to increase pressure on veto actors while maintaining the framework's operational integrity.

Post-100-Day Transition

Upon successful completion of the 100-Day window, the framework transitions from Quick Start mode to Standard Implementation mode. This transition includes: publication of the 100-Day Assessment Report by the governance body secretariat; certification by guarantors that the framework has achieved minimum viability; activation of full Phase 0 benefit tranches; and commencement of Phase 1 preparatory work. The 100-Day Assessment Report is a public document that summarizes achievements, identifies remaining challenges, and outlines the pathway to Phase 1.

If the 100-Day Assessment determines that the framework has not achieved minimum viability, the following remedial measures activate automatically: extended Quick Start period of 30 days with enhanced guarantor engagement; targeted benefit acceleration in tracks showing compliance; and framework modification review if structural barriers are identified. The framework is designed to survive 100-Day setbacks through these remedial mechanisms.

The Veto Player Analytical Framework

Annex PDM-D provides comprehensive veto player matrices for all core parties to the RCSA, identifying the domestic actors whose opposition could prevent or reverse implementation of architecture commitments. These matrices are organized around the analytical framework developed by comparative political scientists, which identifies veto players as individual or collective actors whose agreement is required for policy change. Understanding the veto player landscape in each state is essential for designing implementation strategies that can achieve and sustain domestic ratification.

The matrices distinguish between institutional veto players, whose opposition is legally sufficient to block implementation (such as parliamentary majorities, constitutional courts, and federal sub-units), and partisan veto players, whose opposition may not be legally dispositive but can generate political costs sufficient to deter implementation (such as opposition parties, influential media organizations, and major interest groups). Both categories must be addressed in implementation planning, as even purely partisan opposition can create political dynamics that empower institutional veto players to act on their formal authority.

For each identified veto player, the matrices provide: formal authority over implementation decisions, policy preferences regarding architecture components, political salience of nuclear issues, organizational capacity for opposition, historical patterns of behavior on similar issues, and potential coalition dynamics with other veto players. This detailed characterization enables implementation planners to tailor their strategies to the specific political landscape in each state.

United States Veto Player Matrix

The United States presents a complex veto player landscape characterized by separation of powers, partisan polarization, and the unique role of Congress in sanctions legislation. The primary institutional veto players include: the President, who negotiates and implements executive agreements but cannot permanently lift congressionally enacted sanctions without legislative action; the Senate, which must approve treaties by two-thirds majority and can block sanctions relief through failure to act; the House of Representatives, which controls appropriations and can impede implementation through funding restrictions; and the federal courts, which can review the legality of implementation actions.

The partisan dimension is particularly salient, with Republican opposition to Iran engagement historically more intense than Democratic support. The matrices identify the specific congressional committees with jurisdiction over relevant legislation, the leadership positions that control floor scheduling and amendment procedures, and the individual members who have demonstrated particular influence on Iran policy. This granular identification enables targeted engagement strategies that address the specific concerns of potentially decisive actors.

The Bipartisan Quorum Engineering strategy addresses the requirement for broad political support by designing implementation actions that generate visible benefits for politically salient constituencies in both parties. This includes defense industry contracts for military confidence-building measures, agricultural exports facilitated by sanctions relief, and energy sector opportunities from Iranian market opening. By creating stakeholder constituencies across the partisan spectrum, the architecture reduces the probability that partisan turnover will produce complete policy reversal.

Iran Veto Player Matrix

Iran's veto player landscape is characterized by the interaction of elected institutions, unelected bodies, and informal power centers that collectively determine policy outcomes. The formal institutional structure includes the President and cabinet, the Majlis (parliament), the Supreme National Security Council, and the Guardian Council. Beyond these formal institutions, the Supreme Leader exercises ultimate authority on security matters, while the Islamic Revolutionary Guard Corps maintains significant independent influence on military and economic policy.

The matrices identify specific factions and power centers within this complex landscape, including: pragmatic conservatives who prioritize economic development over ideological confrontation, principled conservatives who resist engagement with the United States on sovereignty grounds, reformists who support engagement but may demand greater domestic political liberalization, and hardliners who oppose any accommodation with the international community. Each faction's strength, policy preferences, and potential for coalition formation are assessed.

The Defense Sector Pivot strategy addresses hardline opposition by designing the architecture to provide tangible benefits to the Iranian defense and security establishment, thereby creating institutional interests in implementation success. These benefits include participation in regional security dialogues, access to certain defensive technologies, and economic opportunities in defense-related sectors. By engaging the defense establishment as a stakeholder rather than treating it as an adversary, the architecture reduces the probability of institutional sabotage.

European Union Veto Player Matrix

The European Union presents a distinctive veto player landscape in which national governments, EU institutions, and domestic political dynamics interact to produce collective decisions. The primary institutional veto players include the Council of the EU, where member states exercise decision-making authority on foreign policy and sanctions matters; the European Parliament, which must approve certain financial arrangements and can influence policy through political pressure; and the European Commission, which implements agreed policies through its administrative authority.

Within the Council, the matrices identify the specific member states most likely to influence Iran policy outcomes. France and Germany traditionally exercise particular influence due to their diplomatic engagement history and economic significance. The United Kingdom maintains substantial influence despite Brexit through its permanent Security Council seat and intelligence capabilities. Member states with stronger Atlanticist orientations tend to defer to U.S. leadership, while those with more autonomous foreign policy traditions may push for stronger European positions.

The Legislative Synchronization strategy addresses the challenge of maintaining coherent European policy across multiple institutional processes by establishing structured coordination mechanisms that align national legislative calendars, EU decision-making schedules, and international implementation timelines. This synchronization prevents the gaps and contradictions that can emerge when different institutional processes operate on independent schedules.

The 100-Day Quick Start Implementation Matrix

The Hundred-Day Quick Start provides a detailed day-by-day implementation roadmap for the first one hundred days following signature, identifying specific actions, responsible actors, resource requirements, and success

indicators for each phase. This granular planning addresses the critical implementation period during which political momentum is highest and the foundations for sustained cooperation are established.

Days 1-15 focus on institutional establishment, including the convening of the initial Governance Body session, the appointment of the international secretariat, the activation of the Joint Monitoring Operations Center, and the establishment of national implementing commissions. These foundational actions create the institutional infrastructure required for subsequent implementation activities.

Days 16-45 focus on initial confidence-building measures, including the activation of maritime safety protocols, the establishment of hotline communications, the release of initial benefit tranches, and the commencement of IAEA verification activities. These early measures generate visible progress that sustains political support through the more challenging implementation phases.

Days 46-75 focus on substantive implementation actions, including the initiation of centrifuge dismantlement or limitation (depending on the selected pathway), the establishment of the Regional Development Fund operational framework, the deployment of conventional forces transparency measures, and the convening of civil society consultative forums. These actions demonstrate that the architecture extends beyond institutional formalities to substantive behavioral change.

Days 76-100 focus on consolidation and assessment, including the first quarterly compliance review, the initial public reporting on implementation progress, the identification and resolution of emerging implementation challenges, and the planning for the subsequent implementation period. This consolidation phase ensures that the momentum generated during the first

hundred days is sustained into the medium term.

Crisis Messaging Cascade and Rapid Response Protocols

The Crisis Messaging Cascade provides pre-scripted communication templates for situations in which implementation challenges or external events threaten to derail the architecture. These templates address scenarios including: detected compliance concerns, major regional incidents, changes in government, terrorist attacks, and adverse media campaigns. The cascade ensures that all parties communicate in coordinated fashion rather than generating contradictory messages that amplify crises.

The cascade operates through a tiered authorization system in which Level One messages can be issued by designated spokespersons without additional approval, Level Two messages require concurrence from specified senior officials, and Level Three messages require Governance Body authorization. This tiered approach enables rapid response to fast-moving situations while maintaining appropriate control over high-stakes communications.

The Rapid Response Protocols complement the messaging cascade with pre-authorized actions that can be implemented immediately when specified triggers are activated. These protocols address situations requiring speed that precludes deliberative decision-making, including security incidents, humanitarian emergencies, and technical compliance anomalies. The protocols specify exactly what actions are authorized, by whom, under what conditions, and with what reporting requirements.

Veto Player Matrix for the Russian Federation

The Russian Federation presents a distinctive veto player landscape characterized by centralized executive authority, limited parliamentary

independence, and the significant role of the security establishment in foreign policy. While formal institutional constraints on executive action are limited, informal power centers and strategic considerations create constraints on flexibility.

P>The President holds concentrated authority over foreign policy, with limited meaningful institutional checks from the legislature or judiciary. Presidential decisions on architecture participation would not face significant institutional opposition if the President chose to support the architecture. However, presidential decisions are shaped by strategic calculations regarding Russia's position vis-a-vis the United States, regional influence, and economic interests.

P>The security establishment, including the military and intelligence services, exercises substantial influence on security policy. While not formal veto players, the security establishment can affect implementation through bureaucratic execution, intelligence assessments, and public commentary. Engagement with the security establishment is essential for ensuring effective Russian implementation.

P>Economic interests include energy sector actors who value regional stability for market access, arms exporters who value regional demand, and businesses seeking investment opportunities. These economic interests generally favor engagement that normalizes regional economic relationships. However, energy geopolitics may create tensions if architecture normalization reduces Russia's leverage over regional energy transit.

Veto Player Matrix for the People's Republic of China

P>China's veto player landscape is characterized by the Communist Party's dominant role in policy-making, with authority concentrated in the Politburo and particularly its Standing Committee. While formal institutional structures

exist, real decision-making authority rests with Party organs rather than state institutions.

P>The Party leadership makes foreign policy decisions through consensus processes within the Politburo Standing Committee. Architecture decisions would involve assessment of implications for China's relationship with the United States, regional energy security, and China's international image as a responsible power. While the Party can ratify decisions without institutional opposition, internal deliberation may produce caution regarding commitments that constrain flexibility.

P>The foreign policy bureaucracy, including the Ministry of Foreign Affairs and intelligence services, provides analysis and recommendations that inform Party decisions. While the bureaucracy does not independently veto decisions, its assessments shape the information available to decision-makers. Engagement with the foreign policy bureaucracy is important for ensuring informed decisions.

P>Economic interests favor regional stability that protects China's energy imports, trade routes, and overseas investments. China has substantial economic interests in the Middle East that benefit from normalization. However, China also values its relationship with Iran and may be cautious about commitments that could constrain that relationship.

Hundred-Day Quick Start Detailed Calendar

P>The Hundred-Day Quick Start provides a day-by-day implementation roadmap for the first one hundred days following architecture signature. This detailed calendar specifies actions, responsible actors, and success indicators for each phase of the Quick Start.

P>Days 1-10: Signature and Ratification. Actions include official signature

ceremonies, transmission of treaty text to capitals, initiation of domestic ratification procedures, and media communication of architecture purposes. Success indicators include formal signatures deposited with depositary and ratification processes commenced in all core parties.

P>Days 11-20: Institutional Pre-Activation. Actions include designation of national contact points, preliminary secretariat staff recruitment, identification of JMOC facility options, and preparation of initial Governance Body session. Success indicators include contact point lists distributed, staff recruitment initiated, and session agenda circulated.

P>Days 21-30: First Governance Body Session. Actions include inaugural session convening, adoption of rules of procedure, appointment of Executive Secretary, and establishment of subsidiary bodies. Success indicators include session concluded, rules adopted, and appointments confirmed.

P>Days 31-50: Operational Launch. Actions include JMOC activation, initial IAEA verification team deployment, first hotline tests, and initial benefit tranche release procedures. Success indicators include JMOC declared operational, IAEA teams on the ground, and hotlines tested.

P>Days 51-70: Initial Implementation. Actions include commencement of centrifuge limitations or dismantlement procedures, first maritime safety patrols, activation of civil society consultation mechanisms, and initial RDF project identification. Success indicators include declared activities commenced and first reports received.

P>Days 71-90: Verification and Assessment. Actions include first IAEA verification reports, initial compliance assessment preparation, first quarterly financial reporting, and initial public communication on implementation progress. Success indicators include reports submitted and published.

P>Days 91-100: Consolidation and Transition. Actions include first quarterly Governance Body review, identification of implementation adjustments required, planning for second quarter activities, and assessment of Quick Start success against defined indicators. Success indicators include review completed and second quarter plan approved.

ANNEX Z

Non-destructive assay (NDA): gamma spectrometry and neutron counting on product cylinders.

11 Process monitoring: feed rate, product take, and tails assay data

cross-checked against declared operating parameters. 2.2 Phase 1 Transition Criteria: Conditional Increase to 5% U-235 Advancement requires simultaneous fulfillment of:

(a) 180 consecutive days of verified compliance at 3.67% with zero enrichment excursions. (b) IAEA certification that all declared advanced centrifuges (IR-2, IR-4, IR-6) remain in sealed storage with continuous camera coverage. (c) Conclusion of a binding external fuel supply guarantee from at least two Nuclear Suppliers Group (NSG) states, deposited with the governance body. (d) Iranian acceptance of enhanced monitoring: additional 2 unannounced inspections per quarter; real-time cascade header pressure/temperature

monitoring; and expanded environmental sampling (8 samples per quarter vs. 4 at Phase 0). Verification Modality for 5% Operations:

OLEM systems recalibrated for 5% enrichment discrimination. Centrifuge count capped at declared Phase 0 baseline; no new machine installation permitted.

Product cylinder tagging with unique RFID identifiers linked to IAEA Material Balance Area (MBA) database.

Quarterly mass balance reconciliation: declared throughput vs.

measured throughput variance not to exceed 0.5%. 2.3 Phase 2 Transition Criteria: Conditional Increase to 10% U-235 (Medical

Isotope Production) Advancement requires: (a) 365 consecutive days of verified Phase 1 compliance. (b) Fordow facility conversion to International Medical Isotope

Research Centre (IMIRC) certified complete by IAEA and governance body technical committee. (c) Production confined exclusively to Fordow IMIRC under

12 international advisory board oversight.

(d) All 10% product immediately converted to uranium oxide or metal for target fabrication; no accumulation of 10% UF₆ stock. 2.4 Phase 3 Transition Criteria: Full Civilian-Grade Equilibrium (up to 20%)

Advancement requires: (a) 24 months of verified Phase 2 compliance. (b) IAEA Board of Governors approval by consensus.

(c) Binding fuel supply assurance for all 20% production, with pre-positioned replacement fuel in escrow. (d) Continuous web-based enrichment monitoring with hourly data

transmission to Vienna and Geneva backup node. 2.5 Breakout Time Floor Maintenance Technical specification: Minimum 9-12 month breakout timeline maintained

at all phases. Quarterly technical assessment by IAEA evaluates:

Effective separative work (SWU) capacity of operating cascades. Stockpile composition and reconfiguration time estimates. Advanced centrifuge R&D progress at PFEP. Concealed enrichment facility probability estimates based on

satellite imagery, procurement intelligence, and environmental sampling. If technical developments threaten to compress breakout below 9 months, the governance body convenes within 14 days to recalibrate: centrifuge number reductions, stockpile ceiling reductions, or additional monitoring measures.

1. ADVANCED CENTRIFUGE R&D CONTROLS AT NATANZ PFEP

3.1 Permitted Activities Limited R&D at PFEP only, with IAEA continuous monitoring via:

Dedicated NGSS camera systems with 24-hour coverage of test

Electronic seals on all test centrifuge casings and feed systems. Monthly declared testing schedule submitted 30 days in advance;

13 deviations exceeding 48 hours require notification.

Real-time vibration and rotational speed monitoring on test

machines; data transmitted to IAEA via RDT. 3.2 Prohibited Activities

Testing of centrifuge configurations exceeding declared mechanical specifications without 60-day advance notice to IAEA.

Use of UF₆ feedstock exceeding 5% enrichment in any test cascade without governance body approval.

Removal of test components from PFEP without IAEA seal application and escorted transport declaration.

Parallel R&D at undeclared locations; any detected off-site R&D

constitutes a material breach. 3.3 Transition Criteria for R&D Expansion Phase 1: No change from Phase 0 R&D parameters.

Phase 2: Expanded R&D permitted on IR-6 and IR-8 designs only; test cascade limited to single-machine or small-cascade configurations (max 20 machines); no UF6 testing above 5%.

Phase 3: Broader R&D permitted subject to IAEA Board approval and annual safeguards approach review.

1. CONTINUOUS MONITORING REDUNDANCY SPECIFICATION

4.1 Primary: On-Site Unattended Systems

NGSS cameras: minimum 1 camera per 50 centrifuges in hall configuration; 1 camera per cascade in PFEP; 1 camera per storage vault.

Unattended Monitoring Systems (UMS): radiation detectors at material balance points; load cells on feed/product cylinders; process sensors (pressure, temperature, flow) on cascade

Electronic seals: EOSS/RMSA on all material containers, access doors to enrichment halls, and sensitive R&D equipment.

14 4.2 Secondary: Satellite Monitoring

Commercial satellite imagery (0.3-1.0m resolution) procured by IAEA or contributed by framework parties; focused on vehicle traffic patterns, construction activity, and thermal signatures.

Synthetic Aperture Radar (SAR) imaging for all-weather, night-time coverage; 1-3m resolution acceptable for change detection.

Satellite data independently reviewed by neutral technical pool (Switzerland, Pakistan, Oman) before fusion into compliance

assessments. 4.3 Tertiary: Environmental Sampling

Wide-area environmental sampling: soil, water, and vegetation samples collected within 5km radius of declared facilities; quarterly collection schedule.

Site-specific swipe sampling: inside enrichment halls during inspections; on equipment surfaces; at waste discharge points.

Analysis performed at IAEA Network of Analytical Laboratories (NWAL) facilities; 14-day turnaround for routine samples;

72-hour expedited turnaround for challenge inspection samples. 4.4

Quaternary: Data Mirroring to Neutral Backup Node

All real-time monitoring data mirrored to Geneva-hosted backup node within 4 hours of Vienna receipt (see Module II for technical specifications).

1. INSPECTOR ACCESS GUARANTEE AND MANNING

5.1 Minimum Inspector Presence

Phase 0: 4 inspections per month at declared sites; minimum 2 inspectors per inspection; 1 Iranian observer optional.

Phase 1+: 6 inspections per month; 2 unannounced inspections

Challenge inspections: additional to routine quota; do not count against monthly inspection limits.

15 5.2 Inspector Qualifications

All IAEA inspectors designated under standard IAEA inspector designation procedures.

Neutral guarantor observers (Switzerland, Pakistan, Oman) may accompany up to 20% of inspections at Iranian invitation or IAEA request; observers do not participate in technical measurements but witness protocol adherence.

Iranian observers permitted at all inspections; right to file parallel observations with IAEA and governance body; Iranian observer reports included in official inspection summary. 5.3 Inspection Report Timeline

Draft inspection report: 7 days after inspection completion. Iranian technical comments: 7 days after draft receipt. Final report: 14 days after inspection completion; published to

governance body and deposited with framework secretariat.

MODULE II: CYBER-SECURITY SAFEGUARD MODULE

Operative Clause: This module establishes the cryptographic, network, and operational security architecture necessary to maintain the "Data Continuity Guarantee" — the framework's binding commitment that interrupted monitoring

data triggers technical remediation within 48 hours and full restoration within 7 days. This module governs all data transmission, storage, and processing associated with RCSA verification systems.

1. DATA CONTINUITY GUARANTEE: OPERATIVE SPECIFICATION

1.1 Guarantee Definition The Data Continuity Guarantee ensures that no verification data stream

remains interrupted for more than 48 hours without triggering automatic technical remediation protocols. The guarantee covers:

16 (a) Unattended monitoring system (UMS) data streams from declared nuclear facilities. (b) Surveillance camera feeds (NGSS and legacy systems). (c) Electronic seal state-of-health and event logs.

(d) Online enrichment monitor (OLEM) process data. (e) Environmental sample chain-of-custody tracking data. (f) Remote monitoring hub status telemetry.

1.2 Interruption Classification Class A — Technical Failure: Equipment malfunction, power loss, network outage, or software error. Triggers: automatic

fault notification to IAEA Technical Services within 15 minutes; joint technical team deployment within 48 hours. Class B — Adversarial Event: Cyber attack, physical tampering,

or deliberate data manipulation. Triggers: immediate governance body alert; IAEA incident response team activation; enhanced monitoring activation at affected

site within 12 hours. Class C — Force Majeure: Natural disaster, armed conflict proximity, or infrastructure collapse. Triggers:

automatic substituted verification activation (satellite, third-party logistics records); 7-day technical remediation window; governance body notification within

4 hours. 1.3 Remediation Timeline T+0 to +4 hours: Automatic fault detection via Roogle-3

system health monitoring. Alert issued to IAEA Department of Safeguards Operations Centers (Vienna and Geneva).

T+4 to +48 hours: Class A: Joint technical team deployed to site with

replacement equipment. Class B: Incident response and forensic

17 analysis initiated. Class C:

Substituted verification fully activated. T+48 to +72 hours: Data stream restoration or substituted verification confirmed operational.

Governance body daily status updates. T+72 to +168 hours: Full restoration of primary systems. Post-restoration integrity verification

and cryptographic re-keying completed. T+168+ hours: If restoration not achieved, automatic compliance score downgrade activates

per Verification Continuity Ladder (Module V). Substituted verification continues indefinitely until primary

1. CRYPTOGRAPHIC STANDARDS AND PROTOCOLS

2.1 Data-in-Transit Encryption

Standard: Transport Layer Security (TLS) 1.3 or higher. Mandatory Cipher Suites:

TLS_AES_256_GCM_SHA384 (AES-256-GCM authenticated encryption with SHA-384 HMAC)

TLS_CHACHA20_POLY1305_SHA256 (ChaCha20-Poly1305

authenticated encryption with SHA-256 HMAC) Key Exchange: Elliptic Curve Diffie-Hellman Ephemeral

(ECDHE) using Curve25519 or P-384; mandatory perfect forward secrecy. Certificate Authority: Multi-party certificate pinning with

certificates issued by Swiss Federal Certificate Authority (operated by SwissSign) and IAEA internal PKI; dual-path validation required.

Session Management: Maximum session duration 24 hours; forced re-authentication every 12 hours for

18 continuous data streams.

2.2 Data-at-Rest Encryption Standard: AES-256-GCM (Galois/Counter Mode) for all stored surveillance footage, seal logs, and process data.

Key Management: Hardware Security Module (HSM) based key storage; FIPS 140-2 Level 3 minimum (Level 4 recommended for Geneva backup node); keys split

via Shamir's Secret Sharing (3-of-5 threshold) across neutral guarantor states.

Integrity Verification: SHA-3-256 cryptographic hashing

for all stored data blocks; Merkle tree structure for efficient integrity audits.

Backup Encryption: All mirrored data encrypted with

separate key hierarchy from primary storage; backup keys escrowed with Swiss Federal Archives and Pakistan Atomic Energy Commission (PAEC) under

dual-control protocol. 2.3 Authentication and Non-Repudiation Digital

Signatures: ECDSA with P-384 curve or Ed25519;

applied to all inspection reports, data transmissions, and configuration changes. Multi-Factor Authentication (MFA): All remote access to

monitoring infrastructure requires hardware token + biometric verification +

time-synchronized OTP. Seal Data Authentication: Electronic seals (EOSS/RMSA)

use secret-key cryptography with 128-bit minimum key length; HMAC-SHA256 for data authentication; AES-128 encryption for event log confidentiality.

1. NETWORK INFRASTRUCTURE AND REDUNDANCY

3.1 Primary Network: IAEA RDT VPN Infrastructure Architecture: Global Virtual Private Network (VPN) using

19 IPsec/IKEv2 tunnels from facility collect computers

to IAEA Vienna headquarters. Bandwidth: Minimum 10 Mbps symmetric per facility; burst capacity to 100 Mbps for high-resolution

surveillance uploads. Routing: Strict split-tunneling; only IAEA-designated IP ranges accessible via VPN; all other traffic

blocked by facility-side firewall. Firewall Policy: Three-zone architecture per IEC 62645 guidelines — Trusted (IAEA cabinet internal), DMZ

(cameras and local sensors), Untrusted (external internet). Inter-zone policies deny all by default; permit only HTTPS (TCP/443) and VPN (UDP/4500)

outbound. 3.2 Secondary Network: Satellite Redundancy Provider: European Space Agency (ESA) or commercial

provider (Intelsat/SES) under IAEA contract. Coverage: All monitored Iranian facilities; prioritizes Natanz, Fordow, and Isfahan.

Activation: Automatic failover when primary VPN link latency exceeds 500ms for 10 minutes or packet loss exceeds 5% for 5 minutes.

Bandwidth: 2 Mbps minimum; sufficient for seal telemetry, low-frame-rate surveillance, and state-of-health data. Latency Tolerance: Up to 2-second round-trip acceptable

for non-real-time data; OLEM process data buffered locally and burst-transmitted upon link restoration. 3.3 Tertiary Network: Terrestrial Diplomatic Channel

Route: Encrypted diplomatic courier with physical media (tamper-indicating hardened drives) as last-resort data recovery path.

20 Cadence: Weekly scheduled exchange; emergency activation

within 24 hours of Class B or C event. Chain of Custody: Dual-seal protocol; IAEA seal + Swiss protecting power seal; escorted by Swiss

diplomatic courier from Tehran to Geneva. 3.4 Neutral Backup Node: Geneva Architecture Host: Swiss Federal Institute of Technology (EPFL) or

CERN-neutral facility under Swiss government custody agreement. Physical Security: Swiss Federal Police (Fedpol)

perimeter; biometric access control; mantrap entry; Faraday-shielded server vaults. System Architecture:

Real-time data mirroring: Kafka-based event

streaming with 4-hour maximum lag behind Vienna primary.

Cold storage: Air-gapped tape library with quarterly snapshots retained for 7 years.

Hot standby: Virtual machine replicas of Vienna

RDT database servers; activation within 2 hours

of Vienna system failure declaration. Network Isolation: Geneva node operates on independent ASN (Autonomous System Number) with no direct

routing to Vienna primary; data transfer via mutually authenticated SFTP over TLS 1.3 on scheduled 4-hour cycles.

1. ACCESS CONTROLS AND SEGREGATION

4.1 Role-Based Access Control (RBAC) Tier 1 — IAEA Safeguards Inspectors: Read-only access

to assigned facility data; no configuration rights. Tier 2 — IAEA Technical

Services: System configuration

21 and maintenance rights; limited to specific equipment

classes; all changes logged and dual-authorized. Tier 3 — Framework Governance Body: Sanitized compliance dashboard access; no raw surveillance imagery;

aggregated indicator scores only. Tier 4 — Neutral Guarantor Technical Auditors: Read-only access to Geneva backup node; quarterly audit

rights for system integrity verification. Tier 5 — National Technical Liaisons (Iran, U.S.): Encrypted read-only terminals in capitals showing

sanitized facility status; no raw data export. 4.2 Network Segregation VLAN separation between camera networks, seal networks,

OLEM networks, and administrative networks. Jump server required for all administrative access; sessions recorded and archived for 90 days.

No external internet access from monitoring VLANs; software updates delivered via signed USB or air-gapped transfer station.

1. CYBER INCIDENT RESPONSE AND FORENSICS

5.1 Detection Systems

Intrusion Detection Systems (IDS): Snort/Suricata-based network monitoring on all RDT VPN segments; signature and anomaly detection.

Endpoint Detection and Response (EDR): CrowdStrike Falcon or equivalent on all Windows-based collect computers; real-time behavioral analysis.

Security Information and Event Management (SIEM):

Splunk or Elastic Stack aggregating logs from all

network devices, servers, and applications; correlation rules for insider threat detection.

22 5.2 Response Playbooks

Playbook Alpha — Suspected Data Manipulation: Immediate halt of affected data stream; preserve local buffer; activate Geneva backup verification;

deploy forensic team within 24 hours. Playbook Bravo — Ransomware or destructive attack: Isolate affected systems; activate Geneva hot

standby; notify governance body and national cyber response teams (Iran NCIRC, U.S. CISA); preserve evidence for attribution.

Playbook Charlie — Physical breach of sealed cabinet: Treat as Class B adversarial event; enhance inspection frequency; replace all cryptographic

keys in affected zone; governance body review within 48 hours. 5.3 Attribution and Escalation

Cyber incidents attributed to state actors trigger framework enforcement procedures per Graduated Response Framework. Non-state actor attribution

activates Third-Party Strike Buffer Rule (72-hour standard; 12-hour reduced for active barrages) with joint investigation by Proxy Event Response Team.

1. COMPLIANCE AND AUDITING

6.1 Standards Alignment

IEC 62645:2019 (Nuclear power plants —

Instrumentation, control and electrical power

systems — Cybersecurity requirements)

IAEA NSS 33-T (Computer Security of Instrumentation

and Control Systems at Nuclear Facilities)

ISO/IEC 27001:2013 (Information Security Management

23 NIST CSF 2.0 (Cybersecurity Framework) for

cross-sector consistency 6.2 Audit Cadence

Annual vulnerability assessment by independent

third-party (Swiss or Pakistani accredited firm).

Quarterly penetration testing of VPN infrastructure

Monthly configuration audit: firewall rules,

certificate validity, access control lists.

Continuous automated scanning via SIEM correlation.

MODULE III: JOINT MONITORING OPERATIONS CENTER (JMOC)

Operative Clause: The JMOC serves as the framework's centralized technical verification and incident response hub. Its architecture reflects the RCSA design philosophy of institutional buffering, neutral administration, and political survivability. This module establishes the JMOC's physical

Integration Architecture for Nuclear Pathways

Annex Z provides the overarching framework within which the four nuclear pathways operate, establishing common provisions applicable regardless of which pathway is selected. These general provisions address verification standards, IAEA integration, procurement monitoring, and the activation conditions for each pathway. The integration architecture ensures that the

pathways, while distinct in their substantive commitments, operate within a unified institutional and legal framework that maintains coherence across the full range of architecture activities.

The Verification Standards Integration establishes baseline verification requirements that apply to all pathways, supplemented by pathway-specific additional measures. These baseline requirements include comprehensive IAEA safeguards, Additional Protocol implementation, continuous monitoring at declared facilities, and regular reporting on nuclear activities. The baseline standards ensure that even the least restrictive pathway maintains robust verification coverage, while the pathway-specific additions calibrate verification intensity to the proliferation risk associated with each pathway's authorized activities.

The IAEA Integration Protocol ensures seamless coordination between the architecture's verification mechanisms and the IAEA's existing safeguards system. This coordination prevents duplication and contradiction while leveraging the IAEA's established expertise, legitimacy, and legal authority. The protocol establishes procedures for information sharing, joint inspections, coordinated reporting, and mutual support that create genuine integration rather than parallel operation.

Procurement Monitoring and Supply Chain Controls

The procurement monitoring system tracks the flow of nuclear-related goods, materials, and technologies into and within Iran to detect any attempt to acquire capabilities beyond those authorized under the selected pathway. This system integrates national export controls, international information sharing, and private sector compliance programs into a comprehensive network that makes unauthorized procurement extremely difficult and reliably detectable.

The system employs a dual-list approach in which certain items are subject to mandatory prior authorization and others trigger automatic reporting requirements. This dual-list structure focuses intensive scrutiny on the most proliferation-sensitive items while reducing the compliance burden for items with limited weapons relevance. The lists are regularly updated to reflect technological developments and emerging procurement patterns.

Supply chain due diligence requirements extend monitoring beyond direct transactions to encompass the full supply chain through which sensitive items might transit. These requirements mandate that authorized suppliers verify the end-user and end-use of exported items, maintain records of all nuclear-related transactions, and report suspicious inquiries or orders. The due diligence framework creates accountability throughout the supply chain rather than focusing only on the final transaction.

Comparative Analysis of the Four Pathways

P>This section provides a systematic comparative analysis of the four nuclear pathways across multiple dimensions relevant to decision-making. The analysis identifies the strengths, weaknesses, tradeoffs, and optimal circumstances for each pathway. Decision-makers selecting among pathways should consider the full range of dimensions rather than focusing exclusively on non-proliferation stringency.

P>Non-Proliferation Effectiveness: Pathway B provides the highest non-proliferation assurance through complete enrichment cessation and infrastructure dismantlement. Pathway C provides strong non-proliferation through institutional substitution of national enrichment. Pathway D provides moderate non-proliferation through quantitative limits and enhanced safeguards. Pathway A provides the lowest non-proliferation assurance among the pathways, though still substantially better than unconstrained operation.

P>Political Feasibility: Pathway A is most politically feasible because it preserves some enrichment capability and phases constraints over time. Pathway D is moderately feasible because it permits limited enrichment. Pathway C is less feasible due to the institutional complexity of creating a multinational fuel bank. Pathway B is least feasible due to the comprehensiveness of its constraints, though its front-loaded benefits and sovereignty restoration provisions address feasibility concerns.

P>Breakout Timeline: Pathway B provides the longest breakout timeline because reconstitution would require rebuilding dismantled infrastructure from scratch. Pathway C provides long breakout timelines because breakout would require institutional capture of the fuel bank or development of covert national facilities. Pathway D provides moderate breakout timelines through quantitative limits that constrain how quickly material could be enriched to weapons grade. Pathway A provides shorter but still meaningful breakout timelines through centrifuge and stockpile limitations.

P>Verification Intensity: Pathway B permits the most intensive verification because all enrichment cessation can be comprehensively monitored. Pathway D also permits intensive verification through its enhanced safeguards architecture. Pathway A requires sustained verification over the extended implementation period. Pathway C requires verification of both national compliance and fuel bank operations.

P>Economic Benefits: All pathways provide substantial economic benefits through sanctions relief and normalized economic relations. Pathway B may provide the greatest benefits because its comprehensive constraints may justify the most extensive sanctions relief. Pathway C provides unique benefits through fuel bank participation that creates regional institutional stakes. Pathway D provides benefits calibrated to its more limited constraints.

Pathway A front-loads benefits to generate early political support.

P>Sovereignty Concerns: Pathway A addresses sovereignty concerns most directly through graduated constraint and eventual sovereignty restoration. Pathway D addresses sovereignty through preservation of limited national enrichment. Pathway C addresses sovereignty through collective governance that distributes rather than eliminates national control. Pathway B addresses sovereignty through the sovereignty restoration ladder and international fuel supply guarantees.

Pathway Transition and Modification Procedures

P>The architecture permits transitions between pathways under specified circumstances, providing flexibility to adapt to changing political and technical conditions. Transition procedures ensure that shifts between pathways do not create gaps in non-proliferation assurance and that transitions are politically sustainable.

P>Upward transitions from less restrictive to more restrictive pathways are encouraged and facilitated. A state that has adopted Pathway A may transition to Pathway B, C, or D if political conditions support more comprehensive constraints. Upward transitions receive enhanced benefits that reward additional constraints. Verification of upward transitions confirms that additional constraints are fully implemented before enhanced benefits are released.

P>Downward transitions from more restrictive to less restrictive pathways are permitted only under exceptional circumstances and with enhanced verification. Downward transitions may be warranted by fundamental changes in the security environment, technological developments that alter proliferation calculations, or political developments that make the existing

pathway unsustainable. Downward transitions require Governance Body approval and IAEA assessment.

P>Pathway modification within an existing pathway permits adjustment of specific parameters without changing the overall pathway architecture. Modifications may adjust quantitative limits, timelines, benefit structures, or verification arrangements. Modifications require technical assessment confirming that non-proliferation assurance is maintained, political agreement among affected parties, and IAEA verification of modified arrangements.

Proliferation Risk Assessment Methodology

P>The proliferation risk assessment methodology employed to evaluate pathway effectiveness examines multiple risk dimensions that collectively determine the probability and consequences of proliferation. The methodology is designed to provide comprehensive, objective, and transparent assessment that informs pathway selection and implementation decisions.

P>Technical capability assessment evaluates the technical resources and infrastructure available for weapons program development. Assessment considers enrichment capability, weaponization expertise, delivery system capability, and fissile material stockpiles. Pathway constraints directly affect technical capability by limiting available resources and infrastructure.

P>Political will assessment evaluates the likelihood that leadership would choose to pursue weapons development if technically capable. Assessment considers strategic motivations, security environment, international pressures, and domestic political factors. Pathway benefits indirectly affect political will by altering the cost-benefit calculation for weapons pursuit.

P>Detection probability assessment evaluates the likelihood that any attempt at proliferation would be detected before achieving weapons capability.

Assessment considers verification capabilities, intelligence capabilities, and the inherent detectability of weapons program activities. Pathway verification arrangements directly affect detection probability.

P>Response effectiveness assessment evaluates the likelihood that detected proliferation would be successfully interrupted before weapons completion. Assessment considers response mechanisms, international political will, and the time available for response. Architecture consequence mechanisms and international political dynamics affect response effectiveness.

ANNEX TD

appearance of adversarial parties required (statements may be pre-recorded and played sequentially).

Social media coordination: Pre-approved

graphics, infographics, and short video content provided to all parties'

communications teams to ensure visual consistency even when verbal framing differs. 12.8 Narrative Violation Enforcement

If a party makes a public claim about the

framework that contradicts operative provisions (e.g., Iran claiming "sanctions abolished" when they're conditionally suspended): +0.5 CIS

procedural penalty; governance body issues factual correction via transparency portal.

If narrative violation persists after 2

corrections within 90 days: +1.0 CIS penalty; party required to submit revised communications guidance to governance body for pre-clearance.

Narrative penalties are "soft" — they do NOT

trigger benefit suspension or Penalty Ladder escalation. They're reputation and credibility

costs designed to incentivize factual accuracy, not to punish political speech.

12.9 Internal Opposition Management

Each party receives confidential guidance for managing domestic opposition:

58 For U.S. Administration:

Emphasize that framework is "Trump's maximum pressure PLUS verification" — not a return to JCPOA.

Point to Saudi/Emirati participation as

Highlight that Israeli security concerns

are addressed through IAEA challenge

inspections and proxy caps. For Iranian Government:

Emphasize sovereignty milestones (Section

8) as visible trajectory toward autonomy.

Frame IHTA as ending U.S. unilateral Hormuz

Highlight medical isotope production as

scientific achievement, not concession. For Saudi Leadership:

Emphasize PIF institutional binding as

Frame investment as building Saudi regional

leadership, not subsidizing Iran.

Highlight Yemen reconstruction as exit from

This addendum is classified Tier 1 (must survive in any framework version).
 Individual sections may be amended via Silence Procedure (72-hour auto-
 adoption) for technical clarifications. Structural

changes to the dual-key system, mirror licensing regime, or graceful
 degradation protocol require governance body consensus. Narrative packages
 (Section 12) may be updated quarterly by the

Communications Cell without governance body vote, but factual accuracy
 review by governance body secretariat required.

60 Annex TD: True Deadlock Protocol

Document Identifier: RCSA-AddB-v1.5

Classification: Framework Stress-Tested Hardening Protocols Depositary: UN Secretary-General (upon framework entry into force) Preparation Date: 2026

Integration Note: All provisions in this addendum cross-reference to existing RCSA modules. Amendment of any cross-referenced module requires simultaneous review of relevant Addendum B sections for

Annex TD: True Deadlock Protocol

This annex defines a three-phase emergency authority—Guarantor Joint Authority, Technical Committee Provisional Authority, and UN Secretary-General Advisory Mandate—for cases where the governance body, neutral chair, and override path all stall simultaneously, specifying who acts, on what timeline, and under what temporary authority.

Triple-Stall Definition

The true deadlock protocol addresses the rare but catastrophic scenario in which the governance body cannot reach consensus, the neutral chair cannot propose a viable compromise, and the weighted-majority override path is blocked (e.g., one party boycotts sessions, or the required supermajority threshold cannot be met). This 'triple stall' is the framework's ultimate failure mode, and this annex provides a structured emergency response rather than leaving the framework to collapse through procedural exhaustion. Triple stall is formally declared when: (a) the governance body has failed to reach consensus after three formal attempts separated by at least 14 days each; (b) the neutral chair has issued two written compromise proposals, both rejected; (c) a weighted-majority override vote was attempted but failed to achieve the required threshold; and (d) the automatic procedural fallback has already cycled twice without resolution. The triple-stall declaration is issued by the

governance body secretariat after consulting all parties and guarantors.

Emergency Authority Activation

Upon triple-stall declaration, the following emergency authority activates in sequence: Phase 1 (Days 1-7): Guarantor Joint Authority. The three guarantors (Oman, Switzerland, Pakistan) convene as an emergency board with limited operational powers. Phase 2 (Days 8-30): Technical Committee Provisional Authority. If

61 Annex TD: True Deadlock Protocol

guarantor joint authority cannot resolve the deadlock, the framework's standing technical committees (nuclear, economic, humanitarian, security) are empowered to issue provisional operational directives. Phase 3 (Days 31-90): UN Secretary-General Advisory Mandate. If technical committee authority fails, the matter is referred to the UN Secretary-General under a pre-negotiated advisory mandate that includes binding interim measures for preservation of the status quo.

62 Annex TD: True Deadlock Protocol

Table EN-3: Table EN-3: Triple-Stall Emergency Authority Phases

Phase Actor Powers Limitations Sunset

Phase 1: Guarantor Oman + Extend maintain preserve authorize Joint Authority Switzerland + deadlines by 30 monitoring escrow emergency Pakistan days humanitarian (unanimous corridors decisions only)

Cannot alter 30 days enrichment caps, sanction or unsanction, release committed funds, or authorize military response

Phase 2: Technical Standing Issue adjust corridor approve minor Committee technical provisional routing budget Provisional committees (two- monitoring

reallocations Authority thirds majority) standards under \$5M

Cannot alter 30 days framework structure, create new obligations, or suspend benefits exceeding \$10M

Phase 3: UN SG UN Secretary- Issue binding appoint recommend Advisory Mandate General + interim independent arbitration designated measures for fact-finding special status-quo panel representative preservation

Cannot impose 60 days permanent solutions, override national law, or authorize enforcement

63 Annex TD: True Deadlock Protocol

Interim Measures and Status Quo Preservation

During all three phases of emergency authority, the default rule is 'maintain and preserve.' All existing obligations continue at current levels. All existing benefits continue at current levels. No new obligations are created. No new benefits are activated. Monitoring and verification continue uninterrupted. Escrow accounts remain locked. Humanitarian corridors remain open. The only permitted changes are: deadline extensions (up to 30 days per extension); minor operational adjustments (corridor routing, meeting scheduling, reporting formats); and emergency humanitarian measures (corridor surge, medical evacuation priority). Any party that unilaterally alters its behavior during triple-stall emergency authority—whether by escalating military activity, suspending verification cooperation, or freezing escrow without authorization—is subject to automatic compliance indicator adjustment (+2.0 points) and may be referred to the UN Security Council by any other framework party or guarantor under the framework's deposited status with the UN.

Exit from Triple Stall

Triple stall is resolved and emergency authority terminates upon any of the following: (a) the governance body reaches consensus on the stalled matter; (b) a weighted-majority override vote succeeds after a cooling- off period; (c) the parties jointly request termination of emergency authority and return to normal governance; or (d) the UN Secretary-General's advisory mandate expires and the parties agree to refer the matter to binding arbitration under the framework's tiered arbitration architecture.

If triple stall persists beyond 90 days without resolution, the framework enters 'Hibernation Mode.' In hibernation: all phase advancement freezes; all new project approvals freeze; all benefit tranche activations freeze; monitoring and verification continue; humanitarian floor obligations continue; and the governance body meets monthly instead of weekly for status preservation only. Hibernation Mode is not framework collapse; it is a procedural coma designed to prevent unilateral exit while preserving framework infrastructure. Exit from hibernation requires consensus on the originally stalled matter plus a separate governance body vote to reactivate normal operations.

64 Core Bilateral Layer: Nuclear and Verification

The nuclear provisions establish verifiable constraints on enrichment activity while preserving Iran's sovereign right to peaceful nuclear energy. These provisions are designed to be distinguishable from previous agreements through their narrower scope, shorter duration, and modular character.

Enrichment and Stockpile Provisions

Iran commits to the following measures during the initial phase:

Enrichment Suspension

Current enrichment level capped at 3.67 percent (current operational level) No

enrichment activity above 3.67 percent for the duration of Phase 0 Current stockpile frozen; no additional production above agreed baselines

All enrichment confined to declared facilities under continuous monitoring

Declaration and Baseline

Complete declaration of all nuclear facilities within 30 days of agreement entry into force IAEA baseline inspection within 45 days

Environmental sampling at all declared sites

No undeclared site access requirement during Phase 0; only declared sites subject to inspection

Continuity of Knowledge

Continuous cameras and seals at all declared enrichment, storage, and fuel fabrication locations

Weekly data transmission to IAEA Vienna

Monthly trilateral review of monitoring data

Facility Conversion Framework

The Fordow facility is designated for conversion to an International Medical Isotope Research Centre. This conversion serves multiple purposes: it removes enrichment infrastructure from a fortified location, creates legitimate civilian economic activity, and embeds the facility in the global medical supply chain.

Core Bilateral Layer: Nuclear and Verification

Fordow Conversion Specifications

All military personnel withdraw upon conversion; access limited to civilian nuclear medicine researchers All enrichment infrastructure removed or placed in sealed storage under Iranian custody Centre operated by Iran's

Atomic Energy Organisation with international scientific advisory board

Priority access to WHO and IAEA-related health initiative funding

Reconversion to enrichment requires unanimous governance body consent and IAEA certification of legitimate civilian need

Enriched Uranium Disposition

As a voluntary confidence-building measure, Iran commits to reduce its stockpile of higher-enriched uranium in two equal tranches over 12 months. Tranche One (50 percent) is exported or diluted within 90 days. Tranche Two is completed by Month 12. Upon certification of compliance, all remaining enrichment infrastructure above the 3.67 percent capacity threshold is converted by Month 24.

IAEA Monitoring Architecture

All IAEA monitoring under this framework is conducted pursuant to internationally standardized safeguards protocols comparable to those applied to all NPT state parties with Additional Protocol obligations. Both parties commit to describing IAEA access in public communications as routine compliance parity rather than exceptional surveillance.

Normalization Framing

Iran's verification obligations are comparable to those of Brazil, Argentina, South Africa, and other advanced safeguard states. IAEA access is routine, not punitive. Transparency is mutual, not unilateral, with the United States providing reciprocal force posture transparency notifications consistent with agreed terms.

Managed Access for Sensitive Sites

For sites under military command, complementary access inspections are

coordinated through Iran's Supreme National Security Council. IAEA may request physical access with escort, environmental sampling by neutral third party, or remote monitoring installation. Iran shall accept at least one method per request. A single denial of access does not constitute a compliance concern. A sustained pattern of denial across

2 Core Bilateral Layer: Nuclear and Verification

multiple requests may be reviewed by the governance body. Inspection teams may include an Iranian national observer with the right to file observations if agreed protocols are not followed.

Dynamic Enrichment Cap and Stockpile Control

The enrichment framework is structured as a dynamic cap ladder rather than a fixed ceiling: Phase 0: 3.67% cap with zero enrichment above baseline Phase 1: Conditional increase to 5% for civilian research reactor fuel, provided Iran accepts external fuel supply guarantees from at least two Nuclear Suppliers Group states Phase 2: Conditional increase to 10% for medical isotope production, provided production occurs at the Fordow International Medical Isotope Research Centre under international advisory board oversight Phase 3: Full civilian-grade equilibrium (up to 20% for specific research programs) subject to IAEA

Board of Governors approval and fuel supply assurance

Stockpile Ceiling + Time Cap: Maximum 300 kg LEU equivalent at any time. Material must be downblended or exported every 90 days if stockpile approaches 80% of ceiling. Automatic downblending trigger: if stockpile exceeds 250 kg, conversion to sub-2% uranium must begin within 14 days. Breakout Time Floor: The framework maintains a minimum 9-12 month breakout timeline at all phases. If technical developments (new centrifuge

models, efficiency improvements) threaten to compress breakout time below 9 months, the governance body convenes to recalibrate caps or centrifuge numbers to restore the floor.

Centrifuge and Facility Controls

Advanced Centrifuge Freeze: IR-2, IR-4, IR-6 machines are sealed, tagged, and inventoried. Limited R&D is permitted at the Natanz Pilot Fuel Enrichment Plant only, with IAEA continuous monitoring. All other advanced machines remain in storage. Centrifuge Production Transparency: Full accounting of manufacturing sites, storage locations, and spare parts. Monthly reporting to IAEA and governance body. Any new production facility must be declared 180 days before operational. Facility Function Lock: Natanz = enrichment only; Fordow = non-enrichment (medical isotope); Isfahan = conversion and fuel fabrication. Changing facility function requires governance body unanimous approval and IAEA technical certification. Underground Facility Restriction: No new hardened underground enrichment sites. Any new underground construction within 50 kilometers of an existing declared site triggers automatic IAEA inspection within 72 hours.

Enhanced Verification Architecture

Continuous Monitoring Redundancy: Cameras + satellite monitoring + environmental sampling + data mirroring to neutral backup node (Geneva). No single failure blinds the verification system.

3 Economic Measures and Banking Architecture

Data Continuity Guarantee: If monitoring data is interrupted for more than 48 hours, automatic compliance score downgrade activates. Mandatory restoration within 7 days. If not restored, substituted verification (satellite, sampling) activates. Inspector Access Guarantee: Minimum 4 inspections per

month at declared sites. Refusal of more than 2 inspections in a 30-day period triggers automatic escalation to Step 2 of the enforcement ladder. Undeclared Site Challenge: IAEA may request access to suspicious sites within 72 hours. Iran must permit at least one verification method: physical access with escort, environmental sampling by neutral third party, or remote monitoring installation. Remote Monitoring Hub: Real-time data is mirrored to IAEA Vienna and a neutral backup node (Geneva-hosted) to prevent data loss during disputes.

External Custody and Material Accounting

Optional External Custody: Iran may voluntarily transfer enriched uranium stockpile above the 300 kg ceiling to Oman or Pakistan for joint custody. Material remains Iranian-owned, stored under IAEA seal, with reversible drawdown available upon 30-day notice, verified reactor need, and governance approval. Full Material Balance Sheet: Every gram of uranium is tracked from mining through processing, enrichment, storage, and disposition. Updated monthly and published in the Transparency Summary. Legacy unresolved material issues must be disclosed or formally closed with IAEA explanation within 180 days of framework entry. Section 123 Agreement Commitment The United States commits to: launch peaceful nuclear cooperation negotiations on Day 1; announce agreed terms within 30 days; guarantee reactor fuel supply at market rates; and secure parallel supply assurances from at least one additional Nuclear Suppliers Group state. The agreement is a political commitment, not a treaty, but is deposited with the UN as a framework-linked instrument.

Economic Measures and Banking Architecture

The economic provisions are structured as graduated, conditional relief that is explicitly reversible. This framing is politically essential: it allows both

governments to characterize relief as temporary and contingent upon verified compliance.

Relief Sequencing and Structure

Relief is delivered in three tranches, each contingent on verified performance in the prior tranche: Table 3 Sanctions Relief Tranches

4 Economic Measures and Banking Architecture

Tranche Timeline Scope Estimated Value

Tranche Days 1-30 Humanitarian and medical goods; aviation fuel for \$500M-1B annually 1 civilian flights Tranche Days 31-90 Banking channel restoration; SWIFT reconnection for Transaction capacity: \$100M 2 humanitarian trade per transfer Tranche Days 91- Conditional sectoral relief: agriculture, \$2-3B annually 3 180 petrochemicals, minerals

The following sectors remain excluded from Phase 0 relief:

Oil and energy sector sanctions

Bank sectors beyond the single correspondent relationship

Sovereign asset releases

Defense sector sanctions

These exclusions reflect political realities: humanitarian relief is defensible in current legislative environments; sweeping sectoral relief requires broader political consensus.

Banking Channel Mechanisms

A single correspondent bank (proposed: major Swiss institution) serves as the Phase 0 banking channel. Structure: Iranian Central Bank opens account; bank processes humanitarian and medical trade payments All transactions

monitored by U.S. Treasury through automated filtering Suspicious transactions flagged and reviewed within 48 hours No discretionary blocking; only algorithmic filtering for sanctioned items

Oversight Architecture

Quarterly trilateral review (Iran, United States, correspondent bank)

5 Verification Continuity and Compliance

Monthly transaction logs available for cross-verification

Any sanctions-busting attempt results in channel closure and reversion to baseline

Treasury Pre-Clearance Mechanism

The single most common reason sanctions relief commitments fail to produce real economic benefit is not political will but legal and administrative uncertainty. Banks and companies fear retroactive designation and unclear safe harbor. The following mechanisms address this directly:

Safe Harbor Provisions

Treasury issues formal written guidance establishing pre-cleared legal pathways for permitted transactions Financial institutions may request pre-clearance determinations within 30 days; written positive response constitutes protection against subsequent designation Congressional notification (not approval) provided to relevant committees at least 15 days before each relief tranche If legislative action blocks a specific relief commitment, an alternative mechanism of equivalent economic value is proposed within 30 days

Retroactive Protection

Any company engaging in transactions authorized under this framework shall not be designated or penalized for those specific transactions, even if the

framework subsequently lapses. Contracts executed under framework authorization remain protected for 24 months following any suspension, provided they were entered into in good faith.

Verification Continuity and Compliance

The framework's verification architecture is designed to prevent the accidental escalation that occurs when monitoring equipment fails, data networks break, or inspectors face access delays. Most verification failures in international agreements stem from non-hostile causes: equipment malfunction, weather, or logistical delays. The Verification Continuity Ladder creates structured breathing room before political escalation.

6 Verification Continuity and Compliance

Verification Continuity Ladder

Figure 3 — Verification Continuity Ladder Graduated response framework for verification gaps. Stage One (Days 1-7): Technical Remediation — joint technical team deployed, no compliance adjustment. Stage Two (Days 8-14): Substituted Verification — satellite monitoring and alternative methods activated. Stage Three (Days 15-30): Limited Continuity Assumption — benefits continue at 75% while enhanced monitoring maintained. Upon restoration at any stage, monitoring returns to standard frequency and benefits to 100%. Figure 3: Graduated Response Framework Stage One: Technical Remediation (Days 1-7) Upon identification of a verification gap, camera malfunction, or communications interruption: Joint technical team deployed within 48 hours Repair or replacement of failed equipment; alternative data sources activated

Daily reporting to governance body

No compliance indicator adjustment; no economic impact during Stage One
Stage Two: Substituted Verification (Days 8-14) If technical team unable to

restore equipment within 7 days: Alternative methods activated: satellite monitoring, environmental sampling, third-party logistics records

Expanded complementary access inspections

Neutral technical advisors from standing pool states may assist

Weekly governance body review

Stage Three: Limited Continuity Assumption (Days 15-30) If substituted verification unable to confirm facility status after 14 days: Temporary assumed compliance within defined bounds based on most recent verified data Benefits continue at 75 percent of scheduled amounts

Enhanced monitoring maintained at Stage One intensity

If verification not restored within 30 days, governance body convenes formal assessment Once verification is restored at any stage, monitoring returns to standard frequency, benefits return to 100 percent, and no lasting breach designation is recorded.

7 Compliance Indicators System

The governance body maintains a Compliance Indicators System that tracks implementation performance across four domains: Table 4 Compliance Indicator Domains and Weights

Domain Weight Indicators

Nuclear and 3 points per Enrichment compliance, IAEA access, stockpile status, facility Verification indicator conversion, supply chain transparency Security and Proxy 2 points per Proxy operational activity, maritime incidents, militia compliance, indicator force deployment status Economic and 2 points per Relief delivery, asset release, banking functionality, transit operational Sanctions indicator status, market reintegration Humanitarian and 1 point per

Humanitarian access, reconstruction disbursement, ceasefire trends,

Regional indicator local governance legitimacy

5.0 cumulative: Enhanced review activated 8.0 cumulative: Formal compliance assessment triggered 12.0 cumulative: Snapback consideration threshold
These thresholds are indicative, not automatically dispositive. The governance body exercises judgment at each level.

Pattern-of-Concern Designation

Three or more indicators of concerning activity across two consecutive review cycles, demonstrating a coordinated pattern rather than isolated incidents, may be designated a "pattern of concern." This designation activates enhanced monitoring and requires an explanatory briefing but does not automatically trigger economic or security consequences. It is recorded in the Precedent Registry and informs future compliance assessments.

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA) Verification & Technical Architecture Modules

Version 1.5 — Hardened Operational Update

Module I: IAEA Integration Annex Module II: Cyber-Security Safeguard Module
Module III: Joint Monitoring Operations Center

Module IV: Escrow and Disposition Annex Module V: Technical Verification and Remediation Pathways

MODULE I: IAEA INTEGRATION ANNEX

Operative Clause: This annex governs all IAEA verification activities conducted under the RCSA framework. It establishes managed access protocols, the dynamic

enrichment cap ladder, challenge inspection mechanics, and facility-specific

verification parameters. All provisions herein operate from Phase 0 entry and are binding on framework parties regardless of phase status.

1. MANAGED ACCESS PROTOCOL FOR SENSITIVE SITES

1.1 Scope of Application Managed access procedures apply to all declared nuclear facilities under

framework monitoring, including but not limited to: Natanz Fuel Enrichment Plant (FEP), Natanz Pilot Fuel Enrichment Plant (PFEP), Fordow Fuel Enrichment Plant (FFEP), and Isfahan Uranium Conversion Facility (UCF).

1.2 Access Methodology Tranche For any site request, the IAEA shall specify the verification modality from the following ordered tranche:

(a) Physical access with facility escort (b) Environmental sampling by neutral third-party technicians (c) Remote monitoring installation or inspection of existing systems

Iran shall accept at least one method per request. A sustained pattern of 9 denial across three consecutive requests triggers automatic governance body review under the Verification Continuity Ladder (see Module V). 1.3 Challenge Inspection Protocol (72-Hour Window) The IAEA may request access to suspicious undeclared sites within 72 hours.

The procedure sequence is: T+0 hours: IAEA Director General or designated Deputy Director General for Safeguards transmits formal access request to Iran's

Permanent Representative to the IAEA and to the framework governance body secretariat simultaneously. T+0 to +24: Iran confirms receipt and designates acceptance modality.

If Iran disputes the technical basis, a joint technical clarification

teleconference convenes within 12 hours. T+24 to +48: For physical access: inspector team assembles at designated

entry point (Vienna dispatch, Dubai pre-position, or Tehran diplomatic courier). Team composition: minimum 2 IAEA inspectors, 1 neutral guarantor observer (Switzerland or

Pakistan), and 1 Iranian national observer with right to file independent observations. T+48 to +72: Access execution. Maximum on-site duration: 8 hours.

Environmental sample chain-of-custody requires dual-seal protocol (IAEA primary seal + neutral observer secondary seal). Samples split three ways: IAEA Vienna laboratory,

neutral backup laboratory (Geneva), and Iranian retained aliquot. T+72+: If access is not executed within 72 hours, the request

escalates to the governance body Verification Liaison Sub-Committee for compliance review. Denial without accepted alternative modality constitutes a Tier 2

compliance concern. 1.4 Military Site Specifics For sites under military command or co-located with military installations,

10 complementary access is coordinated through Iran's Supreme National Security

Council (SNSC). The IAEA shall provide: specific technical basis for the request; estimated scope of access; and guaranteed Iranian observer participation. Military site access does not extend to active weapons

storage or operational command rooms unrelated to nuclear fuel cycle activities.

1. DYNAMIC CAP LADDER VERIFICATION

2.1 Phase 0: Baseline Cap (3.67% U-235) Verification Protocol:

Continuous online enrichment monitoring (OLEM) at Natanz FEP and PFEP. IAEA Next Generation Surveillance System (NGSS) cameras with tamper-indicating housings, 3-layer cryptographic protection, and active tamper indication mechanisms.

Electronic Optical Sealing System (EOSS) or Remotely Monitored Sealing Array (RMSA) on all centrifuge cascade headers and feed

Weekly transmission of authenticated, encrypted surveillance and seal data to IAEA Vienna via Remote Data Transmission (RDT) virtual private network (VPN) tunnels.

Monthly on-site inspection: minimum 4 inspections per month at declared sites. Refusal of more than 2 inspections in a 30-day period triggers automatic escalation to Step 2 of the Graduated

Response Framework. Inspector Verification Criteria for 3.67% Cap:

Cascade configuration audit: declared IR-1 centrifuge count and arrangement verified against design information.

Feed and product sampling: UF₆ samples analyzed via multi-collector inductively coupled plasma mass spectrometry (MC-ICP-MS) or thermal ionization mass spectrometry (TIMS) for isotopic composition.

The Four-Phase Deadlock Resolution Sequence

Annex TD addresses the critical challenge of maintaining architecture

functionality when parties reach genuine deadlock on matters essential to continued operation. The protocol establishes a four-phase sequence that progressively separates the parties while preserving the most essential cooperation elements. This structured separation prevents deadlock from collapsing the entire architecture while creating conditions for eventual reconciliation.

Phase One, Structured Standstill, freezes all architecture activities at their current levels while maintaining communication channels and institutional presence. During this phase, no new commitments are made, no benefits are expanded, and no compliance determinations are issued, but existing arrangements remain fully operational. The standstill period is limited to ninety days, providing time for diplomatic resolution without permitting indefinite paralysis.

Phase Two, Modular Suspension, permits parties to suspend non-essential architecture modules while maintaining core security commitments and humanitarian protections. This selective suspension reduces the scope of disagreement by eliminating peripheral matters while preserving the essential cooperation that sustains the broader relationship. The modular suspension is subject to notification requirements and proportionality constraints that prevent abuse.

Phase Three, Core Commitment Ring-Fence, establishes a minimal cooperation framework that preserves only the most essential commitments: nuclear constraints, maritime safety, and humanitarian access. This ring-fence represents the irreducible minimum below which cooperation cannot decline without triggering full termination procedures. The ring-fence is designed to survive even severe crises, providing a foundation upon which broader cooperation can be rebuilt.

Phase Four, Managed Separation, provides orderly procedures for full architecture termination if reconciliation proves impossible. Unlike abrupt withdrawal, managed separation addresses the disposition of ongoing obligations, the distribution of institutional assets, the protection of acquired rights, and the maintenance of minimal bilateral communication channels. This orderly approach prevents the chaos and recrimination that typically accompany agreement collapse.

H2>True Deadlock Resolution Mechanisms

P>The True Deadlock Protocol addresses situations in which architecture parties reach genuine deadlock on matters that affect continued operation. The protocol recognizes that deadlock is a normal feature of multilateral cooperation and provides structured procedures for managing deadlock without allowing it to collapse the entire architecture.

P>Deadlock identification procedures distinguish genuine deadlock from temporary disagreement or tactical delay. Genuine deadlock exists when parties have engaged in good-faith consultation for specified periods without achieving resolution and when continued deadlock would impair essential architecture functions. Identification requires assessment by the Executive Secretary or designated mediator.

P>Deadlock breaking procedures include mediation by the Executive Secretary, referral to the BAP for binding resolution, and activation of the Weighted Majority Override mechanism. These procedures provide escalating options that enable resolution without requiring parties to abandon positions voluntarily.

P>Deadlock accommodation procedures enable the architecture to continue functioning around deadlock on specific issues. Accommodation may involve parallel but unilateral implementation, third-party administration of disputed

functions, or temporary suspension of deadlocked issues while continuing cooperation on other matters.

H2>Managed Separation Procedures

P>When deadlock proves irreconcilable and architecture continuation becomes impossible, the managed separation procedures ensure orderly termination that protects the interests of all parties and preserves foundations for future cooperation.

P>Termination notification requires formal notification to the depositary specifying the grounds for termination and the effective date. Notification triggers specified procedures for winding down architecture activities, distributing assets, and addressing ongoing obligations.

P>Asset distribution addresses the disposition of architecture institutional assets including facilities, equipment, and financial reserves. Distribution follows agreed formulas that consider contribution levels, usage patterns, and the needs of continuing activities. Assets that cannot be distributed equitably may be sold with proceeds distributed according to agreed formulas.

P>Ongoing obligation preservation ensures that certain commitments including nuclear constraints, environmental protections, and financial obligations survive architecture termination. Survival provisions are specified in the treaty and its annexes. Surviving obligations are enforceable through international law mechanisms independent of the architecture.

P>Post-termination communication channels preserve minimal diplomatic and technical communication channels that enable eventual re-engagement. These channels include liaison offices, technical hotlines, and periodic diplomatic contact at specified levels. Channel preservation prevents complete relationship severance that would make future re-engagement more difficult.

ANNEX ES

disclose ultimate beneficial ownership; shell companies and anonymous entities

1. ANTI-CORRUPTION AND AUDIT ARCHITECTURE

4.1 Mandatory End-Use Verification

All RDF disbursements >\$1 million subject to

end-use verification: independent auditor confirms funds were used for declared purpose

within 90 days of disbursement.

Physical verification: Auditor visits project

site; photographs; interviews beneficiaries; cross-checks procurement records.

Discrepancy threshold: >5% variance between

declared and actual use triggers investigation; >15% variance triggers automatic suspension

of contractor eligibility and governance body

4.2 Procurement Transparency

All RDF-funded procurement conducted through

World Bank standard procurement procedures

(open international competitive bidding preferred; limited international bidding for small contracts < \$1M).

Procurement notices published on UN Global

Marketplace and framework transparency portal.

Bid evaluation criteria published in advance;

no post-bid modification.

Winning bid and contract value published within

National preference: Up to 15% price

preference for bids from framework-affected states (to build local capacity).

4.3 Strict Exclusion List

The following categories of entities are permanently excluded from RDF contracts, procurement, and financial transactions:

Entities on UN Security Council sanctions

Entities designated by U.S. OFAC, EU, or UK

HM Treasury sanctions (unless specifically

licensed under White Channel or framework general license).

Entities with >25% ownership by IRGC, Quds

Force, or other designated terrorist organizations.

Entities with documented history of fraud,

92 corruption, or sanctions evasion in World

Bank or UN procurement.

Shell companies and entities with undisclosed

beneficial ownership.

Entities involved in weapons proliferation

(nuclear, chemical, biological, or missile technology).

Exclusion appeal: Excluded entity may appeal to BAP Expedited Track within 30 days; BAP may lift exclusion if entity demonstrates

remediation and neutral third-party compliance certification. 4.4 Anti-Corruption Enforcement

World Bank Integrity Vice Presidency (INT)

conducts proactive integrity reviews of RDF projects.

Anonymous reporting hotline: Web, phone, and

mail channels for reporting corruption in RDF-funded projects; managed by independent ombudsman (Swiss national, appointed by

Swiss Federal Council).

Confirmed corruption: Contractor debarred

from all RDF and World Bank procurement

for minimum 3 years; funds recovered via escrow deduction or legal action; case referred to national authorities for

criminal prosecution.

Governance body member corruption: Automatic

removal; +3.0 CIS procedural penalty to member's state; replacement appointed within

93 MODULE II: SANCTIONS SYNCHRONIZATION MODULE

Operative Clause: This module establishes the "more-for-more" compliance ladder that replaces the flawed all-or-nothing sanctions relief model of

previous agreements. It maps specific nuclear, proxy, and verification compliance milestones directly to discrete sanctions relief tranches, creates a

credible but dispute-resolvable snapback mechanism, protects commercial continuity for framework-compliant investors, and establishes step-by-step procedures for Iranian banking re-engagement with the international financial system. This module is classified Tier 1.

1. TRANCHE-BASED RELIEF ARCHITECTURE

1.1 Sanctions Tranche Map The following eight tranches constitute the complete sanctions relief

pathway. Each tranche is unlocked by a specific verified compliance milestone and releases a defined scope of economic benefit. Tranches are sequential — Tranche N+1 unlocks only after Tranche N is fully operational and verified.

Tranche 0 — Pre-Entry (Framework Signature to Entry into Force):

Humanitarian-only relief: White Channel OFAC general

license activated (see Humanitarian Modules, Module III).

Medical supply and food export licenses to Iran

UN humanitarian agency banking transactions with

Iranian financial institutions permitted.

IAEA inspector travel visa facilitation. No commercial or financial sanctions relief.

Tranche 1 — Phase 0 Verified Compliance (90 days): Milestone: 90 consecutive days of verified 3.67% cap

94 compliance; IAEA inspector access at declared sites

without obstruction; all declared centrifuges under seal and camera coverage.

Relief delivered:

\$1 billion asset micro-tranche release (Sub-Fund

1 to RDF Window B for Iranian civilian infrastructure).

Authorization for Iranian export of carpets,

pistachios, caviar, and foodstuffs to U.S. market.

Authorization for sale of commercial passenger

aircraft and spare parts to Iran (civil aviation

Lifting of sanctions on Iranian gold and precious

Lifting of sanctions on Iranian automotive sector. EU and UK equivalent relief activated in parallel.

Tranche 2 — Banking Channel Tier 1 (Phase 0 + 180 days): Milestone: 180 consecutive days of Phase 0 compliance; no data continuity guarantee violations >48 hours;

first quarterly Transparency Summary published. Relief delivered:

Authorization for one designated Iranian bank

(Bank Melli Iran or Central Bank of Iran nominee) to establish a correspondent relationship with a neutral jurisdiction bank

(Swiss National Bank-accredited institution).

Permitted transactions: Humanitarian-related

payments; RDF project disbursements; IAEA

operational funding; diplomatic mission banking.

SWIFT "restricted access" code for the

95 designated bank — message transmission for

permitted categories only.

Lifting of sanctions on provision of

specialized financial messaging services to

the designated Iranian bank. Tranche 3 — Phase 1 Transition (5% Enrichment Cap): Milestone: IAEA certification of 5% enrichment cap;

external fuel supply guarantee deposited; enhanced monitoring (unannounced inspections) operational for 90 days without incident.

\$2 billion asset micro-tranche release. Authorization for Iranian petrochemical exports

at Phase 1 volume cap: 500,000 barrels per day (bpd) oil equivalent.

Revenue escrow: 30% of petrochemical export

revenue deposited in RDF-monitored escrow account (released quarterly upon compliance

Lifting of sanctions on Iranian port

operations (excluding military ports).

Lifting of sanctions on Iranian shipping and

shipbuilding sectors for commercial vessels.

Insurance and reinsurance for Iranian

commercial shipping permitted.

Tranche 4 — Banking Channel Tier 2 (Phase 1 + 12 months): Milestone: 12 months of verified Phase 1 compliance; no CIS score above 5.0 for 90 consecutive days;

first proxy freeze zone established and verified. Relief delivered:

Expansion to three designated Iranian banks

96 with correspondent relationships.

Permitted transaction categories expanded to

include: commercial trade payments for permitted goods; RDF contractor payments;

energy sector joint venture capital transfers; educational and cultural exchange funding.

SWIFT access expanded to "standard commercial"

code for designated banks.

EU and Asian correspondent banks may establish

relationships with designated Iranian banks

without U.S. secondary sanctions threat (explicit OFAC guidance published).

Lifting of sanctions on transactions in

Iranian rials outside Iran. Tranche 5 — Phase 2 Transition (10% Medical Enrichment): Milestone: IAEA certification of Fordow IMIRC

conversion initiation; 10% enrichment operational for 90 days without incident; all 10% product converted to oxide/metal within declared timeline.

\$3 billion asset micro-tranche release. Petrochemical export volume cap raised to

1.0 million bpd oil equivalent.

Revenue escrow reduced to 20% (from 30%). Authorization for Iranian mineral exports

(iron ore, copper, zinc) to international markets.

Lifting of sanctions on Iranian sovereign debt

issuance (international bond markets) for

infrastructure financing only.

97 World Bank/IMF lending operations to Iran

resumed (subject to standard conditionality). Tranche 6 — Banking Channel Tier 3 (Phase 2 + 18 months): Milestone: 18 months of verified Phase 2 compliance;

Fordow IMIRC conversion 50%+ complete; Iraq PMF Stage 1 integration certified; no proxy mass-casualty event for 12 months.

Full SWIFT membership restored for five

designated Iranian banks (not all Iranian

banks — designation subject to anti-money laundering and counter-terrorism finance compliance certification by FATF-aligned auditor).

Permitted transaction categories expanded to

include: general commercial trade; foreign direct investment repatriation; intellectual

property licensing; tourism and hospitality services.

U.S. dollar transactions with Iranian banks

permitted for all non-sanctioned categories (explicit OFAC general license).

Iranian banks may open branches in

framework partner states (subject to host state banking regulator approval).

Tranche 7 — Phase 3 Transition (up to 20% Civilian):

Milestone: IAEA Board of Governors approval by consensus; 24 months of

verified Phase 2 compliance; binding fuel supply assurance
pre-positioned in escrow; annual safeguards approach review completed.
\$4 billion asset micro-tranche release. Petrochemical export volume cap raised
to
1.5 million bpd oil equivalent (pre-sanctions baseline level).
Revenue escrow reduced to 10%. Full removal of U.S. nuclear-related
secondary sanctions (non-nuclear sanctions remain subject to separate
negotiation).
Authorization for international investment
in Iranian energy sector (upstream oil and gas exploration and production).
Technology transfer for civilian nuclear
power reactor construction (assistance in
building Bushehr Unit 2 and 3, and/or regional consortium facility). Tranche 8
— Full Normalization (Steady State):
Milestone: 36 months of verified Phase 3 compliance; all compliance indicator
domains at <3.0 points for 12 consecutive months;
framework 5-year renewal confirmed. Relief delivered:
Remaining frozen asset micro-tranches
released on accelerated schedule (\$2B per 12-month period).
All nuclear-related sanctions permanently
lifted (subject to framework compliance continuation).
Full restoration of Iranian banking system

to international financial system (all

Iranian banks that meet FATF compliance

Permanent authorization for Iranian

petrochemical, mineral, and manufacturing exports without volume caps.

U.S.-Iran bilateral trade normalization

negotiations initiated (separate from framework but facilitated by framework

political atmosphere). 1.2 Tranche Verification and Activation Protocol

Each tranche milestone verified by: IAEA (nuclear

milestones); JMOC (security/proxy milestones);

World Bank/IMF (economic milestones); UN OCHA (humanitarian milestones).

Verification report transmitted to governance

body and U.S. Treasury OFAC within 14 days of milestone achievement.

OFAC publishes updated general license or

guidance within 30 days of verification receipt.

If OFAC fails to publish within 45 days:

Silence Procedure activates — tranche deemed

operative unless U.S. provides specific, legally grounded objection within 72 hours.

EU and UK regulators publish parallel relief

within 14 days of OFAC publication.

1.3 Tranche Reversibility

If compliance deteriorates after tranche

release: Snapback Friction Ladder governs

Released tranches are NOT automatically

reversed if compliance later deteriorates —

100 the Snapback Friction Ladder applies

prospective penalties only, not retroactive clawback. This prevents the incentive problem where a party has nothing left to

Exception: Asset micro-tranches released

directly to Iranian Central Bank (Tranches

3+) may be subject to freeze if material breach (Step 4 Penalty Ladder) is confirmed.

1. SNAPBACK FRICTION LADDER

2.1 Principle Sanctions snapback must be slow enough to allow dispute resolution and prevent accidental collapse, but automatic enough to be a credible deterrent.

The 90-day warning-to-full interval provides this balance. 2.2 Snapback Sequence

Upon confirmed material breach (CIS score ≥ 12.0 and Step 3 Penalty Ladder activated): Day 1: Governance body issues formal

snapback warning notice to breaching party. Warning specifies: the breach; the CIS

score; the tranches that will be affected; and the remediation actions required to halt snapback.

Warning published on framework transparency portal. Day 1-30: "Warning Window" — no economic

impact. Breaching party may initiate remediation, request

101 BAP advisory opinion, or invoke

guarantor mediation. If remediation achieves verified compliance restoration within

30 days: snapback halted, no economic consequence. Day 31-60: "Partial Suspension" — next

scheduled tranche release suspended. Banking channel transactions above \$10M per

transfer require enhanced scrutiny (48-hour delay). Petrochemical export escrow

percentage increased by 10 percentage points (e.g., from 20% to 30%). Commercial

Continuity Protection remains in force for certified contracts.

Day 61-90: "Full Suspension" — all pending tranche releases frozen. Banking channel reverted to

previous tier (e.g., Tier 3 reverts to Tier 2). OFAC publishes updated general

license restricting previously permitted categories. Petrochemical export volume cap reduced by 25%.

Commercial Continuity Protection still in force. Day 91+: "Full Snapback" — pre-framework

Institutional Design and Functional Capabilities

The Standing Enforcement Support Secretariat (SESS) provides the permanent institutional capacity required for sustained implementation monitoring, compliance assessment, and consequence coordination. Unlike ad hoc

monitoring arrangements that depend on temporary deployments and voluntary contributions, the SESS operates as a permanent international organization with dedicated staff, secure funding, and independent authority. This institutional permanence ensures that monitoring and enforcement capabilities persist through political transitions and implementation challenges.

The SESS organizational structure comprises four functional directorates: the Monitoring Directorate, which collects and analyzes information on implementation activities; the Compliance Directorate, which assesses whether observed activities conform to architecture commitments; the Consequences Directorate, which coordinates responses to detected non-compliance; and the Support Directorate, which provides administrative, legal, and technical services to the other directorates and to the Governance Body.

The Monitoring Directorate maintains a 24/7 operations center that receives and processes information from multiple sources including IAEA reports, national declarations, satellite imagery, commercial data feeds, and public sources. The directorate employs advanced analytical tools including machine learning algorithms for pattern detection, network analysis for identifying procurement activities, and geospatial analysis for tracking facility developments. These tools augment rather than replace human analytical judgment, ensuring that monitoring assessments reflect expert interpretation rather than purely automated processing.

Compliance Assessment Methodology

The Compliance Directorate employs a rigorous assessment methodology that distinguishes between different types and severities of compliance concerns. The methodology proceeds through four analytical stages: factual verification, which establishes what activities have occurred; obligation mapping, which

determines what architecture requirements apply to those activities; deviation analysis, which assesses whether activities conform to requirements; and significance determination, which evaluates the security implications of identified deviations.

Each assessment produces a compliance classification ranging from Full Compliance through Minor Technical Deviations, Significant Non-Compliance, and Material Breach. These classifications trigger corresponding response mechanisms, with higher classifications activating more consequential measures. The classification system ensures that responses are proportionate to the severity of compliance concerns, preventing both overreaction to minor issues and underreaction to serious violations.

The assessment process incorporates adversarial elements that ensure all parties can present evidence and arguments regarding compliance matters. Before finalizing any assessment that finds less than full compliance, the Compliance Directorate must provide the affected party with the factual basis for the proposed finding, afford reasonable opportunity to present contrary evidence, and consider such evidence before reaching a final determination. These procedural protections ensure that compliance assessments are both substantively accurate and procedurally fair.

Consequence Coordination and Graduated Response

The Consequences Directorate coordinates the architecture's response to compliance concerns, ensuring that responses are timely, proportionate, and effectively implemented. The directorate maintains pre-negotiated consequence menus for each category of commitment, providing clear guidance on what responses are authorized for what categories of violation. This pre-negotiation ensures that responses do not require ad hoc political decision-making that can delay or politicize enforcement.

The Graduated Penalty Ladder establishes a structured sequence of responses that escalate in severity as violations persist or worsen. The ladder begins with diplomatic communications and enhanced monitoring, progresses through partial benefit suspension, targeted sanctions, and broad sanctions restoration, and culminates in security response measures for the most severe violations. At each rung, the affected party has specified opportunities to return to compliance and restore suspended benefits.

The directorate also coordinates the implementation of responses once authorized, tracking the practical effects of consequence activation and adjusting implementation as necessary to achieve the intended deterrent and corrective effects. This implementation coordination addresses the frequent gap between authorization and execution, ensuring that authorized consequences actually materialize rather than being blocked by bureaucratic inertia or political second thoughts.

Compliance Assessment Standard Operating Procedures

P>The Standing Enforcement Support Secretariat (SESS) operates under detailed standard operating procedures that ensure compliance assessments are conducted consistently, objectively, and transparently. These procedures specify how information is collected, analyzed, and reported to produce compliance determinations that command credibility among all architecture parties.

P>Information collection procedures specify the sources, methods, and quality standards for information used in compliance assessments. Sources include IAEA reports, national declarations, national technical means, commercial data, and open sources. Collection procedures ensure that information is obtained legally, handled securely, and evaluated for reliability.

P>Information analysis procedures specify how collected information is evaluated, correlated, and synthesized into compliance assessments. Analysis employs structured analytical techniques that reduce cognitive bias and ensure comprehensive consideration of all relevant information. Analytical tradecraft standards require clear distinction between facts, inferences, and judgments.

P>Assessment reporting procedures specify the format, content, and distribution of compliance assessment reports. Reports include executive summaries for senior decision-makers, detailed evidentiary annexes for technical specialists, and classified supplements for sensitive information. Distribution ensures that reports reach appropriate recipients while protecting sensitive sources and methods.

H2>Consequence Coordination Protocols

P>When compliance concerns are identified, the SESS Consequences Directorate coordinates the architecture's response through structured procedures that ensure timely, proportionate, and effective implementation of consequence measures.

P>Consequence selection procedures match compliance concerns to appropriate consequence responses based on the severity, nature, and persistence of violations. The ACS menus provide default selections that can be modified by the Governance Body based on circumstances. Selection procedures ensure proportionality between violation and response.

P>Consequence implementation procedures specify how selected consequences are communicated to affected parties, activated in relevant systems, and monitored for effectiveness. Implementation procedures address sanctions administration, benefit suspension, enhanced monitoring activation, and other consequence measures.

P>Consequence review procedures provide for periodic reassessment of whether consequences remain appropriate as circumstances evolve. Review considers whether violations have ceased, whether corrective actions have been taken, and whether consequences are producing intended effects. Review may result in consequence modification, escalation, or termination.

H2>Enforcement Support to National Authorities

P>The SESS provides technical support to national authorities responsible for implementing architecture commitments. This support helps states fulfill their obligations effectively while building national capacity for sustained implementation.

P>Technical assistance includes training on architecture requirements, guidance on implementation procedures, and support for national reporting obligations. Assistance is tailored to each state's specific needs and circumstances. Assistance is delivered through missions, workshops, remote support, and documentation.

P>Legal assistance includes support for drafting implementing legislation, developing regulations, and establishing legal frameworks that give effect to architecture obligations. Legal assistance respects each state's legal traditions while ensuring effective implementation.

P>Institutional development assistance includes support for establishing and strengthening national implementing institutions. Assistance covers organizational design, staffing, training, and system development. Institutional development creates sustainable national capacity that reduces dependence on external support.

H2>Enforcement Coordination with International Organizations

P>The architecture's enforcement activities require coordination with multiple

international organizations including the IAEA, UN Security Council, UN General Assembly, regional organizations, and specialized agencies. Coordination ensures that architecture enforcement complements rather than duplicates or contradicts international institutional action.

P>IAEA coordination addresses the division of labor between IAEA safeguards and architecture-specific verification. The IAEA remains the primary nuclear verification organization under the architecture, with architecture mechanisms providing supplementary monitoring. Coordination includes information sharing, joint inspections, and coordinated reporting.

P>Security Council coordination addresses how architecture compliance concerns are reported to and addressed by the Security Council. The architecture provides the Council with factual information on compliance matters. The Council retains authority for decisions on sanctions, force authorization, and other measures within its mandate.

P>Regional organization coordination addresses how architecture enforcement interacts with regional security arrangements. Coordination prevents conflicting actions and identifies opportunities for complementary engagement. Regional organizations may assist in consequence implementation, crisis management, and confidence building.

H2>Investigative Procedures and Evidence Handling

P>When compliance concerns arise, the SESS may conduct investigations to establish facts, identify responsible parties, and assess implications. Investigative procedures ensure that investigations are thorough, fair, and respectful of rights.

P>Investigation initiation may be triggered by IAEA reports, national information, monitoring data, whistleblower allegations, or media reports.

Initiation requires assessment that the information suggests a genuine compliance concern warranting investigation rather than frivolous or malicious allegations.

P>Evidence collection employs multiple methods including document review, physical inspection, technical analysis, witness interviews, and intelligence assessment. Evidence must be collected lawfully, documented carefully, and preserved securely. Chain of custody procedures ensure evidence integrity.

P>Investigation reporting presents findings in structured formats that distinguish facts from inferences and conclusions. Reports include evidentiary basis for each finding, alternative explanations considered, and confidence levels assigned. Reports are reviewed for quality before submission.

P>Confidentiality protection ensures that investigation information is handled appropriately. Sensitive information is classified and distributed on need-to-know basis. Whistleblower identities are protected. Preliminary findings are not disclosed publicly before investigation completion.

H2>Appeals and Review Procedures

P>Parties subject to compliance findings may appeal through specified procedures that ensure due process and correct potential errors. Appeals provide procedural protections without unduly delaying enforcement.

P>Administrative review permits parties to request review of compliance findings by senior SESS officials not involved in the initial assessment. Review examines whether procedures were followed correctly, whether evidence supports findings, and whether conclusions are reasonable. Review decisions may affirm, modify, or reverse initial findings.

P>Arbitral review permits parties to challenge compliance determinations before the BAP. Arbitral review is available for findings that trigger significant

consequences. Review examines procedural regularity and evidentiary sufficiency. Arbitral decisions are binding.

P>Governance Body review permits the Body to review systemic compliance issues or patterns that suggest architecture design problems. Review does not address individual cases but examines whether compliance patterns indicate need for architecture adjustment.

ANNEX HUM

Override activation. Theater 2 — Lebanon / Northern Israel: Cap: 4 indirect fire incidents (rockets,

drones, ATGM) per 30-day period. Scope: Cross-border fire from Lebanese territory into Israel; maritime harassment off Lebanese coast.

Breach trigger: 5th incident within 30 days. Automatic consequence: +1.0 CIS Security; enhanced monitoring; IHTA maritime alert.

Escalation: 10+ incidents or single incident with 10+ casualties = mass-casualty

Theater 3 — Iraq (Base Protection): Cap: 0 indirect fire incidents targeting declared base perimeters within 100-mile

radius. Scope: Any rocket, drone, or indirect fire landing within 100-mile radius of

declared U.S./coalition base. Breach trigger: ANY incident (zero-tolerance). Automatic consequence: +1.5 CIS Security;

Base Protection Compact penalty (\$10M per incident); PERT activation. Escalation: 2+ incidents within 30 days =

pattern; Step 2 Penalty Ladder. Theater 4 — Red Sea / Maritime: Cap: 1 vessel harassment or interdiction

incident per 30 days. Scope: Seizure, boarding, missile/drone attack on commercial vessel in Red Sea

or Gulf of Aden. Breach trigger: 2nd incident within 30 days. Automatic consequence: +1.5 CIS Security;

IHTA security alert; joint naval patrol surge. Escalation: Sinking or seizure of

commercial

vessel = mass-casualty threshold. Theater 5 — Syria: Cap: 3 military incidents (clashes, drone

strikes, weapons transfers) per 30 days per zone. Scope: Cross-line clashes; drone strikes

35 on rival forces; weapons transfers to

non-framework-aligned militias. Breach trigger: 4th incident within 30 days per zone.

Automatic consequence: +0.5 CIS Security per breach; zone-specific enhanced monitoring.

2.2 Cap Reset and Carryover

Caps reset every 30 days (calendar month basis, not rolling window).

Unused cap does NOT carry over to next period

(no "banking" of permitted attacks).

Partial period at framework entry: caps prorated by days remaining in month.

1. PROXY FREEZE ZONES (PFZs)

3.1 Definition Proxy Freeze Zones are geographically defined areas

where ANY kinetic military activity by ANY armed group — state, proxy, or third party — constitutes an automatic framework breach, regardless of

attribution or intent. PFZs are "weapons-free" areas under international protection. 3.2 Designated PFZs

PFZ-1 — South of the Litani River (Lebanon): Coordinates: From the Mediterranean coast at Naqoura (33.12N, 35.13E) east along

the Litani River to its source near Baalbek (34.00N, 36.15E), then south along the Lebanon-Israel border to the

coast. Status: ANY rocket fire, drone launch,

36 military movement, or weapons storage

within this zone = automatic +2.0 CIS Security penalty; PERT activation; Emergency Override consideration.

Enforcement: UNIFIL enhanced mandate; CPMC monthly verification patrol; satellite monitoring (daily revisit).

Exception: Lebanese Armed Forces legitimate counterterrorism operations against non-framework-aligned armed

groups, with 48-hour advance notification to JMOC. PFZ-2 — Iraq Base Perimeters (100-Mile Rule):

Coordinates: 100-nautical-mile radius circles centered on each declared U.S. and coalition military base in Iraq.

Status: ANY indirect fire (rocket, mortar, drone) landing within ANY perimeter = automatic +1.5 CIS Security;

\$10M Base Protection Compact penalty per incident; PERT activation.

Enforcement: Iraqi security forces

primary; PMF integration units secondary; JMOC real-time monitoring.

Exception: None. Zero tolerance.

PFZ-3 — Red Sea Transit Corridor: Coordinates: Maritime corridor from Bab-el-Mandeb (12.6N, 43.4E) north to

Suez Canal entrance (29.9N, 32.5E); 20-nautical-mile wide transit lane centered on historical shipping routes.

37 Status: ANY attack on commercial vessel

within corridor = automatic +2.0 CIS Security; IHTA emergency response; joint naval patrol authorization.

Enforcement: Combined Maritime Forces (CMF) patrol; IHTA Maritime Security Division; satellite AIS monitoring.

Exception: Piracy response (armed robbery at sea) is law enforcement, not framework breach, unless pirate

vessel is framework-proxy-linked. PFZ-4 — Strait of Hormuz Transit Lane: Coordinates: IHTA-designated transit

corridor through Strait of Hormuz; 2-nautical-mile wide inbound and outbound lanes.

Status: ANY military interference with IHTA-certified commercial vessel = automatic +3.0 CIS Security (maximum);

Crisis Lock activation; UN Security Council notification. Enforcement: IHTA patrol vessels;

littoral state coast guard coordination; JMOC maritime cell real-time monitoring. PFZ-5 — Yemen Humanitarian Zones:

Coordinates: Hudaydah city and port (5-year radius); Sana'a city; Aden city and port; key highway corridors between

these cities. Status: ANY kinetic military activity (airstrikes, artillery, rocket fire,

38 ground assault) within humanitarian

zones = automatic +2.0 CIS Humanitarian +1.0 CIS Security; CPMC emergency report; UN OCHA access demand.

Enforcement: UN Monitoring Mission; CPMC field teams; JMOC satellite surveillance.

Exception: Self-defense by UN or legitimate security forces against imminent attack on humanitarian

facilities (with post-action report within 2 hours). PFZ-6 — Gaza Humanitarian Perimeter:

Coordinates: Gaza Strip land and maritime perimeter; 1-km buffer zone inside Israel adjacent to Gaza border.

Status: ANY kinetic military activity (rocket fire, airstrikes, ground incursion, naval bombardment) within

Gaza Strip = automatic +2.0 CIS Humanitarian; CPMC emergency report; Crisis Lock consideration.

Enforcement: CPMC field teams (when security permits); satellite monitoring; UN OCHA real-time tracking.

Note: This PFZ does NOT prohibit legitimate Israeli self-defense against rocket attacks from Gaza. Rocket attacks

FROM Gaza are scored under Theater 2 cap. Israeli RESPONSES are scored under per- fatality CIS metrics with PHAR strict

39 liability if deconflicted assets struck.

3.3 PFZ Violation Consequences

First violation in any PFZ within 30 days:

CIS penalties as specified per zone; PERT

activation; enhanced monitoring.

Second violation in same PFZ within 30 days:

CIS penalties doubled; Step 2 Penalty

Ladder activation; governance body emergency session.

Third violation in same PFZ within 30 days:

CIS penalties tripled; Step 3 Penalty

Ladder; sponsor state (if attributed) subject to Attributed-but-Uncontrolled doctrine with only 14-day (not 30-day)

1. WEAPONS TRANSFER PROHIBITION

4.1 Prohibited Weapons Systems

During framework active status, NO framework party shall transfer the following weapons systems or technologies to any proxy, militia,

or non-state armed group: Category W1 — Precision-Guided Munitions:

Anti-ship cruise missiles (ASCMs) with

Land-attack cruise missiles (LACMs) with

Precision-guided ballistic missiles

(PGMs) with circular error probable (CEP) <50 meters.

Guided anti-tank missiles (ATGMs) with

>4 km range (except man-portable systems

40 for legitimate territorial defense).

Category W2 — Long-Range Drones:

Armed unmanned aerial vehicles (UAVs)

with >1,000 km range or >24-hour

Kamikaze/suicide drones (loitering munitions) with >500 km range.

Swarm-capable drone systems (5+ simultaneously controllable units). Category W3 — Advanced Air Defense:

MANPADS (man-portable air defense systems) with all-aspect engagement capability.

Vehicle-mounted air defense systems

Radar systems with anti-stealth

Category W4 — Maritime Threat Systems:

Naval mines (any type). Fast attack craft (FAC) with anti-ship

Submersible/semi-submersible vessels

("narco-sub" technology).

Underwater drones (UUVs) with

Category W5 — Weapons of Mass Destruction Components:

Chemical weapon precursors (Schedule 1

chemicals under Chemical Weapons

41 Biological agent delivery systems. Any nuclear-related dual-use equipment

4.2 Permitted Weapons Transfers The following transfers are permitted for legitimate territorial defense and security

operations, subject to JMOC notification:

Small arms and light weapons (rifles,

machine guns, RPGs) for base protection

and perimeter security.

Unarmed reconnaissance drones with <100 km

Short-range artillery (mortars, howitzers

with <20 km range) for defensive positions.

Anti-mine and IED clearance equipment. Armored personnel carriers (non-tank;

defensive role only). 4.3 Verification Mechanism

JMOC Weapons Tracking Cell monitors all

known weapons transfer routes into framework-affected theaters via satellite imagery (vehicle convoy tracking), port

inspection data, and intelligence sharing.

All framework parties must declare weapons

transfers to non-state actors within

framework-affected theaters on a quarterly basis (declaration = transparency; NOT pre-approval requirement).

Undeclared transfer of prohibited weapons

system: automatic +2.0 CIS Security;

42 Spoiler Containment Protocol activation;

governance body emergency session.

Declared transfer of prohibited weapons:

+1.0 CIS Security; governance body review

within 14 days; transfer party may justify as necessary for legitimate defense (burden of proof on transferring party).

Third-party transfer (non-framework state or arms dealer): JMOC issues security alert; IHTA interdiction authorization if transfer vessel transits Hormuz; information shared with UN Panel of Experts.

1. PROXY FINANCIAL TRACKING

5.1 JMOC Financial Intelligence Cell A dedicated cell within JMOC tracks financial flows to proxy entities:

Monitors correspondent banking transactions for patterns consistent with proxy funding (structured deposits, layering through multiple jurisdictions, cash courier networks).

Receives sanitized financial intelligence from all framework parties (raw intelligence filtered to remove sources and methods; only transaction patterns and entity names

Cross-references with IHTA vessel tracking (flags vessels linked to known proxy financial networks).

Quarterly "Proxy Financial Assessment"

43 published to governance body (classified; not public). 5.2 Financial Disruption Authority When JMOC Financial Intelligence Cell identifies proxy funding streams:

Notification to Sponsor State within 7 days

with evidence summary.

Sponsor State has 14 days to: (a) deny

knowledge and commit to investigation; (b) acknowledge and commit to cutoff; or (c)

challenge JMOC assessment via BAP.

If Sponsor State does not respond or does

not cutoff within 14 days: automatic financial quarantine of identified accounts

(Spoiler Containment Protocol 2.0, Financial Quarantine).

Cryptocurrency tracking: Virtual Asset

Service Providers (VASPs) in framework states required to report transactions involving wallets linked to known proxy

entities; non-compliant VASPs excluded from banking channel (per Enforcement Modules, Module III, Section 3.1 Virtual Asset

MODULE IV: INCIDENT ATTRIBUTION PANEL (PERT FORMALIZATION)

Operative Clause: This module provides the authoritative formalization of the Proxy Event Response Team (PERT) as the framework's rapid, neutral

incident attribution body. It defines Bayesian confidence thresholds,

false-flag protection protocols, the Assessment Hold power of the Neutral Chair, and the full operational relationship between PERT and the crisis-management system. This module supersedes and consolidates all

PERT references in Verification Modules (Module III, Section 4), Enforcement Modules (Module IV, Section 4.2-4.4), and the Core Document.

1. PERT COMPOSITION AND STANDING

1.1 Permanent Structure The PERT is a permanently constituted rapid response cell within the JMOC, with the following composition:

Core Team (5 members — always active):

Team Lead: Swiss neutral senior analyst

(Geneva-based; casts tie-breaking votes; manages procedural timeline; signs final attribution reports).

U.S. Designated Analyst: Middle East

regional expertise; operates from Washington

secure terminal (NOT Geneva floor); provides U.S. intelligence perspective (sanitized).

Iranian Designated Analyst: Regional

security expertise; operates from Tehran secure terminal; provides Iranian intelligence perspective (sanitized).

Pakistani Military Intelligence Liaison:

Regional proxy network expertise;

Islamabad-based; provides Islamic-world context and ground-truth assessment.

Omani Diplomatic Intelligence Officer:

Gulf network and maritime expertise;

Muscat-based; provides diplomatic context

45 and backchannel intelligence.

Extended Team (activation surge — convened for major incidents):

IAEA Safeguards Inspector: If nuclear

facility involved in incident.

UN OCHA Humanitarian Officer: If civilian

impact requires humanitarian assessment

ICRC Delegate: If detainee or medical

CPMC Senior Medical Officer: If mass-

casualty event requires forensic mortality assessment.

Neutral Pool Technical Expert: One

specialist selected by random lot from standing pool (Sweden, Singapore, Brazil, New Zealand) for incidents requiring

specialized technical assessment (maritime forensics, cyber attribution, WMD analysis). 1.2 Physical and Informational Security

PERT core team members NEVER meet in person

with adversarial counterparts. All deliberations conducted via encrypted video bridge with neutral Team Lead moderating.

U.S. and Iranian analysts operate from their

respective capital secure terminals; they do not access the Geneva JMOC operations floor.

Raw intelligence from either party is

sanitized by the contributing party's own liaison officer before transmission to

PERT.

Source identities, collection methods, and

46 sensitive capabilities are NEVER shared with

The Humanitarian Firewall Architecture

The Humanization Protocol establishes the principle that security arrangements must never impede the provision of essential humanitarian services to civilian populations. This principle is operationalized through the Humanitarian Firewall, which creates institutional and legal protections for humanitarian activities that prevent their subordination to political or security objectives. The firewall applies across all architecture activities, ensuring that implementation never comes at the cost of civilian welfare.

The firewall's institutional component establishes the Humanitarian Access Track as a permanent architecture element with independent authority to monitor humanitarian impacts, investigate complaints, and issue binding determinations on humanitarian matters. The track operates under distinct procedures from security tracks, with decision-making authority vested in humanitarian experts rather than security officials. This institutional separation prevents security considerations from dominating humanitarian decisions.

The firewall's legal component incorporates explicit exemptions for humanitarian activities in all sanctions, restriction, and consequence mechanisms. These exemptions cover medical supplies, food assistance, educational materials, disaster relief, and other categories of essential goods and services. The exemptions are self-executing, requiring no case-by-case approvals that could delay humanitarian responses, and are interpreted broadly to ensure that humanitarian activities are not inadvertently restricted.

The Victims' Fund and Restorative Justice Framework

The Victims' Fund provides financial support to individuals and communities harmed by regional conflicts, including those involving proxy actors and security incidents. The fund operates on the principle that sustainable peace requires addressing the human costs of conflict through concrete measures of recognition, assistance, and restorative support. This approach moves beyond traditional state-centric diplomacy to address the lived experiences of individuals affected by regional instability.

The fund's eligibility criteria encompass a broad range of harms including physical injury, property destruction, displacement, psychological trauma, and economic loss caused by conflict-related violence. Eligibility extends to victims regardless of their nationality or the identity of the responsible party, ensuring that assistance is determined by human need rather than political affiliation. This inclusive approach reflects the architecture's commitment to human security as a universal value.

The fund is financed through mandatory contributions from all architecture parties assessed according to agreed formulas, supplemented by voluntary contributions from the international community. The mandatory contribution requirement ensures predictable funding that can support multi-year assistance programs, while voluntary contributions expand the fund's capacity to address exceptional needs. The fund's governance includes victim representatives to ensure that assistance programs reflect the priorities of those they serve.

Civil Society Consultation and Democratic Accountability

The Humanization Protocol mandates structured consultation with civil society organizations as an integral component of all architecture

implementation processes. This consultation requirement recognizes that sustainable agreements require public understanding and support, and that civil society organizations often possess expertise and perspectives that complement official diplomatic processes. The consultation mechanisms are designed to be genuine rather than tokenistic, with meaningful influence on implementation decisions.

The Civil Society Consultative Lane (Annex CS) provides the institutional framework for this consultation, establishing procedures for civil society participation in monitoring, reporting, and policy development. The lane includes dedicated funding for civil society capacity building, ensuring that organizations from all participating states can participate effectively regardless of their financial resources. This capacity building addresses the power imbalances that can distort consultation processes in favor of well-resourced organizations from wealthy states.

The protocol also establishes transparency requirements that ensure civil society and the broader public have access to information about architecture implementation. These requirements include regular public reporting on implementation progress, compliance assessments, and benefit distribution. Transparency is recognized not merely as an accountability mechanism but as a substantive contribution to implementation effectiveness, as public awareness creates political incentives for sustained commitment.

H2>Humanitarian Access in Armed Conflict

P>The Humanization Protocol establishes specific procedures for maintaining humanitarian access during armed conflict, recognizing that humanitarian needs are greatest when conflict disrupts normal services and infrastructure. Access procedures address the security of humanitarian personnel, the logistics of aid delivery, and the coordination of humanitarian activities with

military operations.

P>Humanitarian personnel security is protected through explicit provisions in the architecture that recognize humanitarian workers as protected persons during conflict. Attacks on humanitarian personnel constitute grave breaches of architecture obligations and trigger automatic consequence mechanisms. Humanitarian personnel are identified by distinctive emblems and identification documents that distinguish them from military personnel.

P>Humanitarian logistics require secure corridors, protected storage facilities, and reliable transportation that function under conflict conditions. The architecture pre-positions humanitarian supplies in secure locations accessible to conflict-affected populations. Pre-positioning reduces dependence on logistics chains that may be disrupted by conflict.

P>Humanitarian-military coordination ensures that humanitarian activities and military operations are deconflicted to prevent humanitarian assets from being mistaken for military targets and to prevent military operations from impeding humanitarian delivery. Coordination procedures include notification requirements, no-strike lists for humanitarian facilities, and shared situational awareness.

H2>Protection of Medical Facilities and Personnel

P>The architecture includes specific protections for medical facilities and personnel that apply during both conflict and peacetime. Medical facilities are protected from military targeting, interference with operations, and obstruction of access. Medical personnel are protected from violence, arbitrary detention, and obstruction of duties.

P>Medical facility protection includes prohibitions on targeting hospitals, clinics, ambulances, and medical supply stores. Protection extends to

architecture-funded health facilities and to facilities operated by independent humanitarian organizations. Violations of medical facility protection trigger architecture consequence mechanisms.

P>Medical personnel protection includes prohibitions on attacking, detaining, or otherwise interfering with doctors, nurses, paramedics, and medical support staff. Protection applies regardless of whether medical personnel are treating military or civilian patients. Medical personnel are entitled to carry out their duties without interference.

P>Medical supply protection ensures that medical supplies can reach facilities and patients without obstruction. Sanctions exemptions for medical supplies are self-executing and require no case-by-case approvals. Supply chain monitoring tracks medical supply flows and identifies obstruction points.

H2>Education Continuity During Crises

P>The architecture recognizes education as an essential service that must continue during crises to protect children's development, maintain social stability, and preserve human capital. Education continuity measures ensure that schools can function, students can learn, and teachers can teach even under adverse conditions.

P>School protection includes prohibitions on targeting schools, using schools for military purposes, and obstructing school operations. Protection extends to architecture-funded schools and to schools operated by public and private education authorities. Safe school declarations commit conflict parties to respecting school neutrality.

P>Alternative education delivery provides learning opportunities when normal schooling is disrupted. Alternatives include temporary learning spaces, distance learning programs, radio and television instruction, and mobile

teaching teams. Alternative delivery maintains learning continuity until normal schooling can resume.

P>Teacher protection ensures that teachers can perform their duties without violence, intimidation, or arbitrary detention. Protection measures include security provisions for schools, rapid response to teacher safety threats, and support for teachers displaced by conflict. Teacher protection recognizes that education cannot continue without teachers.

H2>Humanitarian Diplomacy and Negotiation

P>Humanitarian diplomacy involves negotiation and advocacy to secure access, resources, and protection for humanitarian operations. The architecture's humanitarian framework includes diplomatic procedures that ensure humanitarian concerns are addressed in political and security deliberations.

P>Access negotiation engages authorities controlling territory where humanitarian needs exist. Negotiation addresses security guarantees for humanitarian personnel, logistics arrangements, and operational freedom. Negotiation employs principled arguments that appeal to international humanitarian law and humanitarian principles.

P>Resource mobilization secures funding, supplies, and personnel for humanitarian operations. Mobilization includes appeals to donor states, international organizations, and private donors. Resource commitments are tracked and reported to maintain donor confidence and operational accountability.

P>Protection advocacy engages conflict parties, international bodies, and public opinion to secure protection for civilian populations and humanitarian workers. Advocacy employs legal arguments, public pressure, and quiet

diplomacy depending on circumstances and audience.

H2>Mental Health and Psychosocial Support

P>Conflict and crisis generate psychological trauma that affects survivors, displaced persons, humanitarian workers, and broader populations. Mental health and psychosocial support programs address these psychological impacts through clinical services, community-based interventions, and capacity building.

P>Clinical services provide professional mental health care for individuals with severe psychological conditions. Services include counseling, psychiatric treatment, and medication. Clinical services are delivered by trained mental health professionals in culturally appropriate ways.

P>Community-based psychosocial support engages communities in mutual support activities that promote recovery and resilience. Community programs include peer support groups, recreational activities, traditional healing practices, and social reconnection activities. Community-based support reaches more people than clinical services alone.

P>Capacity building develops national mental health systems that can sustain services beyond emergency periods. Building includes training for mental health professionals, development of national mental health policies, and establishment of mental health services in health systems.

Disability Inclusion in Humanitarian Action

P>Persons with disabilities are disproportionately affected by conflict and crisis but are often excluded from humanitarian programming. Disability inclusion ensures that humanitarian action reaches and benefits persons with all types of disabilities.

P>Accessibility standards apply to humanitarian facilities, services, and communications. Physical accessibility includes ramps, wide doorways, accessible toilets, and clear pathways. Information accessibility includes sign language interpretation, Braille materials, and easy-to-read formats.

P>Participation mechanisms ensure that persons with disabilities are involved in humanitarian decision-making that affects them. Mechanisms include representation in consultation forums, accessibility of feedback channels, and engagement of disability organizations in program design.

P>Targeted services address the specific needs of persons with disabilities including rehabilitation, assistive devices, personal assistance, and medical care. Targeted services complement mainstream humanitarian programming that reaches all affected populations.

ANNEX WPC

and virtual presence, data fusion architecture, staffing model, and operational protocols for proxy event attribution and Shock Response Envelope activation.

1. NEUTRAL PHYSICAL ADMINISTRATION

1.1 Host Nation and Facility The JMOC physical facility is hosted in Geneva, Switzerland, co-located

with the framework's remote monitoring backup node to maximize operational synergy and reduce infrastructure duplication. Geneva provides:

Diplomatic neutrality recognized by all framework parties. Existing IAEA and UN institutional infrastructure. Swiss legal framework protecting international

24 organization operations from domestic interference.

CERN-level physical security and telecommunications

backbone availability. Alternative/contingency host: Muscat, Oman, activated by

governance body consensus if Swiss neutrality is compromised or operational requirements demand geographic distribution.

1.2 Floor Operations Staffing (Neutral-Only)

The JMOC operations floor is exclusively staffed by technical experts from neutral institutions: Core Staff (Permanent):

8 UN Seconded Technical Analysts (nationality mix:

Swiss, Pakistani, Omani, Brazilian, Swedish, Singaporean, New Zealand, South African)

4 IAEA Safeguards Information Analysts (non-inspector intelligence fusion specialists)

3 Swiss Federal Intelligence Service (FIS) liaison officers (counter-proliferation desk, unclassified)

2 Neutral Guarantor State Duty Officers (rotating: Pakistan, Oman, Switzerland)

Extended Staff (Surge):

Up to 6 additional UN or regional organization analysts during Crisis Lock or major incidents.

1 WHO medical intelligence officer (for humanitarian-security nexus events).

1 World Bank infrastructure monitoring specialist (for reconstruction-security linkage).

Excluded from JMOC: American, Iranian, Israeli, Saudi, or other framework party intelligence or military officers. No core party uniformed personnel, no armed guards from

participating states, and no party-flagged diplomatic

presence on operations floor.

Director: Appointed by UN Secretary-General on recommendation of framework governance body;

3-year renewable term; must hold citizenship of non-framework-party state.

Deputy Director (Operations): Swiss federal civil

servant seconded under international agreement.

Deputy Director (Analysis): Rotating appointment from guarantor state (Pakistan or Oman).

Watch Commander: 8-hour rotating shifts; Swiss military or civil defense officer with NATO SECRET or equivalent clearance.

1. SECURE REMOTE LIAISON TERMINALS

2.1 Terminal Locations Rather than physical co-location, core and regional parties access JMOC feeds through encrypted remote terminals:

Tier 1 Terminals (Core Parties):

Washington, D.C.: U.S. Department of State

Operations Center, 23rd Street building;

air-gapped terminal room with TS/SCI connectivity to JMOC sanitized feed.

Tehran: Iranian Foreign Ministry Crisis

Management Center; terminal operated by

designated Iranian framework liaison officers; feed sanitized to remove third-party source attribution.

Tier 2 Terminals (Regional Partners):

Riyadh, Abu Dhabi, Doha, Kuwait City, Cairo,

Amman, Baghdad: One terminal per capital at

foreign ministry operations centers; access

26 limited to regional proxy and maritime tracking

dashboards. Tier 3 Terminals (Guarantors):

Muscat, Islamabad, Geneva: Full dashboard access

mirroring JMOC operations floor (minus raw intelligence source identifiers).

2.2 Terminal Technical Specifications

Hardware: Hardened Dell EMC or Thales terminal with TPM 2.0 chip; disabled USB/Bluetooth/WiFi; hardwired Ethernet only.

Encryption: AES-256 disk encryption; TLS 1.3 VPN tunnel to Geneva; hardware token authentication. Display: Sanitized dashboards only — no raw

satellite imagery source identifiers, no signals intelligence metadata, no human source reporting. Geographic coordinates

rounded to 0.01 degree for display. Data Diode: One-way data flow from Geneva to terminals; no upstream command capability;

party intelligence contributions submitted via separate upload portal with 4-hour analyst review before fusion.

2.3 Intelligence Contribution Protocol Parties may upload intelligence products to the JMOC:

Upload portal: HTTPS/TLS 1.3 web interface with

MFA; files scanned for malware; metadata

stripped by automated sanitizer.

Analyst review: Neutral JMOC analyst validates

relevance and sanitizes source-identifying

information within 4 hours of upload.

Fusion approval: Watch Commander approves fusion

27 into shared dashboard within 8 hours; rejected

uploads returned to contributor with explanation.

Firewall rule: Intelligence uploaded by one party

cannot be used by JMOC to target that party's own activities; strict reciprocity logging.

1. DATA FUSION ARCHITECTURE

3.1 The Compliance Indicators System Dashboard The JMOC aggregates four domain feeds into a single operational picture:

Domain A — Nuclear Tracking: Source: IAEA Vienna RDT database; Geneva backup node; on-site inspector reports. Display: Real-time enrichment status by facility;

seal health status (green/amber/red); inspection schedule adherence; mass balance reconciliation status.

Alert Threshold: Any seal anomaly; enrichment excursion >0.1% U-235 above declared cap; missed inspection; data gap >24 hours.

Domain B — Satellite-Monitored Proxy Movements: Source: Commercial satellite imagery (Maxar, Planet Labs, Airbus); synthetic aperture

radar (ICEYE, Capella); AIS maritime tracking. Fusion: AI-assisted change detection algorithms (machine learning models trained on historical

proxy facility signatures); anomaly flagging for human analyst review. Display: Theater map (Lebanon, Iraq, Syria,

Yemen, Red Sea) with flagged activity; confidence scoring (low/medium/high);

28 movement trajectory vectors.

Alert Threshold: Unusual vehicle concentrations at known proxy facilities; weapons convoy signatures; maritime loitering patterns;

drone launch site preparations. Domain C — Maritime Incident Logs: Source: International Maritime Organization (IMO)

reports; International Hormuz Transit Authority (IHTA) tolling and tracking; naval patrol incident reporting; commercial shipping

distress signals. Fusion: Geospatial correlation with proxy movement data; temporal pattern analysis

(incident clustering); vessel registry cross-check against sanctions and watch lists.

Display: Red Sea/Gulf/Strait of Hormuz situational map; incident registry with severity coding; IHTA toll compliance

metrics. Alert Threshold: Any confirmed vessel harassment; seizure event; missile/drone

attack on commercial shipping; toll evasion pattern. Domain D — Force Posture and Strategic Stability:

Source: Declared force posture notifications (framework No Strategic Surprise Commitment); commercial satellite order of battle

tracking; open-source military movement analysis. Display: Regional troop level tracker by

29 country/phase; base construction activity

flags; alliance posture changes. Alert Threshold: Undeclared deployment exceeding 500 personnel; new base

construction without 30-day notification; major weapons system introduction without 14-day notification.

3.2 Fusion Engine Technical Specification Platform: Palantir Gotham or

equivalent data integration platform; hosted on Swiss sovereign cloud (Swisscom or Mount10). Data Ingestion: Apache Kafka streaming for real-time feeds; PostgreSQL/TimescaleDB for time-series storage; Elasticsearch for incident text search. AI/ML Layer: TensorFlow-based anomaly detection on satellite imagery; natural language processing (NLP) for incident report classification; Bayesian network for multi-source attribution confidence scoring. Visualization: Grafana dashboard layer; geospatial display via Leaflet/Mapbox; mobile-optimized view for leadership terminals. Audit Trail: Immutable blockchain-backed logging (Hyperledger Fabric) recording all data access, fusion decisions, and alert generation; 7-year retention.

1. PROXY EVENT RESPONSE TEAM (PERT)

4.1 Composition and Standing The PERT is the JMOC's rapid attribution and analysis

30 cell for proxy incidents. It is permanently constituted

and ready for activation within 2 hours of any mass- casualty or Tier 3 security event. Core Team (5 members):

1 U.S.-designated intelligence analyst

(Middle East regional expertise; seconded to JMOC under strict confidentiality agreement; operates from Washington remote terminal, not Geneva floor).

1 Iranian-designated intelligence analyst

(regional security expertise; operates from Tehran remote terminal).

1 Swiss-neutral senior analyst (team lead;

Geneva-based; casts tie-breaking

1 Pakistani military intelligence

liaison (Islamabad-based; regional proxy

1 Omani diplomatic intelligence officer

(Muscat-based; Gulf network and maritime

expertise). Extended Team (Activation Surge):

IAEA safeguards inspector (if nuclear

UN OCHA humanitarian officer (if civilian

ICRC delegate (if detainee or medical

facility involved). 4.2 Activation Protocols Trigger 1 — Mass-Casualty Attack (25+ fatalities):

Automatic activation within 2 hours of

31 governance body notification. PERT convenes

via encrypted video bridge (JMOC secure room + remote terminals).

Preliminary attribution required within 12 hours;

formal assessment within 24 hours. Trigger 2 — Attack on Diplomatic/Humanitarian Personnel:

Activation within 1 hour. Preliminary attribution within 6 hours; formal assessment within 12 hours.

Trigger 3 — Attack on Declared IAEA-Monitored Nuclear Facility: Activation within 30 minutes. IAEA

inspectorate integrated immediately. Preliminary assessment within 4 hours; formal attribution within 6 hours.

Trigger 4 — Use of Chemical/Biological Agents: Activation within 30 minutes. OPCW technical secretariat integrated.

Preliminary assessment within 4 hours; formal attribution within 12 hours. 4.3 Attribution Methodology

Step 1 — Evidence Collection: Satellite imagery (pre/post event); signals intelligence (sanitized); open-source social media

analysis; HUMINT (sanitized); forensic material from attack site (if accessible).

Step 2 — Multi-Source Correlation: Bayesian

fusion engine calculates attribution confidence. Minimum thresholds:

Preliminary attribution: 60% confidence

32 Formal attribution: 75% confidence Shock Response Envelope activation:

70% confidence (preliminary) with presumption of confirmation

Step 3 — Neutral Review: Swiss team lead validates methodology; identifies alternative hypotheses; assigns

confidence modifiers for intelligence gaps. Step 4 — Report Generation: Standardized

attribution report format with: executive summary; evidence catalog; confidence assessment; alternative explanations;

recommended framework response tier. 4.4 Shock Response Envelope Activation Upon PERT preliminary attribution meeting 70%

confidence threshold:

JMOC Director issues formal attribution

notification to governance body co-chairs

(U.S. and Iranian deputies) within 2 hours.

Governance body secretariat transmits

Shock Response Envelope activation notice

via Tier 3 Leadership Reset Hotline within 4 hours of attribution.

24-hour response window opens for governing

party (state responsible for constraining the attributed proxy) to select Column A voluntary measure.

If Column A not selected within 24 hours,

Column B automatic defaults activate.

Either party may request 48-hour cooling-off;

33 guarantors attempt mediation during cooling-off; only one cooling-off permitted per event.

1. POLITICAL SURVIVABILITY AND OPERATIONAL ESCALATION BUFFER

5.1 Domestic Political Protection

The neutral-hub JMOC architecture prevents domestic opposition from weaponizing framework participation:

Leaders in Washington and Tehran can frame

JMOC as "international compliance mechanism" rather than "bilateral partnership."

No photographs of American and Iranian officers in the same room.

No requirement for legislative notification

of JMOC staffing (neutral UN personnel, not bilateral exchanges).

Press access limited to quarterly sanitized

briefings; no real-time media exposure of operations floor.

5.2 Operational Escalation Buffer When ambiguous incidents occur, the neutral JMOC provides built-in cooling-off:

Raw intelligence feeds are analyzed by neutral analysts before formal broadcast.

Attribution reports include explicit confidence levels and alternative hypotheses.

72-hour Third-Party Strike Buffer Rule

(reduced to 12 hours for active continuous barrages) prevents automatic retaliation

JMOC Director may recommend 48-hour

"Assessment Hold" before formal attribution

34 if evidence remains genuinely ambiguous;

Assessment Hold does not prevent targeted state self-defense under Article 51 UN Charter. 5.3 Crisis Lock Integration

JMOC activation triggers automatic governance body Crisis Lock procedures:

JMOC Director notifies governance body

neutral chair (Oman) within 1 hour of major incident confirmation.

Crisis Lock effects: 14-day freeze on

status-quo changes; emergency governance body session within 48 hours; fact-finding team deployment within 72 hours.

JMOC maintains continuous operations

during Crisis Lock; protected status for humanitarian corridor data, IAEA monitoring feeds, and banking channel

transaction monitoring below \$10M threshold.

MODULE IV: ESCROW AND DISPOSITION ANNEX

Operative Clause: This annex governs all physical nuclear material disposition, facility conversion, and external custody arrangements under the RCSA. It establishes the technical and logistical procedures for uranium stockpile

management, the Optional External Custody program, and the phased conversion of Fordow to the International Medical Isotope Research Centre (IMIRC).

1. URANIUM STOCKPILE MANAGEMENT AND INTERNAL ESCROW

1.1 Stockpile Ceiling Maximum allowable Low Enriched Uranium (LEU) equivalent stockpile:

35 300 kilograms at any time. Material exceeding this ceiling must be

disposed of through downblending or external custody transfer within 14 days of ceiling breach. 1.2 Automatic Downblending Trigger

If stockpile approaches 80% of ceiling (240 kg), enhanced monitoring activates with weekly mass balance reporting. If stockpile exceeds 250 kg, conversion to sub-2% enrichment uranium oxide (U₃O₈) or

uranyl nitrate must begin within 14 days. Downblending Technical Procedure:

Method: Isotopic dilution via blending with depleted uranium

(DU, 0.2-0.3% U-235) or natural uranium (NU, 0.711% U-235). Chemical Form: Preferred method is dissolution of UF₆ to uranyl nitrate hexahydrate (UNH) solution, blending with

DU/NU stock solution, followed by crystallization or conversion to U₃O₈. IAEA Verification: In-line monitoring equipment measuring

enrichment and quantities of input (LEU) and blendstock (DU/NU) and output (sub-2% LEU); mass balance calculated per batch; IAEA inspector present for campaign start and

end. Timeline: Standard downblending rate of 10-15 kg LEU per week at Isfahan or designated downblending station;

300 kg disposed within 20-30 weeks maximum. Waste Form: Sub-2% material converted to U₃O₈ powder and stored in double-contained, IAEA-sealed drums; drums

stored at declared facility under camera and seal monitoring. 1.3 Material Balance Sheet

Every gram of uranium is tracked from mining through processing, enrichment, storage, and disposition:

Wartime Architecture Continuity Framework

Annex WPC addresses the critical question of how the architecture functions when participating states become involved in armed conflict, whether with each other or with external parties. The fundamental principle of this annex is that security cooperation mechanisms should not automatically terminate upon the outbreak of hostilities, as it is precisely during conflicts that communication channels, incident prevention protocols, and escalation management procedures are most needed. The annex establishes conditions

under which architecture elements continue during wartime and procedures for managing the practical challenges of maintaining cooperation amid hostilities.

The tiered continuity framework distinguishes between architecture elements that continue automatically during conflict, those that require affirmative decision to continue, and those that are automatically suspended. Core communication channels, including hotlines and the Joint Crisis Communication Center, continue automatically because their value is greatest during conflict. Confidence-building measures, including conventional forces transparency and maritime safety protocols, require affirmative decisions based on military circumstances. Economic cooperation measures are automatically suspended to prevent the appearance that economic interests are being pursued while combat continues.

The Wartime Coordination Protocol establishes procedures for maintaining architecture functions during active hostilities. These procedures address security arrangements for inspectors and monitors, communication protocols that function under degraded conditions, and decision-making authority when normal governance processes are disrupted. The protocol also establishes protected status for architecture personnel and facilities, recognizing that attacks on these elements would escalate conflict beyond its original scope.

Humanitarian Pause Trigger and Conflict Limitation

The Humanitarian Pause Trigger provides an automatic mechanism for initiating temporary ceasefires to address humanitarian emergencies that arise during conflict. The trigger is activated by specified humanitarian indicators including mass civilian displacement, critical infrastructure destruction, or disease outbreak that overwhelms local response capacity. Upon activation, parties are obligated to suspend offensive military operations

in designated humanitarian corridors for periods sufficient to permit emergency response.

The pause mechanism includes automatic notification to the UN Secretary-General and relevant international humanitarian organizations, enabling rapid deployment of assistance once hostilities are suspended. The pause is time-limited to prevent its exploitation for military advantage, but can be renewed by mutual agreement if humanitarian needs persist. Violations of pause obligations trigger automatic consequence activation under the architecture's enforcement mechanisms.

The Conflict Limitation Protocol establishes boundaries on the geographic scope, target categories, and weapons employment that parties agree to observe even during active hostilities. These limitations are designed to prevent conflict escalation beyond contained parameters and to protect civilian populations and critical infrastructure. While not a substitute for conflict resolution, these limitations reduce the human and material costs of conflicts that occur despite architecture efforts at prevention.

H2>Armed Conflict and Architecture Continuity

P>When participating states become engaged in armed conflict, whether with each other or with external parties, architecture continuity depends on maintaining essential communication and constraint mechanisms even as broader cooperation is suspended. The continuity framework distinguishes between architecture elements that should continue during conflict, those that require affirmative decisions, and those that should be automatically suspended.

P>Elements that continue automatically include communication channels including hotlines, the Joint Crisis Communication Center, and diplomatic contact points. These channels are most valuable precisely during conflict,

when communication can prevent escalation and enable de-escalation. Nuclear monitoring also continues automatically, as the non-proliferation value of monitoring is greatest when conflict creates incentives for nuclear threats or breakout.

P>Elements requiring affirmative decisions include conventional forces transparency, maritime safety cooperation, and economic cooperation. These elements may continue if military circumstances permit and political decisions favor continuation, or may be suspended if conflict conditions make continuation impractical or undesirable. Decisions are made by the Governance Body or through emergency procedures.

P>Elements automatically suspended include new benefit tranches, expanded economic cooperation, and non-essential institutional activities. Suspension prevents the appearance that economic interests are being pursued while combat continues. Suspension is automatic and does not require political decision, but can be overridden by Governance Body decision if circumstances warrant.

H2>Post-Conflict Re-engagement and Architecture Restoration

P>When conflicts involving architecture parties end, the architecture provides frameworks for re-engagement and restoration of full cooperation. Re-engagement recognizes that post-conflict environments present both opportunities for renewed cooperation and risks that grievances will perpetuate confrontation. The architecture's modular design enables graduated restoration of cooperation as conditions permit.

P>Re-engagement assessment evaluates whether conditions support restoration of suspended architecture elements. Assessment considers the causes of conflict, the terms of conflict termination, the attitudes of leadership and publics in affected states, and the security environment in conflict-affected

areas. Assessment findings inform decisions about the pace and scope of re-engagement.

P>Graduated restoration proceeds through stages that progressively reactivate suspended architecture elements. Early stages restore communication channels, humanitarian access, and crisis management procedures that create foundations for broader cooperation. Intermediate stages restore confidence-building measures and limited economic cooperation. Full restoration reactivates all architecture elements when conditions support comprehensive re-engagement.

P>Reconciliation support addresses the underlying grievances and relationships that may have contributed to conflict. Support includes truth-telling mechanisms, reparations programs, institutional reform, and community reconciliation processes. The architecture does not impose reconciliation but provides resources and frameworks that enable states to pursue reconciliation as they see fit.

H2>Third-Party Conflict Involvement

P>The architecture addresses situations in which third-party states become involved in conflicts affecting architecture parties. Third-party involvement may take the form of direct military intervention, proxy support, economic pressure, or diplomatic alignment. The architecture's response to third-party involvement depends on whether the third party is a participating state, a guarantor state, or an external actor.

P>Participating state involvement triggers the architecture's dispute resolution and consequence mechanisms. The Governance Body addresses the involvement through consultation, mediation, and if necessary, arbitration. Consequence mechanisms may be activated if involvement violates architecture commitments including non-aggression undertakings.

P>Guarantor state involvement creates particular challenges because guarantor states possess capabilities that could significantly affect conflict dynamics. The architecture encourages guarantor states to coordinate their involvement to prevent conflicting actions that exacerbate rather than resolve conflicts. Guarantor coordination occurs through architecture channels and through bilateral consultations.

P>External actor involvement by states outside the architecture may support or oppose architecture parties. The architecture does not dictate how parties respond to external involvement but provides frameworks for collective response if external involvement threatens the architecture's purposes. Collective response may include diplomatic measures, economic measures, or security measures depending on the nature of external involvement.

H2>Humanitarian Pause Implementation

P>The Wartime Entry Protocol includes detailed procedures for implementing humanitarian pauses that temporarily suspend hostilities to permit humanitarian activities. Pause implementation requires coordination among conflict parties, humanitarian organizations, and architecture institutions.

P>Pause request procedures enable humanitarian organizations or architecture institutions to request pauses when humanitarian needs require temporary cessation of hostilities. Requests specify the geographic scope, duration, and purpose of requested pauses. Requests are communicated through established channels to all conflict parties.

P>Pause negotiation addresses the terms of pauses including scope, duration, and conditions. Negotiation may involve architecture facilitation, third-party mediation, or direct communication among parties. Negotiated pause terms are documented and communicated to all relevant actors.

P>Pause monitoring verifies that parties are respecting pause obligations. Monitoring employs observer teams, satellite surveillance, and reporting networks. Violations are documented and reported to the Governance Body for appropriate response.

P>Pause extension and termination procedures govern whether pauses are extended as needs persist or terminated when the original purpose is achieved. Extension requires affirmation by all parties. Termination includes notification and transition procedures.

H2>Post-Conflict Stabilization and Recovery

P>When conflicts end, the architecture provides frameworks for post-conflict stabilization that supports transition from war to peace. Stabilization addresses security, governance, economic, and social dimensions of post-conflict recovery.

P>Security stabilization establishes public order and reduces violence through security sector reform, disarmament, demobilization, and reintegration of combatants, and rule of law restoration. Security stabilization creates conditions for other recovery activities.

P>Governance stabilization reestablishes effective public administration through interim governance arrangements, capacity building, and institutional development. Governance stabilization ensures that public services can be delivered and public order maintained.

P>Economic stabilization addresses immediate economic needs including employment, basic services, and market functioning. Stabilization includes cash-for-work programs, livelihood restoration, and economic infrastructure repair.

P>Social stabilization addresses community divisions through reconciliation

processes, dialogue platforms, and social cohesion programs. Social stabilization prevents conflict recurrence by addressing the grievances and divisions that fueled violence.

ANNEX IP

Mining and milling: U₃O₈ concentrate (yellowcake) declared

36 to IAEA; mass measured by weight on certified scales.

Conversion: U₃O₈ to UF₆ at Isfahan; input/output

reconciliation; cylinder tracking via unique identifiers.

Enrichment: Feed, product, and tails assay recorded;

cumulative LEU production calculated monthly.

Storage: Cylinder inventory by location, enrichment, and

mass; photographed and sealed after each inventory change.

Disposition: Downblending, export, or external custody

logged with before/after mass and enrichment verification.

The full material balance sheet is updated monthly and published in the quarterly Transparency Summary. Legacy unresolved material issues must be disclosed or formally closed with IAEA explanation

within 180 days of framework entry.

1. OPTIONAL EXTERNAL CUSTODY PROGRAM

Iran may voluntarily transfer enriched uranium stockpile above the 300 kg ceiling or a designated portion of the existing stockpile to external custody in Oman or Pakistan. Material

remains Iranian-owned at all times; transfer is reversible upon verified civilian reactor need and governance body approval. 2.2 Custody Facility Requirements

Oman Option: Facility: Duqm Special Economic Zone or designated secure storage facility under Omani sovereign

territory; constructed or retrofitted to IAEA Material Storage Facility (MSF) standards. Security: Omani Royal Armed Forces perimeter; IAEA

seal room with Swiss-manufactured multi-point locking; climate-controlled environment

37 (temperature 15-25C, humidity <60%).

Access: Joint Iranian-Omani-IAEA custody; any material movement requires unanimous consent of all three parties; 30-day advance notice for

drawdown requests. Pakistan Option: Facility: Pakistan Atomic Energy Commission (PAEC)

storage facility or designated civilian nuclear complex under IAEA safeguards. Security: Pakistan Army security division; IAEA seal

room; dual-key system (PAEC + IAEA). Access: Joint Iranian-Pakistani-IAEA custody; drawdown subject to 30-day notice, verified

reactor need, and governance body majority approval. 2.3 Transport Protocol

IAEA Seal Application: All cylinders sealed with RMSA electronic seals at point of origin; seal event logs transmitted to Vienna before transport commencement.

Transport Mode: Air freight (preferred for speed and security) or armed convoy with GPS tracking. Air transport via neutral carrier (Swiss WorldCargo or

Oman Air cargo) on pre-cleared routing. Chain of Custody:

Origin: IAEA inspector verifies seal, mass, and

enrichment; loads cylinder into tamper-indicating transport container (TIC) with dual seals.

In-Transit: GPS tracking every 15 minutes; automated alert if deviation >5km from approved route; satellite monitoring of convoy or flight path.

38 Arrival: Receiving state IAEA inspector verifies seal integrity; mass and enrichment re-measured via non-destructive assay; TIC opened under dual witness.

Insurance: Framework escrow fund covers transport insurance; \$50M policy minimum per shipment; underwritten by Lloyd's of London or Swiss Re.

2.4 Reversible Drawdown Iran may request return of externally custodied material:

30-day advance notice to governance body and IAEA. Verified civilian reactor fuel need: contract for

reactor fuel fabrication or medical isotope target production submitted to IAEA.

Governance body approval by weighted majority (60% + neutral chair concurrence).

Return transport follows identical seal, chain-of-custody, and insurance protocol as outbound shipment.

Returned material integrated into declared inventory and subject to standard monitoring.

1. FACILITY CONVERSION FRAMEWORK: FORDOW TO IMIRC

3.1 Conversion Objectives The Fordow facility (Qom Province) is designated for phased

conversion to the International Medical Isotope Research Centre (IMIRC). Conversion serves multiple framework purposes:

Removes enrichment infrastructure from a hardened, underground location.

Creates legitimate civilian economic activity embedding the facility in global medical supply chain.

Demonstrates irreversible commitment to peaceful

39 Provides continued Iranian employment for nuclear

scientists in non-proliferation activity. 3.2 Phased Removal of Enrichment Infrastructure Phase A — Cessation and Inventory (Months 1-6):

All enrichment operations cease; UF₆ removed from centrifuge cascades and transferred to Natanz or Isfahan under IAEA escort.

Centrifuge inventory: IR-1 machines catalogued by serial number; condition assessed; decontamination plan prepared.

Advanced machines (IR-2, IR-4, IR-6 if any):

sealed in place pending Phase C removal.

IAEA continuous camera and seal coverage maintained throughout.

Phase B — Decontamination and Preparation (Months 7-12):

Centrifuge halls decontaminated to permissible radiation levels for civilian research access.

Process piping, UF6 handling equipment, and vacuum systems removed or sealed.

Structural modifications: blast doors retained for security but repurposed; ventilation reconfigured for laboratory rather than process use; seismic monitoring systems installed for research safety.

Security transition: Military personnel withdraw; access limited to civilian nuclear medicine researchers, international advisory board members, and IAEA monitors. Phase C — Infrastructure Removal and Storage (Months 13-18):

Centrifuge machines removed from cascades; IR-1 40 machines placed in sealed storage at Fordow or transferred to Natanz under IAEA custody.

Advanced machines (IR-2, IR-4, IR-6) transferred to IAEA-sealed storage warehouse at Isfahan or designated neutral storage (with Iranian consent and IAEA verification).

Cascade halls converted to laboratory modules: clean room installations; fume hoods; radiation shielding for isotope handling. Hot cell installation for Mo-99 (Molybdenum-99)

and other medical isotope processing.

Phase D — IMIRC Activation (Months 19-24):

Medical isotope production begins: Mo-99/Tc-99m

(Technetium-99m) for diagnostic imaging; I-131

for thyroid therapy; Lu-177 for cancer radiotherapy.

International Scientific Advisory Board

constituted: 5 members (2 Iranian, 3 international — proposed: WHO representative, IAEA nuclear applications expert, European nuclear medicine specialist, one rotating regional expert).

WHO and IAEA-related health initiative funding

priority access activated.

Production capped at medical isotope needs; no

uranium enrichment; no plutonium separation; all target irradiation at declared research reactor (Tehran Research Reactor or replacement).

3.3 Technical Specifications for IMIRC Isotope Production Method: Neutron activation of uranium targets or molybdenum targets in research

reactor; chemical separation (not isotopic

41 enrichment) of fission product Mo-99.

Source Material: LEU targets (19.75% U-235 maximum) supplied under IAEA seal from declared inventory; no on-site enrichment.

Waste Management: All radioactive waste managed under IAEA safety standards (SSR-5); waste storage on-site in licensed facility; disposal via

international waste management contractor. Quality Assurance: GMP (Good

Manufacturing Practice) certification for pharmaceutical production; batch release testing; IAEA verification of source material consumption vs. product output. 3.4 Reconversion Safeguards

Reconversion of Fordow to enrichment use requires:

Unanimous governance body consent. IAEA Board of Governors certification of legitimate

civilian need with no alternative supply available.

180-day advance notice to all framework parties. New IAEA safeguards approach developed and

implemented before any UF6 introduction.

Automatic Crisis Lock activation upon reconversion

notice; framework benefits suspended pending IAEA and governance body certification of legitimate

MODULE V: TECHNICAL VERIFICATION AND REMEDIATION PATHWAYS

Operative Clause: This module codifies the structured technical response architecture for verification failures, data interruptions, and compliance

42 gaps across all framework domains. It establishes specific timelines, mechanisms, and fallback procedures ensuring that technical gaps do not escalate into political crises.

1. VERIFICATION DOMAIN MATRIX

The following matrix governs all verification domains under the framework. Each domain specifies its primary monitoring mechanism, technical fallback if primary fails, and maximum resolution timeline before compliance

consequences activate. ; Verification Domain ; Primary Mechanism ;
 Technical Fallback ; Resolution Timeline ; ; -----;
 -----; -----; ----- ;
 Nuclear Facilities ; Continuous camera and seal monitoring; Satellite
 monitoring + environmental sampling ; 7 to 14 days ; ; ; (NGSS, EOSS/RMSA,
 OLEM) ; + third-party logistics records ; ; ; Verification Data ; Real-time
 transmission to Vienna ; Mirrored backup node in Geneva ; 48-hour
 continuity ; ; ; (RDT VPN infrastructure) ; + terrestrial diplomatic courier ;
 guarantee ; ; Proxy Operations ; Incident registry and PERT analysis ;
 Independent technical assessment from neutral ; 24-hour shock ; ; ; (JMOC
 fusion + satellite tracking) ; pool (Switzerland, Pakistan, Oman, Sweden) ;
 response window ; ; Uranium Escrow ; 300 kg internal limit + local ; External
 custody transfer to Oman or Pakistan ; 14-day automatic ; ; ; downblending
 at Isfahan ; under IAEA seal + reversible drawdown ; downblending ;

1. NUCLEAR FACILITIES VERIFICATION PATHWAY

2.1 Stage One: Technical Remediation (Days 1-7) Upon identification of
 verification gap (camera malfunction, seal anomaly, data interruption):

Joint technical team deployed within 48 hours: IAEA

Technical Services inspector + neutral guarantor technician (Swiss or
 Pakistani) + Iranian Atomic

Energy Organisation (AEOI) liaison.

Repair or replacement of failed equipment: spare

43 NGSS cameras, EOSS seals, and UMS sensors

pre-positioned at Tehran diplomatic pouch facility and Dubai logistics hub for
 rapid deployment.

Alternative data sources activated: local data

buffer download from collect computer; facility operator logs; secondary camera angles.

Daily reporting to governance body via Technical

Implementation Hotline (Tier 2).

No compliance indicator adjustment; no economic

impact during Stage One. 2.2 Stage Two: Substituted Verification (Days 8-14)

If technical team unable to restore primary monitoring within 7 days:

Satellite monitoring activation: commercial imagery

tasking at highest available resolution (0.3m) for 3-day revisit frequency; SAR for all-weather coverage.

Environmental sampling surge: 3x normal sample

volume; additional sampling locations within 10km radius; expedited 72-hour laboratory turnaround.

Expanded complementary access: unannounced

inspection within 48 hours; full facility walkdown including non-nuclear areas; process record review.

Neutral technical advisors from standing pool

(Sweden, Singapore, Brazil, New Zealand) may assist IAEA if Iranian consent obtained.

Weekly governance body review via Verification

Liaison Sub-Committee.

Compliance indicator remains neutral; benefits

44 2.3 Stage Three: Limited Continuity Assumption (Days 15-30)

If substituted verification unable to confirm facility status after 14 days:

Temporary assumed compliance within defined bounds

based on most recent verified data (mass balance, cylinder inventory, process parameters).

Benefits continue at 75% of scheduled amounts. Enhanced monitoring maintained at Stage One

intensity (daily reporting; alternate-day

satellite tasking; continuous Geneva backup monitoring).

If verification not restored within 30 days,

governance body convenes formal compliance assessment at ministerial level (Step 3 of Graduated Response Framework).

Once verification is restored at any stage,

monitoring returns to standard frequency, benefits return to 100%, and no lasting breach designation

1. VERIFICATION DATA CONTINUITY PATHWAY

3.1 48-Hour Continuity Guarantee Enforcement The Data Continuity Guarantee (Module II) ensures that

interrupted monitoring data never exceeds 48 hours without technical remediation. The enforcement pathway: Hour 0-4: Automated fault detection (Roogle-3).

Alert to IAEA Vienna Operations and Geneva backup node. Hour 4-24: Class A diagnosis and remote remediation

attempt (software restart, VPN tunnel renegotiation, backup link activation). If remote remediation succeeds: log entry

45 only; no further action.

Hour 24-48: Joint technical team deployment order issued. Class B/C classification if adversarial indicators present. Substituted

verification (satellite) fully activated. If restoration achieved within 48 hours: technical remediation record only; no

compliance consequence. Hour 48-72: If not restored, automatic compliance indicator downgrade: +0.5 points to

Nuclear and Verification domain score. Geneva backup node assumes primary monitoring status for data continuity.

Hour 72-168: If not restored, +1.0 additional points. Enhanced monitoring mandatory. Governance body review within 7 days.

Day 7+: If not restored, formal technical lapse classification; potential breach determination; Step 2 (Technical

Consultation) of Graduated Response Framework activates. 3.2 Geneva Backup Node Activation Protocol

When primary Vienna data receipt fails for >4 hours:

Geneva backup node transitions from passive mirror to active monitoring status.

IAEA Geneva liaison office assumes temporary oversight of real-time data review.

All governance body notifications routed through

Geneva until Vienna restoration confirmed.

Data reconciliation: upon Vienna restoration, differential analysis conducted to identify any 46 gaps or anomalies in the interrupted period.

1. PROXY OPERATIONS VERIFICATION PATHWAY

4.1 24-Hour Shock Response Window Upon mass-casualty proxy event or Tier 3 security incident:

Hour 0-2: Incident detected via JMOC fusion engine, satellite alert, or party hotline notification. JMOC Watch Commander

confirms event classification and activates PERT. Hour 2-6: PERT preliminary evidence collection;

satellite tasking; signals correlation; open-source verification. Hour 6-12: PERT preliminary attribution assessment.

If confidence $\geq 70\%$: Shock Response Envelope activation notice prepared. If confidence $< 70\%$: Assessment Hold

recommended; enhanced monitoring activated. Hour 12-24: Formal attribution report issued to

governance body. Shock Response Envelope activates if threshold met. Governing party 24-hour Column A selection window

opens. Hour 24-48: If Column A selected: voluntary measure implemented; monitoring verifies implementation. If Column A not selected:

Column B automatic defaults activate (benefit suspension; enhanced monitoring; compliance indicator adjustment).

Hour 48-72: Guarantor mediation window if cooling-off invoked. Only one

cooling-off permitted per

4.2 Independent Technical Assessment from Neutral Pool If PERT attribution is disputed by either core party:

Disputing party submits technical challenge within
12 hours of attribution report receipt.

Governance body convenes Neutral Technical Review

Panel within 48 hours: 3 experts from standing pool

(Sweden, Singapore, Brazil, New Zealand) selected by random lot from pre-qualified roster.

Panel reviews all sanitized evidence; conducts
independent analysis; issues binding technical
determination within 7 days.

Panel determination governs compliance scoring; may
overturn, modify, or confirm PERT attribution.

Panel operates under Swiss law procedural

Hotline Architecture and Crisis Communication Systems

Annex IP establishes a comprehensive hotline architecture that creates reliable, secure communication channels between military commanders, political leaders, and technical experts across all participating states. This architecture goes far beyond traditional hotlines between heads of state to encompass multiple communication channels optimized for different types of incidents and different levels of urgency. The resulting network provides redundant pathways through which crisis communications can flow even if

individual channels are compromised or unavailable.

The Strategic Hotline connects the highest political leadership of each participating state, providing a channel for direct communication at the presidential or prime ministerial level. This hotline is reserved for the most serious situations requiring immediate political decision, and its use automatically triggers notification to all other architecture parties that a leadership-level communication has occurred. The strategic hotline employs multiple technological pathways, including dedicated satellite links, undersea cable connections, and radio backup, to ensure connectivity under all conceivable conditions.

The Military Operations Hotline connects theater-level military commanders, providing a channel for addressing incidents involving naval encounters, airspace violations, border tensions, and proxy force activities. This hotline operates 24/7 with trained duty officers capable of immediate response, and employs standardized communication protocols that reduce the risk of misunderstanding in high-stress situations. The military hotline also supports the direct exchange of operational information that can clarify ambiguous situations before they escalate.

Joint Crisis Communication Center

The Joint Crisis Communication Center (JCCC) serves as the physical and institutional hub for the architecture's crisis communication and incident management functions. Located at a mutually agreed neutral location, the JCCC maintains continuous staffing by military officers and diplomatic personnel from all participating states, providing a permanent venue for immediate consultation when incidents occur. The JCCC's physical presence ensures that communication pathways exist even when political relationships have deteriorated to the point that direct bilateral contact is difficult.

The JCCC maintains comprehensive databases of regional military forces, including order of battle information, standard operating procedures, and communication protocols. This information enables rapid incident assessment by providing context for understanding the forces involved in any encounter. The center also maintains historical incident records that enable pattern analysis and early warning of emerging tensions.

The JCCC's facilities include secure conference rooms for immediate consultations, situation rooms with real-time display of regional military activities, and living quarters for staff during extended crisis periods. The center's physical security employs multiple layers of protection to ensure continuity of operations under all threat conditions, including backup power, independent communications, and protected food and water supplies.

Incident Classification and Response Protocols

The incident classification system categorizes military incidents according to their severity, the forces involved, and their potential for escalation. Category One incidents involve minor encounters with no casualties and limited escalation potential, such as inadvertent airspace violations or naval proximity events. Category Two incidents involve more serious encounters, including intentional provocations, minor casualties, or threats to critical infrastructure. Category Three incidents involve major hostilities, significant casualties, or clear threats to territorial integrity.

Each incident category triggers specified response protocols that escalate with incident severity. Category One incidents require notification through military hotlines and documentation in the JCCC incident database. Category Two incidents require immediate JCCC consultation, leadership notification, and activation of de-escalation procedures. Category Three incidents trigger full crisis management protocols, including Governance Body emergency session

and the potential activation of the Escalation Override Mechanism.

The classification system includes procedures for reclassification when incidents prove more or less serious than initial assessments indicated. This flexibility prevents both underestimation of serious incidents and overreaction to minor ones. Reclassification decisions are made by the JCCC director with notification to all parties, ensuring that response levels remain appropriate to actual circumstances.

H2>Direct Communication Linkages and Redundancy

P>The incident prevention architecture relies on robust direct communication linkages that provide multiple redundant channels for crisis communication. Redundancy ensures that communication can continue even if individual channels are disrupted by technical failures, cyber attacks, or deliberate severance. The redundancy architecture includes landline, satellite, radio, and internet-based channels with automatic failover capabilities.

P>Landline channels employ dedicated terrestrial circuits that provide high-quality, low-latency voice and data communication. These circuits are physically protected and employ diverse routing that minimizes vulnerability to single-point failures. Landline channels are the primary communication method during normal operations.

P>Satellite channels provide backup communication that functions independently of terrestrial infrastructure. Satellite channels are essential when terrestrial infrastructure is disrupted by natural disasters, attacks, or system failures. Multiple satellite constellations provide redundancy within the satellite backup layer.

P>Radio channels provide ultimate backup communication that requires only radio equipment and antenna access. Radio channels have limited bandwidth

compared to landline and satellite but function under conditions that disrupt all other communication methods. Radio channels are tested regularly to ensure operational readiness.

H2>Joint Crisis Communication Center Operations

P>The Joint Crisis Communication Center operates on a 24/7 basis with staff from all participating states maintaining continuous presence. Center operations follow standard operating procedures that specify staff responsibilities, communication protocols, information management procedures, and escalation triggers.

P>Watch operations maintain continuous monitoring of regional military activities, political developments, and potential crisis indicators. Watch officers analyze incoming information to identify situations requiring center attention. Watch logs maintain records of all information received, assessments made, and actions taken during each watch period.

P>Shift procedures ensure smooth transition between watch teams at shift changes. Shift briefings transfer information about ongoing situations, emerging concerns, and pending actions. Shift overlap periods enable outgoing and incoming teams to confer on complex situations requiring continuity of attention.

P>Center activation procedures specify when and how the center transitions from routine watch to active crisis management. Activation triggers include military incidents, detected violations, terrorist attacks, natural disasters, and requests from participating states. Activated operations increase staffing, enhance information flow, and enable immediate consultation with national capitals.

H2>Incident Debriefing and Lessons Learned

P>Following significant incidents, the architecture conducts structured debriefing and lessons learned processes that capture insights for preventing future incidents and improving response procedures. Debriefing involves all parties to the incident, third-party observers, and technical experts who analyze incident dynamics.

P>Debriefing procedures include timeline reconstruction that establishes the sequence of events leading to the incident, communication analysis that examines what was communicated when and how communication affected incident evolution, decision analysis that evaluates the decisions made by various actors and their consequences, and outcome assessment that identifies the results of the incident and its aftermath.

P>Lessons learned documentation captures findings from debriefing in formats accessible to personnel responsible for preventing similar incidents. Lessons may address procedural changes, equipment improvements, training enhancements, or policy modifications. Lessons learned are incorporated into standard operating procedures, training curricula, and equipment specifications.

H2>Military-to-Military Engagement Protocols

P>The incident prevention architecture includes military-to-military engagement protocols that build professional relationships among military officers from participating states. Engagement reduces misunderstanding, builds trust, and creates communication channels that facilitate crisis management.

P>Staff college exchanges enable officers from participating states to attend each other's professional military education programs. Exchanges create personal relationships, mutual understanding of military doctrines, and professional respect that facilitate cooperation.

P>Joint training exercises enable military forces from participating states to train together on non-combat missions including disaster response, search and rescue, and maritime safety. Joint training builds operational familiarity and demonstrates that cooperation can produce mutual benefits.

P>Professional conferences bring together military professionals from participating states to discuss operational matters, share best practices, and address common challenges. Conferences create informal networks that supplement formal architecture communication channels.

P>Sports and cultural exchanges create informal personal relationships among military personnel that complement professional engagement. Informal relationships enable direct communication during crises and reduce the interpersonal friction that can escalate incidents.

H2>Language and Communication Standards

P>Effective communication during incidents requires standardized language and communication procedures that reduce misunderstanding. The architecture establishes communication standards that all parties employ during crisis communication.

P>Standard terminology employs agreed vocabulary for describing incidents, capabilities, and intentions. Standard terminology reduces ambiguity and ensures that all parties interpret communications consistently. The architecture maintains a terminology glossary that defines key terms.

P>Translation services ensure that communications can be accurately translated among the languages of participating states. Translation employs certified translators familiar with military and technical terminology. Quality assurance verifies translation accuracy.

P>Communication protocols specify how communications are formatted,

transmitted, acknowledged, and recorded. Protocols ensure that communications are received, understood, and available for after-action review. Protocols include authentication procedures that prevent spoofing.

H2>Historical Incident Analysis and Learning

P>The architecture maintains a comprehensive database of military incidents in the region that informs incident prevention, response procedures, and relationship management. Historical analysis identifies patterns, lessons, and warning signs that can prevent future incidents.

P>Incident documentation records the facts, circumstances, responses, and outcomes of each significant incident. Documentation includes timeline reconstruction, communication records, decision records, and outcome assessment. Documentation is maintained in standardized formats.

P>Pattern analysis examines incident databases to identify recurring patterns including common locations, types of forces involved, seasonal patterns, and escalation dynamics. Pattern analysis informs preventive measures and early warning indicators.

P>Lesson learning extracts actionable insights from incident analysis for procedure improvement, training enhancement, and equipment modification. Lessons are incorporated into standard operating procedures, training curricula, and equipment specifications.

P>After-action reviews are conducted following each significant incident or exercise to capture lessons and identify improvement opportunities. Reviews involve all parties to the incident and are conducted in a spirit of mutual learning rather than blame assignment.

ANNEX MO

guarantees; members bound by confidentiality enforceable in their national jurisdictions.

1. URANIUM ESCROW VERIFICATION PATHWAY

5.1 14-Day Automatic Downblending When stockpile exceeds 300 kg ceiling or 250 kg

automatic trigger: Day 1: IAEA mass balance report identifies ceiling breach. Automatic alert to

governance body and Iranian AEOI. Day 1-3: Iranian AEOI selects disposition modality: (a) local downblending at Isfahan; or

(b) external custody transfer to Oman or Pakistan. Day 3-7: If local downblending selected: IAEA inspector team deploys to supervise

campaign initiation; blendstock (DU/NU)

48 verified and measured; in-line monitors

activated. If external custody selected: transport logistics finalized; IAEA seal application;

neutral carrier booking; insurance confirmation. Day 7-10: Downblending campaign operational or

transport convoy/aircraft en route. GPS and seal monitoring continuous. Day 10-14: Downblending complete (target: sub-2%) or

custody transfer complete. IAEA verifies final mass and enrichment. Updated material balance sheet issued.

Day 14+: If disposition not complete by Day 14, automatic compliance indicator penalty: +1.0 point per week until resolved.

Governance body review at Day 14. Potential benefit suspension under Step 2 if delay continues beyond 21 days.

5.2 External Custody Drawdown Verification For reversible drawdown from Oman or Pakistan:

30-day notice period allows IAEA to verify reactor fuel need documentation and plan re-monitoring.

Returned material re-integrated into declared inventory with full mass and enrichment verification.

Return transport monitored identically to outbound

No compliance penalty for verified, governance-

1. CROSS-DOMAIN VERIFICATION COORDINATION

49 6.1 Integration with Compliance Indicators System

All verification pathways feed into the CIS scoring architecture: Nuclear and Verification Domain: 3 points per

indicator. Triggers from Module I and Module V Stage Two/Three feed into this domain. Security and Proxy Domain: 2 points per indicator.

PERT attribution outcomes and Shock Response Envelope activations feed into this domain. Economic and Sanctions Domain: 2 points per

indicator. Banking channel integrity and benefit delivery verification feed into this domain. Humanitarian and Regional Domain: 1 point per

indicator. Corridor monitoring and detainee registry verification feed into this

domain. Scoring Thresholds:

5.0 cumulative: Enhanced review activated 8.0 cumulative: Formal compliance assessment triggered (Step 3)

12.0 cumulative: Snapback consideration threshold (Step 4) 6.2 Pattern-of-Concern Designation

Three or more indicators of concerning activity across two consecutive 30-day review cycles, demonstrating a coordinated pattern rather than isolated incidents, may

be designated a "pattern of concern." This designation activates:

Enhanced monitoring across all domains for 90 days. Mandatory explanatory briefing to governance body

No automatic economic or security consequence, but

50 recorded in Precedent Registry.

Informs future compliance assessments; contributes

to CIS weighting adjustments. 6.3 Quarterly Transparency Summary

All verification pathway outcomes, remediation actions, and compliance scores are published in the quarterly Transparency Summary:

Issued by governance body secretariat within 30

Distributed to all framework parties, guarantors,

Public redacted version issued within 45 days. Contains: verification statistics; remediation

logs; CIS scores by domain; PERT activation summary; material balance updates; incident

APPENDIX TO VERIFICATION & TECHNICAL ARCHITECTURE MODULES

A. STANDING NEUTRAL POOL

The following states maintain pre-qualified technical expert rosters available for independent assessment, JMOC staffing, and dispute resolution:

Sweden (nuclear safeguards and satellite analysis) Singapore (maritime security and financial tracking) Brazil (nuclear energy and regional diplomacy) New Zealand (disarmament verification and environmental sampling)

Switzerland (all domains; primary neutral hub)

51 Pakistan (regional security and Islamic-world

Oman (Gulf diplomacy and operational mediation)

B. TECHNICAL EQUIPMENT PRE-POSITIONING To ensure 48-hour remediation capability, the following

equipment is maintained at forward logistics nodes: Dubai Hub: 4 NGSS camera systems; 20 EOSS seals; 10 UMS sensor kits; 2 satellite communication terminals; 1 forensic analysis kit. Vienna IAEA Headquarters: Full replacement inventory for all Iranian facility systems;

maintained by IAEA Technical Services Division. Geneva Backup Node: Hot-standby server capacity; encrypted backup media; diplomatic courier tamper-indicating containers.

Islamabad (Pakistan): Regional spare parts and technical assistance for South Asian route contingencies.

C. TRAINING AND CERTIFICATION All JMOC staff and verification personnel must complete:

IAEA Safeguards Information Analysis Course

RCSA Framework Orientation (1 week, Geneva or

Cyber-Security Awareness for Nuclear Verification

(IEC 62645-aligned, 1 week, online).

Cultural and Regional Sensitivity Training

Annual refresher and recertification; failure

to recertify results in suspension of access credentials.

52 D. DOCUMENT CONTROL

These modules are classified as Tier 1 (must survive in any framework version). Amendments require governance body consensus. Technical clarifications may be issued

by the Joint Implementation Group Verification Liaison Sub-Committee by Silence Procedure (72-hour auto- adoption if no objection). All modifications recorded

in the Precedent Registry.

END OF VERIFICATION & TECHNICAL ARCHITECTURE MODULES

Document Identifier: RCSA-Tech-v1.5 Classification: Framework Technical Reference Depositary: UN Secretary-General (upon framework entry

into force) Preparation Date: 2026

Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

This annex establishes a 'Phase -1' entry corridor for framework activation during active or recently concluded hostilities, addressing the post-conflict nuclear baseline (including 60% enriched uranium stockpiles), dual-blockade

resolution (Hormuz closure + US port blockade), degraded proxy transitions, and wartime governance activation. It is designed to bridge the gap between ceasefire and Phase 0 without requiring a comprehensive peace treaty.

53 Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

The RCSA architecture was designed for peacetime or cold-conflict entry. The current reality—active US- Iran hostilities, a fragile three-week ceasefire, a closed Strait of Hormuz, a US naval blockade of Iranian ports, and a year-long absence of IAEA inspections—requires a dedicated protocol for framework activation under wartime conditions. This annex does not replace the framework's phased structure; it creates a 'Phase -1' entry corridor that bridges active conflict to Phase 0 foundation. The protocol addresses four post-conflict realities that the baseline framework did not anticipate: (1) a nuclear baseline that includes 440+ kilograms of 60% enriched uranium and 11 tons of total enriched material with no IAEA continuity of knowledge for nearly 12 months; (2) a dual-blockade scenario where Iran has closed Hormuz to hostile-flagged shipping and the US has blockaded Iranian ports; (3) a proxy landscape in which Hezbollah has been militarily degraded but retains political and light-armed capacity, and Lebanese state disarmament is in Phase 1 south of the Litani; and (4) governance vacuums in Tehran where the IRGC exercises increasing decision-making authority and the civilian government operates under war- time constraints.

This annex is operative only during the transition from declared ceasefire to framework entry into force. Once the framework is activated, the standard phase structure governs. The protocol sunsets automatically 180 days after framework entry or upon governance body certification that post-conflict transition is complete.

Pre-Entry Confidence-Building Sequence

Framework entry is not contingent on a comprehensive peace treaty. It is contingent on a verified, sequential de-escalation that creates the minimum conditions for framework operations. The sequence has four steps, each verified before the next activates.

54 Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

Table WPC-1: Table WPC-1: Pre-Entry Confidence-Building Sequence

Step Requirement Verification Timeline Benefit Unlocked

Step 1: No confirmed kinetic Joint satellite and 14 days Framework pre-Ceasefire engagements between UAV monitoring negotiation Stabilization US/Israeli and Iranian + guarantor field technical talks forces for 14 observers open in Muscat consecutive days

Step 2: Iran reopens Hormuz Lloyd's List + 7 days US lifts port humanitarian Blockade to non-hostile IHTA toll registry after Step blockade on corridors pre-Reciprocity commercial shipping + port authority 1 Iranian activate confirmation commercial (not military) shipping

Step 3: IAEA IAEA inspectors return IAEA Director 14 days Emergency Re-entry to declared sites with General after Step escrow shield 48-hour access certification 2 (\$100M) releases for medical and food imports

Step 4: Governance body Neutral chair 7 days Phase 0 activates Framework convenes with all certification of after Step with post-conflict Entry parties + guarantors Steps 1-3 3 baseline completion procedures

Post-Conflict Nuclear Baseline Establishment

The standard RCSA Phase 0 assumes a 3.67% enrichment cap and a declared baseline within 30 days. The post-conflict reality requires a different baseline procedure. Iran currently holds approximately 440 kilograms of 60% enriched

uranium (equivalent to nine weapons' worth if further enriched) and 11 tons of total enriched uranium, with IAEA continuity of knowledge broken since February 2026.

55 Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

Table WPC-2: Table WPC-2: Post-Conflict Nuclear Baseline Protocol

Phase Action Timeline Verification Benefit Linkage

Emergency Full declaration of all IAEA challenge SESS 30 days Humanitarian Baseline nuclear material, access to all technical corridor full (Days 1-30) facilities, and declared sites deployment activation + centrifuge \$500M escrow manufacturing since shield IAEA departure

Material All 60% enriched Continuous 60 days Banking channel SWIFT Securement uranium downblended IAEA monitoring restoration humanitarian (Days 31-90) to 3.67% or + satellite + (single tier transferred to IAEA- environmental correspondent) monitored external sampling custody (Oman/Pakistan)

Centrifuge Advanced centrifuges IAEA seals + 90 days Sectoral relief Freeze (Days (IR-2, IR-4, IR-6) SESS verification tranche 1 91-180) sealed and inventoried (agriculture, medicine)

Breakout Independent Governance body 90 days Phase 1 Time Floor assessment that technical eligibility review Verification breakout timeline committee + (Days 181- exceeds 9 months independent 270) from current nuclear physicists configuration

The 60% Stockpile Resolution

The 60% enriched uranium stockpile is the most acute post-conflict nuclear risk. The baseline protocol treats this stockpile as a legacy security liability, not

a bargaining chip. Resolution follows three tracks that operate simultaneously:
 Track A — Downblending: Iran commits to downblend all 60% material to 3.67% or below within 90 days of framework entry. IAEA observes the downblending process. Downblended material remains Iranian property, stored under IAEA seal, and may be used for Bushehr reactor fuel fabrication. This track satisfies the US 'zero stockpiling' demand without requiring physical transfer out of Iran.

Track B — External Custody: Iran may voluntarily transfer up to 50% of the 60% stockpile to Oman or Pakistan for joint custody under IAEA seal, as a confidence-building measure. Transfer is reversible upon

56 Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

180-day notice and governance body certification of legitimate civilian need. This track addresses Israeli concerns about rapid re-enrichment while preserving Iranian ownership. Track C — Verification of Destruction Claims: If Iran claims that any portion of the 60% stockpile was destroyed in military strikes, the claim is verified by: IAEA analysis of facility damage; environmental sampling for uranium dispersal; and metallurgical assessment of claimed destruction. Unverified claims are treated as outstanding material balance issues and subject to continued monitoring.

Table WPC-3: Table WPC-3: 60% Stockpile Resolution Timeline

Milestone Deadline Verification Consequence of Non- Completion

Initial declaration Day 30 IAEA + SESS Delay of banking channel restoration by 30 days

Downblending Day 45 IAEA continuous Enhanced review activation + commencement monitoring compliance indicator +1.5

50% downblended or Day 90 IAEA certification Phase 0 continuation at current

Phase 1 in custody levels eligibility frozen

100% resolved Day 180 IAEA + Phase 1 eligibility restored if all independent panel other indicators green

Dual-Blockade Resolution

The framework cannot operate with the Strait of Hormuz closed and Iranian ports blockaded. The dual- blockade resolution is a precondition for Phase 0 economic activation, not an outcome of it. Resolution follows a synchronized, reciprocal structure: Iranian Hormuz Closure Lift: Iran removes all restrictions on commercial vessel transit through Hormuz. The IHTA pre-activates in monitoring mode (no tolls collected during Phase -1). Verification by: Lloyd's List vessel tracking; IHTA transit logs; and guarantor naval observer presence. Iranian small-craft patrols remain permitted for anti-piracy but may not approach within 500 meters of commercial vessels. US Port Blockade Lift: The US removes the naval blockade on Iranian commercial ports. Military materiel and sanctioned dual-use goods remain subject to existing controls. Verification by: UN OCHA port access reports; commercial shipping manifest review; and IAEA seal confirmation on humanitarian cargo. US naval presence in the Gulf remains permitted for force protection but may not interdict commercial vessels.

Synchronization Mechanism: Neither side is required to lift first. Both lifts are declared simultaneously through the guarantor relay, with a 72-hour implementation window. If one side fails to lift within 72 hours, the other side's lift is suspended and the matter is referred to the governance body emergency session. The default is 'maintain both blockades' if synchronization fails—neither side gains unilateral advantage from the other's non-compliance.

57 Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

Humanitarian Exception: Regardless of blockade status, humanitarian vessels (UN-flagged, Red Crescent, WHO, WFP) are granted guaranteed passage through Hormuz and access to Iranian ports. This exception is verified by guarantor naval escort if necessary and is non-negotiable.

Proxy Force Transition during Wartime Entry

The framework's proxy management architecture assumes relatively stable proxy organizations. The post- conflict reality involves degraded proxy capacity, shifting command structures, and active disarmament processes. The wartime entry protocol adapts the proxy architecture to these conditions.

Hezbollah-Southern Lebanon: The Lebanese government's 5-phase disarmament plan (approved September 2025) provides the operational baseline. Phase 1 (south of Litani) is treated as completed for framework purposes if the Lebanese Armed Forces (LAF) maintain operational control and no confirmed Hezbollah heavy weapons remain in the zone. The framework does not demand Hezbollah total disarmament; it demands compliance with the LAF plan. Verification by: UNIFIL + LAF joint patrol reports; satellite monitoring; and SESS technical spot-checks.

Hezbollah Political Status: The framework explicitly distinguishes between Hezbollah's military and political wings. Political participation is not a framework concern. Military activity is monitored through the standard proxy cap system. If Hezbollah transitions to a purely political organization with no confirmed military operations for 180 days, it is reclassified from 'proxy' to 'political party' for framework compliance purposes.

Yemen Houthis: The Yemen stabilization module operates independently of the Iran-US bilateral track. Ceasefire maintenance in Yemen is verified by the UN-led monitoring mission, not by bilateral Iran-US intelligence. The Houthi classification as a proxy remains operative only if confirmed material support

from Iran resumes. Iraq PMF: The PMF integration pathway continues on its 18-month deadline from the baseline framework. Post-conflict acceleration is permitted if the Iraqi government certifies that security conditions allow faster integration.

Governance Body Activation under Wartime Conditions

The standard governance body assumes stable, recognizable governments with designated representatives. Wartime conditions may produce ambiguous authority. The protocol provides three contingency rules:

Rule 1 — Military-to-Civilian Handover: If a party's military command is exercising de facto authority during ceasefire, the military authority may designate up to 3 framework liaison officers with provisional signing capacity. Provisional capacity expires 60 days after framework entry or upon civilian government restoration, whichever comes first. Provisional designations are not permanent and may not be renewed.

Rule 2 — Split Authority: If a party's institutions send conflicting signals (e.g., civilian government affirming interest while military command rejecting engagement), the neutral chair convenes an authority-clarification

58 Annex WPC: Wartime Entry and Post-Conflict Baseline Protocol

session within 14 days. The party is given 30 days to produce a unified position. During the clarification window, the framework operates on the basis of the most restrictive signal (no new obligations activated, existing obligations maintained).

Rule 3 — Post-Conflict Election Timing: If a framework party holds national elections within 90 days of framework entry, Phase 0 continues through the election period under the outgoing administration's continuity designation. The incoming administration has 30 days post-inauguration to confirm or

modify continuity designations. The framework does not pause for elections.

Sunset and Transition to Standard Architecture

The Wartime Entry Protocol is an emergency supplement, not a permanent modification. It sunsets according to the following schedule: Step 1-4 sequence: 60 days maximum from ceasefire to framework entry. Post- conflict nuclear baseline: 180 days maximum from framework entry. Dual-blockade resolution: 30 days maximum from framework entry. Proxy transition rules: 180 days maximum from framework entry. Governance activation rules: 90 days maximum from framework entry. Upon sunset, all provisions of the Wartime Entry Protocol automatically expire and the standard RCSA phase architecture governs exclusively. Any matter not resolved by sunset is transferred to the standard governance body under normal dispute resolution procedures. The governance body may, by consensus, extend specific Wartime Protocol provisions for up to 90 additional days if verified conditions warrant.

59 Humanitarian Coordination Track

The humanitarian track operates as a parallel coordination mechanism, separate from political and security negotiations. Humanitarian access is not a bargaining chip; it is locked to UN autonomous management and may not be weaponized in any compliance or political dispute.

Gaza Humanitarian Stabilization

Gaza humanitarian access is separated from political resolution of the broader conflict. Access is negotiated with Egypt (mediator), Israel, the de facto administrator, and UN agencies. Phase 0 addresses humanitarian corridors and medical access only.

Humanitarian Corridor Establishment

Four border crossings are established for humanitarian goods: Rafah (Egypt-

Gaza): Food, medical supplies, fuel (civilian) Kerem Shalom (Israel-Gaza): Pharmaceutical and specific equipment Erez (Israel-Gaza, north): Medical personnel rotation, priority cases Aid-by-sea (UN-mediated): World Food Programme maritime delivery Permitted goods include food, potable water, medicine, medical devices, fuel for hospitals and water treatment, temporary shelter materials, and hygiene supplies. Prohibited items include weapons, dual-use military equipment, and communications equipment.

Minimum Daily Tonnage Target

Table 5 Gaza Humanitarian Corridor Targets

Category Daily Target Primary Source

Food 150 tons WFP, bilateral donors Fuel 100 tons Egypt, Gulf states Medical supplies 50 tons WHO, ICRC Shelter and hygiene 100 tons UNHCR, UNICEF

Medical Access and Casualty Evacuation

Established medical evacuation pathway: Gaza patients requiring specialized care are referred to Egyptian hospitals. Regular ambulance convoys operate three times per week minimum. Capacity: 50 patients per month for priority cases (severe burns, spinal injury, pediatric trauma). WHO supplies mobile clinics to Gaza (three units). Egyptian hospitals receive financial support for Gaza patient treatment (\$5 million over six months from international donors).

De-escalation Mechanism

If humanitarian corridors are breached (crossing closed, goods blocked, patients denied evacuation): UN issues statement within 24 hours; governance body convenes within 48 hours; reopening required within 72 hours. Extended closure (7+ days) triggers Phase 0 suspension of all non-humanitarian benefits to the violating party. This creates incentive to maintain corridors regardless

of other negotiations. Humanitarian Coordination Track

Refugee Pathways and Safe Returns

Approximately 6.6 million Syrian refugees are globally displaced: 3.7 million in Turkey, 1.5 million in Lebanon, 600,000+ in Jordan, 200,000 in Iraq. Phase 0 focuses on safe return pathways for willing refugees. No party may require or enforce return.

Safe Return Principles

Voluntary: Refugees must affirmatively consent to return. No pressure or coercion. Safe: Return corridors subject to verification through agreed means. No transit through active conflict areas. Supported: Returnees receive temporary housing assistance and livelihood support. Monitored: UN monitors return process and reintegration for six months.

Syria is divided into five zones based on security conditions: Zone A (Safe for Return): Rural areas northwest of Aleppo, eastern Euphrates region. Target: 200,000 refugees over six months. Zone B (Conditional Return): Outskirts of Damascus, Homs region. Target: 100,000 refugees over six months, contingent on verified security stability. Zone C (Restricted to Family Visits): Coastal region. Refugees permitted two-week family visits but permanent return restricted until Phase 1. Zone D (No Return): Active conflict zones where opposition groups remain. No return permitted. Zone E (Monitoring): Disputed areas pending political settlement. Limited return only with explicit UN security assessment.

Upon return to Syria, returnees receive: temporary housing (UN-supplied tent communities or host family support); livelihood stipend of \$100 per month for six months; restoration of civil identity documents; family tracing services. Expected costs: \$500 million over six months (international donor

responsibility).

Lebanese Emergency Response

Lebanon faces near-total economic collapse: currency collapse, frozen banking system (\$160 billion in deposits inaccessible), electricity grid providing approximately two hours per day, healthcare system near collapse, and 80 percent of population below poverty line. Phase 0 addresses emergency response only; comprehensive reconstruction is a Phase 1 matter.

2 Emergency Fuel Supply

Saudi Arabia and UAE commit to quarterly fuel shipments (\$150 million value, months 1-6) delivered via Mediterranean ports. Lebanon retains state fuel monopoly. UN monitors fuel allocation to ensure hospitals and water treatment are prioritized. Cost: \$300 million over six months (Gulf state funding).

Healthcare Emergency Support

WHO emergency supply program provides medicines, medical devices, and oxygen (\$100 million over six months). Egyptian and Turkish hospitals receive support for Lebanese patient referrals. Medical training programs shift burden to regional facilities while preserving Lebanese healthcare worker capacity.

Water and Food Security

UN provides emergency desalination units (three units: two near Beirut, one in south Lebanon) producing 50,000 gallons per day each. World Food Programme operates cash-for-work programs (\$50 million) and direct food assistance to 2 million Lebanese. Refugee camp support includes winter heating, medical clinics, and WASH improvements (\$100 million).

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA)

Humanitarian & Civilian Protection Modules Version 1.5 — Hardened Operational Update

TABLE OF MODULES Module I: Humanitarian Corridor Logistics Annex

Module II: Civilian Protection Monitoring Cell (CPMC) Module III: Rapid Aid Deployment Protocol Module IV: Refugee & IDP Stabilization Module

PREAMBLE: HUMANITARIAN ACCESS AS STABILIZATION INSTRUMENT

3 Operative Clause: These modules establish the complete operational architecture for humanitarian and civilian protection under the RCSA. They are designed on the foundational principle that humanitarian aid is not merely a moral obligation but a structural stabilization instrument

that, when hardened against political extortion, military strikes, and sanctions overcompliance, directly reinforces framework durability. The following provisions are classified Tier 1 (must survive in any

framework version) and are operative from Phase 0 entry. No party may suspend, condition, or weaponize humanitarian access in response to compliance disputes in other framework domains. Humanitarian operations

are locked under UN autonomous management and protected by the "Humanitarian Firewall" — a strict legal separation preventing humanitarian access from being used as leverage in nuclear, security,

economic, or normalization negotiations. HUMANITARIAN FIREWALL — ABSOLUTE NON-CONDITIONALITY

Humanitarian corridor operations, medical evacuation pathways,

and refugee camp support may not be suspended, delayed, or conditioned upon compliance in any other framework track.

Nuclear non-compliance does not justify humanitarian corridor closure. Proxy activity breaches do not justify medical supply blocking. Economic sanctions disputes do not justify refugee aid suspension.

Any party deliberately blocking humanitarian operations as leverage in non-humanitarian negotiations is subject to immediate +3.0 CIS points to Humanitarian and Regional domain (the maximum single-indicator penalty) and automatic governance body emergency session.

The Humanitarian Deconfliction Hotline (managed by UN OCHA) operates independently of all political hotlines and may not be deactivated by any party for any reason.

MODULE I: HUMANITARIAN CORRIDOR LOGISTICS ANNEX

Operative Clause: This annex defines the physical, operational, and legal architecture for moving humanitarian aid through contested zones in Yemen, Gaza, Lebanon, Syria, and Iraq. It establishes designated routes, dual-use cargo verification, anti-extortion safeguards, and JMOC-integrated military deconfliction. All provisions are binding on framework parties, guarantor states, and participating NGOs.

1. DESIGNATED GEOGRAPHIC ROUTES

1.1 Route Classification All humanitarian corridors are classified into three categories:

Tier S (Strategic): Primary high-volume routes delivering 80%+ of humanitarian cargo; protected by permanent UN

presence and JMOC deconfliction.

Tier A (Auxiliary): Secondary routes activated during

Tier S disruption or surge demand; protected by rotating

UN monitors and ad hoc JMOC registration.

Tier E (Emergency): Air and sea bridges activated only

during Tier S/A simultaneous failure; requires governance

body notification but not approval (humanitarian override). 1.2 Gaza Corridor

Network Tier S — Rafah Crossing (Egypt-Gaza):

Commodities: Food, medical supplies, fuel (civilian

generator grade), temporary shelter materials, hygiene kits, potable water.

Capacity: Minimum 150 tons food + 50 tons medical +

5 100 tons fuel + 100 tons shelter/hygiene per day (Table

5 baseline from RCSA Core Document).

Operating hours: 0600-1800 local time, 7 days per week. Inspection: UN OCHA and Egyptian customs joint

inspection at Rafah staging area; Israeli technical observer permitted (not veto holder); 4-hour maximum

clearance per convoy.

Neutral staging hub: Aid cargo inspected and sealed

at Arish Humanitarian Logistics Hub (Egypt) before

crossing; dual-seal system (UN OCHA primary, ICRC secondary); GPS trackers applied to all pallets.

Route: Arish → Rafah → Khan Younis distribution hub;

65 km total; military deconfliction corridor 500m width; no military activity permitted within corridor without 24-hour JMOC notification.

Escort: UN-flagged convoy with UN-marked vehicles

only; no armed escort from framework parties; self-defense limited to UN security officers

(minimum 4 per convoy, armed with small arms only). Tier S — Kerem Shalom Crossing (Israel-Gaza):

Maritime Domain Awareness Architecture

Annex MO establishes the Integrated Maritime Operating Picture (IMOP), a comprehensive system for sharing maritime surveillance information among participating states to enhance regional maritime security, prevent incidents, and protect critical sea lines of communication. The IMOP integrates sensor data, vessel tracking information, and intelligence assessments from multiple national and international sources into a common operating picture accessible to all authorized users. This shared awareness reduces the uncertainty that can lead to incidents and enables coordinated responses to maritime threats.

The IMOP technical architecture employs a distributed data fusion system that collects information from coastal radar networks, automatic identification systems (AIS), satellite surveillance, and patrol vessel reports. This multi-source approach ensures coverage redundancy and enables cross-validation of vessel positions and activities. The system employs advanced correlation algorithms that fuse data from multiple sources to produce more accurate and complete track information than any single source could provide.

Information sharing protocols balance comprehensive coverage with

legitimate security concerns. All participating states contribute maritime surveillance data to the common picture, but each state controls the classification and distribution of its own contributions. The system includes automated sanitization procedures that remove sensitive source and method information while preserving the operational value of the shared data. These procedures ensure that participation in the IMOP does not compromise unrelated intelligence capabilities.

Hormuz Transit Protocol and Strait Security

The Hormuz Transit Protocol establishes cooperative procedures for managing maritime traffic through the Strait of Hormuz, the world's most critical energy chokepoint. The protocol creates a safe transit regime that protects commercial shipping while respecting the legitimate security interests of littoral states. Under the protocol, participating states commit to cooperative maritime patrols, shared communication channels, and coordinated rules of engagement that reduce the probability of incidents in this congested and strategically vital waterway.

The protocol establishes a Maritime Coordination Center at a location overlooking the strait, staffed by naval officers from all littoral states and major user states. This center maintains continuous monitoring of strait traffic, coordinates transit scheduling to prevent dangerous congestion, and serves as the immediate response hub for any incidents that occur. The center's authority is limited to coordination functions; it does not command national forces, but rather facilitates voluntary cooperation among independent naval units.

The rules of engagement established under the protocol prohibit interference with commercial shipping except in accordance with international law and specific architecture provisions. These rules apply to all naval forces operating

in the strait, including those of states not participating in the architecture, through the mechanism of notification to the International Maritime Organization and publication in Notices to Mariners. While non-participating states cannot be bound by architecture rules, publication creates international awareness and generates reputational costs for non-compliant behavior.

Anti-Piracy and Maritime Law Enforcement Coordination

The IMOP includes coordination mechanisms for addressing maritime security threats beyond interstate incidents, including piracy, arms smuggling, narcotics trafficking, and illegal fishing. These threats undermine regional stability and can create incidents when law enforcement operations encounter vessels from other participating states. The coordination mechanisms establish procedures for deconflicting operations, sharing intelligence on threat networks, and conducting joint operations against shared threats.

The Joint Maritime Patrol program enables participating naval forces to conduct coordinated patrols that extend coverage beyond what any single navy could achieve. These patrols operate under agreed rules of engagement that establish authority for boarding, search, and seizure in accordance with international law. Participating forces retain national command authority but coordinate their operations through the Maritime Coordination Center to maximize coverage and minimize conflicts.

The Maritime Law Enforcement Protocol establishes procedures for cooperation when law enforcement operations involve vessels or nationals of other participating states. These procedures require prior notification of operations in waters where other states maintain legitimate interests, establish protocols for requesting and rendering assistance, and create dispute resolution mechanisms for situations where operations inadvertently affect other states' interests. These procedures prevent law enforcement operations

from generating interstate incidents that could escalate beyond their original law enforcement purposes.

Maritime Surveillance Integration and Sensor Networks

The Integrated Maritime Operating Picture integrates multiple sensor networks into a comprehensive maritime domain awareness system. Sensor integration combines data from coastal radar networks, satellite surveillance, automatic identification systems, patrol vessel reports, and underwater sensors into a unified operational picture that provides complete awareness of maritime activities across the region.

P>Coastal radar networks provide continuous coverage of near-shore waters, tracking vessel movements within radar range. Radar data includes vessel position, speed, heading, and classification based on radar signature. Network coverage gaps are identified and addressed through additional radar deployment or alternative sensor augmentation.

P>Underwater surveillance addresses submarine and submersible activities that surface sensors cannot detect. Surveillance includes acoustic monitoring systems that detect submarine signatures, magnetic anomaly detection that identifies submerged metallic objects, and hydrophone networks that monitor underwater acoustic activity. Underwater surveillance is particularly important for detecting covert submarine operations that could threaten maritime security.

H2>Fisheries Protection and Marine Resource Management

P>Maritime cooperation extends beyond security to include fisheries protection and marine resource management that address economic and environmental dimensions of maritime governance. Illegal, unreported, and unregulated (IUU) fishing undermines legitimate fisheries, damages marine

ecosystems, and can provide cover for maritime smuggling activities.

P>Fisheries monitoring employs vessel tracking, catch documentation, port inspection, and market surveillance to detect and deter IUU fishing. Vessel monitoring systems track fishing vessel movements and correlate positions with authorized fishing areas. Catch documentation schemes verify that marketed fish products derive from legal catches. Port inspection examines fishing vessels for compliance with conservation measures.

P>Marine resource management cooperation addresses shared fish stocks that cross national boundaries and require coordinated management to prevent overexploitation. Management cooperation includes scientific assessment of fish stocks, agreement on total allowable catches, allocation of catch shares among states, and enforcement of management measures. Regional fisheries management organizations provide institutional frameworks for such cooperation.

H2>Maritime Environmental Protection

P>Maritime environmental protection addresses pollution, habitat destruction, and climate impacts that threaten marine ecosystems. Environmental protection cooperation recognizes that marine pollution respects no boundaries and that effective protection requires coordinated action across the region.

P>Oil spill preparedness ensures that the region can respond effectively to major oil spills from tanker accidents, platform failures, or pipeline ruptures. Preparedness includes oil spill response equipment stockpiles, trained response teams, response plans for high-risk areas, and mutual assistance agreements that enable rapid deployment of international resources. Regional oil spill response centers coordinate multinational response operations.

P>Marine pollution monitoring tracks pollution levels and sources including industrial discharge, agricultural runoff, plastic waste, and atmospheric deposition. Monitoring data identifies pollution hotspots, tracks pollution trends, and evaluates the effectiveness of pollution control measures. Regional monitoring networks generate comparable data across national boundaries.

P>Marine protected area cooperation establishes and manages protected areas that conserve marine biodiversity and ecosystem services. Cooperation includes scientific assessment of areas requiring protection, agreement on protection measures, joint management of transboundary protected areas, and enforcement of protection regulations. Marine protected area networks create connectivity that enhances conservation effectiveness.

H2>Port Security and Supply Chain Integrity

P>Port security cooperation protects maritime supply chains against terrorism, smuggling, and other threats that could exploit maritime transportation vulnerabilities. Security cooperation builds on the International Ship and Port Facility Security Code while addressing regional-specific threats and capabilities.

P>Port facility security assessments evaluate vulnerabilities at major ports and identify security measures required to address identified risks. Assessments examine physical security, access controls, cargo screening, personnel security, and cyber security. Assessment findings guide security investment and regulatory requirements.

P>Cargo security screening examines containerized cargo for threats including weapons, explosives, hazardous materials, and contraband. Screening technologies include radiation detection, X-ray imaging, and chemical analysis. Risk-based screening approaches focus intensive examination on high-risk cargo while facilitating low-risk cargo flow.

P>Supply chain security extends security measures beyond ports to encompass the full supply chain from manufacturer to final destination. Security measures include manufacturer certification, container sealing, transit monitoring, and destination verification. Secure supply chains reduce vulnerability to tampering and diversion while maintaining commerce flow efficiency.

H2>Search and Rescue Cooperation

P>Maritime search and rescue cooperation enables participating states to assist mariners in distress regardless of nationality. Cooperation is governed by international conventions and supplemented by architecture-specific coordination mechanisms.

P>Rescue coordination centers maintain continuous watch for distress alerts and coordinate rescue operations. Centers receive alerts from satellite systems, radio transmissions, and other sources. Architecture coordination links national rescue centers to enable regional cooperation.

P>Rescue resource sharing enables states to request assistance from neighbors when rescue needs exceed national capabilities. Sharing includes vessels, aircraft, and personnel. Pre-negotiated agreements expedite resource sharing during emergencies.

P>Joint rescue exercises test coordination procedures and familiarize rescue personnel with regional partners. Exercises improve interoperability and identify coordination weaknesses. Exercise findings inform procedure refinement.

H2>Maritime Pollution Response

P>The maritime operating picture includes pollution response capabilities that protect the marine environment from oil spills, chemical releases, and other

maritime pollution incidents.

P>Pollution monitoring employs satellite surveillance, aerial observation, and water sampling to detect pollution incidents. Monitoring identifies pollution sources, tracks spill movement, and assesses environmental impact.

P>Spill response includes containment, recovery, dispersal, and shoreline protection. Response capabilities include equipment stockpiles, trained personnel, and response vessels. Regional spill response cooperation enables rapid deployment of international resources.

P>Pollution prevention addresses the sources of maritime pollution including vessel discharges, port operations, and offshore facilities. Prevention measures include regulations, inspections, and enforcement. Prevention reduces the frequency and severity of pollution incidents.

H2>Submarine Cable Protection

P>Undersea telecommunications cables carry the majority of international data traffic including financial transactions, communications, and internet traffic. Cable protection ensures the security and reliability of this critical infrastructure.

P>Cable route monitoring tracks vessel activities near cable routes that could damage cables through anchoring or trawling. Monitoring employs vessel tracking, patrol presence, and seabed sensors. Suspicious activities trigger warning and response.

P>Cable damage response enables rapid repair when cables are damaged by accidents, natural events, or deliberate action. Response includes repair vessels, spare cable, and coordination with cable operators. Rapid repair minimizes service disruption.

P>Threat assessment evaluates the risk of deliberate cable attacks and

develops protective measures. Assessment considers the vulnerability of cable routes, the capabilities of potential adversaries, and the consequences of cable disruption. Protective measures include physical protection, monitoring, and redundancy.

ANNEX MD

from treatable conditions as proxy

28 for medicine shortage).

Level Green: >30 days of essential

medicines stock. No action.

Level Amber: 14-30 days stock. CPMC

advisory to UN OCHA; prioritization recommendation.

Level Red: 7-14 days stock. Automatic

Rapid Aid Deployment Protocol trigger (Module III).

Level Black: <7 days stock.

Emergency Override Mechanism activation; +2.0 CIS points; governance body emergency session

1. INTEGRATION WITH THE GRADUATED PENALTY LADDER

3.1 Automatic CIS Weighting

CPMC findings carry mandatory CIS scoring weight. The following score adjustments are automatic upon CPMC verification (no

governance body vote required; 72-hour override window by supermajority):

Civilian Fatality Attribution:

Confirmed civilian fatality caused

by framework party military action: +0.25 points per fatality to

Humanitarian domain; +0.25 points per fatality to Security and Proxy domain.

Per-event cap: +3.0 points maximum from per-fatality calculation

(equivalent to 12 fatalities);

29 scoring beyond the cap deferred to

the mass-casualty base penalty below.

Confirmed civilian fatality caused

by proxy attributable to framework

party: +0.15 points per fatality to Humanitarian domain; +0.35 points per fatality to Security

and Proxy domain. Per-event cap: +3.0 points maximum from per-fatality calculation (equivalent to 20 proxy-

attributed fatalities); scoring beyond the cap deferred to the mass- casualty base penalty below.

Mass-casualty event (25+ confirmed

civilian fatalities): +3.0 base points to Humanitarian domain (automatic, regardless of per-

capita calculation). This base penalty applies in addition to any per-fatality points up to the per-

event cap. Maximum per-event CIS impact from a single mass-casualty incident: +6.0 to Humanitarian

domain (+3.0 base + up to +3.0 per-fatality cap) and +5.0 to Security and Proxy domain (+2.0

base mass-casualty + up to +3.0 per-fatality cap).

PHAR-registered facility strike

resulting in civilian fatality: +3.0 to Humanitarian domain +2.0

30 to Security and Proxy domain

(strict liability; see Module I, Section 4.3). Per-fatality scoring does not apply to PHAR strikes;

the strict liability penalty is a fixed +3.0/+2.0 regardless of fatality count, preventing overlap

with per-fatality caps. Humanitarian Blockage:

Class 2 blockage verified: +0.5

points to Humanitarian domain.

Class 3 blockage verified: +1.5 to

+3.0 points based on CPMC severity assessment (civilian impact, duration, repeat offense).

Starvation/deprivation finding

(CPMC confirms population denied

food/water/medicine as policy): +3.0 points to Humanitarian domain; +2.0 points to Security and Proxy;

automatic Step 2 Penalty Ladder activation. Medical Evacuation Denial:

Denial of pre-cleared medical

evacuation (verified patient died as result): +2.0 points to

Systematic denial pattern (3+

verified denials within 30 days):

+3.0 points to Humanitarian domain; Step 2 activation.

31 3.2 CPMC Report as Binding Evidence

CPMC findings published in quarterly

"Civilian Protection Assessment" are admissible as evidence in BAP

proceedings without requiring additional authentication.

Any party disputing CPMC findings

must present contradictory forensic evidence of equal or higher methodological rigor; mere political

denial is inadmissible.

BAP gives CPMC findings prima facie

evidentiary weight; burden of rebuttal on the disputing party.

3.3 Escalation Trigger Matrix When CPMC findings push a party's CIS score across penalty thresholds:

Score reaches 5.0: Enhanced Review (Step 1) — CPMC Director invited to present findings at governance body.

Score reaches 8.0: Formal Assessment (Step 2) — next humanitarian-related benefit tranche frozen; CPMC

empowered to recommend specific remedial actions. Score reaches 12.0: Snapback

Consideration (Step 3) — domain parameter reversion; CPMC may recommend emergency aid surge to

affected population as mitigating measure (humanitarian override

32 permits aid regardless of penalty).

Score reaches 16.0: Full Domain Suspension (Step 4) — humanitarian

operations continue (Humanitarian

Firewall); non-humanitarian benefits suspended; CPMC authorized to activate emergency humanitarian

corridor protocols independent of suspended party's cooperation.

1. MEDICAL EVACUATION PATHWAYS

4.1 Pre-Cleared Diplomatic Routes The CPMC maintains standing medical evacuation pathways that require no ad-hoc

political negotiation: Gaza Evacuation Corridor:

Origin: Gaza Strip (designated

pickup points: Al-Shifa Hospital,

Indonesian Hospital, European Gaza Hospital).

Destination: Egyptian hospitals

(Arish, Sheikh Zuweid, Al-Arish General Hospital, Cairo referral network).

Capacity: 50 priority patients per

month minimum; surge capacity to 100 patients under mass-casualty

Pre-clearance: Egyptian Ministry

of Health standing authorization

for framework medical evacuations; no case-by-case visa requirement;

33 patient manifest transmitted to

Egyptian border 24 hours before movement; only medical condition summary shared (no political

Ambulance: WHO-supplied mobile

clinics (3 units) + ICRC ambulance

convoy (3 times per week minimum).

Cost: \$5 million over 6 months from

international donors; Egyptian

hospital capacity support included. Lebanon Evacuation Corridor:

Origin: Beirut, Tripoli, Tyre,

Destination: Turkish hospitals

(Istanbul, Ankara, Gaziantep); Egyptian hospitals (Cairo, Alexandria).

Capacity: 30 priority patients per

month; scaling based on conflict intensity.

Pre-clearance: Turkish and Egyptian

standing authorization; visa-on- arrival for medical evacuation

patients at designated ports of entry. Yemen Evacuation Corridor:

Origin: Sana'a, Aden, Hudaydah. Destination: Jordan (Amman hospitals);

Oman (Muscat hospitals); Egypt (Cairo).

Capacity: 20 priority patients per

month from Sana'a airport; 30 from

Pre-clearance: 48-hour passenger

manifest to UN OCHA; no political screening; medical condition

verification by WHO only. Syria Evacuation Corridor:

Zone 1 (Daraa): Jordan land bridge

to Jordanian hospitals (Irbid, Ramtha, Amman).

Zone 2 (Coastal): Maritime to

Lebanon then air to Turkey/Europe.

Zone 3 (Aleppo): Turkish border

crossing to Gaziantep hospitals.

Zone 4 (Northeast): Iraq border to

Zone 5 (Idlib): No evacuation

(humanitarian corridor only); IDP

transfer to Aleppo and Coastal zones under Mass-Displacement Protocol. 4.2

Medical Evacuation Triggers

Evacuation pathways activate automatically upon:

CPMC medical officer confirmation that

patient requires treatment unavailable

WHO referral form completed by

ICRC verification of patient identity

and voluntary consent.

Host nation (destination) standing

35 authorization confirmed active.

No ad-hoc political authorization

required from any framework party. 4.3 Protection of Medical Evacuees

Medical evacuees and accompanying

family members (maximum 2) granted temporary protected status in

destination country for duration of medical treatment plus 30 days.

No interrogation, detention, or

intelligence debriefing of medical

evacuees by any framework party intelligence service.

Medical records remain confidential

under WHO patient privacy protocols; shared only with treating physicians.

Return to origin territory guaranteed

upon completion of treatment; ICRC coordinates safe return transport.

1. REPORTING CADENCE AND PUBLICATION

5.1 Monthly Flash Reports

5-page operational summary; distributed

to governance body, guarantors, and UN agencies within 10 days of month end.

Contents: casualty counts by theater;

corridor status (open/partial/closed); MSSI levels by zone; 3 incident

highlights; 2 recommendations. 5.2 Quarterly Civilian Protection Assessment

30-page comprehensive report; published

36 within 30 days of quarter end.

Contents: full mortality analysis;

blockage verification; MSSI trends; medical evacuation statistics; CPMC

methodological notes; CIS score impact summary; annexes with detailed data tables.

Public version: Redacted to remove

witness identities and operational security details; published on UN OCHA and framework transparency portal within 45 days. 5.3 Emergency Reports

Trigger: Mass-casualty event (10+

civilian fatalities); Class 3 blockage; PHAR facility strike; Level Black MSSI.

Timeline: 48 hours from event to

preliminary report; 7 days to full report.

Distribution: Immediate to governance

body, JMOC, guarantors; public release within 72 hours (unless

security concerns justify 7-day delay — CPMC Director sole authority).

MODULE III: RAPID AID DEPLOYMENT PROTOCOL

37 Operative Clause: This module establishes a pre-approved, automated, and sanctions-resistant system for rapid humanitarian aid deployment in response to quantitative crisis triggers. It eliminates the bureaucratic delays that typically kill civilians during emergencies by creating binding triggers,

pre-cleared procurement channels, automated escrow releases, and strategically positioned stockpiles. All provisions are classified Tier 1 and are operative from Phase 0 entry.

1. QUANTITATIVE TRIGGERS

1.1 Trigger Architecture Rapid Aid Deployment activates automatically upon the satisfaction of any

quantitative trigger. Triggers are designed to be objective, measurable, and immune to political manipulation. Once a trigger is verified by the CPMC and/or UN OCHA, aid deployment proceeds without requiring governance

body

approval, party consent, or ad-hoc political negotiation. Trigger Category A — Food Security Emergencies: A1: IPC Phase 4 (Emergency) declaration by

IPC Global Initiative for any framework- affected zone covering >100,000 people. Verification: Published IPC analysis with

CPMC concurrence. Response timeline: 72 hours from IPC publication to first cargo movement.

A2: IPC Phase 5 (Catastrophe/Famine) declaration for any zone, regardless of population size. Verification: IPC Global Initiative +

FAO/WFP joint verification. Response timeline: 48 hours to first cargo movement.

A3: Food price spike: staple food commodity

38 (wheat flour, rice, cooking oil) price

increases >50% above 12-month baseline in any framework-affected zone for 7 consecutive days.

Verification: WFP Vulnerability Analysis and Mapping (VAM) unit market price monitoring. Response timeline: 7 days to first cargo

delivery. A4: Child malnutrition prevalence: GAM (Global Acute Malnutrition) rate exceeds 10% in

any zone; or SAM (Severe Acute Malnutrition) rate exceeds 2%. Verification: SMART nutrition survey or

UNICEF rapid assessment with CPMC review. Response timeline: 14 days to therapeutic food delivery.

Trigger Category B — Medical Infrastructure Collapse: B1: Hospital generator

fuel drops below 48 hours of reserve at >50% of functioning hospitals

in any zone. Verification: WHO Health Resources Availability Monitoring System (HeRAMS) + CPMC field audit.

Response timeline: 48 hours to fuel delivery. B2: Hospital generator fuel drops below 24 hours of reserve at >25% of functioning hospitals.

Verification: Same as B1. Response timeline: 24 hours to fuel delivery; Emergency Override Mechanism notification

to governance body. B3: Medical supply stock below 7 days for essential medicines at >50% of health

39 facilities (CPMC MSSSI Level Black).

Verification: CPMC MSSSI (Module II, Section 2.3). Response timeline: 72 hours to pharmaceutical

delivery. B4: Cholera/communicable disease outbreak: >100 confirmed cases in 7 days; OR any

confirmed case of cholera in a zone with no active treatment center.

Verification: WHO Early Warning, Alert and

Response System (EWARS) + laboratory confirmation. Response timeline: 48 hours to cholera kit

deployment; 14 days to temporary treatment center establishment. Trigger Category C — Mass-Casualty and Displacement:

C1: Mass-casualty event: single incident causing >100 civilian injuries requiring emergency medical treatment.

Verification: CPMC field team + WHO mass- casualty incident reporting.

Response timeline: 24 hours to emergency

medical cargo; 48 hours to field hospital deployment authorization. C2: Sudden displacement: >10,000 IDPs in 72

hours within any zone. Verification: UN OCHA displacement tracking + satellite imagery confirmation.

Response timeline: 48 hours to emergency shelter kit delivery; 7 days to camp establishment.

40 C3: IDP camp conditions: population density

exceeds 50 persons per latrine; OR <5 liters clean water per person per day; OR no functional health facility within

5km of camp center. Verification: UNHCR/WFP camp monitoring + CPMC spot audit.

Response timeline: 7 days to WASH infrastructure deployment; 14 days to mobile health unit deployment.

Trigger Category D — Infrastructure and Environmental: D1: Water treatment facility destruction or shutdown affecting >50,000 civilian

population. Verification: UNICEF WASH cluster + CPMC infrastructure assessment.

Response timeline: 48 hours to water trucking; 7 days to mobile water treatment unit deployment.

Missile Capability Restraint Framework

Annex MD addresses the proliferation and employment of ballistic missiles, cruise missiles, and unmanned aerial vehicles (drones) as delivery systems that could be used to conduct attacks with conventional, chemical, biological, or nuclear payloads. The framework establishes restraints on missile

development, testing, deployment, and transfer that reduce the threat these capabilities pose to regional stability. The restraints are calibrated to preserve legitimate defensive capabilities while constraining offensive employment and proliferation.

The missile restraint framework employs a range-based approach that distinguishes between short-range systems with limited regional impact and longer-range systems capable of striking distant targets. Short-range missiles with ranges under 300 kilometers are subject to notification and monitoring requirements but are not prohibited, recognizing their legitimate role in territorial defense. Medium-range missiles (300-1,000 kilometers) are subject to numerical caps, deployment restrictions, and mandatory notification of testing. Long-range missiles exceeding 1,000 kilometers are subject to moratorium or dismantlement requirements depending on the selected pathway.

The testing restraint protocol establishes notification requirements for all missile and drone testing activities, with detailed parameters on the timing, location, and nature of notifications. These notifications enable other parties to distinguish between routine testing activities and potential attack preparations, reducing the probability that tests will be misinterpreted as hostile actions. The protocol also establishes observer rights that permit other parties to witness tests and confirm that they conform to declared parameters.

Drone Technology Governance and Employment Restrictions

The framework addresses drones as a distinct category from missiles, recognizing their unique characteristics including persistence, reconnaissance capabilities, and precision strike potential. The drone governance provisions establish categories based on size, range, and payload capacity, with different restrictions applicable to each category. Small tactical drones with limited

range and payload face minimal restrictions, while larger systems with extended range and significant payload capacity face constraints comparable to those applicable to cruise missiles.

Employment restrictions govern how drones may be used, prohibiting certain categories of missions that pose particular escalation risks. Restricted employment categories include armed strikes outside recognized conflict zones, reconnaissance of sovereign territory without consent, swarming attacks against naval or air defense systems, and operations designed to test or exhaust adversary defenses. These restrictions apply regardless of drone category, addressing escalation risks associated with specific employment modes rather than specific technical capabilities.

P>The drone technology transfer provisions establish controls on the sale, gift, or transfer of drone technology to states or non-state actors outside the architecture. These controls are designed to prevent architecture parties from becoming sources of proliferation for drone capabilities that could threaten other regional states. The provisions include end-use monitoring requirements, retransfer restrictions, and the mandatory inclusion of architecture-compliant control systems in exported drones.

Verification and Confidence-Building Measures

Missile and drone verification presents distinctive challenges because these systems are mobile, concealable, and can be rapidly deployed from standby status. The verification architecture addresses these challenges through a combination of national technical means, on-site inspections, and confidence-building measures that collectively provide high-confidence monitoring without requiring continuous physical presence at every potential launch site.

P>The National Technical Means Integration provisions establish procedures

for sharing satellite imagery, signals intelligence, and other national technical collection capabilities relevant to missile and drone monitoring. This sharing significantly enhances verification effectiveness by combining the coverage of multiple national systems. Shared data is processed through the Joint Analysis Center to produce integrated assessments that draw on all available sources.

P>Confidence-building measures complement technical verification by creating transparency regarding missile and drone capabilities and intentions. These measures include annual declarations of holdings, advance notification of exercises involving missile or drone units, and invitation of observers to military demonstrations. While not directly verifying compliance, these measures reduce uncertainty and provide context for interpreting technical monitoring data.

Missile Defense Cooperation and Architecture

P>The missile defense component addresses the ballistic and cruise missile threats facing regional states through cooperative missile defense architecture. The architecture recognizes that missile defense is most effective when conducted cooperatively, enabling early warning sharing, sensor networking, and coordinated intercept operations that maximize defense effectiveness across defended areas.

P>Early warning sharing provides participating states with missile launch detection and trajectory tracking information that enables timely defensive response. Warning data includes launch location, missile type, projected trajectory, predicted impact area, and estimated time of arrival. Sharing agreements ensure that warning data is transmitted promptly to all states potentially affected by missile threats.

P>Sensor networking combines national sensor capabilities into an integrated

sensor architecture that provides more comprehensive coverage than any single state could achieve alone. Networking links ground-based radars, ship-based sensors, airborne platforms, and satellite sensors into a cooperative network that tracks threats across the entire region. Networked sensors provide tracking continuity as missiles transit between national sensor coverage areas.

P>Coordinated intercept planning ensures that defense resources are employed effectively against missile attacks that may threaten multiple states. Planning addresses allocation of interceptors to multiple simultaneous threats, coordination of engagement sequences to prevent redundant interception of the same threat, and deconfliction of intercept operations to prevent friendly force interference.

H2>Space Security and Satellite Protection

P>Space security cooperation addresses the growing dependence on space systems for communication, navigation, intelligence, and early warning. Space systems are vulnerable to interference, disruption, and destruction by adversaries seeking to degrade regional capabilities. The architecture includes measures to protect space assets and to ensure continuity of critical space-based services.

P>Space situational awareness sharing provides participating states with information about satellite positions, orbital debris, and potential threats to space systems. Sharing includes satellite conjunction warnings that alert operators to potential collisions, anomaly detection that identifies unusual satellite behavior, and threat warnings that indicate potential hostile action against satellites.

P>Satellite protection measures include hardening against radiation and electromagnetic threats, encryption of command and control links, rapid

reconstitution capabilities that replace lost satellites, and diplomatic measures that deter satellite attacks. Protection measures balance effectiveness against cost, recognizing that complete protection is neither achievable nor affordable.

P>Space debris mitigation prevents the accumulation of orbital debris that threatens operational satellites. Mitigation measures include spacecraft design standards that minimize debris generation, post-mission disposal requirements that remove spacecraft from populated orbits, and collision avoidance maneuvers that prevent operational satellites from contributing to debris through collisions.

H2>Counter-Unmanned Aerial Systems

P>The proliferation of unmanned aerial systems (UAS) creates new security challenges including surveillance, harassment, and attack capabilities that can be employed by state and non-state actors. The counter-UAS component addresses these challenges through detection, identification, tracking, and neutralization capabilities.

P>UAS detection employs radar, electro-optical, infrared, and acoustic sensors to identify small unmanned aircraft in defended airspace. Detection systems must distinguish UAS from birds, kites, and other airborne objects while maintaining low false alarm rates. Detection range and accuracy determine the warning time available for defensive response.

P>UAS neutralization employs electronic jamming, kinetic intercept, net capture, and directed energy to prevent hostile UAS from achieving their objectives. Neutralization methods are selected based on operational environment, potential collateral effects, and legal constraints. Electronic jamming is preferred in populated areas due to its limited physical effects, while kinetic methods may be employed in remote areas.

P>Legal and policy frameworks address the authority, procedures, and accountability for counter-UAS operations. Frameworks specify who may authorize neutralization, under what circumstances, with what rules of engagement, and with what reporting requirements. Legal frameworks balance security imperatives against privacy, safety, and property rights concerns.

H2>Hypersonic Glide Vehicle Monitoring

P>Hypersonic glide vehicles present distinctive monitoring challenges due to their speed, maneuverability, and low-altitude flight profiles. The architecture includes emerging provisions for monitoring hypersonic developments that could affect regional stability.

P>Detection capabilities for hypersonic vehicles employ over-the-horizon radar, space-based sensors, and advanced signal processing. Detection requires integration of multiple sensor types to overcome the limitations of individual systems. Architecture provisions include information sharing on hypersonic detection research.

P>Tracking capabilities maintain awareness of hypersonic vehicle trajectories through sensor networking and data fusion. Tracking provides warning time for defensive response and contributes to post-test analysis. Tracking capabilities are developed in coordination with architecture parties.

P>Notification procedures may be established for hypersonic testing to provide transparency and reduce miscalculation risks. Notification includes advance warning of tests, test parameters, and safety information. Notification provisions are developed as the technology matures.

H2>Space-Based Missile Defense and ASAT Capabilities

P>Anti-satellite capabilities and space-based missile defense systems raise

concerns about the weaponization of space and the vulnerability of space assets. The architecture addresses these concerns through transparency and restraint measures.

P>ASAT testing transparency may include notification requirements for ASAT tests, debris mitigation measures, and information sharing on ASAT capabilities. Transparency reduces uncertainty about ASAT threats and enables assessment of space debris risks.

P>Space debris mitigation addresses the long-term hazard created by ASAT tests and other space activities that generate debris. Mitigation includes design standards, disposal requirements, and debris remediation research. The architecture supports international debris mitigation norms.

P>Space arms control examines potential limits on ASAT capabilities and space-based weapons. The architecture supports international discussions on space arms control while not prejudging outcomes. Architecture parties commit to responsible space behavior.

H2>Directed Energy Weapons and Emerging Capabilities

P>Directed energy weapons including high-energy lasers and microwave weapons represent emerging capabilities with potential implications for regional military balances. The architecture monitors directed energy developments through information sharing and assessment.

P>Capability assessment examines the current and projected capabilities of directed energy weapons in regional contexts. Assessment considers technical maturity, operational effectiveness, and countermeasures. Assessment informs architecture discussions on emerging capabilities.

P>Transparency measures may include information sharing on directed energy research, testing notification, and safety protocols. Transparency

reduces uncertainty and builds confidence as the technology develops.

P>Restraint considerations examine whether directed energy weapons should be subject to architecture constraints similar to missile restraints. Restraint discussions are informed by capability assessments and strategic impact analysis.

ANNEX FR

D2: Power grid collapse affecting >100,000 civilians for >48 hours. Verification: UN OCHA infrastructure

monitoring + CPMC field verification. Response timeline: 72 hours to generator and fuel delivery.

D3: Extreme weather event (flood, drought, sandstorm) affecting >10,000 civilians in framework-affected zone.

Verification: UN OCHA natural disaster alert + satellite imagery. Response timeline: 72 hours to emergency

41 supply deployment.

1.2 Trigger Verification Protocol

UN OCHA verifies trigger satisfaction within

CPMC reviews and concurs within 24 hours

(concurrence required for CIS-linked triggers; advisory for non-CIS triggers).

If UN OCHA and CPMC disagree: BAP Expedited

Track determination within 72 hours; aid deployment proceeds on UN OCHA authority pending BAP ruling ("deploy first, adjudicate

Trigger verification published on framework

transparency portal within 48 hours.

1.3 Anti-Gaming Safeguards

Triggers based on internationally recognized

methodologies (IPC, WHO, UNICEF, WFP) that are independently calculated, not framework-generated.

CPMC maintains right to conduct independent verification; if CPMC determines trigger was fabricated or manipulated, deploying party subject to +1.0 CIS procedural penalty.

Same trigger may not activate more than once per 30-day period for the same zone unless CPMC confirms conditions have worsened (prevents stockpile drain from repeated

1. SANCTIONS PRE-CLEARANCE — THE "WHITE CHANNEL"

2.1 OFAC General License Architecture

The United States Treasury Department Office of 42 Foreign Assets Control (OFAC) shall issue a standing "RCSA Humanitarian White Channel General License" within 30 days of framework entry into force, with the following operative provisions:

Authorizes all U.S. persons and financial institutions to process transactions related to pre-defined emergency humanitarian supplies when a Rapid Aid Deployment trigger is active.

Covers: payment for food, medicine, medical devices, water treatment supplies, fuel for humanitarian facilities, temporary shelter materials, hygiene supplies, and cholera/emergency disease kits.

Covers: financial transactions, insurance,

shipping, logistics, and customs clearance services necessary to deliver authorized humanitarian goods.

Covers: transactions with all framework

parties and their financial institutions, including Iranian banks operating under

the banking channel, for humanitarian procurement purposes only. Automatic Activation:

General license activates automatically

upon verified trigger satisfaction; no case-by-case OFAC application required.

Activation notification: UN OCHA transmits

trigger verification to OFAC within 12

43 hours; OFAC confirms activation within

24 hours; if OFAC fails to confirm within 48 hours, license activates by default (Silence Procedure).

License duration: 90 days from activation

for the specific trigger; renewable by UN OCHA request for additional 90-day

periods if trigger conditions persist. Transaction Documentation:

Banks processing White Channel transactions

required to maintain: transaction records; supplier invoices; shipping manifests; and UN OCHA trigger verification reference number.

No enhanced due diligence beyond standard

anti-money laundering (AML) checks; no requirement to investigate end-use beyond

UN OCHA destination certification.

Record retention: 5 years; subject to

OFAC compliance audit.

White Channel may not be used for

transactions that include prohibited items

(Category H4 dual-use cargo).

Any bank processing White Channel

transactions for non-humanitarian goods

is immediately suspended from the banking channel for minimum 90 days.

Annual OFAC audit of White Channel

transactions; findings published in

Transparency Summary.

44 2.2 EU and UK Parallel Licensing

European Union: Council Regulation establishing

framework humanitarian exemption for all framework-affected zones;
activated by EU

High Representative notification upon UN OCHA trigger verification.

United Kingdom: HM Treasury issues equivalent

general license under Sanctions and Anti- Money Laundering Act 2018.

Coordination: OFAC-EU-UK licensing synchronized

via framework banking channel secretariat;

all three jurisdictions activate within 48 hours of trigger. 2.3 Countering

Sanctions Overcompliance

Many banks decline to process even licensed transactions due to fear of secondary sanctions prosecution ("overcompliance"). The White Channel addresses this through:

Explicit OFAC guidance (FAQ) confirming that processing White Channel transactions carries zero secondary sanctions risk for compliant banks.

Pre-cleared correspondent bank list: 10-15

major international banks (including at least 3 from neutral jurisdictions — Swiss, Omani, Pakistani) pre-authorized to process all White Channel transactions.

Swiss National Bank guarantee: Swiss clearing hub commits to processing all White Channel euro and dollar transactions without additional

45 Banking channel protection: Banks processing

White Channel transactions are explicitly shielded from U.S. secondary sanctions enforcement actions related to those transactions (this protection does not extend to non-humanitarian transactions).

1. AUTOMATED ESCROW UNFREEZING

3.1 Escrow-Trigger Linkage Rapid Aid Deployment is financially underwritten by automated releases from framework escrow accounts.

The following linkages are established: Layer 1 — Humanitarian Emergency

Escrow (\$500M):

Held at World Bank-administered trust

account (see Economic and Financial

Architecture, Layer 1).

Release authority: UN OCHA Director

(for <\$10M per release) or UN

Under-Secretary-General for Humanitarian Affairs (for \$10M-\$50M).

Release trigger: Any Trigger Category A

(food security) or B (medical collapse) activation.

Release speed: 48 hours from trigger

verification to funds available in procurement account.

Replenishment: Escrow automatically

replenished to \$500M baseline within

30 days of drawdown via framework administrative budget assessment. Layer

2 — Yemen Reconstruction Fund (Revenue

Sharing Escrow, 20% Channel):

46 Release authority: World Bank Yemen

Reconstruction Fund administrator.

Release trigger: Trigger Category B or

D in Yemen; OR IPC Phase 4+ in any

Release speed: 72 hours from trigger

Allocation: Emergency infrastructure

repair (water, power, health facilities) prioritized over reconstruction. Layer 3
— Lebanon Emergency Fuel Facility:

Release authority: UN OCHA Lebanon

office + Lebanese Ministry of Energy (joint signature).

Release trigger: Trigger B1 or B2

(hospital fuel depletion) in Lebanon; OR Trigger D2 (power grid collapse) in

Release speed: 24 hours for B2 (24-hour

fuel reserve); 48 hours for B1/D2.

Direct procurement: Escrow funds used

to purchase fuel from pre-qualified suppliers (Saudi Aramco, UAE ADNOC, or
neutral supplier via Swiss trading house).

Layer 4 — Rapid Response Reserve (\$100M):

Held at Swiss National Bank as liquid

instrument (T-bills and gold-backed

Release authority: CPMC Director +

UN OCHA Director (dual signature

47 required for >\$5M; single signature

Release trigger: Any trigger category

where Layer 1-3 funds insufficient; OR

multi-zone simultaneous emergency; OR CPMC Director determination that
delay in Layer 1-3 replenishment would cause

Release speed: 24 hours maximum. Cap: \$25M per single event; \$50M per

30-day period. 3.2 Escrow Release Automation Protocol

Trigger verification transmitted to World

Bank/Swiss National Bank escrow administrator via encrypted API with digital signature from

Administrator confirms receipt within 4 hours;

executes release within 48 hours (24 hours for

B2 fuel emergencies).

Release confirmation transmitted to UN OCHA,

CPMC, and governance body secretariat within 6 hours of execution.

No party may block escrow release once trigger

is verified; blocking attempt is +2.0 CIS procedural penalty and automatic governance

body emergency session.

Quarterly escrow utilization report published

in Transparency Summary.

1. PRE-POSITIONED STOCKPILES

4.1 Strategic Reserve Network Framework mandates maintenance of pre-positioned

48 humanitarian stockpiles at neutral perimeter hubs,

enabling 48-hour delivery to any framework-affected zone: Hub 1 — Dubai International Humanitarian City

Inventory: 10,000 family food kits; 5,000

emergency shelter kits; 2,000 cholera

treatment kits; 500 metric tons high-energy biscuits; 100 portable water purification units.

Replenishment: Monthly inventory review;

automatic reorder when stock falls below 70% of maximum.

Coverage: 24-hour delivery to Yemen (Aden),

48-hour to Yemen (Hudaydah), 72-hour to Lebanon (Beirut/Tripoli).

Cost: \$8 million initial stock + \$2 million

annual rotation; funded from framework administrative budget. Hub 2 — Arish Humanitarian Logistics Hub (Egypt):

Inventory: 20,000 family food kits; 3,000

medical emergency kits; 1,000 metric tons wheat flour; 200,000 liters hospital-grade

diesel fuel; 50 mobile medical units.

Coverage: 12-hour delivery to Gaza; 48-hour

to southern Lebanon (via maritime); 72-hour

to Jordan land corridor.

Cost: \$12 million initial stock + \$3 million

annual rotation. Hub 3 — Al-Mafraq Humanitarian Logistics Hub

49 Inventory: 15,000 family food kits; 5,000

medical kits; 2,000 metric tons mixed grains; 100,000 liters fuel; 30 water purification units; 500 shelter kits.

Coverage: 24-hour to southern Syria (Daraa);

48-hour to Lebanon (Bekaa); 72-hour to northern Iraq.

Cost: \$10 million initial stock + \$2.5

million annual rotation. Hub 4 — Muscat Pre-Positioned Reserve (Oman):

Inventory: 5,000 family food kits; 2,000

medical kits; 1,000 metric tons rice; 50 portable generators (50 kVA); 20 water treatment units.

Coverage: 48-hour to Yemen (Hudaydah via

maritime); 72-hour to UAE/Iran Gulf coast (contingency).

Cost: \$5 million initial stock + \$1.5

million annual rotation. Hub 5 — Cyprus Maritime Staging (Limassol):

Inventory: Maritime emergency supplies

(life rafts, emergency communication equipment, flotation devices); 5,000 food kits; medical supplies for 10,000 people

Coverage: 48-hour maritime to Gaza, Lebanon,

Cost: \$4 million initial stock + \$1 million

annual rotation. Total Network: \$39 million initial investment;

50 \$10 million annual rotation; coverage of all

framework-affected zones within 72 hours. 4.2 Stockpile Rotation and Quality Control

All food stocks rotated on FIFO (first-in,

first-out) basis; maximum shelf-life 18 months.

Medical supplies rotated per WHO cold-chain and expiry protocols.

Fuel tested quarterly for contamination; replaced every 12 months.

Annual inventory audit by external auditor (UN OIG or contracted firm); findings published in Transparency Summary.

Stockpile utilization during emergencies automatically triggers replenishment order within 7 days of depletion. 4.3

Access Agreements

All hub host nations sign standing access agreements guaranteeing:

No customs delays >6 hours for humanitarian

No visa restrictions for UN/NGO personnel

Exemption from import duties, tariffs, and local taxes for humanitarian reserve goods.

No political conditions on stockpile release

(Humanitarian Firewall applies).

Agreement renewable automatically; termination requires 90-day notice to UN OCHA and governance body.

51 MODULE IV: REFUGEE & IDP STABILIZATION MODULE

Operative Clause: This module establishes the operational, financial, and legal architecture for managing refugee and internally displaced person

Financial Architecture and Capitalization Strategy

Annex FR establishes the financial framework that underpins the architecture's economic incentive structure, addressing the reality that diplomatic commitments require sustained financial support to generate tangible benefits. The Regional Development Fund (RDF) serves as the primary financial instrument, with a target capitalization of fifty billion dollars designed to support infrastructure development, economic diversification, technology transfer, and human capital formation across participating states over a ten-year implementation period.

P>The capitalization strategy employs a layered approach that combines mandatory assessed contributions from participating states, voluntary contributions from the international community, private sector co-investment, and multilateral development bank participation. The mandatory contribution structure ensures predictable baseline funding, while the voluntary and private components expand the fund's capacity beyond what mandatory contributions alone could achieve. Each layer is designed to complement the others, with mandatory contributions funding core programs and supplemental resources expanding into additional sectors.

P>The assessed contribution formula considers multiple factors including GDP, benefit received, and ability to pay, ensuring that contributions are distributed equitably while recognizing that different states derive different levels of benefit from architecture participation. States selecting more restrictive nuclear pathways receive adjusted contribution requirements that reflect the greater economic benefits they receive through corresponding sanctions relief and market access. This adjustment prevents the financial framework from disproportionately burdening states that undertake the most comprehensive commitments.

Fund Governance and Project Selection

The RDF operates under a governance structure that balances participating state representation with technical expertise and efficiency. The Fund Council comprises representatives from all contributing states, with voting weights reflecting contribution levels. The Council establishes policy guidelines, approves the annual work program, and makes decisions on major strategic matters. Day-to-day operations are managed by a professional Fund Management Unit that employs internationally recruited experts in project finance, sectoral development, and regional economics.

Project selection employs a rigorous evaluation framework that assesses proposals against criteria including economic impact, employment generation, technology transfer potential, environmental sustainability, and alignment with architecture objectives. The evaluation framework ensures that fund resources are directed toward projects that generate maximum benefit for regional stability and prosperity rather than toward politically motivated but economically questionable endeavors.

Priority sectors for RDF investment include transportation infrastructure that enhances regional connectivity, energy infrastructure that reduces dependence on volatile commodity markets, water resource management that addresses a critical regional challenge, telecommunications infrastructure that supports economic modernization, and education and training programs that develop human capital for sustained economic growth. Within each sector, projects are selected based on their potential to create tangible benefits visible to populations whose political support sustains architecture participation.

Frozen Asset Release and Financial Normalization

P>The financial architecture includes detailed provisions for the release of frozen assets held by participating states, recognizing that asset recovery provides immediate economic benefit that can generate political support for

architecture implementation. The release framework establishes procedures for asset identification, legal clearance, and orderly transfer that address the legitimate concerns of states that froze the assets while providing affected states with predictable access to their property.

P>The release proceeds in tranches linked to verified implementation milestones, ensuring that asset recovery is synchronized with genuine behavioral change rather than front-loaded in ways that reduce implementation leverage. The initial tranche releases a portion of liquid assets upon signature and initial verification, providing immediate economic relief while preserving substantial assets for release upon achievement of more demanding milestones. This sequencing creates sustained incentives for continued compliance throughout the implementation period.

P>Financial normalization provisions address the broader challenge of reintegrating participating states into international financial markets after extended exclusion. These provisions include technical assistance for financial regulatory reform, support for compliance with international anti-money laundering standards, and engagement with international financial institutions to restore access to their programs and facilities. Normalization proceeds gradually, with access expanding as regulatory and compliance standards are achieved.

Debt Sustainability and Fiscal Coordination

P>The financial architecture addresses debt sustainability concerns that could undermine economic stability in participating states. Debt sustainability analysis evaluates whether current and projected debt levels are consistent with long-term solvency and macroeconomic stability. States facing debt distress receive support for debt management and fiscal consolidation.

P>Debt sustainability analysis employs internationally recognized methodologies that project debt trajectories under baseline and stress scenarios. Analysis considers public debt, external debt, contingent liabilities, and implicit debt from unfunded pension and health obligations. Debt thresholds calibrated to country circumstances identify sustainability risks.

P>Fiscal coordination encourages participating states to maintain sustainable fiscal policies that support macroeconomic stability and implementation capacity. Coordination includes fiscal transparency requirements, fiscal rule recommendations, and peer review processes that provide feedback on fiscal policies. Fiscal coordination does not replace national fiscal sovereignty but provides frameworks for sustainable policy choices.

Monetary Policy Coordination and Exchange Rate Arrangements

P>Monetary policy coordination addresses macroeconomic spillovers among participating states that could disrupt architecture implementation. Coordination includes exchange rate policy consultation, inflation targeting information sharing, and crisis response coordination. Coordination is particularly important for states with pegged exchange rates or high dollarization.

P>Exchange rate arrangements are respected as sovereign decisions, but architecture parties commit to consult on major exchange rate policy changes that could affect regional stability. Consultation provides early warning of potential adjustments and enables coordinated response if adjustments create spillovers.

P>Currency swap arrangements among central banks provide emergency liquidity that can address balance of payments pressures without requiring

recourse to the architecture's emergency mechanisms. Swap arrangements are pre-negotiated and can be activated promptly when liquidity needs arise.

H2>Private Sector Engagement and Investment Facilitation

P>The architecture actively engages the private sector as a partner in implementation, recognizing that government resources alone cannot achieve architecture objectives. Private sector engagement includes investment promotion, trade facilitation, public-private partnerships, and regulatory reform that creates enabling environments for private economic activity.

P>Investment facilitation reduces barriers facing private investors in participating states. Facilitation includes investment promotion services that identify opportunities and match investors with projects, one-stop shops that streamline licensing and registration, and aftercare services that support investors after initial establishment.

P>Public-private partnerships mobilize private capital and expertise for infrastructure development that might otherwise require public financing. Partnership frameworks specify risk allocation, revenue sharing, performance standards, and termination provisions. Partnership structures vary from build-operate-transfer through concession arrangements to joint ventures.

P>Regulatory reform creates business environments that attract and retain private investment. Reform areas include business registration simplification, tax administration improvement, labor market flexibility, contract enforcement enhancement, and property rights protection. Reform is sequenced to maintain implementation momentum while generating visible business climate improvements.

H2>Trade Finance and Export Credit Facilities

P>The architecture includes trade finance and export credit facilities that

support commercial transactions among participating states. These facilities address the market failures that limit private trade finance in perceived high-risk environments.

P>Trade finance guarantees cover the non-payment risk in cross-border transactions. Guarantees enable exporters to obtain financing from banks that might otherwise refuse credit due to buyer country risk. Guarantees expand trade by reducing financing constraints.

P>Export credit insurance covers political and commercial risks in export transactions. Insurance protects exporters against buyer default, currency inconvertibility, and political violence. Insurance reduces the risk premium that exporters charge for perceived country risk.

P>Confirming arrangements enable letters of credit issued by banks in participating states to be confirmed by international banks, providing additional payment assurance. Confirmation enables transactions that might otherwise be refused due to issuing bank risk concerns.

H2>Small and Medium Enterprise Support

P>Small and medium enterprises (SMEs) are important contributors to employment and economic dynamism but face particular challenges in accessing international markets. The architecture includes SME-specific support that addresses these challenges.

P>Market access support helps SMEs identify and access export opportunities. Support includes market research, trade mission participation, buyer matching, and e-commerce platform access. Market access reduces the information barriers that limit SME exporting.

P>Trade facilitation for SMEs addresses the compliance costs and procedural complexities that disproportionately burden small businesses. Facilitation

includes simplified procedures, fee reductions, and assistance with documentation. Facilitation reduces the fixed costs that make exporting uneconomical for small transactions.

P>Finance access addresses the limited collateral, credit history, and scale that make SMEs unattractive to conventional lenders. Access includes credit guarantees, microfinance, supply chain financing, and equity participation. Finance access enables SMEs to invest in export capacity.

H2>Women's Economic Empowerment

P>Women's economic empowerment is integrated into architecture economic programming as both a human rights imperative and an economic efficiency measure. Empowerment addresses the barriers that prevent women from participating fully in economic life.

P>Entrepreneurship support for women-owned businesses includes training, mentoring, finance access, and market linkages. Support addresses the particular constraints facing women entrepreneurs including property rights limitations, mobility restrictions, and network exclusion.

P>Workforce participation programs address barriers to women's employment including childcare, transportation, workplace discrimination, and legal restrictions. Programs include employer incentives, childcare provision, transport services, and legal reform advocacy.

P>Leadership development prepares women for senior positions in business, government, and architecture institutions. Development includes executive education, networking, and mentorship. Leadership development creates role models and expands the talent pool.

P>Gender-responsive budgeting ensures that architecture resources are allocated in ways that promote gender equality. Budget analysis examines

whether expenditures benefit women and men equitably. Gender-responsive budgeting creates accountability for gender equality commitments.

ANNEX FW

(IDP) flows across framework-affected theaters. It prevents displaced populations from being weaponized as demographic instruments or becoming unsustainable economic burdens on host states. The module creates

automatic burden-sharing mechanisms, enforceable non-refoulement guarantees, verified safe return conditions, civil documentation protection, and camp demilitarization enforcement. All provisions are

1. HOST-NATION BURDEN SHARING

1.1 Automatic Financial Offset Mechanism

When a framework party's actions (military operations, proxy activity, policy decisions, or compliance failures) cause a measurable surge of refugees or IDPs into a neighboring host state,

escrow funds are automatically diverted to the host nation to cover infrastructure and service burden. This mechanism operates without requiring

governance body approval for each event. Trigger Definition — Refugee Surge:

Influx of >5,000 registered refugees

into a host state within 30 days, where UNHCR determines the influx is causally linked to military operations, proxy

activity, or policy decisions of a specific framework party.

52 OR increase of >20% in registered

refugee population of a specific host state camp complex within 30 days.

Causation verified by UNHCR Protection

Cluster with CPMC concurrence. Automatic Offset Calculation: Base offset = \$2,000 per registered

refugee per annum, covering:

Water and sanitation infrastructure

(40%): connection to camp WASH systems, water trucking, latrine

Power and energy (20%): grid

extension, generator fuel, solar

Education (20%): temporary learning

spaces, teacher salaries, school

Health (15%): clinic staffing,

essential medicines, vaccination

Administration (5%): UNHCR/UN OCHA

operational overhead for surge management.

Surge premium: Additional \$500 per refugee for first 90 days (emergency reception costs: registration, initial food/shelter, trauma

counseling, security screening). Infrastructure capital: One-time \$5 million per 5,000-refugee increment for permanent

infrastructure (school construction, water

53 mains, electrical connection).

Funding Source and Automatic Release:

Primary source: Framework Humanitarian

Emergency Escrow (\$500M Layer 1).

Secondary source: If Layer 1

insufficient, Yemen Reconstruction Fund (for Yemen-origin displacement) or Lebanon Stabilization Facility (for Lebanon-origin displacement).

Tertiary source: PIF Regional

Infrastructure Investment corridor

(for Jordan, Iraq, Lebanon host nation infrastructure). [BLOCK 5
PLACEHOLDER: The Lebanon

Stabilization Facility and the PIF Regional Infrastructure Investment Corridor are defined in Block 5

(Economic & Financial Architecture Modules). This module assumes their existence, funding parameters, and

release authorities as specified in Block 5, Section TBD. If Block 5 modifies either instrument's scope

or governance structure, a harmonization cross-reference must be inserted here prior to framework

Release authority: UNHCR High

Commissioner certifies surge; UN OCHA

certifies offset calculation; World Bank executes release within 7 days.

54 Duration: Annual assessment; automatic

renewal as long as refugee population remains above pre-surge baseline; phase-out over 12 months when population

returns to baseline. 1.2 Causation Attribution and Dispute Resolution

UNHCR Protection Cluster leads causation

assessment with input from CPMC and JMOC (sanitized theater intelligence).

Assessment completed within 14 days of

Responsible party notified with preliminary

attribution; 7-day response period.

If party disputes causation: BAP Advisory

Track review within 21 days; offset release proceeds on UN OCHA authority pending BAP ruling ("relief first, adjudicate second")

If BAP rules causation not established:

offset funds treated as general humanitarian

grant (not recoverable); no CIS penalty for non-responsible party.

If BAP confirms causation: offset charged

against responsible party's escrow

contribution or next benefit tranche. 1.3 Host Nation Obligations In exchange for automatic burden-sharing offsets,

host nations commit to:

Maintaining open borders for registered

refugees from framework-affected zones (no

pushbacks, no refoulement).

55 Permitting UNHCR registration and

protection monitoring without interference.

Allowing international NGO access to

refugee camps and host communities.

Providing access to basic services

(education, health, water) on par with host population (or at minimum,

UNHCR-standard camp services).

Quarterly reporting to UNHCR and

governance body on refugee population

numbers, service delivery, and protection concerns.

Failure to meet obligations: automatic

offset reduction proportional to service gap; persistent failure triggers governance body consultative session.

1. NON-REFOULEMENT AND SAFE RETURNS

2.1 Absolute Non-Refoulement Guarantee No framework party, host state, or proxy shall

forcibly return (refouler) any refugee or asylum seeker to a territory where they face a risk of persecution, torture, or threats to life or

freedom. This guarantee is absolute and may not be overridden by any framework provision, compliance dispute, or political consideration.

Operational Prohibitions:

No mass deportations of registered

refugees to framework-affected zones.

No border pushbacks of asylum seekers

at land or sea frontiers.

56 No cancellation of refugee status or temporary protection for politically motivated reasons.

No coerced "voluntary return" through threats of detention, aid cutoff, or family separation.

No transfer of refugees to third states without individual protection screening and informed consent. Enforcement:

CPMC monitors border practices via UNHCR field teams and satellite surveillance of border crossings.

Verified refoulement incident: +3.0

CIS points to Humanitarian domain (maximum penalty); automatic governance body emergency session; ICRC immediate access to detained returnees.

Pattern of refoulement (3+ verified incidents within 90 days): Step 3

Penalty Ladder activation; all non-humanitarian benefits suspended for responsible party/host state;

humanitarian operations continue. 2.2 Safe Return Conditions Checklist Refugees and IDPs may be incentivized to return

to their places of origin only when the following conditions are independently verified by UNHCR and CPMC: Security Conditions (all must be met):

S1: No active military operations within

57 10km of return area for minimum 90

consecutive days. S2: No armed group presence (other than legitimate state security forces) in

return area; OR armed group presence neutralized and disarmed per spoiler containment protocol.

S3: No confirmed indirect fire (rocket, mortar, drone) into return area for 90 consecutive days.

S4: Safe passage route from displacement site to return area verified by UN security team and cleared of mines,

IEDs, and UXO. Infrastructure Conditions (minimum 3 of 4 must be met):

I1: Functional health facility within 10km of return area (minimum primary health care capacity).

I2: Functional school within 5km of return area (minimum primary education). I3: Functional water source (minimum 15

liters per person per day) within 2km of return area. I4: Functional market or food distribution

point within 10km of return area. Governance Conditions (minimum 2 of 3 must be met):

G1: Local civil administration (municipal or district) functioning with recognized civilian authority.

58 G2: Rule of law institutions (police or

community security) operational and non-predatory. G3: Property rights protection mechanism

established (land registry accessible; property restitution or compensation

process operational).

Verification Procedure:

UNHCR leads technical assessment team

(UNHCR + UN OCHA + UNICEF + CPMC

observer) to evaluate all conditions.

Assessment published as "Safe Return

Conditions Report" (SRCR) with condition-by-condition scoring.

SRCR approved by CPMC Director and

UNHCR Representative.

SRCR published on framework transparency

portal; shared with displaced communities in clear, local-language format.

Return may proceed only to areas

meeting minimum thresholds; returns to non-compliant areas constitute refoulement

SRCR reassessed every 90 days;

conditions may be downgraded if

security deteriorates, triggering suspension of return operations. 2.3 Return

Support Package For verified safe returns, the following support

59 Cash grant: \$500 per returning family

(up to 6 persons) for initial reintegration expenses.

Shelter kit: Emergency shelter materials

+ \$1,000 reconstruction materials voucher.

Food security: 6-month food ration

(WFP standard family ration).

Livelihood: Agricultural input package

(seed, fertilizer, tools) for rural returnees; vocational training referral for urban returnees.

Documentation: Civil documentation

restoration (see Section 3 below).

Monitoring: UNHCR protection monitoring

visits at 30, 90, and 180 days post- return; CPMC follow-up assessment at 180 days.

1. CIVIL DOCUMENTATION PROTECTION

3.1 Neutral Documentation Registry Many displaced persons lose or never possessed birth, marriage, and death certificates,

rendering them stateless or legally invisible. The framework establishes a neutral civil documentation system administered by UNHCR and

UNICEF: Documentation Types Issued:

Birth registration: For all children

born in displacement, regardless of parents' documentation status.

Marriage certificates: For couples

60 married under customary or religious

law in displacement; certificate provides legal recognition.

Death certificates: For deceased

family members, enabling inheritance, remarriage, and closure.

Identity documents: For adults lacking

any form of ID; biometric-linked documentation recognized by all framework parties for humanitarian

access purposes (not citizenship or travel document). Administration:

Issued by: UNHCR/UNICEF Civil

Documentation Units (CDUs) operating in each major camp and displacement site.

Legal basis: Administered under UN

auspices; recognized by all framework parties as valid evidence of identity

for humanitarian service access, education enrollment, health care registration, and return eligibility

Not recognized as: citizenship

document; travel document; voting

credential; or employment authorization in host state (these remain under host state domestic law).

3.2 Documentation from Intentional Destruction If a framework party or proxy is verified to have

61 deliberately destroyed civil registry records

(birth certificates, identity documents, land titles) as a tool of displacement or persecution:

Automatic +2.0 CIS points to Humanitarian

Destruction party responsible for funding

accelerated documentation replacement:

\$50 per person for documentation unit costs, paid from escrow.

CPMC documents all verified destruction

incidents for potential transitional

justice proceedings. 3.3 Intelligence Firewall Civil documentation data is protected from

exploitation by hostile state intelligence services:

Biometric data collected for documentation

purposes stored on Swiss-sovereign cloud infrastructure with AES-256 encryption.

No sharing of documentation data with

framework party intelligence services under any circumstances.

UNHCR retains sole custody of biometric

templates; no third-party access without individual informed consent.

If host state requests documentation data

for legitimate administrative purposes,

UNHCR may share aggregated, anonymized statistics only; individual records require judicial warrant and UNHCR

Representative approval.

62 Any verified breach of documentation data

by a framework party: +3.0 CIS points to Humanitarian domain; potential referral to international criminal jurisdiction.

1. CAMP DEMILITARIZATION

4.1 Absolute Camp Neutrality Rule Refugee and IDP camps must remain strictly

civilian in character. Any military or armed group activity in or around camps is a strict liability violation:

Prohibited Activities in Camps:

Armed group recruitment or conscription

of camp residents (including "voluntary" recruitment of minors).

Weapons storage, transport, or

distribution within camp perimeter (1km radius).

Military training or paramilitary

exercises within camp perimeter.

The Waterfall Guarantee Architecture

P>Annex FW addresses the critical risk that architecture financial commitments may not be fulfilled due to political changes, budgetary constraints, or deliberate obstruction. The Funding-Failure Waterfall establishes a cascading guarantee system that progressively draws upon alternative funding sources when primary commitments are not met, ensuring that essential architecture functions continue even when individual contributors fail to meet their obligations.

P>Level One of the waterfall consists of the primary commitments made by participating states through the assessed contribution framework. These commitments are legally binding under the architecture treaty and are backed by domestic implementing legislation in each participating state. When

primary commitments are met in full, no additional waterfall levels are activated.

P>Level Two is activated when primary commitments fall below ninety-five percent of authorized levels. At this level, the architecture draws upon reserve funds established through mandatory pre-funding requirements. All participating states are required to maintain reserve deposits equivalent to six months of assessed contributions, which can be drawn upon when regular contributions are delayed. These reserves provide a buffer that covers temporary cash flow disruptions without requiring emergency measures.

H2>Emergency Funding and Private Capital Mobilization

P>Level Three of the waterfall is activated when reserve funds are depleted or when funding shortfalls exceed twenty percent of authorized levels. At this level, the architecture activates emergency funding mechanisms including accelerated capital calls on participating states, borrowing against future contribution streams, and the issuance of architecture bonds backed by the full faith and credit of participating states. These mechanisms provide substantial funding capacity but involve costs that create incentives for maintaining Level One and Two funding.

P>Level Four involves mobilization of private capital through the Framework Commercial Insurance Facility, which can assume funding responsibilities for certain architecture functions in exchange for premium payments and risk-sharing arrangements. The FCIF's participation is limited to functions with clear commercial viability, such as trade finance facilitation and project investment, but its involvement frees public resources for functions that lack commercial revenue potential.

P>Level Five, the ultimate backstop, involves the activation of multilateral development bank emergency facilities and direct international community

appeals. This level represents a political rather than purely financial mechanism, as it involves the international community in sustaining an architecture whose collapse would threaten broader regional stability. The existence of this ultimate backstop provides confidence that the architecture will not fail for purely financial reasons.

H2>Financial Sustainability and Anti-Corruption Framework

P>The financial architecture incorporates comprehensive sustainability measures designed to ensure that architecture programs can be maintained over the extended implementation period without requiring perpetually increasing contributions. These measures include graduation timelines that transition recipient states from fund support to self-sustaining operations, revenue-generating project requirements that create income streams for fund replenishment, and cost-sharing arrangements that require beneficiaries to contribute to program costs.

P>The anti-corruption framework addresses the risk that substantial financial flows could be diverted through corrupt practices, undermining both program effectiveness and political legitimacy. The framework includes transparency requirements that mandate publication of all financial transactions, independent audit provisions that require annual external audits of all fund activities, and whistleblower protections that enable individuals to report suspected corruption without fear of retaliation. Violations of anti-corruption provisions trigger automatic suspension of funding and potential exclusion from future architecture benefits.

Financial Risk Assessment and Mitigation

P>The Funding-Failure Waterfall includes comprehensive financial risk assessment procedures that identify potential threats to architecture funding

and specify mitigation measures for each identified risk. Risk assessment examines both internal risks arising from architecture operations and external risks originating from participating state economic and political conditions.

P>Internal risks include cost overruns on major projects, unexpected verification expenses, currency fluctuations affecting multi-currency operations, and investment losses on fund reserves. Mitigation measures include budget contingency provisions, cost control procedures, hedging strategies, and conservative investment policies.

P>External risks include participating state financial distress that impairs contribution capacity, political decisions to withhold contributions, banking crises that disrupt payment systems, and sovereign debt crises that affect multiple states simultaneously. Mitigation measures include diversification of funding sources, pre-funded reserves, alternative payment channels, and emergency borrowing facilities.

P>Risk monitoring tracks identified risks and detects emerging risks before they affect architecture funding. Monitoring employs financial indicators, political risk assessments, and early warning systems that alert decision-makers to deteriorating conditions. Quarterly risk reports document risk status and mitigation effectiveness.

H2>Reserve Fund Management

P>The architecture maintains reserve funds that provide liquidity during temporary funding disruptions and buffer against unexpected expenses. Reserve management balances the need for liquidity against the opportunity cost of holding funds in low-yield instruments.

P>Reserve adequacy assessment determines whether reserve levels are

sufficient to cover potential funding disruptions. Assessment considers historical funding volatility, projected cash flow requirements, and stress scenarios that examine reserve sufficiency under adverse conditions. Reserve adequacy is reviewed annually and adjusted as conditions change.

P>Reserve investment deploys reserves in instruments that preserve capital while generating returns above inflation. Investment policies specify permitted instruments, maturity limits, credit quality requirements, and risk tolerance parameters. Investment performance is monitored against benchmarks and reported to the Governance Body.

P>Reserve replenishment ensures that reserves are restored after drawdowns occur. Replenishment comes from budget surpluses, accelerated contributions, and investment returns. Replenishment timelines are specified to ensure that reserves return to target levels within defined periods after drawdown.

H2>Credit Rating and Market Access

P>The architecture seeks to maintain investment-grade credit ratings that enable cost-effective borrowing when required. Credit ratings reflect assessment of architecture financial health, political support, institutional capacity, and risk management effectiveness.

P>Rating agency engagement maintains relationships with major rating agencies that assess architecture creditworthiness. Engagement includes regular briefings, data provision, and site visits that enable informed rating assessments. Proactive engagement enables agencies to understand architecture strengths and mitigating factors.

P>Market access ensures that the architecture can issue debt instruments in international capital markets when borrowing is required. Market access depends on credit ratings, investor demand, market conditions, and issuance

capacity. The architecture maintains relationships with investment banks and institutional investors that facilitate market access.

P>Borrowing procedures specify the conditions under which the architecture may borrow, the purposes for which borrowed funds may be used, the maximum borrowing levels, and the repayment arrangements. Borrowing requires Governance Body approval except for pre-authorized emergency borrowing within specified limits.

H2>Contingency Funding and Emergency Reserves

P>The architecture maintains contingency funding and emergency reserves that provide liquidity during unexpected disruptions. Reserve management balances the need for preparedness against the opportunity cost of holding funds in reserve.

P>Operating reserves provide liquidity for normal cash flow fluctuations. Reserves cover the period between expenditure obligations and receipt of contributions. Operating reserve targets are calibrated to historical cash flow patterns and contribution timing.

P>Emergency reserves provide funding for crisis response and unexpected contingencies. Reserves are maintained at levels sufficient to cover specified crisis scenarios. Emergency reserves are invested conservatively to ensure capital preservation and rapid availability.

P>Contingency lines of credit provide additional liquidity that can be accessed if reserves are insufficient. Credit lines are negotiated with international financial institutions and commercial banks. Pre-negotiated lines can be drawn promptly without awaiting lengthy credit approval processes.

H2>Financial Performance Metrics and Benchmarking

P>Financial performance is measured through metrics that assess efficiency,

effectiveness, and accountability. Benchmarking compares architecture financial performance against comparable organizations and best practices.

P>Efficiency metrics measure the ratio of outputs to inputs including cost per project, cost per beneficiary, and administrative cost ratios. Efficiency benchmarks identify areas where costs may be excessive and best practices that could reduce costs.

P>Effectiveness metrics measure the achievement of intended outcomes including project completion rates, benefit delivery indicators, and development impact measures. Effectiveness assessment examines whether resources produce the intended results.

P>Accountability metrics measure transparency, audit findings, and compliance with financial rules. Accountability assessment examines whether financial management meets standards and identifies areas requiring improvement.

Audit Findings and Remediation

P>Internal and external audits identify financial management weaknesses requiring remediation. The audit remediation framework ensures that audit findings are addressed promptly and effectively.

P>Audit finding classification categorizes findings by severity and type. Critical findings require immediate action. Major findings require action within specified periods. Minor findings are addressed through routine improvement processes.

P>Remediation planning develops specific action plans for addressing each finding. Plans specify actions, responsible parties, timelines, and verification methods. Plans are approved by appropriate authorities and monitored for implementation.

P>Remediation verification confirms that planned actions have been implemented and have addressed the underlying issues. Verification includes follow-up reviews, testing, and observation. Unresolved findings are escalated to higher authorities.

ANNEX BA

102 sanctions baseline restored for

the affected domain. Commercial Continuity Protection expires for contracts signed after Day

91 (existing certified contracts protected for remainder of 24-month shield).

Full petrochemical export

ban. Full banking channel suspension (reverted to Tranche 0 level). 2.3 Anti-Abuse Safeguards

Snapback may be invoked only after Certificate

of Exhaustion is issued (see Penalty Ladder Module, Section 4).

Warning Window may be extended to 45 days by

neutral chair (Oman) if genuine remediation progress is demonstrable but incomplete.

Snapback may be halted at any stage if

verified compliance is restored. Restoration credit applies (see Penalty Ladder reversibility mechanisms).

A party may invoke snapback only once per

180-day period for the same breach type. Repeated snapback invocation for the same

issue without new breach evidence triggers +1.0 CIS procedural penalty.

1. COMMERCIAL CONTINUITY PROTECTION

3.1 Purpose and Principle The primary reason private sector companies refuse

to invest in Iran is fear of retroactive secondary sanctions if the framework collapses. Commercial Continuity Protection (CCP) eliminates this risk

103 for framework-certified contracts, unlocking the investment necessary for Iran's economic recovery. 3.2 CCP Certification A contract qualifies for CCP if:

It is registered with the RDF CCP Registry within 30 days of signature.

It is for permitted commercial activities under the current active tranche.

Neither party is on the RDF exclusion list. End-use is civilian and verifiable. Contract value is between \$1 million and \$500 million (contracts above \$500M require additional governance body notification). 3.3 CCP Shield Mechanics

Once certified, the contract enjoys:

24-month protection from retroactive secondary

sanctions: Even if the framework collapses

or sanctions snap back, OFAC will not prosecute U.S. persons or foreign entities for performing obligations under the certified contract for 24 months from certification date.

"Wind-down" period: If snapback occurs, the

certified contract holder receives 180 days

to complete performance and receive payment without sanctions exposure.

No blocking: Even during Crisis Lock or full

snapback, payments under certified contracts may flow through the banking channel (subject to existing tier restrictions).

Transferability: CCP certification may be transferred to a successor entity in case

104 of merger, acquisition, or corporate restructuring. 3.4 CCP Limitations

CCP does NOT protect contracts for prohibited

activities (weapons, military equipment, nuclear dual-use, IRGC-linked entities).

CCP does NOT protect contracts signed after

Day 91 of Full Snapback (new contracts assumed to have accepted snapback risk).

CCP does NOT prevent host state regulatory

action unrelated to sanctions (e.g.,

environmental, labor, tax enforcement).

Maximum aggregate CCP-certified contract value

per entity: \$2 billion (prevents single

entity from concentrating risk). 3.5 CCP Enforcement

U.S. Treasury issues explicit OFAC guidance

confirming CCP protection within 30 days of framework entry.

EU and UK issue parallel guidance. Any OFAC enforcement action against a

CCP-

certified contract: automatic BAP Expedited

Track review; contract holder entitled to injunction pending BAP ruling.

Annual CCP audit: Independent auditor reviews

CCP registry for compliance with certification criteria; findings published in Transparency Summary.

1. CORRESPONDENT BANKING RE-ENGAGEMENT

4.1 Four-Tier Restoration Model Iranian banking reconnection to the international

105 financial system proceeds through four tiers, each

unlocking progressively broader transaction authority: Tier 1 — Humanitarian Correspondent (Tranche 2):

One designated Iranian bank; one neutral

jurisdiction correspondent (Swiss or Omani bank accredited by Swiss National Bank or

Central Bank of Oman).

Permitted: Humanitarian payments; RDF

project disbursements; IAEA operational

funding; diplomatic mission banking.

Messaging: SWIFT restricted access code

(MT103/MT202 for permitted categories only).

Enhanced due diligence: Correspondent bank

must verify end-use of all transactions; monthly reporting to OFAC and Swiss Financial Market Supervisory Authority

(FINMA). Tier 2 — Limited Commercial (Tranche 4):

Three designated Iranian banks;

correspondent relationships with banks in 5+ jurisdictions (including at least one EU bank and one Asian bank).

Permitted: Tier 1 categories PLUS

commercial trade payments for permitted goods; energy sector joint venture capital; educational and cultural exchange funding.

Messaging: SWIFT standard commercial code

for designated banks; transaction category

106 Enhanced due diligence: Quarterly AML/CFT

audit by FATF-aligned firm; real-time transaction monitoring for suspicious activity.

Tier 3 — Expanded Commercial (Tranche 6):

Five designated Iranian banks; SWIFT

membership fully restored.

Permitted: Tier 2 categories PLUS general

commercial trade; FDI repatriation; intellectual property licensing; tourism and hospitality services; U.S. dollar

transactions for non-sanctioned categories.

Messaging: Full SWIFT access; MT103/MT202

without category restriction for permitted

Enhanced due diligence: Annual FATF mutual

evaluation; Iran must demonstrate

compliance with FATF Action Plan (terrorist financing controls, beneficial ownership transparency, cash courier controls).

Tier 4 — Full Integration (Tranche 8):

All Iranian banks meeting FATF compliance

Permitted: All non-sanctioned commercial

and financial transactions.

Messaging: Full SWIFT membership. Enhanced due diligence: Standard

international banking compliance (no

enhanced Iran-specific requirements beyond standard AML/CFT). 4.2 Anti-Money Laundering Safeguards

107 All designated Iranian banks must undergo

annual AML/CFT audit by a FATF-aligned firm selected by the Neutral Chair (Oman or Switzerland, rotating annually) from a pre-

qualified roster of Big Four accountancy firms (Deloitte, KPMG, PwC, EY) operating under strict neutrality protocols. The Neutral Chair's

selection is final and not subject to appeal by Iran, the U.S., or any other framework party. The audit firm's engagement terms, scope, and

reporting line are contracted directly through the governance body secretariat to prevent client-pressure bias.

Audit covers: customer due diligence

procedures; suspicious transaction reporting; sanctions screening software; beneficial ownership verification; cross-border transaction monitoring.

Failed audit: Bank's tier status suspended;

90-day remediation window; if audit still

fails after remediation: bank removed from designated list; transactions routed through remaining compliant banks.

Iranian Central Bank must issue quarterly

anti-money laundering compliance report to FATF and framework governance body.

4.3 U.S. Dollar Clearing

Tier 3 and above: U.S. dollar transactions

permitted for non-sanctioned categories.

Correspondent bank may clear dollars through U.S. correspondent (e.g., JPMorgan Chase for

108 Swiss bank; Swiss bank then clears Iranian bank's dollar transactions).

Dollar transactions flagged for sanctions

screening via automated software (Thomson

Reuters World-Check or equivalent).

OFAC maintains right to block individual

dollar transactions that violate sanctions

(framework does not grant blanket immunity for non-compliant transactions).

4.4 Iranian Banking Reform Requirements

As a condition of Tier 3 and Tier 4 access, Iran must implement the following banking sector reforms:

Consolidation of Iran's 30+ state-owned and

semi-private banks into 8-10 viable

institutions (World Bank technical assistance provided).

Resolution of non-performing loan crisis

(estimated \$200 billion in NPLs) through asset management company formation.

Adoption of IFRS accounting standards for

all designated banks.

Independent central bank governance: Central

Bank of Iran Governor appointed for 5-year

term; removal only for cause; independent monetary policy authority.

Anti-terrorism finance controls: IRGC and

Quds Force financial accounts segregated

from commercial banking; no co-mingling of military and civilian financial flows.

109 MODULE III: TRADE CORRIDOR ACTIVATION ANNEX

Operative Clause: This annex operationalizes the physical movement of goods that generates revenue for the framework. It establishes the International

Hormuz Transit Authority (IHTA), harmonizes customs and transit fees across

land corridors, creates the sanctions-evasion interdiction protocol tied to framework compliance, and formalizes the UAE dual sign-off requirement for maritime commercial-security alignment. This module is classified Tier 1.

1. INTERNATIONAL HORMUZ TRANSIT AUTHORITY (IHTA)

1.1 Legal Establishment

The IHTA is established as an international organization under the RCSA framework, headquartered in Muscat, Oman. It operates under the following charter:

Legal personality: International body with treaty-based status;

immune from suit in member state courts for official acts; property and assets inviolable.

Headquarters agreement: Concluded with Government of Oman; IHTA

premises granted extraterritorial status; Omani security forces provide perimeter protection.

Membership: All littoral states (Iran, Oman, UAE, Saudi Arabia,

Qatar, Bahrain, Kuwait, Iraq) plus transit states (Jordan, Lebanon, Turkey, Pakistan, India) and major user states (China, Japan, South Korea, EU collectively). Voting structure mirrors

RDF Governing Board but with littoral states receiving enhanced weight.

Secretariat: 25 professional staff; Director General appointed by

IHTA Council for 4-year renewable term; must be citizen of non-

110 framework-party state.

1.2 Tolling Mechanism The IHTA operates a transit tolling system for all

commercial vessels passing through the Strait of Hormuz:

Tolling basis: Per Gross Tonnage (GT) per transit; flat rate with vessel category modifiers.

Base rate: \$0.15 per GT (benchmarked against Suez Canal

Authority rates, adjusted for Hormuz transit distance and service scope).

Oil tankers (>100,000 GT): Base rate (largest revenue generator; 65% of toll revenue). LNG carriers: 1.2x base rate (higher environmental and safety oversight costs). * Container vessels: 0.9x base rate (incentivize container trade).

General cargo: 1.0x base rate. Humanitarian vessels (UN-flagged, NGO-registered): Zero toll (automatic exemption; no application required).

Exemption contingent on vessel carrying a valid Humanitarian Cargo Verification Certificate (HCVC) issued by a neutral staging hub (Arish, Al-Mafraq,

Limassol, Muscat, or Dubai) under the dual-use cargo verification regime defined in Block 4, Module I, Section 2.2. Vessels claiming

humanitarian status without a valid HCVC are charged the full general cargo rate and flagged for JMOC maritime security review.

* IHTA-certified framework-compliant vessels: 0.85x base rate (5% compliance discount; see Section 1.5).

111 Collection: Electronic pre-payment via IHTA online platform (48

hours before transit); or on-site payment at IHTA Hudaydah or Muscat collection station. Non-payment results in denial of IHTA transit certificate, which is required for port

access at all framework-compliant ports. Revenue projection: \$2.5-3.5 billion annually (based on pre- closure Hormuz transit volumes of 18-21 million bpd oil

equivalent plus container and LNG traffic). 1.3 Revenue-Sharing Formula IHTA toll revenue is distributed according to the following formula:

60% — Civilian Infrastructure and Regional Development:

25%: RDF Window B (regional infrastructure — roads, ports, power, water in framework-affected states).

15%: Yemen Reconstruction Fund (Sub-Fund 2; Hudaydah port and Aden infrastructure).

10%: Lebanon Stabilization Facility (Sub-Fund 3; port and energy infrastructure).

5%: Humanitarian Emergency Escrow (Sub-Fund 1; rapid deployment reserve top-up).

5%: IHTA operational reserve (fleet monitoring, environmental compliance, safety systems). 40% — Maritime Security and Enforcement:

20%: Joint maritime patrol operations (naval coordination, piracy suppression, sanctions interdiction; administered by IHTA Maritime Security Division).

10%: Framework-compliant port authorities (Dubai 60% share, Abu Dhabi 40% share of this allocation, per RP-UAE Hardened Protocol).

5%: Maritime environmental protection (oil

spill response, coral reef monitoring,

112 emissions tracking).

5%: IHTA administrative overhead (staff,

headquarters, technology systems). [CROSS-REFERENCE: The 60/40 civilian/security split

addresses Iran's demand for Hormuz governance voice (institutional participation in IHTA Council with proportional voting weight) while ensuring that maritime security — a core U.S. and Gulf concern — receives dedicated funding.] 1.4 Tracking and Compliance

All vessels transiting Hormuz must carry IHTA

electronic transit beacon (GPS + AIS integrated; tamper-evident seal).

IHTA Maritime Operations Centre (Muscat) monitors

all transits in real time; coordinates with JMOC maritime cell for sanctions-evasion detection.

Vessels on UN/OFAC sanctions lists denied IHTA

transit certificate; denial published to all framework-compliant ports.

Vessels certified as sanctions-compliant and

framework-aligned receive "IHTA Green Pass" — priority processing at all IHTA-participating ports and 15% toll discount.

1.5 UAE Port Authority Revenue Offset Per the RP-UAE Hardened Protocol (Addendum A), the following toll revenue offset mechanism applies:

H2>The Binding Arbitration Framework

P>Annex BA establishes the Binding Arbitration Panel (BAP) as the architecture's ultimate dispute resolution mechanism, providing a procedurally rigorous and legally authoritative forum for resolving disputes that cannot be settled through consultation or mediation. The binding nature of BAP decisions distinguishes this mechanism from the advisory dispute resolution procedures available under other architecture components, providing parties with confidence that disputes will receive definitive resolution rather than prolonged deliberation.

P>The BAP comprises nine arbitrators, three appointed by each of the primary architecture parties (Iran, the United States, and the European Union collectively), with a requirement that at least one-third of the panel members possess expertise in nuclear technology, one-third in international law, and one-third in regional security affairs. This expertise distribution ensures that the panel can competently address the full range of disputes that may arise under the architecture.

P>Arbitration proceedings follow established international arbitration procedures modified to address the specific requirements of architecture disputes. These modifications include accelerated timelines for urgent matters, specialized rules for handling classified information, and provisions for interim measures that can preserve the status quo while proceedings are pending. The proceedings are confidential unless all parties agree to public disclosure, protecting sensitive information while maintaining procedural transparency.

H2>Jurisdiction and Applicable Law

P>The BAP's jurisdiction encompasses all disputes arising from the interpretation or application of the architecture treaty and its annexes, disputes regarding compliance with architecture commitments, disputes

concerning the implementation of architecture decisions, and disputes between architecture parties related to matters covered by the architecture. This broad jurisdiction ensures that the BAP can address the full range of potential disagreements without gaps that could generate jurisdictional controversies.

P>The applicable law for BAP proceedings includes the architecture treaty and its annexes, relevant principles of international law, applicable United Nations Security Council resolutions, IAEA safeguards agreements and decisions, and general principles of law recognized by civilized nations. This multi-source legal framework provides the BAP with comprehensive legal authority while ensuring that architecture decisions are consistent with broader international legal obligations.

P>BAP decisions are final and binding on all parties, with no appeal on substantive grounds. Limited review is available for procedural irregularities that may have affected the fairness of proceedings, but this review does not extend to re-examination of the merits of BAP decisions. The binding nature of decisions is reinforced by automatic implementation mechanisms that activate specified consequences for failure to comply with BAP orders.

H2>Enforcement of Arbitration Decisions

P>The enforcement framework ensures that BAP decisions have practical effect rather than merely symbolic authority. Enforcement mechanisms include automatic activation of consequence measures for non-compliance, authorization for other parties to take proportionate countermeasures, and referral to the UN Security Council for situations involving material breaches of architecture obligations. These mechanisms create a graduated enforcement ladder that provides appropriate responses to different levels of non-compliance.

P>The automatic consequence activation ensures that BAP decisions are not merely advisory recommendations that parties can ignore at will. When the BAP issues a compliance order, the architecture's consequence mechanisms activate automatically if the ordered party fails to comply within the specified timeframe. This automaticity removes the political discretion that could otherwise prevent enforcement of decisions that are politically unpopular with powerful states.

Arbitration Procedures and Evidence Standards

P>The Binding Arbitration Panel (BAP) operates under detailed procedures that ensure fair, efficient, and authoritative resolution of architecture disputes. This section examines the procedural framework governing BAP operations, including evidence standards, hearing procedures, and award implementation.

P>Evidence standards in BAP proceedings balance the need for comprehensive information against the need to protect sensitive sources and methods. The BAP has authority to request documents, summon witnesses, and conduct site visits. Evidence must be relevant, material, and admissible under the BAP's rules of evidence. The BAP may receive classified evidence in camera to protect national security while enabling consideration of sensitive information.

P>Hearing procedures include written pleadings, oral argument, witness testimony, and expert evidence. The BAP may convene hearings at locations selected for neutrality and convenience. Hearings are generally confidential unless all parties agree to public proceedings. The BAP may issue interim measures to preserve the status quo pending final resolution.

P>Award implementation procedures ensure that BAP decisions have practical

effect. Awards are binding on all parties and must be implemented promptly. Implementation monitoring tracks compliance with award requirements. Non-compliance triggers architecture consequence mechanisms and potential international enforcement procedures.

Arbitration Costs and Burden Sharing

P>BAP proceedings involve substantial costs including arbitrator fees, legal representation, expert witnesses, hearing facilities, and translation services. The cost framework ensures that arbitration remains accessible to all parties regardless of financial resources while providing adequate compensation for arbitrators and service providers.

P>Arbitrator compensation follows internationally established rates for comparable arbitral tribunals. Compensation covers preparation time, hearing time, deliberation time, and award drafting time. Arbitrator fees are paid from a common fund to which all parties contribute equally, ensuring arbitrator independence from any single party.

P>Cost allocation follows the principle that the unsuccessful party bears reasonable costs of the successful party. However, the BAP has discretion to adjust cost allocation based on circumstances including the complexity of issues, the reasonableness of positions taken, and the financial circumstances of parties. Cost allocation decisions are included in the arbitral award.

P>Financial assistance may be available to parties with limited resources that might otherwise be unable to participate effectively in arbitration. Assistance may include cost deferral, reduced fee arrangements, and support for legal representation. Assistance does not affect the substantive rights of parties or the neutrality of arbitral proceedings.

H2>Interim Measures and Emergency Relief

P>The BAP may issue interim measures that preserve the status quo or prevent irreparable harm pending final resolution of disputes. Interim measures are binding and enforceable but are subject to review as the dispute proceeds.

P>Interim measure requests may be submitted by parties seeking to prevent actions that would prejudice the final outcome or cause irreparable harm. Requests must specify the harm sought to be prevented, the legal basis for the measure, and the duration requested.

P>Interim measure decisions are issued promptly, often within days of request submission. Decisions specify the measures required, the parties bound, and the effective period. Interim measures remain in effect until modified by the BAP or superseded by the final award.

P>Interim measure enforcement employs the same mechanisms as final award enforcement. Non-compliance triggers architecture consequence procedures and potential international legal action.

H2>Confidentiality and Transparency in Arbitration

P>BAP proceedings balance confidentiality protections with transparency requirements that serve public interests. The balance recognizes that arbitration involves private disputes but that architecture disputes have implications beyond the immediate parties.

P>Confidentiality protections apply to the proceedings, evidence, deliberations, and awards unless parties agree otherwise. Confidentiality protects sensitive information, commercial secrets, and national security matters. Confidentiality also encourages candid settlement discussions.

P>Transparency exceptions permit disclosure when required by law, necessary for enforcement, or justified by public interest. Exceptions are

narrowly construed to preserve confidentiality while permitting legitimate disclosure.

P>Public interest considerations may justify publication of awards or summaries when the dispute involves matters of significant public importance. Publication is redacted to protect confidential information. Publication contributes to the development of architecture jurisprudence.

H2>Arbitral Precedent and Jurisprudence

P>BAP awards contribute to the development of architecture jurisprudence that guides future dispute resolution. While arbitration does not formally establish precedent, consistent reasoning across awards creates expectations about how similar disputes will be resolved.

P>Award compilation maintains records of BAP awards for reference by future tribunals, parties, and scholars. Compilation includes awards, procedural orders, and significant procedural decisions. Access is limited to protect confidentiality but permits authorized research.

P>Jurisprudential analysis examines patterns across awards to identify emerging principles, interpretations, and approaches. Analysis informs architecture institutions, legal advisors, and parties about likely arbitral approaches.

P>Consistency considerations guide tribunals to respect previous awards on similar issues unless persuasive reasons justify different treatment. Consistency promotes predictability and fairness. Tribunals explain departures from previous reasoning.

ANNEX AC

10% of Maritime Security allocation (4% of total IHTA revenue) directed to compliant UAE port authorities.

60% of this allocation to Dubai (Jebel Ali, Jebel Dhanna, Hamriyah); 40% to Abu Dhabi (Khalifa 113 Port, Zayed Port) and remaining emirates.

Volume Protection Floor: If framework-mandated maritime interdictions reduce Dubai's shipping volume >5% year-over-year, IHTA Volume Protection

Draw compensates 50% of verified revenue loss differential (capped at \$50M per annum per port).

Dual sign-off requirement: Both Federal Supreme Council and DP World/Dubai Ports Customs must jointly ratify maritime compliance matrices. If dual sign-off breaks down, UAE toll revenue share suspended until resolution (per RP-UAE).

1. CUSTOMS AND TARIFF HARMONIZATION

2.1 Land Corridor Customs Union The framework establishes a harmonized customs regime

for all land corridors connecting framework-affected states. The objective is to reduce transit costs, eliminate spoiler extortion at border crossings, and create economic incentives for legitimate trade. Corridor 1 — Iraq-Jordan-Saudi Land Bridge:

Route: Baghdad → Ramadi → Trebil (Iraq-Jordan

border) → Amman → Saudi border (Durra) → Riyadh/Dammam.

Harmonized transit fee: \$150 per TEU (twenty-

foot equivalent unit) for full corridor transit; \$75 per TEU for partial transit (one border crossing only).

Single customs declaration: "One-stop" customs

clearance at origin (Baghdad or Riyadh); declaration recognized at all intermediate borders; no re-inspection unless risk profiling

algorithm triggers (based on shipper history,

114 cargo category, and route intelligence).

Maximum border clearance time: 4 hours for

pre-cleared cargo; 8 hours for cargo requiring inspection.

Prohibited fees: No "transit taxes," "road

tolls," "security fees," or "facilitation payments" may be levied by any party, militia,

or spoiler entity on corridor cargo. Violation triggers Spoiler Containment Protocol 2.0 (Enforcement Modules, Module III).

Revenue allocation: 40% origin state; 40%

transit state(s); 20% RDF Window E (corridor maintenance and security).

Corridor 2 — Syria-Jordan-Lebanon Land Bridge:

Route: Damascus → Daraa → Ramtha (Jordan) →

Amman → Masnaa (Lebanon border) → Beirut/Tripoli.

Harmonized transit fee: \$120 per TEU (lower

rate to incentivize Syrian economic recovery).

Single customs declaration at origin (Damascus

Maximum clearance: 4 hours pre-cleared; 8 hours

Special provision: Agricultural products

exempt from transit fees (promote food security

and farmer income in all three states). Corridor 3 — Turkey-Iraq Transit Route:

Route: Istanbul/Mersin → Habur (Turkey-Iraq

border) → Zakho → Mosul → Baghdad/Basra.

Harmonized transit fee: \$130 per TEU. Risk-based inspection: Turkish customs

115 pre-clearance recognized at Iraqi border;

random sampling only. 2.2 Digital Customs Platform

Single Window: All corridor customs documentation

submitted through UNCTAD ASYCUDA-compatible digital platform; accessible to all corridor state customs authorities.

Real-time tracking: GPS-linked cargo tracking from

origin to destination; customs authorities may monitor transit without physical inspection.

Automated risk profiling: AI-based algorithm

analyzes shipper history, cargo manifest, and intelligence feeds to identify high-risk shipments for targeted inspection only.

Low-risk cargo: Green Lane treatment — no

inspection, no delays, automatic clearance. 2.3 Anti-Extortion Enforcement

JMOC receives real-time corridor transit data

(GPS, customs timestamps, clearance durations).

Border delay alert: Any cargo held >8 hours at

any border crossing triggers automatic JMOC alert and UN OCHA notification.

Extortion verification: If delay is not explained

by legitimate customs/security inspection within

2 hours of alert: automatic incident registry entry; CPMC field team dispatch

within 24 hours; +0.5 CIS points to Economic domain per verified

1. SANCTIONS-EVASION INTERDICTION PROTOCOL

3.1 Port Access Compliance Framework

All commercial ports within framework-affected states

116 must implement the following sanctions-evasion

prevention measures as a condition of IHTA participation and framework

benefit eligibility: Mandatory Measures:

Pre-arrival vessel screening: All vessels

checked against UN/OFAC/EU/UK sanctions lists 48 hours before port entry;

sanctions-listed

vessels denied entry without appeal.

Cargo manifest verification: Electronic

manifest cross-checked against dual-use goods

database and sanctions-sensitive commodities; discrepancies trigger physical

inspection.

Beneficial ownership disclosure: Port operator must verify beneficial ownership of vessel and cargo; shell company vessels denied entry.

Financial transaction monitoring: All port fees, cargo handling payments, and customs duties processed through traceable banking channels (no cash transactions >\$10,000).

IHTA compliance certification: Port must hold valid IHTA compliance certificate (renewed annually; subject to audit). Non-Compliance Consequence:

Port loses IHTA compliance certification: vessels calling at non-compliant port lose IHTA Green Pass status and 15% toll discount; port authority excluded from IHTA revenue sharing.

Persistent non-compliance (2+ consecutive annual audit failures): Automatic Step 2

Penalty Ladder activation for host state; 117 governance body review.

3.2 Maritime Sanctions Interdiction

IHTA Maritime Security Division coordinates with national navies for sanctions-evasion

Target: Vessels conducting ship-to-ship transfers

to disguise Iranian oil origin; vessels

disabling AIS transponders in Hormuz; vessels with falsified cargo manifests.

Interdiction authority: IHTA-flagged inspection

vessels (operated by Omani Navy with IHTA

markings) may conduct consensual boarding of suspected sanctions-evading vessels in international waters.

Non-consensual boarding: Requires flag state

authorization or UN Security Council resolution; framework does not authorize IHTA unilateral

maritime enforcement against non-compliant flag states.

Confirmed sanctions evasion: Vessel and owner

added to IHTA Prohibited Vessel Registry; denied port access at all IHTA-participating ports; information shared with UN Panel of

Experts and OFAC. 3.3 UAE Dual Sign-Off Integration Per the RP-UAE Hardened Protocol (Addendum A), the

following applies to all UAE maritime framework compliance:

Dual ratification required: Federal Supreme

Council (Abu Dhabi) AND DP World/Dubai Ports

Customs executive leadership must jointly

118 sign all maritime compliance instruments.

Instruments requiring dual sign-off: IHTA

participation; sanctions-interdiction protocols; tolling compliance matrices; denial-of-port

orders for sanctions-evading vessels.

Breakdown procedure: 14-day internal

consultation; if unresolved, Oman neutral chair

mediation; if mediation fails, UAE participation in affected instrument suspended (not framework- wide); IHTA tolling continues at standard rate.

Toll revenue offsets: 15% of IHTA administrative

fees to compliant UAE ports; Volume Protection Floor for >5% shipping volume loss.

MODULE IV: ENERGY INTERDEPENDENCE MODULE

Operative Clause: This module creates structural energy interdependencies that make conflict economically devastating for all parties. It establishes

cross-border electrical grid integration, a regional desalination network, and petrochemical export parameters with revenue escrow. By embedding each party's economic survival into shared infrastructure, this module creates

the "mutually assured economic destruction" that incentivizes sustained compliance. This module is classified Tier 1.

1. CROSS-BORDER GRID INTEGRATION

1.1 GCC-Iraq Electrical Interconnection The existing GCC-Iraq interconnection project is incorporated into the framework as its first operational energy interdependence asset:

Technical Parameters:

Route: Al-Wafrah Substation (Kuwait) to Al-Faw

119 Substation (southern Iraq); 295 km of 400 kV

double-circuit overhead lines.

Initial capacity: 500 MW (operational from

Phase 2 upgrade: 1,000 MW (triggered by 12

months of verified Phase 1 compliance and Iraqi Ministry of Electricity certification

of grid absorption capacity).

Ownership: GCC Interconnection Authority

(GCCIA) 60%; Iraqi Ministry of Electricity 40%.

Pricing: \$0.045 per kWh (benchmarked against

Iraqi domestic generation cost of \$0.065 per kWh); price review annually by joint technical

Payment mechanism: Iraqi payments through

RDF Window D escrow; 30-day payment terms;

late payment triggers automatic GCC supply reduction (not cutoff — reduction to 75% capacity).

Framework protection: Supply may not be cut

for political disputes in non-energy domains. Only technical failures or payment default

may reduce supply. 1.2 Iraq-Jordan Electrical Interconnection

Route: Jordanian border (Rabba/Al-Qadisiyah) to

Iraqi grid at Rutba; 400 kV line.

Phase 1 capacity: 150 MW (functional at framework

entry; undergoing upgrades).

Phase 2 capacity: 500 MW (triggered by Phase 1

120 transition and Jordanian grid upgrade completion).

Ownership: Jordan National Electric Power Company

(NEPCO) 50%; Iraqi Ministry of Electricity 50%.

Pricing: \$0.055 per kWh; RDF subsidizes differential

for first 24 months (Jordan pays \$0.040; RDF covers \$0.015) to incentivize adoption. 1.3 Jordan-Syria-Lebanon Power Transit Triangle

Jordan-Syria link: Reactivate 132 kV and 400 kV

interconnections (damaged during conflict); RDF Window B funds reconstruction.

Syria-Lebanon link: Reactivate Deir Ammar (Lebanon)

to Syrian border 220 kV line; Lebanese Electricite du Liban (EDL) receives Syrian power at \$0.050 per kWh.

Jordan-Lebanon indirect transit: Jordan exports to

Syria; Syria re-exports to Lebanon; creates revenue stream for Syrian transitional electricity sector.

Capacity targets: 200 MW Jordan→Syria by Month 12;

100 MW Syria→Lebanon by Month 18.

Conditionality: Syrian power transit contingent on

Zone 1 (Daraa) ceasefire maintenance; if ceasefire

breaks, transit suspended for 30 days minimum. 1.4 Iran-Iraq Gas Supply Agreement (Framework Integration)

Existing Iran-Iraq gas supply (currently disrupted by sanctions and payment disputes) reactivated under framework umbrella.

Supply: 50 million cubic feet per day (mmcf/d)

initial; scaling to 150 mmcf/d by Phase 3.

Pricing: \$3.50 per million BTU (benchmarked against regional spot price; 15% discount from market to 121 reflect pipeline proximity).

Payment: Through RDF Window D escrow; Iranian gas export revenue deposited in designated escrow and released quarterly upon compliance certification.

Use: Iraqi power generation (Basra and Baghdad plants); reduces Iraq's dependence on Iranian electricity imports while Iran maintains revenue.

1.5 Grid Interdependence Safeguards

All grid interconnections designated as "critical shared infrastructure" under framework protection.

Deliberate sabotage of grid interconnector: +3.0

CIS points to Economic domain; strict liability restitution for repair costs; governance body emergency session within 48 hours.

Cyber attack on grid operations center: Treated as equivalent to physical sabotage; activates Cyber-Security Safeguard Module (Enforcement

Dispute resolution: Technical disputes over pricing, capacity allocation, or payment referred to BAP Standard Track (40-day maximum).

Emergency sharing: If one party experiences generation crisis (natural disaster, plant failure), interconnected partners must provide emergency power up to 10% of interconnector capacity; emergency supply may not be denied for political disputes.

1. REGIONAL DESALINATION NETWORK

2.1 Jordan Desalination Priority Jordan's water security is a framework priority due to

its demographic vulnerability and political sensitivity

122 (see RP-JOR Narrative Shielding Protocol, Addendum A):

Project: Aqaba-Amman Desalination and Conveyance System (Phase 1)

Desalination plant at Aqaba (Red Sea):

300 million cubic meters per year capacity.

Conveyance pipeline: Aqaba to Amman; 320 km;

gravity-assisted where topography permits;

pumping stations powered by grid electricity (including Jordan-Syria and GCC-Iraq interconnectors).

Cost: \$2.5 billion (Phase 1); funded from

RDF Window B (\$1.5B) + PIF Regional Infrastructure Investment Pool (\$0.5B) + World Bank IBRD loan (\$0.5B).

Timeline: 36 months from groundbreaking to

Water pricing: \$0.80 per cubic meter to

Amman municipality (subsidized from \$1.20 production cost; RDF covers differential for first 36 months).

Sovereign branding: All infrastructure branded

"Jordanian Sovereign Water Security Initiative" per RP-JOR vocabulary templates; no

"normalization" or "regional integration" language in public communications.

2.2 Gaza Desalination Unit

H2>The Graduated Consequence Architecture

P>Annex AC establishes the Automatic Consequence System (ACS) that provides pre-negotiated, proportionate responses to compliance concerns without requiring ad hoc political decision-making for each response. The consequence menus specify exactly what responses are activated for what categories of violation, providing predictability that deters violations by making consequences clearly foreseeable and that prevents disproportionate responses that could escalate rather than resolve compliance concerns.

P>The menus are organized by commitment category, with distinct consequence sets for nuclear restrictions, verification cooperation, financial obligations, security commitments, and institutional participation. Within each category, consequences are graduated across five tiers: advisory notice, enhanced monitoring, partial benefit suspension, comprehensive sanctions restoration, and security response measures. The tier structure ensures that responses are proportionate to the severity of violations.

P>Each consequence specification includes trigger conditions that define what

events or patterns activate the consequence, implementation procedures that specify how the consequence is applied, duration parameters that define how long consequences remain in effect, and termination conditions that define what actions can restore suspended benefits. This comprehensive specification prevents disputes about when consequences are activated, how they are implemented, and when they are terminated.

H2>Proportionality Assessment and De-Escalation Pathways

P>The ACS incorporates proportionality assessment procedures that evaluate whether triggered consequences are appropriate to the specific circumstances of detected violations. These procedures prevent rigid application of consequence menus in situations where literal application would produce clearly disproportionate results. The assessment considers factors including the severity of the violation, the intent of the violating party, the existence of mitigating circumstances, and the potential consequences of various response options.

P>De-escalation pathways provide structured procedures for returning to normal cooperation after consequences have been activated. These pathways specify the actions required to restore suspended benefits, the verification required to confirm that corrective actions have been taken, and the timeline for graduated restoration. The pathways create incentives for prompt compliance restoration by making the path back to full cooperation clear and predictable.

P>The Good Faith Restoration provisions address situations in which parties take genuine corrective actions but full compliance restoration requires extended periods. These provisions permit partial benefit restoration as a reward for genuine progress even before full compliance is achieved, creating positive incentives for partial compliance that might not exist if only full

restoration were recognized. The partial restoration provisions include safeguards against gaming through superficial compliance gestures.

H2>Safeguards Against Consequence Abuse

P>The ACS includes comprehensive safeguards against the misuse of consequence mechanisms for purposes unrelated to genuine compliance concerns. These safeguards recognize that powerful states might attempt to exploit automatic consequence activation to pursue political objectives that go beyond architecture compliance. The safeguards include mandatory fact-finding procedures before consequences can be activated, right of appeal to the BAP for disputed compliance determinations, and emergency suspension procedures that can halt consequence implementation pending review.

P>The Fact-Finding Requirement mandates that no consequences can be activated without a written determination by the SESS Compliance Directorate that specifies the factual basis for the compliance concern, the architecture obligation allegedly violated, and the evidentiary basis for the violation allegation. This requirement prevents consequences from being activated on purely political grounds without supporting evidence.

P>The Right of Appeal permits parties subject to consequence activation to challenge compliance determinations before the BAP, with automatic stay of consequence implementation pending the BAP's decision. This appeal right ensures that parties cannot be subjected to consequences based on erroneous compliance determinations, and provides a procedural check on the SESS's compliance assessment authority.

Consequence Menu Design and Calibration

P>The Automatic Consequence Menus are designed through structured processes that ensure consequences are proportionate to violations, effective

in deterring non-compliance, and politically sustainable across participating states. Menu design involves technical experts, legal specialists, and political advisors who collectively assess what consequences are appropriate for what violations.

P>Proportionality assessment evaluates whether proposed consequences are proportionate to the severity of violations. Proportionality considers the harm caused by the violation, the intent of the violator, the reversibility of violation effects, and the precedent created by the consequence. Grossly disproportionate consequences may be counterproductive by generating political backlash rather than compliance incentives.

P>Deterrence assessment evaluates whether proposed consequences create sufficient incentive for compliance. Deterrence depends on the magnitude of consequences, the probability of consequence activation, and the value that violators place on avoided consequences. Effective deterrence requires both credible threats and reliable implementation.

P>Political sustainability assessment evaluates whether consequences can be maintained through political transitions and changing circumstances. Consequences that require ongoing political support may not be sustainable if political conditions change. Automatic consequences that do not require political decisions are more sustainable but less flexible.

H2>Pre-Programmed Response Triggers and Thresholds

P>The ACS operates through pre-programmed triggers that activate specific consequences when specified conditions are met. Trigger design requires careful calibration to balance detection sensitivity against false alarm rates. Overly sensitive triggers generate false alarms that undermine confidence and create political friction. Insensitive triggers miss violations that should be detected.

P>Trigger calibration employs quantitative risk analysis that models the tradeoffs between detection probability and false alarm rate. Calibration data draws from historical compliance data, simulation exercises, and expert judgment. Triggers are periodically recalibrated as data accumulates and understanding of compliance patterns improves.

P>Threshold specifications define exactly what level of deviation from committed parameters activates each consequence tier. Thresholds are specified in measurable terms that permit objective assessment of whether they have been crossed. Vague thresholds create uncertainty that undermines the predictability essential for deterrence.

P>Escalation procedures govern how the ACS responds when violations persist or worsen after initial consequence activation. Escalation may involve progressive intensification of consequences, expansion of consequence scope, or activation of additional mechanisms. Escalation is automatic but subject to override by the Governance Body in exceptional circumstances.

H2>Override Mechanisms and Safeguards

P>The ACS includes override mechanisms that enable the Governance Body to halt consequence activation when circumstances warrant. Overrides are limited to prevent abuse but available to prevent clearly disproportionate or counterproductive consequences.

P>Emergency override permits the Executive Secretary to suspend consequence activation for up to seventy-two hours pending Governance Body review. Emergency override is available when consequences would cause severe humanitarian effects, trigger unintended escalation, or undermine architecture objectives. The Executive Secretary must report override rationale to the Governance Body within twenty-four hours.

P>Governance Body override permits the Body to halt or modify consequence activation by supermajority vote. Override decisions require justification based on disproportionality, changed circumstances, or implementation of corrective measures. Override does not eliminate the underlying compliance concern but adjusts the response to circumstances.

P>Judicial review permits parties to challenge ACS determinations before the BAP. Review is limited to procedural regularity and evidentiary sufficiency rather than substituting judicial judgment for technical assessment. Review is available for Level Two and Three consequence activations but not for Level One advisory notices.

H2>Consequence Implementation Monitoring

P>The architecture monitors the implementation of activated consequences to ensure they are applied effectively and consistently. Monitoring tracks whether consequences achieve intended deterrent and corrective effects.

P>Implementation tracking follows each consequence from activation through full execution. Tracking records the date of activation, the responsible implementing party, the specific actions taken, and the current status. Tracking ensures that consequences do not stall after activation.

P>Effectiveness assessment evaluates whether consequences produce intended effects on the targeted party's behavior. Assessment examines whether violations cease, whether compliance improves, and whether the targeted party returns to cooperative behavior. Ineffective consequences may be modified or escalated.

P>Impact assessment evaluates collateral effects of consequences on innocent parties, regional stability, and architecture objectives. Assessment ensures that consequences do not cause disproportionate harm beyond their intended

targets. Collateral effects may trigger humanitarian protections.

H2>Sanctions Implementation and Administration

P>Sanctions are a major category of architecture consequences that require specialized administration procedures. Sanctions administration ensures that sanctions are applied accurately, comprehensively, and lawfully.

P>Sanctions designation identifies the specific entities, individuals, and activities subject to sanctions. Designation requires evidentiary support that satisfies legal standards. Designated parties have rights to challenge their designation through administrative and judicial procedures.

P>Sanctions licensing permits exceptions for humanitarian activities, diplomatic functions, and other legitimate purposes. Licensing procedures balance sanctions enforcement against protection of essential activities. License applications are processed promptly to avoid disrupting legitimate activities.

P>Sanctions compliance by private sector actors is supported through guidance, training, and compliance tools. Guidance clarifies sanctions requirements for banks, businesses, and other actors. Training builds compliance capacity. Tools including screening software assist compliance.

P>Sanctions enforcement investigates and penalizes violations of sanctions requirements. Enforcement employs administrative, civil, and criminal mechanisms depending on violation severity. Penalties create deterrent effects that reinforce compliance.

H2>Benefit Suspension and Restoration

P>Benefit suspension temporarily withholds architecture benefits when compliance concerns arise. Suspension creates incentives for corrective action while preserving the possibility of benefit restoration upon compliance

improvement.

P>Suspension procedures specify how benefits are suspended, which benefits are affected, and how suspension is communicated. Procedures ensure that suspension is implemented promptly and transparently. Affected parties receive notice and explanation.

P>Restoration procedures specify the conditions under which suspended benefits are restored. Restoration requires verification that compliance concerns have been addressed. Restoration may be partial or full depending on the degree of compliance improvement.

P>Reinstatement timelines establish the period between corrective action and benefit restoration. Timelines balance the need to reward prompt correction against the need to verify that correction is genuine and sustained.

ANNEX ST

verified compliance milestones — NOT blanket removal. This preserves U.S. leverage while providing Iran a predictable, irreversible pathway to economic normalization.

Asset unfreezing occurs through micro-tranche releases tied to IAEA and JMOC verification — NOT a single lump-sum release. This addresses Iran's demand for access to frozen funds while preventing a one-time payout that would eliminate ongoing incentive alignment.

Banking reconnection proceeds through a four-tier restoration of correspondent relationships, starting with humanitarian (White Channel) and escalating to permitted commercial trade. Full SWIFT reconnection is a Phase 3 achievement, not an

Petrochemical exports are permitted with volume caps, pricing floors, and revenue escrow requirements. Iran regains energy export revenue — a core economic demand — but within a monitored framework that prevents breakout-scale accumulation.

The International Hormuz Transit Authority (IHTA) establishes a multilateral governance mechanism for the Strait — addressing Iran's demand for institutional voice — while guaranteeing freedom of navigation and creating revenue-sharing arrangements that benefit all littoral states.

No formal reparations or compensatory payments are mandated.

79 Instead, the Regional Development Fund channels reconstruction and infrastructure investment into Iran and all affected states — producing tangible economic benefits without the political toxicity of "war reparations."

Energy interdependence (cross-border grids, desalination networks, pipeline cooperation) creates structural incentives for peace by making conflict economically devastating for all parties — the "mutually assured economic destruction" principle.

Commercial Continuity Protection guarantees that companies investing under the framework will not face retroactive secondary sanctions if the framework later collapses — addressing the private sector's primary fear and unlocking the investment necessary for Iran's economic recovery.

These modules are classified Tier 1 (must survive in any framework version) and are operative from Phase 0 entry. All financial provisions are legally binding upon deposit with the UN Secretary-General.

MODULE I: REGIONAL DEVELOPMENT FUND CHARTER

Operative Clause: This Charter establishes the Regional Development Fund (RDF) as the central financial institution of the RCSA. The RDF governs all framework-related capital flows, escrow arrangements, disbursement authorities, and audit mechanisms. It is designed to ensure that funds cannot be unilaterally frozen by any single party, that disbursements flow automatically upon verified compliance, and that corruption and misuse are structurally prevented.

1. CAPITALIZATION STRUCTURE

1.1 Phase 1 Baseline Capitalization (\$5 billion)

80 The RDF opens with a baseline capitalization of \$5 billion, contributed as follows: Core Party Contributions (\$3.0 billion):

United States: \$1.5 billion (humanitarian and reconstruction windows; NOT direct transfer to Iranian state institutions)

Saudi Arabia (via PIF): \$800 million (regional infrastructure corridor; locked via PIF standing directive per RP-SA Hardened Protocol)

United Arab Emirates: \$400 million (trade corridor and maritime infrastructure)

Iran: \$300 million (in-kind contribution: fuel supply guarantees for humanitarian operations; NOT cash — verified market value of committed

fuel deliveries) Guarantor State Contributions (\$1.2 billion):

Switzerland: \$400 million (humanitarian corridor and civilian protection operations)

Pakistan: \$400 million (refugee burden-sharing and IDP stabilization)

Oman: \$400 million (Hormuz transit infrastructure and maritime security) International Institution Contributions (\$0.8 billion):

World Bank IBRD/IDA facility: \$300 million (concessional lending window for host nations)

Asian Infrastructure Investment Bank (AIIB):

\$250 million (energy interconnection projects)

European Investment Bank (EIB): \$250 million

(trade corridor and customs modernization) 1.2 Tiered Payment Schedule
(Phases 1-3)

81 Contributions are not delivered as lump sums but through

a tiered payment schedule linked to framework milestones: Phase 1 (\$5 billion
baseline):

40% (\$2 billion) deposited upon framework entry

into force and IAEA Phase 0 baseline monitoring activation.

30% (\$1.5 billion) deposited upon 90 consecutive

days of verified Phase 0 compliance.

30% (\$1.5 billion) deposited upon Phase 1

transition (5% enrichment cap; banking channel Tier 1 operational; first proxy
freeze zones

established). Phase 2 (\$8 billion expanded capitalization):

Additional \$3 billion triggered by Phase 2

activation (10% medical enrichment; Fordow IMIRC conversion initiated;
Yemen ceasefire extended 180+ days).

Additional \$3 billion triggered by 12 months of
verified Phase 2 compliance.

Additional \$2 billion triggered by Phase 3

governance body review and approval. Phase 3 (\$12 billion full capitalization):

Additional \$4 billion triggered by Phase 3

activation (up to 20% enrichment for civilian

fuel; full banking channel operational; Iraq PMF Stage 2 integration certified).

Additional \$4 billion triggered by 24 months

of verified Phase 3 compliance.

Final \$4 billion released upon framework

full-phase steady state (all tracks at

82 maximum integration).

1.3 Capitalization Protection

All RDF funds held in World Bank-administered

trust accounts under the Bank's standard trust

fund protection protocols.

No single contributor may withhold, redirect, or

freeze its contribution as leverage in a

compliance dispute. Disputes over contributor obligations are resolved

through BAP arbitration (Module I of Enforcement & Dispute Resolution),

NOT through unilateral financial coercion.

If a contributor fails to make a scheduled

payment, the World Bank may advance the shortfall from RDF administrative

reserves (capped at 10%

of total fund) and recover via deduction from that contributor's future benefit

allocations.

Contributor withdrawal: Any contributor may

withdraw uncommitted funds with 180 days' notice to governance body; committed funds (already allocated to projects) may not be withdrawn and continue under World Bank administration.

1. THE ESCROW HIERARCHY

2.1 World Bank-Administered Master Trust Account

All RDF funds flow through a World Bank Multi-Donor Trust Fund (MDTF) structured as follows: Trustee Level: World Bank receives, holds, invests, and reports on all donor funds. Funds held in U.S. Treasury securities and AAA-rated sovereign bonds for capital preservation and liquidity.

Window Level: Five operational windows manage fund allocation by sector:

83 Window A: Humanitarian Emergency (\$500M

baseline; see Humanitarian & Civilian Protection Modules, Module III).

Window B: Regional Infrastructure (\$3B;

roads, ports, power, water, digital).

Window C: Reconstruction (\$2B; Yemen,

Syria, Lebanon, Gaza).

Window D: Energy Interdependence (\$1.5B;

grid interconnection, desalination, pipeline construction).

Window E: Trade Facilitation (\$500M; customs

modernization, IHTA establishment, corridor hardening). Disbursing Level:

Funds transferred to recipient

entities (governments, UN agencies, World Bank lending operations, certified contractors) via standard World Bank grant agreement procedures.

2.2 Sub-Fund Architecture Sub-Fund 1 — Humanitarian Emergency Escrow: Capitalization: \$500 million (Layer 1 of

Rapid Aid Deployment Protocol). Administrator: World Bank (trustee) + UN OCHA (operational).

Release authority: UN OCHA Director for <\$10M; UN Under-Secretary-General for Humanitarian Affairs for \$10M-\$50M; governance body for

>\$50M. Release trigger: Verified Rapid Aid Deployment quantitative triggers (see Humanitarian

Modules, Module III). Auto-replenishment: To \$500M baseline within

84 30 days of any drawdown via RDF

administrative budget. Protection: Humanitarian Firewall — may NOT be suspended for compliance disputes in other

domains. Sub-Fund 2 — Yemen Reconstruction Fund: Capitalization: \$2 billion (Phase 1); scaling

to \$4 billion (Phase 3). Administrator: World Bank (trustee) + UN Development Programme (UNDP) (operational).

Revenue linkage: 40/40/20 revenue-sharing escrow from Hudaydah port operations (see Core Document, Yemen Stabilization Framework).

Release authority: World Bank Yemen Reconstruction Fund administrator; releases conditional on UN ceasefire monitoring

certification. Release trigger: Verified 60-day ceasefire maintenance; OR

verified absence of proxy

indirect fire from revenue-producing zone. Audit: Annual independent audit by Big Four accountancy firm; published in Transparency

Summary. Sub-Fund 3 — Lebanon Stabilization Facility: Capitalization: \$1.5 billion (Months 1-12);

\$3 billion (Months 13-36). Administrator: World Bank (trustee) + Lebanese Council for Development and Reconstruction

(CDR) (operational, under UN oversight). Primary purpose: Emergency fuel supply (\$150M quarterly, Months 1-6, scaling to \$300M);

85 infrastructure repair (power, water, port);

banking sector liquidity support. Release authority: Joint signature — World Bank Lebanon country director + UN OCHA Lebanon

coordinator + Lebanese Ministry of Finance (neutral chair tie-breaking vote). Release trigger: CPMC verification of

humanitarian need; JMOC certification of no security obstruction to aid delivery. [CROSS-REFERENCE: Block 4 Humanitarian Modules

reference this facility at Module IV, Section 1.1. Any modification to this sub-fund's scope or governance must be harmonized with

Block 4 provisions.] Sub-Fund 4 — Rapid Response Reserve: Capitalization: \$100 million.

Holding location: Swiss National Bank (liquid T-bills and gold-backed deposits; 48-hour accessibility).

Administrator: Swiss National Bank (custodian) + CPMC Director + UN OCHA Director (dual release signature for >\$5M).

Purpose: Bridge financing when primary sub-fund releases are delayed; multi-zone simultaneous emergencies; CPMC Director determination that delay would cause preventable deaths. Cap: \$25M per single event; \$50M per 30-day period.

Replenishment: Automatic from RDF Window A within 14 days of drawdown.
Sub-Fund 5 — PIF Regional Infrastructure

Capitalization: \$1.5 billion (Phase 1); \$4 billion (Phase 3). Administrator: Saudi PIF (investment manager)

+ World Bank (oversight and fiduciary monitoring). Standing directive: PIF Board Resolution

locking investment to pre-approved project pipeline; survives Saudi leadership transitions per RP-SA Hardened Protocol.

Project pipeline: Pre-approved list of 50+ infrastructure projects in Jordan, Iraq, Lebanon, and Yemen; vetted by World Bank

and IMF technical teams. Release trigger: JMOC certification of compliance milestone achievement by

relevant framework party. [CROSS-REFERENCE: Block 4 Humanitarian Modules reference this pool as tertiary source for

host-nation burden-sharing offsets.] 2.3 Asset Freeze Micro-Tranches (Iranian Frozen Assets) Approximately \$100 billion in Iranian assets are frozen

in various jurisdictions. These are unfrozen through a micro-tranche system: Total Pool: \$100 billion (estimated across U.S.,

European, Asian, and Gulf frozen asset pools). Micro-Tranche Size: \$1 billion per tranche, released upon verified compliance milestones.

Release Sequence: Tranche 1 (\$1B): Framework entry + 90 days verified Phase 0 compliance. Released to

87 RDF Window B (infrastructure) for Iranian

civilian infrastructure projects only (hospitals, water treatment, power grid).

No direct transfer to Iranian government

treasury. Tranche 2 (\$1B): Phase 1 transition certified. 50% to RDF Window D (energy); 50% to

banking channel capital reserve (for Iranian bank recapitalization). Tranche 3 (\$1B): 180 consecutive days of

Phase 1 compliance. Released to Iranian Central Bank for foreign exchange reserves (monitored by IMF quarterly review).

Tranche 4 (\$1B): Phase 2 transition. Released for World Bank lending operations in Iran (private sector development, SME financing).

Tranches 5-10 (\$6B): One tranche per 180-day verified compliance period through Phase 3. Tranches 11-20 (\$10B): One tranche per

12-month verified compliance period during steady state. Additional tranches contingent on 5-year framework renewal.

Jurisdiction: Releases coordinated across all holding jurisdictions (U.S. Treasury, European Central Bank, Bank of England, Bank of Japan,

UAE Central Bank) via simultaneous release protocol. No single jurisdiction may block a verified release; blocking party subject

to BAP arbitration and +2.0 CIS procedural penalty. Use Restrictions: Tranches 1-4 restricted to

88 RDF windows and World Bank operations — NOT

direct Iranian government budget support. Tranches 5+ gradually relaxed to include Iranian sovereign budget support (subject to IMF macroeconomic conditionality review).

1. GOVERNANCE AND VETO RULES

3.1 RDF Governing Board

The RDF is governed by a Governing Board with the following composition and voting structure: Composition (9 members):

World Bank: 1 seat (permanent) UN Development Programme: 1 seat (permanent) Neutral Chair (Oman): 1 seat (permanent; casts tie-breaking vote)

Switzerland: 1 seat (permanent guarantor) Pakistan: 1 seat (permanent guarantor) United States: 1 seat (core party) Iran: 1 seat (core party) Saudi Arabia: 1 seat (regional party) Rotating seat: 1 seat (rotating among UAE, Jordan, Iraq, Lebanon, Turkey, EU

representative — 12-month terms) Voting Weights:

World Bank: 25% (fiduciary authority; operational veto on misuse of funds)

UN/Neutral guarantors combined: 25% (Switzerland 8%, Pakistan 8%, Oman 9%)

Core parties combined: 30% (U.S. 15%,

Regional parties combined: 20% (Saudi Arabia 10%, rotating seat 10%)

89 Decision Thresholds:

Standard disbursement approval: 60% weighted majority (prevents any single bloc from dominating).

Emergency disbursement (Rapid Response Reserve): 50% + Neutral Chair concurrence.

Governance structure amendment: 75% + guarantor bloc unanimous.

Exclusion of contractor or entity from

RDF eligibility: 60% + World Bank fiduciary concurrence.

No single party veto: NO decision requires unanimity or any single party's affirmative vote. A party may be outvoted.

3.2 Veto Prevention Mechanisms

U.S. Veto Blocked: The U.S. cannot unilaterally block disbursements to Iran-approved projects if 60% weighted majority supports them. U.S. objections are recorded but do not prevent disbursement.

Iran Veto Blocked: Iran cannot block disbursements to projects in rival states (Saudi Arabia, UAE, Israel-linked) if 60% weighted majority supports them.

Saudi Veto Blocked: Saudi Arabia cannot block

Iranian-accessible infrastructure funding if 60% weighted majority supports it.

World Bank Fiduciary Override: World Bank may

suspend any disbursement it determines poses unacceptable fiduciary risk

(corruption,

90 terrorism financing, sanctions violation)

without board vote; override subject to BAP review within 30 days. 3.3

Transparency and Reporting

Quarterly financial statements: Published on

framework transparency portal within 30 days of quarter end.

Annual independent audit: Big Four accountancy

firm; published within 90 days of fiscal year end.

Project-level tracking: All disbursements

linked to specific projects with GPS coordinates, contractor identity, and progress milestones; publicly searchable database.

Beneficial ownership: All RDF contractors must

H2>Stress Testing Methodology and Framework

P>Annex ST establishes the Annual Macro Stress Test program that subjects the architecture to comprehensive evaluation under simulated adverse conditions. The stress testing methodology draws upon financial sector stress testing practices adapted for the distinctive characteristics of international security architectures. Annual stress tests identify vulnerabilities, evaluate resilience, and generate recommendations for strengthening architecture provisions.

P>The stress testing framework employs scenario analysis that examines architecture performance under specified adverse conditions. Scenarios are developed through structured processes involving threat assessment, historical analysis, and expert judgment. Each scenario specifies the triggering

events, the resulting conditions, and the expected architecture responses that are evaluated during the stress test.

P>Stress tests evaluate architecture performance across multiple dimensions: institutional resilience (whether institutions can continue functioning under stress), compliance maintenance (whether commitments are sustained under political pressure), verification effectiveness (whether monitoring can detect violations under adverse conditions), benefit continuity (whether economic benefits persist during crises), and security stability (whether regional security is maintained during architecture stress).

H2>Scenario Development and Governance

P>Scenario development follows a structured methodology that ensures comprehensive coverage of potential risks. The methodology begins with risk identification that catalogues all potential threats to architecture implementation. Risk assessment evaluates each identified threat in terms of probability and potential impact. Scenario construction combines selected threats into coherent narratives that specify the conditions under which architecture performance is tested.

P>Scenario governance ensures that stress testing remains rigorous and independent from political pressures that might favor optimistic assumptions. The Stress Testing Board, comprising technical experts without current government affiliations, approves scenarios and evaluates results. Board independence prevents scenario selection that would produce artificially favorable results.

P>Scenario categories include political scenarios (leadership changes, domestic crises, alliance shifts), economic scenarios (financial crises, commodity price shocks, trade disruptions), security scenarios (military incidents, proxy attacks, terrorist events), institutional scenarios (verification

failures, governance deadlock, personnel losses), and combined scenarios that examine interactions among multiple stressors.

H2>Remediation and Architecture Strengthening

P>Stress test results generate remediation recommendations that address identified vulnerabilities. Remediation actions are classified as immediate (requiring action within thirty days), short-term (requiring action within six months), and long-term (requiring action within eighteen months). The Governance Body reviews and approves remediation plans with specified timelines and accountability measures.

P>Remediation tracking ensures that identified vulnerabilities are actually addressed rather than merely documented. The SESS maintains a vulnerability register that tracks all stress-test-identified weaknesses through remediation completion. Quarterly reports to the Governance Body document remediation progress and identify obstacles requiring political attention.

P>Architecture strengthening incorporates lessons from stress tests into architecture amendments and implementing guidance. Stress test insights inform annual work programs, budget allocations, and institutional development priorities. The stress testing program creates a continuous improvement cycle that progressively enhances architecture resilience.

Stress Test Governance and Independence

P>The Annual Macro Stress Test program operates under governance arrangements that ensure independence from political pressures that might favor optimistic assumptions or suppress unfavorable findings. Independence is essential for stress test credibility and for the value of stress tests as diagnostic tools.

P>The Stress Testing Board comprises experts appointed for fixed terms with

protection from arbitrary removal. Board members are selected based on technical expertise, independence from current government affiliations, and demonstrated judgment in risk assessment. Board composition includes nuclear technology experts, financial risk specialists, political analysts, and regional security scholars.

P>Board authority includes scenario approval, methodology review, result validation, and recommendation approval. The Board has access to all architecture information required for stress testing, classified at appropriate levels. Board reports are submitted directly to the Governance Body without filtering by secretariat or other architecture institutions.

P>Secretariat support provides the Board with analytical resources, data access, and administrative services required for stress test execution. Support staff are assigned to the Board for the duration of stress test activities and report to Board direction rather than to regular secretariat management. This reporting arrangement ensures that support staff serve Board needs rather than institutional interests.

Scenario Categories and Stress Dimensions

P>Stress scenarios are organized into categories that address different dimensions of architecture vulnerability. Each category includes multiple scenarios that explore different combinations of stressors and intensities.

P>Political scenarios examine architecture performance under leadership changes, electoral transitions, domestic crises, and international realignments. Political scenarios assess whether architecture institutions survive political transitions, whether commitments persist through leadership changes, and whether domestic crises generate pressures for withdrawal or violation.

P>Economic scenarios examine architecture performance under financial

crises, commodity price shocks, trade disruptions, and aid dependence crises. Economic scenarios assess whether benefit delivery continues during economic stress, whether economic distress generates political pressure for reversal, and whether financial architecture functions under crisis conditions.

P>Security scenarios examine architecture performance under military incidents, proxy attacks, terrorist events, and cyber attacks. Security scenarios assess whether communication channels survive conflict, whether verification continues during hostilities, and whether crisis management procedures function under stress.

P>Institutional scenarios examine architecture performance under verification system failures, governance deadlock, personnel losses, and funding disruptions. Institutional scenarios assess whether institutional functions survive component failures, whether backup systems maintain essential operations, and whether institutional resilience enables continuity through disruptions.

P>Combined scenarios examine interactions among multiple stressors that may produce effects greater than the sum of individual stressors. Combined scenarios are particularly important because real-world crises often involve simultaneous political, economic, and security challenges.

H2>Remediation Tracking and Architecture Evolution

P>Stress test findings generate remediation requirements that are tracked through completion. Tracking ensures that identified vulnerabilities are addressed rather than merely documented. The remediation framework assigns responsibility, establishes timelines, and monitors progress.

P>Remediation responsibility assignment identifies the institution or state responsible for addressing each identified vulnerability. Assignment considers

capability, authority, and accountability. Where multiple parties share responsibility, coordination mechanisms ensure coherent action.

P>Remediation timelines establish deadlines for addressing vulnerabilities based on severity and complexity. Critical vulnerabilities require immediate action. Serious vulnerabilities require action within defined periods. Minor vulnerabilities are addressed through routine improvement processes.

P>Progress monitoring tracks remediation implementation against timelines and quality standards. Monitoring identifies delays, obstacles, and resource requirements. Quarterly reports to the Governance Body document progress and identify areas requiring additional attention or resources.

P>Architecture evolution incorporates stress test insights into ongoing architecture development. Stress tests inform amendment priorities, resource allocation, and institutional design. The stress testing program creates a feedback loop that progressively strengthens architecture resilience.

Stress Test Scenario Catalog

P>The Annual Macro Stress Test program maintains a comprehensive catalog of stress test scenarios that address the full range of potential threats to architecture implementation. The catalog is continuously updated to reflect emerging risks, changed circumstances, and lessons from previous stress tests.

P>Political scenario catalog includes scenarios for leadership transitions in each participating state, domestic political crises, alliance realignments, and changes in great power relationships. Each scenario specifies the triggering events, the resulting conditions, and the expected architecture responses.

P>Economic scenario catalog includes scenarios for financial crises, commodity price shocks, trade disruptions, debt crises, and aid dependence crises. Economic scenarios examine how architecture funding, benefit

delivery, and political sustainability would be affected.

P>Security scenario catalog includes scenarios for military incidents, proxy attacks, terrorist events, cyber attacks, and weapons of mass destruction use. Security scenarios examine how architecture crisis management, verification, and security cooperation would function.

P>Institutional scenario catalog includes scenarios for verification system failures, governance deadlock, key personnel losses, funding disruptions, and information system compromise. Institutional scenarios examine architecture resilience and backup system effectiveness.

P>Combined scenario catalog includes scenarios that examine interactions among multiple stressors. Combined scenarios are particularly important because real-world crises often involve simultaneous political, economic, and security challenges.

H2>Stress Test Reporting and Follow-Up

P>Stress test results are reported to the Governance Body and participating states through structured reports that communicate findings, vulnerabilities, and remediation recommendations. Reporting ensures that stress test insights inform architecture governance.

P>Executive summaries provide accessible overviews of stress test findings for senior decision-makers. Summaries highlight key vulnerabilities, recommended actions, and resource requirements. Summaries are designed for officials who require strategic awareness without technical detail.

P>Technical annexes provide detailed analysis of stress test methodology, scenarios, and results for technical specialists. Annexes include quantitative models, scenario narratives, and sensitivity analyses. Technical annexes enable expert review and informed debate.

P>Remediation tracking monitors implementation of stress test recommendations. Tracking identifies responsible parties, timelines, and progress. The Governance Body reviews remediation progress quarterly and addresses obstacles to implementation.

H2>Stress Test Integration with Architecture Planning

P>Stress test insights are integrated into architecture planning processes including budget development, work program design, and institutional development. Integration ensures that planning reflects stress test findings rather than proceeding independently.

P>Budget integration allocates resources to address stress-test-identified vulnerabilities. Budget proposals include line items for resilience building, backup systems, and contingency capabilities. The Governance Body reviews stress test implications during budget approval.

P>Work program integration schedules activities that address stress test recommendations. Work programs include tasks for vulnerability mitigation, procedure improvement, and capacity building. Integration ensures that stress test findings translate into concrete actions.

P>Institutional development integration shapes the evolution of architecture institutions based on stress test insights. Development priorities, staffing plans, and training programs reflect stress test findings. Integration creates a feedback loop that progressively strengthens architecture resilience.

ANNEX DV

3 Annex 4W: Unified Governance Matrix — Who Pays, Administers, Signs, and Audits

RCSA economic architecture, eliminating the need to cross-reference multiple modules for economic governance clarity.

Every fund, sub-fund, corridor, escrow account, guarantee facility, and credit line in the RCSA economic architecture is mapped across four governing dimensions: Payer (source of capital), Administrator (operational manager), Signatory (binding decision-maker), and Auditor (verification authority). This annex creates a unified master matrix so that economic architecture governance can be read in one reference document rather than distributed across multiple modules.

4 Annex 4W: Unified Governance Matrix — Who Pays, Administers, Signs, and Audits

Table FR-3: Table FR-3: Master 4-W Matrix — Core Funds and Facilities

Fund/Facility	Payer	Administrator	Signatory	Auditor

Delegation and Substitution Rules

Where the primary payer, administrator, signatory, or auditor becomes unable
to perform its function (political transition, domestic crisis, insolvency, or
withdrawal), the following substitution cascade applies: (a) the affected party
notifies the governance body within 14 days; (b) the governance body

convenes within 7 days to confirm the incapacity; (c) the remaining parties in that fund's 4-W matrix select an interim

6 Annex FW: Funding-Failure Waterfall

substitute from a pre-approved standing pool; (d) the interim substitute operates for up to 90 days; (e) permanent replacement requires consensus of all non-incapacitated matrix parties. The standing pool for payer substitution comprises: European Union (via EIB or EC budget), Japan (JICA), South Korea (Korea Eximbank), and China (AIIB). The standing pool for administrator substitution comprises: UNDP, UNOPS, ADB, and EBRD. The standing pool for auditor substitution comprises: the big- four audit firms (rotation mandatory) and two regional audit consortia (one Gulf-based, one South Asia- based). No standing pool member may substitute in more than two RCSA funds simultaneously.

Decision Thresholds by Matrix Party

Each 4-W dimension carries defined decision thresholds: Payer: may suspend future contributions after 30- day notice if compliance deterioration is certified; may not claw back committed funds without governance body authorization. Administrator: may adjust operational procedures within pre-authorized ranges; may not alter fund purpose or beneficiary eligibility without signatory approval. Signatory: may authorize tranche releases, emergency reallocations, and new sub-fund creation; may not expand total fund ceiling without payer concurrence. Auditor: may issue qualified opinions, recommend forensic review, and trigger compliance indicator adjustment; may not freeze fund operations (that power rests with signatory upon auditor recommendation). Any single matrix party may request an emergency 4-W review if it has evidence that another party has exceeded its threshold. The review is conducted by the governance body secretariat within 14 days.

Findings are binding on administrator and auditor decisions; recommendations to signatory and payer are advisory but require written justification if rejected.

Annex FW: Funding-Failure Waterfall

This annex establishes a three-tier automatic waterfall—Internal Remediation, Framework Adjustment, and Structural Reallocation—that specifies precisely what happens first, second, and third when a contributor misses a scheduled payment to any RCSA fund, supplementing the RDF shortfall-advance concept with comprehensive default and cure procedures.

Waterfall Architecture

The funding-failure waterfall specifies the precise sequence of operational, financial, and political responses when a contributor misses a scheduled payment to any RCSA fund or facility. The waterfall applies to all committed and conditional contributions above \$10 million annually. It operates independently of the broader enforcement ladder, serving as an internal financial-procedure mechanism rather than a compliance-sanction instrument.

7 Annex FW: Funding-Failure Waterfall

The waterfall has three tiers: Tier 1 (Days 1-30): Internal Financial Remediation; Tier 2 (Days 31-60): Framework-Level Financial Adjustment; Tier 3 (Days 61-90): Structural Reallocation and Political Notification. Each tier activates automatically upon expiration of the prior tier's deadline unless the missed payment is cured.

Table FR-5: Table FR-5: Funding-Failure Waterfall by Tier

Tier Trigger Automatic Actions Discretionary Options Escalation Threshold

Tier 1: Internal Payment missed Late-payment interest Administrator may extend Payment not Remediation by 1 calendar accrues at LIBOR + deadline by 15 days with received by Day day past due 2% neutral-chair concurrence 30

Tier 2: Tier 1 expired Next tranche to same Governance body may Day 60 without Framework without cure fund withheld reallocate withheld tranche to cure Adjustment other contributor

Tier 3: Structural Tier 2 expired Fund operating Governance body may invoke Day 90 without Reallocation without cure budget reduced substitute payer from standing cure — formal proportionally pool default

Tier 1 — Internal Financial Remediation

Upon a missed payment, the fund administrator issues a Payment Default Notice within 3 business days. The notice specifies: the amount overdue, the original due date, the cure deadline (Day 30), and the late-interest calculation. The defaulting contributor may cure at any time during Tier 1 by remitting the full overdue amount plus accrued interest.

During Tier 1, no other framework benefits are suspended. The missed payment is treated as an internal accounting matter. The administrator may draw from the fund's operating reserve (up to 10% of annual budget) to cover immediate obligations without governance body approval. If the reserve is drawn, it must be replenished before the next scheduled tranche release. The defaulting contributor's other financial obligations to the framework are not affected. A missed payment to the Yemen Reconstruction Fund does not trigger default status for the Lebanon Emergency Fund or the Escrow Shield. Cross-default applies only where the same contributor misses payments to three or more separate funds within a single 90-day cycle.

Tier 2 — Framework-Level Financial Adjustment

If Tier 1 expires without cure, Tier 2 activates automatically. The fund administrator withholds the next scheduled tranche due to the defaulting contributor. The withheld amount is placed in a suspense account.

8 Annex FW: Funding-Failure Waterfall

The governance body convenes within 14 days to determine: whether to reallocate the withheld tranche to a substitute contributor from the standing pool; whether to reduce the fund's annual operating budget by the defaulting contributor's share; or whether to accept a payment plan from the defaulting contributor spanning up to 180 days. During Tier 2, the defaulting contributor loses voting rights on fund-specific decisions (tranche timing, beneficiary eligibility, project selection) but retains governance body membership and voting rights on non-fund matters. This partial suspension is designed to isolate the financial breach without collapsing broader framework cooperation. If the defaulting contributor provides credible evidence that the missed payment results from: (a) a UN-recognized force majeure event; (b) a domestic court injunction blocking transfer; or (c) an IMF or World Bank suspension of the contributor's own credit access, the neutral chair may grant a one-time 45-day extension of Tier 2. Extensions require documentation and are published in the quarterly Transparency Summary.

Tier 3 — Structural Reallocation and Default

If Tier 2 expires without cure or approved extension, the defaulting contributor is formally designated in 'Contribution Default.' The fund's total authorized budget is reduced by the defaulting contributor's committed share. Other contributors are invited to cover the gap through voluntary supplemental contributions. If supplemental contributions cover at least 50% of the gap within 30 days, the fund continues at reduced capacity. If supplemental contributions cover less than 50%, the fund enters 'Restricted

Operations Mode'—existing projects continue but no new projects are approved. In Contribution Default, the defaulting contributor's framework benefits in the economic domain are suspended until cure. Benefits in other domains (humanitarian access, verification cooperation, normalization signals) continue unless the default is accompanied by a separate compliance breach. The defaulting contributor remains bound by all non-financial framework obligations. A party in Contribution Default may return to good standing only by: (a) remitting all overdue amounts plus Tier 1 and Tier 2 interest; (b) presenting a credible forward-payment schedule certified by its central bank or treasury; and (c) obtaining governance body approval (consensus default, weighted majority override available) for reinstatement. Reinstatement does not restore the original budget ceiling; that requires a separate budget amendment process.

Cross-Fund Contagion Prevention

The waterfall includes explicit cross-fund contagion firebreaks. A default in one fund does not automatically trigger defaults in others. A contributor may be in good standing on the Escrow Shield while in Contribution Default on the Yemen Reconstruction Fund. The only cross-fund linkage is the 'Three-Fund Rule': a contributor in default on three or more separate funds simultaneously triggers a comprehensive financial

9 Annex PR: Project-Priority Rulebook

review by the Economic Cooperation Sub-Committee, which may recommend governance body-level measures including benefit-domain suspension. The RDF shortfall-advance mechanism referenced in the Regional Development Bank module operates as a pre-authorized Tier 2 tool. If a contributor misses an RDF capital call, the RDF may draw on callable capital from non-defaulting members up to 15% of their subscribed capital, without requiring case-by-case

approval. This advance is repaid from the defaulting contributor's future contributions plus interest at LIBOR + 3%. The advance mechanism does not apply to escrow, guarantee, or bilateral trust fund payments.

Annex PR: Project-Priority Rulebook

This annex establishes an automatic, non-discretionary ranking system—based on a composite Priority Score with four weighted factors—for sequencing humanitarian, grid, desalination, banking, and corridor projects when available capital underperforms projections, ensuring that capital shortages produce transparent outcomes rather than ad hoc political competition.

Priority Ranking Framework

When available capital underperforms projections—whether due to contributor default, currency devaluation, commodity price shock, or unplanned emergency expenditure—the framework requires an automatic, non-discretionary method for ranking competing projects across five categories: Humanitarian (food, medical, shelter), Grid (electricity infrastructure), Desalination (water security), Banking (financial channel restoration), and Corridors (trade and transit logistics). This annex creates that rulebook.

The ranking is determined by a composite Priority Score calculated from four weighted factors: Lives at Immediate Risk (40% weight), Irreversibility of Delay (30% weight), Framework Compliance Linkage (20% weight), and Private Capital Mobilization Potential (10% weight). Each project is scored by the administrator and reviewed by the auditor. Scores range from 0 to 100.

10 Annex PR: Project-Priority Rulebook

Table FR-6: Table FR-6: Priority Score Weighting and Scoring Methodology

Factor Weight Scoring Measurement Source Range

Lives at Immediate Risk 40% 0-100 UN OCHA, WHO, UNHCR verified beneficiary counts

Irreversibility of Delay 30% 0-100 Technical assessment by administrator + independent engineer

Framework Compliance 20% 0-100 Governance body compliance indicators Linkage

Private Capital Mobilization 10% 0-100 Investor Confidence Index + feasibility study

Category-Specific Tiebreakers

If two projects receive identical Priority Scores, the following category-specific tiebreakers apply in descending order: (1) Projects with verified IAEA or UN monitoring linkages receive priority over unmonitored projects. (2) Projects located in active conflict zones receive priority over stabilization zones. (3) Projects with co-financing commitments from two or more contributors receive priority over single- source projects. (4) Projects with completed environmental and social impact assessments receive priority over unassessed projects.

Table FR-7: Table FR-7: Automatic Project Rankings by Capital Availability Scenario

Capital Humanitarian Grid Desalination Banking Corridors Shortfall Severity

Mild (under All categories All categories All categories All categories All categories 10%) funded at 95% funded at funded at 95% funded at 95% funded at 95% 95%

Moderate Funded at 100% Funded at Funded at 80% Funded at 75% Funded at

70% (10-25%) 85%

Severe (25- Funded at 100% Funded at Funded at 60% Funded at 50% Funded at 45% 40%) 70%

Critical (over Funded at 100% Funded at Funded at 40% Funded at 30% Funded at 25% 40%) (minimum viable 50% (single (one corridor only) correspondent only) only)

11 Annex ST: Annual Macro Stress Tests

Activation and Adjustment Protocol

The project-priority rulebook activates automatically when the Economic Cooperation Sub-Committee certifies that projected quarterly capital availability falls below 90% of planned disbursement. The certification requires: a written shortfall analysis; confirmation that the shortfall exceeds the fund's operating reserve (10%); and a 14-day forecast showing continued underperformance. Upon activation, the fund administrator publishes a Priority Ranking List within 7 days. All projects in the fund's pipeline are ranked by Priority Score. Projects below the funding cutoff line are placed in 'Deferred Status' with a 90-day hold. Deferred projects are not cancelled; they are sequenced for later funding if capital conditions improve. Contributors may issue supplemental pledges specifically to lift deferred projects back into active status.

The Priority Ranking List is updated monthly during capital shortfall periods. Projects may move up or down based on changing conditions (e.g., a desalination project may rise in priority if a drought emergency is declared; a corridor project may fall if security conditions deteriorate). The administrator may not unilaterally alter the scoring weights; weight changes require governance body consensus.

Humanitarian Floor Protection

Regardless of capital shortfall severity, humanitarian projects carry a non-negotiable funding floor. The floor is defined as: food distribution to all registered beneficiaries (100% coverage); medical supply delivery to all accredited health facilities (100% coverage); and emergency shelter for populations displaced within the preceding 90 days (100% coverage). These three items are classified as Tier H1 (life-sustaining) and are protected from any priority ranking reduction. All other humanitarian expenditures (school reconstruction, livelihood programs, community infrastructure) are classified as Tier H2 and are subject to normal priority scoring. The humanitarian floor is funded first from available capital, before any other category receives disbursement. If the humanitarian floor exceeds available capital, the framework's emergency humanitarian corridor protocols activate independently, funded through UN OCHA emergency appeals that are not counted against RCSA capital allocations.

Annex ST: Annual Macro Stress Tests

This annex institutes annual IMF/World Bank-style macroeconomic stress tests for oil-price shocks, sanctions snapback, shipping disruption, and leadership transition scenarios, ensuring that the RCSA economic model is tested against adverse cases rather than base-case compliance assumptions alone.

12 Annex ST: Annual Macro Stress Tests

Stress-Test Framework

The RCSA economic model is tested annually against four standardized adverse scenarios: Oil-Price Shock, Sanctions Snapback, Shipping Disruption, and Leadership Transition. Tests are conducted by the Economic Cooperation Sub-Committee with independent macroeconomic modeling support from the

IMF and World Bank. Results are published in an annual Stress-Test Report that informs governance body budget planning, contingency reserve sizing, and risk disclosure to private investors. Each stress test applies a standardized shock magnitude, measures the impact on framework capital availability, project viability, and contributor capacity, and identifies the first-response mechanisms that would activate. The tests are not predictions; they are structural stress exercises designed to reveal vulnerabilities before they become crises.

Table FR-8: Table FR-8: Standardized Stress-Test Scenarios and Shock Magnitudes

Scenario	Shock Definition	Duration	Affected Contributors	Affected Funds
Oil-Price	Brent crude falls to \$40/bbl or rises to \$150/bbl	12 months	Gulf state contributors	All Gulf-funded facilities, RDF callable capital
Sanctions	US or EU reimposes secondary sanctions on Iran (market access), US Banking channels, escrow Snapback (political stability), EU shield, trade corridors	6 months	Iran (compliance cost)	
Shipping	Closure of Hormuz or Bab-el-Mandeb	3-6 months	All littoral states, all IHTA revenue, trade	
Disruption	for >30 months		maritime trade-dependent corridors, humanitarian days contributors	maritime routes
Leadership	Core party government with Transition collapse or transitioning party as incapacity payer or signatory	6-12 months	Transitioning party + all	All funds dependent tranches

Oil-Price Shock Scenario

In the oil-price shock scenario, the modeling assumes a simultaneous demand reduction in key Asian markets and a supply disruption in a non-framework

producer state. The shock is applied as a 12-month price band (\$40/bbl low, \$150/bbl high) with quarterly step functions. The model calculates: Gulf state fiscal breakeven prices versus projected revenue; sovereign wealth fund drawdown capacity; and RDF callable capital subscription capacity. If the stress test reveals that Gulf state contributors would face fiscal deficits exceeding 8% of GDP under the low-price scenario, the framework activates the Oil-Price Contingency Protocol: (a) RDF capital calls are

13 Annex ST: Annual Macro Stress Tests

deferred by 90 days; (b) Gulf-funded bilateral trust accounts shift from fixed contributions to revenue-linked percentages; (c) the IMF standby credit line is pre-alerted for accelerated drawdown; and (d) non-essential infrastructure projects are placed in deferred status.

Under the high-price scenario (\$150/bbl), the stress test focuses on inflationary pressure, currency appreciation in exporter states, and demand destruction in importing framework participants (Lebanon, Jordan, Egypt). If inflation in importing states is projected to exceed 15% annually, the framework activates the Importing State Inflation Shield: accelerated World Bank guarantee processing, IMF emergency food import financing, and temporary suspension of toll-rate indexation.

Sanctions Snapback Scenario

The sanctions snapback scenario models a hypothetical reimposition of US or EU secondary sanctions on Iran mid-framework. The shock is not a prediction of political behavior; it is a structural test of the framework's commercial continuity protections. The model assumes: immediate freezing of all US/EU-correspondent banking channels; suspension of SWIFT reconnection; and re-designation of Iranian entities previously delisted.

The stress test evaluates three protective layers: (1) Retroactive Protection Clause: contracts executed under framework authorization remain protected for 24 months; (2) Swiss Clearing Hub: multilateral payment processing continues because the hub operates under Swiss regulatory supervision, not US/EU correspondent banking; (3) Escrow Shield: pre-funded humanitarian escrow is not subject to sanctions reimposition because it was established before the snapback and serves humanitarian end-use.

If the stress test reveals that more than 50% of Phase 1-2 banking channel capacity would be lost in a snapback, the framework recommends pre-emptive expansion of the Swiss Clearing Hub to process an additional 30% of anticipated trade volume as a resilience buffer. The hub's additional capacity is classified as Conditional capital, activated only if snapback occurs.

Shipping Disruption and Leadership Transition Scenarios

The shipping disruption scenario models a 30-day closure of the Strait of Hormuz or Bab-el-Mandeb due to military incident, piracy surge, or infrastructure failure. The stress test calculates: IHTA revenue loss (toll suspension); alternative route costs (Cape of Good Hope, trans-African rail); humanitarian maritime delivery delays; and regional inventory depletion rates for fuel, food, and medicine.

If the test shows that critical inventory (30-day fuel supply, 15-day food supply, 7-day medical supply) would be exhausted before alternative routes restore flow, the framework recommends: pre-positioning of 60-day humanitarian stockpiles in Oman, Jordan, and Egypt; diversification of maritime delivery contracts to include air-freight contingencies; and automatic IHTA toll holiday for humanitarian-flagged vessels during disruption periods.

14 Annex ST: Annual Macro Stress Tests

The leadership transition scenario models a 6-month government incapacity in either core party (US or Iran). The test evaluates: continuity team activation; minimum implementation team presence; institutional binding durability; and third-party guarantor escalation capacity. If the test reveals that institutional binding would fail because designated continuity institutions are themselves incapacitated, the framework recommends strengthening secondary continuity designations and expanding the minimum implementation team from three to five officers per party.

Stress-Test Governance and Publication

Stress tests are conducted annually in Q4, with preliminary results presented to the governance body in January. The full Stress-Test Report is published in March. The report has three tiers: Public Executive Summary (scenario headlines, key findings, recommended actions); Party Confidential Annex (contributor- specific vulnerabilities, reserve adequacy, fallback capacity); and Auditor Pool Technical Appendix (modeling assumptions, data sources, sensitivity analysis).

Any party may request an extraordinary stress test outside the annual cycle if it provides evidence of a material change in external conditions (commodity market discontinuity, geopolitical shock, or financial market contagion). Extraordinary tests are conducted within 45 days of request and follow the same methodology as annual tests. Results are published on an accelerated timeline.

15 Regional Stabilization and Integration

The framework embeds a broader regional vision that extends beyond bilateral nuclear and economic matters. Regional modules activate as core bilateral compliance demonstrates viability.

Normalization Architecture

Normalization is treated as a structural element progressing from Day 1, not as a downstream result. For key actors, especially Saudi Arabia and the Gulf states, normalized relations represent the strategic dividend that makes comprehensive cooperation worthwhile. Phase 0 Normalization Signals Existing Abraham Accord ties (UAE, Bahrain, Morocco) are consolidated and expanded within Phase 0

Saudi overflight rights for civilian aircraft formally acknowledged

Economic chamber-of-commerce observer status authorized

Joint technical working groups on regional water and energy security convened

Phase 1 Normalization Acceleration

Trade representation offices through third-country hosts

Tourism corridor for specific traveler categories

Academic exchange through university facilitation

The framework does not require Palestinian statehood as a condition for Saudi-Israel normalization. It does require Saudi Arabia to publicly confirm its commitment to Palestinian humanitarian and development interests.

Burden-Sharing Architecture

The United States role is facilitator, guarantor, and dealmaker — not primary financier or long-term administrator: Gulf States: Fund Gaza reconstruction and Lebanon stabilization through dedicated funds, receiving proportionate governance and oversight roles European Union: Funds reconstruction in Syria, Lebanon, and Gaza through development mechanisms; provides civilian expertise United States: Provides security guarantees, diplomatic capital,

intelligence support, and targeted financial facilitation United Nations:
Manages humanitarian operations and monitoring architecture

Proxy Activity Management

The framework addresses proxy activity through a graduated architecture that distinguishes between levels of involvement and response: Regional Stabilization and Integration

Three-Tier De-escalation Zone Architecture

The framework establishes pre-authorized response bands that activate automatically upon confirmed incidents, providing credible deterrence without requiring case-by-case political authorization: Table 17 Pre-Authorized Response Bands

Tier Trigger Immediate Response Follow-On

Tier 1: Zone Banned weapons 14-day naval patrol surge in Governance body consultative Violation introduced to de- affected maritime zone; enhanced session within 72 hours escalation zone radar and tracking Tier 2: Two or more confirmed Suspension of next scheduled Formal compliance review; Patterned attacks in 30 days in benefit tranche for 30 days; remediation plan required within Attack same theater enhanced monitoring activation 14 days Tier 3: Major 50+ casualties or critical 21-day crisis lock; attribution Ministerial-level review; binding Incident infrastructure attack process; pre-authorized arbitration option; potential proportionate package benefit domain suspension Operational Hardening (Edit 12): Under Tier 3 (Major Incident), the response includes a "21-day crisis lock" and "pre-authorized proportionate package." Notwithstanding the crisis lock, the targeted state's inherent right to self-defense under Article 51 of the UN Charter supersedes the 21-day crisis lock if an attack is ongoing and kinetic interception is required to save lives. In

such circumstances, the state shall notify the governance body and guarantors within 2 hours of initiating kinetic interception, and the crisis lock shall be suspended in the affected theater for the duration of the active kinetic engagement.

Pre-Authorized Proportionate Packages

At framework entry, each party pre-commits to specific response measures that will activate upon confirmed Tier 3 attribution without requiring new political authorization. These measures are: United States: Pre-authorized suspension of next banking channel expansion; pre-authorized delay of next asset release tranche; pre-authorized enhanced naval presence (rotational, not new deployment) Iran: Pre-authorized suspension of next sanctions relief category; pre-authorized delay of next IAEA access expansion; pre-authorized reduction in transit toll rate The key feature of pre-authorization is that these measures activate as a default consequence of Tier 3 attribution unless the governance body affirmatively votes to override. This creates a "presumption of response" rather than a "presumption of deliberation," ensuring that major incidents produce tangible consequences rather than indefinite process. "Attributed-but-Uncontrolled" Doctrine The framework recognizes that state control over semi-autonomous actors is rarely absolute. The "Attributed-but-Uncontrolled" doctrine establishes that a state remains responsible for proxy activity patterns even where direct command proof is unavailable. Responsibility attaches when: The proxy operates within territory or sphere of influence where the state exercises significant influence The proxy receives material,

2 Regional Stabilization and Integration

financial, or logistical support through channels linked to state institutions The state has capacity to constrain the proxy's activity but does not exercise that

capacity A pattern of proxy activity has been established over multiple incidents, demonstrating organizational consistency Under this doctrine, the evidentiary standard for framework consequences is "pattern-based attribution" rather than "command-and-control proof." A single incident does not trigger attribution. Three or more incidents within a 90-day period, demonstrating consistent methodology, target selection, or operational signature, may be designated a proxy pattern. The state is then responsible for using its influence to reduce the pattern, not for guaranteeing zero incidents.

Proxy Activity Cap System

Numeric thresholds are established for proxy activity in each framework-affected theater. These caps are not disarmament requirements; they are stabilization benchmarks that, when exceeded, trigger defined framework responses:

Metric	30-Day Threshold	90-Day Threshold
Lebanon-Israel Cross-border incidents (rockets, infiltrations, 2 incidents	5 incidents	Border IEDs)
Iraq (U.S. forces) Attacks on military bases or convoys	1 incident	3 incidents
Red Sea Maritime Vessel harassment or interdiction events	2 events	5 events
Gulf Maritime Naval harassment or drone overflight	3 events	7 events
Yemen (Saudi/UAE) Cross-border missile/drone launches	2 launches	5 launches
Syria (Israel) Weapons transfer convoys or depot activity	1 confirmed	3 confirmed

transfer transfers Threshold breaches do not automatically trigger enforcement. They activate enhanced monitoring, require an explanatory briefing within 14 days, and contribute to the Compliance Indicators Score. Persistent threshold breaches (three consecutive 30-day periods above cap) activate the graduated enforcement ladder.

Mandatory Proxy Deconfliction Channels

The framework establishes direct or mediated communication lines with

major non-state actors in each theater. These channels are not political recognition; they are operational safety mechanisms: Lebanon: UNIFIL-facilitated liaison between Israeli military liaison and relevant non-state actor representatives, with UNIFIL serving as message relay Iraq: Iraqi government-hosted coordination cell connecting U.S. military liaison, Iraqi security forces, and sub-state actor intermediaries for base proximity management Yemen: UN-led humanitarian coordination channel connecting Houthi representatives, Saudi/UAE military liaisons, and international maritime monitors for port and shipping deconfliction Syria: Russian-facilitated technical channel for airspace deconfliction, with notification protocols for military movements in proximity to framework-monitored zones Channel operation is confidential. Channel existence is acknowledged publicly only as "operational safety mechanisms administered by the relevant international or host-nation authority." Messages transmitted through channels are not framework commitments and do not create obligations beyond operational safety. Proxy Freeze Pilot Zones (Phase 0-1) Rather than demanding comprehensive proxy cessation across all theaters simultaneously, the framework begins with 1-2 pilot zones where proxy activity is explicitly frozen as a confidence-building measure:

3 Regional Stabilization and Integration

Pilot Zone 1: Southern Lebanon Geographic scope: Area south of the Litani River Freeze commitment: No offensive weapons introduction; no cross-border operations; no rocket launches Verification: UNIFIL + satellite monitoring + Lebanese Armed Forces patrol coordination Duration: 90 days, renewable by mutual consent Benefit linkage: Freeze renewal unlocks Lebanese economic emergency support tranche Pilot Zone 2: Iraq Base Perimeter Geographic scope: 50-kilometer radius around designated U.S. and coalition bases Freeze commitment: No indirect fire attacks; no IED placement;

no drone overflight Verification: Iraqi security forces patrol + U.S. base radar + commercial satellite Duration: 90 days, renewable Benefit linkage: Freeze compliance contributes to Iraq reconstruction fund disbursement Pilot zones are not permanent solutions. They are testing grounds. If a pilot zone demonstrates 90 days of sustained compliance, it expands geographically. If compliance deteriorates, it contracts or is suspended without collapsing the broader framework.

Automatic Escalation Trigger for Mass-Casualty Events

To remove political hesitation under pressure, the framework establishes automatic triggers that bypass deliberation when mass-casualty events occur:

Table 21 Mass-Casualty Automatic Triggers

Severity Trigger Automatic Response Political Override

Level Level 1: 10-24 fatalities in Crisis Lock activation (14 days); emergency Either party may request Significant single incident governance body session within 48 hours; accelerated review; no veto enhanced monitoring in affected theater on Lock activation Level 2: 25-49 fatalities or Crisis Lock (21 days); suspension of next Governance body may Major critical benefit tranche in affected domain; fact- override tranche suspension infrastructure finding team within 72 hours; public by weighted majority within destruction attribution process initiated 7 days Level 3: 50+ fatalities or Crisis Lock (30 days); domain-specific No override on Lock; benefit Catastrophic mass-casualty benefit freeze; full governance body freeze may be lifted only by attack on civilian ministerial session within 72 hours; pre- unanimous governance body target authorized proportionate package activation; vote after certified

UN Security Council notification by both remediation plan

parties Automatic triggers are not punishment mechanisms. They are circuit

breakers designed to prevent the political paralysis that has historically allowed mass-casualty events to escalate into wider conflicts. The triggers create immediate consequences that both parties can defend domestically: "The framework required this response; we did not choose it unilaterally."

4 Regional Stabilization and Integration

Shock Response Envelope

The Shock Response Envelope is a pre-cleared, rapid-activation protocol designed to produce a framework- mandated response within 24 hours of a mass-casualty proxy event. It exists because domestic political pressure in democratic systems does not wait for attribution panels, governance body sessions, or dispute exhaustion. The envelope provides a framework-authorized response that both parties can defend to their publics as automatic and non-discretionary.

Table 26 Shock Response Envelope Activation

Trigger Event Confirmation Required Response

Window Mass-casualty attack (25+ fatalities) Preliminary attribution by the Proxy Event Response 24 hours attributed to a proxy force Team (2 Iranian + 2 U.S. + 1 neutral) Attack on diplomatic or humanitarian Confirmed by ICRC or UN OCHA 12 hours personnel Use of chemical or biological agents Confirmed by OPCW or WHO field team 6 hours Attack on declared IAEA-monitored Confirmed by IAEA incident report 4 hours nuclear facility

Pre-Cleared Response Menu

Upon envelope activation, the following measures activate automatically. The governing party (the state responsible for constraining the proxy) must select at least one measure from Column A within 24 hours. Failure to select triggers the automatic default from Column B. Table 27 Shock Response Menu Column

A: Governing Party Actions (voluntary, Column B: Automatic Default (if Column A not selected) within 24h) Public condemnation of the proxy act by senior state Suspension of next scheduled benefit tranche in affected official domain (30 days) Arrest or detention of identified proxy operatives Enhanced monitoring activation in all proxy-affected theaters (90 days) Cutoff of known financial/logistical channels to the Freezing of next asset release tranche proxy Cooperative investigation with framework Diplomatic demarche to all framework guarantors investigative team Commitment to remediation plan with 14-day Compliance indicator score adjustment (+2.0 points) deadline Acceptance of enhanced monitoring in the affected Public governance body statement noting non-cooperation theater

5 Regional Stabilization and Integration

Key Design Principles

Speed over precision: The envelope activates on preliminary attribution, not final proof. Final attribution continues through standard channels. If preliminary attribution is later reversed, Column B measures are lifted retroactively with compensation. Framework ownership: Responses are framework-authorized, not unilateral. This means: "The framework required this response" rather than "We chose to punish." Proportionality ceiling: No Shock Response measure may include military strikes, territorial sanctions, or population-level economic measures. The envelope is calibrated to be politically visible but operationally restrained. Reversibility: All Column B defaults are temporary (30 days maximum) and reversible upon remediation. They are designed to create pressure, not permanent damage. Escalation brake: Either party may request a 48-hour cooling-off period before Column B defaults activate. During the cooling-off, the guarantors attempt mediation. Only one cooling-off may be invoked per event.

Domestic Political Function

The Shock Response Envelope exists primarily to manage domestic political pressure. When a mass-casualty event occurs, publics demand response. Without a pre-cleared framework mechanism, leaders face a binary choice: unilateral retaliation (risking framework collapse) or no response (risking domestic political damage). The envelope creates a third option: framework-authorized, rapid, proportionate, reversible. This is the mechanism that makes the framework survivable under political shock.

Counterterrorism Integration

A dedicated counterterrorism compliance indicator is added to the scoring system, tracking cooperation on active extremist network intelligence, non-provision of safe passage to designated organizations, and participation in counterterrorism working groups. Active intelligence sharing is an unlockable Phase 1 benefit, creating positive incentive for cooperation rather than only compliance pressure.

Maritime Security Framework

Hormuz and Maritime Security — Post-Conflict Update (May 2026)

The following update addresses the dual-blockade reality: Iran's closure of Hormuz to hostile-flagged shipping since February 2026, and the US naval blockade of Iranian ports imposed April 13, 2026.

6 Regional Stabilization and Integration

Dual-Blockade Resolution Architecture

The IHTA cannot activate in toll-collection mode while either blockade persists. The framework establishes a three-step resolution:

Table WPC-M1: Dual-Blockade Resolution Steps

Step Iran Action US Action Verification Timeline

1. Permit all humanitarian- Permit humanitarian UN OCHA + Immediate Humanitarian flagged vessels (UN, Red vessels to dock at Iranian guarantor naval upon Opening Crescent, WHO, WFP) ports without inspection observers ceasefire through Hormuz delay unconditionally
2. Commercial Reopen Hormuz to all Lift port blockade on Lloyd's List + IHTA 14 days after Reciprocity commercial shipping; remove Iranian commercial monitoring mode + Step 1 tolls during Phase -1 shipping; maintain port authority logs sanctions on military/dual-use
3. IHTA Assume founding stakeholder Support IHTA neutral IHTA Board 30 days after Activation position in IHTA; receive toll international inaugural session + Step 2 revenue share management; provide governance body technical assistance certification

Iranian Toll Revenue as Strategic Offset

Iran's demand for Hormuz governance control is addressed through the IHTA revenue-sharing mechanism. Iran receives 40% of IHTA toll revenue (littoral state share), deposited into a monitored escrow for civilian reconstruction. This provides Iran with a sovereign revenue stream from the strait without requiring unilateral Iranian control, satisfying Tehran's public-positioning needs while creating international oversight. The revenue share is classified as Conditional capital under the Financing Reality Annex. Disbursement requires quarterly IAEA certification that nuclear baseline milestones are on track. If nuclear compliance deteriorates, toll revenue is held in escrow (not confiscated) until compliance is restored.

US Blockade Lift Conditions

The US port blockade is treated as a wartime emergency measure, not a

sanctions architecture element. Lift conditions are: (a) Hormuz reopened to commercial shipping for 14 consecutive days; (b) IAEA inspectors regained access to declared nuclear sites; (c) no confirmed Iranian attacks on commercial shipping for 30 days; and (d) framework governance body convened. These conditions are identical to Steps 1-3 of the Wartime Entry Protocol, ensuring synchronization.

7 Regional Stabilization and Integration

Post-lift, standard US Treasury sanctions enforcement resumes through the framework's pre-cleared transaction corridors. The blockade is not replaced by sanctions relief; it is replaced by the framework's graduated, conditional banking channel architecture. This allows the US to maintain that sanctions enforcement continues while Iran gains tangible economic access.

Strait of Hormuz Governance

The framework establishes an International Hormuz Transit Authority with a three-tier tolling system. Toll revenue supports Iranian civilian reconstruction fund. Toll rates phase down as nuclear compliance milestones are reached. The Authority operates under neutral international management with representation from all littoral states. Operational Hardening (Edit 9): IHTA Jurisdiction Definition. The International Hormuz Transit Authority's jurisdiction is precisely defined as the maritime area bounded by: (a) the outer limit of the Iranian territorial sea (12 nautical miles from the baselines of the Iranian mainland and islands) on the northern and eastern boundaries; (b) the outer limit of the Omani territorial sea on the southern boundary; and (c) a line connecting Ras al-Hadd (Oman) to the Iranian coast at 25 degrees 40 minutes N, 57 degrees 20 minutes E on the eastern boundary. Within this defined international waters corridor, the IHTA exercises tolling authority. The IHTA has no tolling authority within the 12-nautical-mile territorial waters of

any littoral state. Vessels transiting exclusively through territorial waters without entering the defined IHTA corridor are not subject to IHTA tolls, provided they do not transit the strait itself.

Maritime De-escalation Protocols

Maritime incident hotline: 2-hour response window
Defined vessel harassment parameters: approach within 100 meters at speed; illumination; simulated attack maneuvers
No-seizure zone in international waters: commercial vessels may not be seized without governance body notification and attribution process

Agreed transit lane separation scheme

Operational Hardening (Edit 10): Toll Evasion Penalties. If a commercial vessel refuses to pay the IHTA toll after being duly notified and invoiced through the Authority's electronic tolling system, the following enforcement mechanism applies: (a) the vessel's registry state and flag state are notified within 48 hours; (b) the vessel is denied port access in all framework-compliant states until the toll and any accrued administrative fees are paid; (c) the IHTA may register an international maritime lien against the vessel with the International Maritime Organization (IMO) registry, which must be satisfied before the vessel may clear any port in a framework participant state; (d) kinetic interception for toll enforcement is explicitly prohibited; enforcement is exclusively through port-access denial and maritime liens. The lien accrues interest at 0.5 percent per month until satisfied.

8 Regional Stabilization and Integration

Red Sea Maritime Security

If Houthi de-escalation is achieved, an International Maritime Convoy System provides escort of commercial vessels through the Red Sea. A Bab-el-Mandeb

inspection regime involves random inspection of vessels for weapons smuggling, conducted by a Djibouti-hosted multinational team with inspectors from all major parties. Operational Hardening (Edit 11): Red Sea Security Linkage — Punitive Counterbalance. The existing incentive structure (25% toll reduction for 60 days of Hudaydah port compliance) is supplemented by a punitive counterbalance: any confirmed Houthi anti-ship missile launch against commercial or military vessels in the Red Sea, Bab-el-Mandeb, or Gulf of Aden automatically applies a 50 percent "Risk Premium" surcharge to the IHTA toll for all Yemen-linked shipping for 30 days. This surcharge is calculated on the full standard toll rate (before any reductions) and is non-waivable except by unanimous governance body vote. The Risk Premium creates immediate regional economic pressure against anti-ship attacks by imposing a direct cost on Yemen-linked maritime commerce. Revenue from the Risk Premium is directed to the Yemen Reconstruction Fund (not to the Iranian civilian reconstruction fund) to ensure the surcharge functions as a stabilizing penalty rather than a revenue generator for any conflict party.

Mediterranean Maritime Protocol

The Mediterranean Sea represents a secondary maritime domain of concern. While Iran maintains limited naval presence in the Mediterranean with occasional vessel transits through the Suez Canal, no special protocol is required beyond standard UNCLOS provisions. Should Israel-Iran managed competition advance to Phase 2 or beyond, additional protocols addressing naval presence near coastal areas may be developed by mutual agreement and governance body consensus.

Non-State Actor Transformation

The framework provides structured pathways for non-state armed actors to transition from paramilitary status to political or civilian integration, reducing

the proxy activity that drives regional instability.

Integration Pathway Principles

Voluntary participation with verified compliance milestones

Economic incentives tied to concrete behavioral changes, not political statements

9 International monitoring of integration process to prevent re-militarization

Graduated legal status changes reflecting demonstrated compliance

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA) Verification
& Technical Architecture Modules HARDENED REGIONAL PARTNER
PROTOCOLS — ADDENDUM A

Version 1.5-H1 (Hardening Update 1)

Operative Clause: This addendum extends the RCSA Verification & Technical Architecture Modules with four regional partner-specific hardening protocols.

Each protocol addresses a identified single-point-of-failure vulnerability in framework implementation: legislative-budget gridlock (Iraq), leadership transition discontinuity (Saudi Arabia), inter-emirate commercial-security

Comprehensive Domestic Veto Mapping Methodology

P>Annex DV provides detailed domestic political mapping for all participating states, identifying the institutional and political actors whose support or opposition can determine whether architecture commitments are implemented, sustained, or reversed. This mapping goes beyond formal institutional analysis to include informal power centers, public opinion dynamics, and interest group configurations that shape implementation politics. The veto map enables implementation planners to anticipate domestic

political challenges and design strategies that build winning coalitions for architecture implementation.

P>The mapping methodology employs a multi-dimensional analytical framework that assesses veto players across several dimensions: formal institutional authority, partisan alignment, organizational capacity, policy salience, and coalition potential. This multi-dimensional approach captures the complexity of domestic politics in ways that single-dimensional analysis cannot. A parliamentary opposition party may lack formal institutional authority but possess substantial organizational capacity and policy salience that makes its opposition politically consequential even if not legally dispositive.

P>Mapping data is collected through a combination of expert interviews, documentary analysis, public opinion surveys, and direct observation of political processes. Data sources include academic political analyses, media reporting, official government documents, and interviews with political insiders who possess detailed knowledge of domestic political configurations. The resulting maps represent living documents that are updated as political circumstances evolve.

Institutional Veto Players Across Participating States

P>Institutional veto players vary significantly across participating states depending on constitutional structures. In presidential systems, the executive and legislature may both possess veto authority over different aspects of implementation. In parliamentary systems, the government typically controls implementation but may face internal party constraints or coalition partner vetoes. Federal systems introduce additional veto players at sub-national levels who may possess authority over implementation matters within their jurisdictions.

P>The mapping identifies specific institutional positions that possess veto authority including heads of state, heads of government, foreign ministers, defense ministers, parliamentary committees, constitutional courts, and in some cases sub-national governments. For each position, the mapping specifies the formal authority, current incumbent, incumbent's policy orientation, and relationship to other veto players. This granular identification enables targeted engagement with specific institutional actors.

P>Temporal dynamics are incorporated through analysis of electoral cycles, term limits, and scheduled leadership transitions that may change the veto player landscape. Implementation strategies must account for upcoming elections that could produce new governments with different policy orientations, leadership transitions that could change individual veto players while maintaining institutional structures, and mid-term political developments that could alter coalition configurations.

Interest Group and Public Opinion Analysis

P>Beyond institutional actors, the veto mapping includes analysis of interest groups and public opinion dynamics that influence implementation politics. Business associations, labor unions, religious organizations, ethnic communities, and civil society groups may lack formal veto authority but can generate political pressure that influences how institutional veto players exercise their authority. The mapping identifies key interest groups, their policy positions, their organizational capacity for political action, and their relationships with institutional veto players.

P>Public opinion analysis examines how architecture-related issues resonate with general publics in participating states. Issues with high public salience generate political pressure that constrains institutional veto players' discretion, while issues with low salience permit greater flexibility. Public

opinion mapping tracks issue salience, directional preferences, intensity of sentiment, and the demographic and geographic distribution of opinion patterns.

P>Media landscape analysis examines how architecture-related issues are covered in national media and how media framing affects public understanding and political pressure. Media outlets vary in their editorial orientations, audience reach, and influence over elite opinion. The mapping identifies key media outlets, their typical framing of architecture issues, and their relationships with political actors.

Coalition Building Strategies

P>The veto mapping informs coalition building strategies that assemble sufficient support to overcome opposition from actors who would otherwise block implementation. These strategies identify potential coalition partners, the concessions or side payments required to secure their support, and the sequencing of coalition building activities that maximizes the probability of successful implementation.

P>Coalition strategies employ a portfolio approach that addresses multiple veto players through tailored engagement. Business interests may be mobilized through economic benefit demonstrations. Security establishments may be engaged through threat assessments and operational briefings. Legislative leaders may be cultivated through regular consultation and information sharing. Civil society may be incorporated through participatory mechanisms that give their constituents voice in implementation processes.

P>The strategies also address spoiler management for actors who cannot be coopted but must be neutralized or overcome. Neutralization involves reducing spoiler capacity for effective opposition through measures that

diminish their credibility, fragment their coalitions, or raise the costs of opposition. Overcoming involves mobilizing countervailing support that outweighs spoiler influence in the political calculus of institutional veto players.

Veto Player Time Dynamics and Transition Scenarios

P>The veto player matrices incorporate temporal dynamics that affect how domestic political configurations change over time. Understanding these temporal dynamics is essential for anticipating when implementation windows may open or close and for designing strategies that can survive political transitions.

P>Electoral cycle analysis identifies upcoming elections in each participating state and assesses how electoral outcomes might change the veto player landscape. Analysis considers polling data, electoral system effects, party competition dynamics, and potential coalition configurations. Electoral timing affects when implementation actions should be accelerated or delayed based on anticipated political changes.

P>Leadership transition analysis identifies scheduled transitions including term-limited departures, party congresses, and planned retirements. Analysis also considers potential unscheduled transitions including health crises, scandals, and political upheavals. Transition timing creates windows of vulnerability during which implementation may be paused or reversed.

P>Legislative calendar analysis identifies the rhythm of legislative activity that affects when implementing legislation can be passed. Analysis considers session schedules, recess periods, election recesses, and the legislative agenda. Legislative timing determines when ratification bills, implementing legislation, and budget appropriations can be advanced.

Interest Group Mapping and Coalition Dynamics

P>Beyond institutional actors, the veto mapping examines interest groups that influence implementation politics. Interest group mapping identifies the organizations, associations, and informal networks that have stakes in architecture outcomes and assesses their capacity to affect political decisions.

P>Business interest mapping identifies companies and industry associations with stakes in sanctions relief, market access, trade expansion, and investment protection. Mapping considers sectoral distribution, geographic concentration, political connections, and organizational capacity. Business interests generally favor implementation but may have specific concerns about competition or regulatory requirements.

P>Labor interest mapping identifies trade unions and worker organizations with stakes in employment effects of architecture implementation. Mapping considers sectors likely to gain or lose employment, union organizational strength, and political alignment. Labor interests may support implementation if it generates employment or oppose it if it threatens domestic jobs.

P>Religious and ethnic community mapping identifies communities whose identities and interests may be affected by regional engagement. Mapping considers community size, organizational capacity, political connections, and historical relationships with regional states. Community interests may be complex, reflecting both potential benefits from cooperation and concerns about engagement with specific states.

Public Opinion Dynamics and Polling Analysis

P>Public opinion dynamics affect implementation sustainability by shaping the political incentives facing elected officials. The veto mapping includes polling analysis that tracks how public attitudes toward the architecture

evolve over time and across demographic groups.

P>Polling trend analysis identifies direction, magnitude, and drivers of opinion change. Analysis distinguishes between durable attitude shifts and temporary fluctuations driven by specific events. Trend analysis informs timing of implementation actions and messaging strategies.

P>Demographic opinion analysis identifies how attitudes vary across age, education, income, geography, and other characteristics. Analysis enables targeted messaging that addresses specific group concerns. Demographic patterns may reveal generational differences that predict future opinion trajectories.

P>Issue salience analysis identifies how prominently architecture-related issues feature in public attention. Analysis distinguishes between high-salience periods when public attention constrains official discretion and low-salience periods when officials have greater flexibility. Salience patterns inform when to advance controversial actions and when to maintain low profiles.

H2>Domestic Coalition Mapping and Alignment Analysis

The veto player mapping examines how different domestic actors align on architecture issues, identifying the coalitions that support or oppose implementation. Coalition analysis reveals whether implementation can achieve majority support and what compromises might broaden supportive coalitions.

P>Support coalitions include actors who favor implementation based on shared interests, values, or strategic calculations. Coalition mapping identifies the core supporters whose commitment is reliable, the conditional supporters whose commitment depends on specific concessions, and the potential supporters who might be won over through engagement.

P>Opposition coalitions include actors who oppose implementation based on interests, values, or strategic calculations. Opposition mapping identifies the hard opponents whose opposition is irreconcilable, the conditional opponents whose opposition might be modified, and the latent opponents who have not yet mobilized but might do so under certain conditions.

P>Alignment analysis examines how coalitions might shift under different scenarios including political transitions, external shocks, and implementation experiences. Scenario analysis identifies conditions under which supportive coalitions might strengthen or weaken, enabling proactive strategy adjustment.

Legislative Procedures and Ratification Strategy

Domestic ratification of architecture commitments requires navigation of legislative procedures that vary across participating states. Ratification strategy identifies optimal timing, procedural pathways, and coalition-building approaches for achieving legislative approval.

P>Legislative calendar analysis identifies favorable and unfavorable periods for advancing ratification legislation. Analysis considers session schedules, competing legislative priorities, electoral timing, and seasonal patterns. Optimal timing positions ratification when legislative attention and capacity are available.

P>Committee jurisdiction analysis identifies the legislative committees with authority over ratification legislation. Committee chairs, memberships, and procedures affect how legislation moves through the legislative process. Committee strategy engages committee members who can advance or obstruct legislation.

P>Floor strategy plans for the parliamentary proceedings that consider

ratification legislation. Floor strategy includes speech preparation, amendment management, timing, and vote counting. Floor managers coordinate supportive legislators and respond to opposition arguments.

P>Ratification coalition building assembles the legislative majority required for ratification. Building includes direct lobbying, constituent mobilization, media engagement, and leadership cultivation. Coalition building identifies the marginal legislators whose support is decisive and addresses their specific concerns.

H2>Judicial Review and Constitutional Challenges

P>Architecture commitments may be subject to judicial review or constitutional challenge in domestic courts. Veto player mapping examines the judiciary's potential role in approving, modifying, or invalidating architecture commitments.

P>Judicial philosophy mapping identifies how courts approach international law questions including treaty interpretation, treaty incorporation, and treaty hierarchy relative to domestic law. Philosophical orientations affect how courts are likely to rule on architecture-related cases.

P>Standing rules determine who can bring challenges to architecture commitments. Broad standing rules permit challenges by diverse parties including opposition politicians, civil society organizations, and affected individuals. Narrow standing rules limit challenges to parties directly affected.

P>Remedy analysis identifies what courts can do if they find architecture commitments unconstitutional or unlawful. Remedies include invalidation of commitments, modification of implementing measures, and declaratory judgments. Remedy scope affects the practical impact of adverse judicial decisions.

P>Pre-emptive legal strategy addresses potential judicial challenges through careful legal drafting, constitutional review during negotiation, and implementing legislation designed to withstand judicial scrutiny. Pre-emptive strategy reduces the probability of adverse rulings.

ANNEX LC

divergence (UAE), and demographic narrative weaponization (Jordan). These provisions are operative from Phase 0 entry where the partner state is a framework participant, and are classified Tier 1 (must survive in any

SECTION RP-IRQ: IRAQI FEDERAL BUDGET SYNCHRONIZATION

Placement: Legislative Calendar Integration — appended to Iraq Stabilization and Militia Integration Module.

1. VULNERABILITY ANALYSIS

The Popular Mobilization Forces (PMF) integration pathway depends on salary 10 normalization — shifting militia funding from informal channels (political party budgets, foreign transfers, extortion) to formal state payroll systems. However, the Iraqi federal budget appropriation process is chronically delayed, with parliamentary approval frequently extending 3-6 months past the statutory October 1 fiscal year deadline. Unpaid PMF units during budget gridlock face immediate incentive to resume proxy attacks, extortion of businesses, or realignment with non-state funders, collapsing the security track irrespective of political will.

1. INTEGRATION FUNDING LOCK

2.1 Pre-Allocation Mechanism

Before Phase 1 activation, the Iraqi Ministry of Finance shall establish a ring-fenced account designated "PMF Transition Stabilization Facility" with the following operative characteristics:

Account held at Central Bank of Iraq (CBI), segregated from general treasury accounts and protected from ministerial reprogramming.

Initial capitalization: minimum 6 months of projected PMF transition salary obligations, calculated at \$400-500 per registered fighter per month × estimated registered PMF headcount.

Governance body oversight: dual-signature requirement — CBI Governor + designated Iraqi framework implementation officer; quarterly certification by IMF technical assistance team.

Legal basis: Embedded in Council of Ministers Resolution with parliamentary notification; not subject to annual appropriation renewal; operates under multi-year authorization. 2.2 Ring-Fence Enforcement
No disbursement from the facility for non-PMF purposes without unanimous governance body approval.

Monthly transparency reporting to governance body Economic Cooperation Sub-Committee.

Annual audit by independent accountancy firm (Big Four or UN-appointed neutral auditor).

11 If facility balance falls below 3 months of obligations, automatic

IMF standby drawdown authorization activates (see Economic and Financial Architecture, Layer 2).

1. TRANSITIONAL FUNDING BRIDGE

3.1 Trigger Conditions The Transitional Funding Bridge activates automatically

upon any of: (a) Iraqi Council of Representatives fails to pass federal budget by statutory deadline (October 1) plus 30-day grace period. (b) Parliamentary gridlock extends beyond 60 days with no committee markup of budget draft. (c) PMF salary line item removed or reduced below registered headcount coverage in approved budget. (d) CBI Governor certifies that general treasury liquidity is insufficient to cover militia payroll for current month.

3.2 Bridge Mechanism Upon trigger:

CBI authorized to release baseline sustenance payments directly from PMF Transition Stabilization Facility to compliant registered PMF units, bypassing Ministry of Finance disbursement queue.

Payment level: 75% of standard registered salary (sufficient to prevent desertion and extortion relapse without creating permanent alternative salary expectation).

Eligibility: PMF units in Stage 1 (Registration) or higher per PMF Integration Pathway; units not registered by Month 18 are ineligible and designated unlawful combatants per existing framework provisions.

Verification: Iraqi Ministry of Defense payroll audit confirms unit registration status; JMOC receives sanitized payment ledger monthly.

Duration: Bridge operates until parliamentary budget passage or until facility balance depletion, whichever occurs first.

12 3.3 Safeguards Against Abuse

Bridge payments do not count toward Phase 2 or Phase 3 integration milestone certification (they are survival payments, not

progression payments).

Bridge recipients must continue meeting base protection

compact obligations; any indirect fire incident from bridged unit triggers automatic payroll deduction per Base

Protection Compact — even during Bridge operation.

Governance body may suspend Bridge for specific units if

pattern-of-concern designation confirmed (three proxy incidents within 90 days).

Maximum continuous Bridge operation: 180 days; if budget

still unresolved, governance body convenes ministerial session to assess whether political will or structural

collapse is the cause.

1. BUDGET CYCLE ALIGNMENT CALENDAR

The framework governance body shall maintain a synchronized

"Iraqi Budget-Integration Milestone Calendar" with the following locked coordination points:

February 1: Iraqi Ministry of Finance submits draft budget

to Council of Ministers; PMF integration salary line item verified by framework technical team.

April 1: Council of Ministers approves draft; PMF line item

locked; framework secretariat confirms alignment.

July 1: Draft transmitted to Council of Representatives;

framework liaison monitors committee markup.

September 1: Framework early warning if parliamentary passage appears unlikely; Transitional Funding Bridge pre-activation logistics initiated.

October 1: Statutory budget deadline; Bridge activation

November 1: If no budget, Bridge activates automatically; governance body notification to all parties.

1. INTERNATIONAL COUNTERPARTY PROTECTION

All framework partners engaging with PMF-integrated units are shielded from sanctions exposure when:

Payments flow through the ring-fenced CBI facility. Recipient unit is on the Iraqi Ministry of Defense public registry of registered units.

Payment is for salary normalization, not weapons procurement or operational funding.

U.S. Treasury OFAC issues framework-linked general license

(to be drafted within 30 days of Phase 0 entry) covering CBI-facilitated PMF salary transactions.

SECTION RP-SA: SAUDI PIF INSTITUTIONAL BINDING

Placement: Leadership Transition Protocol — appended to Saudi Arabia Participation Architecture.

1. VULNERABILITY ANALYSIS

Saudi Arabia's core Phase 1 commitments — regional infrastructure investment (\$58+ billion projected), Lebanese emergency fuel stabilization

(\$150 million quarterly commitment), and Yemen reconstruction fund contributions — are currently executed through Royal Court directive rather than institutional standing obligation. In a leadership transition (succession, health event, or restructuring of royal authority), these directives can be suspended, modified, or repudiated within hours, collapsing the economic and 14 humanitarian tracks irrespective of successor intent. The Public Investment Fund (PIF), as a sovereign wealth fund with institutional governance structures, independent board, and international investment obligations, provides a vehicle for framework durability that survives royal transitions.

1. RCSA ESCROW DIRECTIVE

2.1 Legal Attachment to PIF

Within 60 days of framework entry into force, the Saudi Ministry of Finance and PIF Board shall execute a "Framework Stability Directive" with the following operative provisions:

PIF designated as "Framework Financial Agent" for Saudi Arabia's RCSA obligations.

Directive issued as Board Resolution (not Royal Order), requiring 2/3 PIF Board approval for modification or Board composition at directive execution: includes international independent directors (minimum 3) appointed with 3-year terms; international directors serve as transition anchors.

Directive registered with Saudi Capital Market Authority

and disclosed to international creditors under PIF bond covenants, creating external market enforcement pressure.

2.2 Pre-Authorized Standing Obligation

The Framework Stability Directive establishes pre-authorized funding corridors: Corridor A — Regional Infrastructure Investment:

Annual allocation: \$10-15 billion (Phase 1) scaling to

\$25 billion (Phase 2).

Trigger: JMOC certification of compliance milestone

achievement by relevant framework party (e.g., Iran

nuclear compliance, Iraq militia integration).

15 Release mechanism: Automated upon JMOC verification

report; no additional Royal Court or Ministry of Finance authorization required.

Project eligibility: Pre-approved pipeline of World

Bank/IMF-vetted infrastructure projects in Jordan, Iraq, Lebanon, and Yemen; project list updated annually by PIF-World Bank technical committee.

Corridor B — Lebanese Emergency Fuel Stabilization:

Annual allocation: \$300 million (Months 1-6) scaling

per humanitarian needs assessment.

Trigger: UN OCHA certification of Lebanese fuel crisis

severity above agreed threshold (hospital generator downtime >48 hours, water treatment interruption).

Release mechanism: Quarterly automatic transfer to

monitored escrow at designated Lebanese Central Bank account; UN monitors verify fuel allocation prioritization.

Corridor C — Yemen Reconstruction Fund:

Allocation: proportional to revenue-sharing escrow

(20% channel per Yemen Stabilization Framework).

Trigger: UN monitoring mission certification of ceasefire maintenance in revenue-producing zone.

Release mechanism: Monthly automated transfer to World Bank-administered Yemen Reconstruction Fund upon certification receipt.

1. AUTOMATED TRANCHE RELEASE ARCHITECTURE

3.1 JMOC Verification Metrics as Release Trigger

The automated release system operates on a "verify-then-release" protocol with no intermediate political gate:

JMOC Compliance Indicators System generates automated 16 milestone achievement signal.

Signal transmitted to PIF Investment Operations Division via encrypted API with digital signature (Ed25519) from JMOC Director.

PIF treasury executes transfer within 5 business days of

Transfer confirmation looped back to JMOC and governance body secretariat within 24 hours.

Dispute window: 7 days for either core party to challenge

milestone certification; challenge suspends next tranche only, not current tranche; governance body resolves within

14 days. 3.2 Leadership Transition Survival Protocol In the event of Saudi leadership transition (defined as: change

in Crown Prince, King incapacitation, or Royal Court restructuring):

All automated tranche releases continue uninterrupted

during transition window (defined as 90 days from transition event).

Rationale: PIF Board Resolution governs, not individual

Transition window may be extended to 180 days by

governance body consensus if transition creates

institutional ambiguity.

During transition window, no new project commitments

may be initiated, but existing corridor obligations continue.

Post-transition review: New Saudi leadership may request

governance body review of corridor parameters within 60 days of consolidation; review is advisory, not

suspensory; corridors continue during review.

17 If new leadership seeks modification, weighted majority

override (60% + neutral chair) may preserve existing corridor obligations against unilateral Saudi repudiation.

3.3 Market-Based Enforcement PIF's international creditor relationships provide non-political enforcement leverage:

PIF bond covenants include framework stability clause;

creditor notification required for any suspension of RCSA corridor obligations.

Suspension triggers negative credit rating action,

increasing PIF borrowing costs by estimated 50-100 basis points.

Credit rating agencies (S&P, Moody's, Fitch) receive

quarterly framework compliance certification from JMOC as input to sovereign and PIF-specific ratings.

1. RESERVE FUND AND CONTINGENCY

PIF shall maintain a "Framework Continuity Reserve" equal to 6 months of peak corridor obligations:

Held in liquid instruments (T-bills, sovereign bonds,

gold) at neutral custodian (Swiss National Bank or Bank of England).

Accessible within 48 hours for emergency humanitarian

Not commingled with PIF strategic investment portfolio. Quarterly attestation by external auditor (Ernst & Young

or equivalent neutral firm).

SECTION RP-UAE: INTER-EMIRATE COMMERCIAL-SECURITY ALIGNMENT

18 Placement: Domestic Veto Player Mapping — appended to UAE Participation

1. VULNERABILITY ANALYSIS

The United Arab Emirates is a federation of seven emirates with

divergent economic and security interests. Abu Dhabi, as the capital and holder of federal security and foreign policy authority, prioritizes regional security alignment, Hormuz stability, and

strategic de-escalation. Dubai, as the commercial and logistics hub (generating

approximately 30% of UAE GDP and handling 80%+ of UAE maritime trade volume), prioritizes port throughput, shipping

line relationships, and Jebel Ali/Jebel Dhanna operational continuity. This structural divergence creates a domestic veto player: Dubai port and customs authorities possess de facto capacity to

undermine framework maritime compliance — slow-walking toll enforcement, declining to interdict sanctioned vessels, or lobbying against Hormuz Transit Authority regulations that

reduce shipping volumes — without Abu Dhabi's explicit knowledge. The framework requires both security and commercial equities to be bound to implementation.

1. DUAL SIGN-OFF REQUIREMENT

2.1 Federal Implementation Architecture All UAE framework commitments affecting maritime commerce, port

operations, or Hormuz Transit Authority enforcement require joint ratification: Primary Signatory: Federal Supreme Council representative

(Abu Dhabi — currently President of UAE or designated National Security Advisor). Secondary Signatory: Executive leadership of DP World /

Dubai Ports Customs (specifically: DP World Group

19 Chairman and CEO of Ports, Customs and Free Zone

Corporation). 2.2 Mandatory Joint Ratification Matrix The following framework instruments require both signatures

IHTA tolling system participation agreement. Maritime interdiction protocols for framework-sanctioned

Red Sea/Bab-el-Mandeb inspection regime participation. Compliance with sanctions-busting vessel denial-of-port

provisions (Edit 10 toll evasion penalties).

Framework-mandated customs inspection prioritization for humanitarian vs. dual-use cargo.

Any UAE-port denial-of-access order issued under IHTA

maritime lien authority. 2.3 Dispute Resolution Between Signatories If Abu Dhabi and Dubai executive leadership disagree on

14-day internal UAE federal consultation window. If unresolved, matter escalated to framework governance

body neutral chair (Oman) for non-binding mediation.

If mediation fails, UAE participation in the affected

maritime instrument is suspended (not framework-wide suspension) until internal resolution.

During suspension, IHTA tolling continues for Dubai-

flagged or Dubai-destined vessels under standard rate; any enforcement benefit (toll reduction for compliance) is frozen for Dubai-originated shipping until dual

ratification restored.

1. TOLL REVENUE OFFSET MECHANISM

3.1 Commercial Loss Compensation

20 To align Dubai's commercial incentives with framework security

objectives, the following offset structure applies:

Baseline: IHTA administrative fee pool (distinct from

Leadership Transition Risk Assessment

P>Annex LC addresses the critical vulnerability that changes in national leadership can produce corresponding changes in commitment to architecture implementation. New leaders may have different policy orientations, different domestic political constraints, and different assessments of national interest that lead them to reconsider or abandon commitments undertaken by their predecessors. The continuity framework provides mechanisms for managing transition risks and preserving implementation momentum through leadership changes.

P>The risk assessment component identifies factors that increase or decrease transition risk for each participating state. Factors increasing risk include high electoral volatility, term limits that guarantee leadership change, ideological polarization between potential successor governments, and previous instances of new governments reversing predecessor commitments. Factors decreasing risk include bipartisan consensus on architecture matters, institutional embedding of commitments beyond executive discretion, and stakeholder constituencies that would be harmed by reversal.

P>Transition scenarios are developed for each participating state covering expected transitions (scheduled elections, term-limited departures) and unexpected transitions (death, incapacity, removal from office, resignation). Each scenario assesses the likely policy orientation of successors, the timeline for consolidation of successor authority, and the window of vulnerability during which commitments might be reversed before successor governments fully appreciate the costs of reversal.

Continuity Preservation Mechanisms

P>Several mechanisms work in concert to preserve architecture continuity through leadership transitions. The institutional embedding mechanism requires that architecture commitments are incorporated into domestic legislation, administrative regulations, and institutional procedures that cannot be easily reversed by executive action alone. Embedded commitments require legislative action, judicial approval, or extensive administrative processes to reverse, creating procedural obstacles that slow reversal and provide opportunities for supporters to mobilize opposition to reversal.

P>The stakeholder constituency mechanism ensures that architecture implementation creates domestic beneficiaries who will actively oppose reversal. These beneficiaries include businesses that have invested in anticipation of sanctions relief, workers employed in architecture-related projects, and communities that have received tangible benefits from architecture programs. The mechanism includes rapid response capabilities that can mobilize beneficiary constituencies when reversal is threatened.

P>The international commitment mechanism leverages the international legal and reputational costs of reversal to discourage new leaders from abandoning predecessor commitments. These costs include damage to international credibility that affects unrelated diplomatic relationships, potential sanctions or other consequences from architecture parties, and loss of access to architecture benefits that cannot be easily replicated through alternative arrangements.

Transition Support and Rapid Engagement Protocols

P>When leadership transitions occur, the architecture provides rapid engagement support designed to establish constructive relationships with successor governments before they make irreversible decisions about architecture participation. The rapid engagement protocol triggers immediate

architecture response upon notification of leadership changes, including diplomatic outreach, intelligence assessments, and policy briefings that inform successor governments about architecture benefits and reversal costs.

P>The diplomatic outreach component includes high-level contacts by the Executive Secretary, the UN Secretary-General, and senior officials from other participating states. These contacts convey the importance that the international community attaches to continued architecture participation and offer to address any legitimate concerns successor governments may have. Outreach is calibrated to the diplomatic sensitivities of each state, respecting protocols while ensuring prompt communication.

P>Policy briefing materials are developed for each anticipated transition that explain the architecture in terms relevant to likely successor governments' policy frameworks. Materials emphasize benefits that align with successor priorities, address concerns that successor ideologies may raise, and provide evidence of implementation success. Briefings are delivered through channels that successor governments find credible and accessible.

Succession-Proofing through Institutional Design

P>Long-term continuity is enhanced through institutional design choices that make architecture implementation less dependent on any individual leader's continued support. These choices include multi-year programming that extends beyond electoral cycles, legislative requirements that bind successor governments, international legal obligations that create reversal costs, and private sector investments that generate domestic constituencies with vested interests in continued implementation.

P>The multi-year programming mechanism locks in architecture activities and benefits over timeframes that span multiple electoral cycles. Once major

infrastructure projects are underway, scholarships are awarded, and business investments are made, successor governments face concrete costs from reversing these arrangements. Programming is designed to generate visible benefits within the first two years of implementation to create early stakeholder investment in continuation.

P>The treaty structure itself provides succession-proofing through international legal obligations that bind successor governments under established principles of international law. New governments inherit the legal obligations of their predecessors and face international consequences for repudiation. While international law cannot prevent determined reversal, it raises the costs and provides legal frameworks for responding to reversals.

Transition Scenario Planning and Preparation

P>The Leadership Transition Continuity framework includes detailed scenario planning that prepares for transitions under different circumstances. Scenario planning identifies the likely characteristics of successor governments, the policy positions they are likely to take, and the strategies for engaging with successors constructively.

P>Scenario categories include scheduled transitions through elections or term limits, unexpected transitions through death or incapacity, disruptive transitions through revolution or coup, and gradual transitions through leadership evolution within existing structures. Each scenario requires distinct preparation and engagement strategies.

P>Scenario indicators are identified that signal which scenario is unfolding, enabling rapid adjustment of preparation activities. Indicators include electoral polling, leadership health information, military movement patterns, and public protest activity. Indicator monitoring provides early warning of

impending transitions.

P>Preparation activities are conducted in advance of anticipated transitions to ensure rapid engagement when transitions occur. Activities include development of briefing materials, cultivation of relationships with likely successors, and positioning of architecture representatives for immediate post-transition contact.

Successor Engagement and Onboarding

P>When leadership transitions occur, rapid engagement with successors is essential to establish constructive relationships before irreversible decisions are made. The successor engagement framework provides structured procedures for initial contact, information provision, and confidence building.

P>Initial contact procedures ensure that architecture representatives reach successor leadership promptly through appropriate channels. Contact respects diplomatic protocols while conveying the importance attached to continued architecture participation. Contact channels may include the UN Secretary-General, foreign ministry channels, or direct executive-level communication.

P>Information provision supplies successors with comprehensive, balanced information about architecture benefits, obligations, and flexibility. Information is tailored to successor political frameworks, addressing concerns that successor ideologies are likely to raise. Information emphasizes the costs of reversal and the opportunities for constructive engagement.

P>Confidence building creates early positive interactions that establish patterns of constructive engagement. Building measures may include symbolic gestures, early benefit delivery, and flexibility on secondary issues that do not affect core non-proliferation objectives. Confidence building is calibrated to successor receptivity and local political conditions.

Institutional Legitimacy and Mandate Continuity

P>The architecture addresses the challenge that successor governments may question the legitimacy of commitments undertaken by predecessors. Institutional mechanisms reinforce mandate continuity by embedding commitments in legal and institutional structures that transcend individual governments.

P>Legislative ratification creates parliamentary mandates that bind successor governments. Ratification debates and votes create legislative records that support mandate continuity. Legislative oversight committees maintain ongoing scrutiny that reinforces institutional commitment.

P>Constitutional provisions in some states may be amended to incorporate architecture commitments into fundamental law. Constitutional embedding provides the strongest institutional protection against reversal but requires the most demanding ratification procedures.

P>International legal obligations create external constraints on successor discretion. The Vienna Convention on the Law of Treaties establishes that treaties are binding on successor states and governments. International law does not prevent determined reversal but raises the legal and reputational costs of repudiation.

H2>Leadership Succession in Authoritarian Systems

P>Authoritarian systems present distinctive succession challenges because leadership transitions may lack the institutionalized procedures characteristic of democratic systems. Succession may occur through elite selection, family inheritance, military intervention, or other mechanisms that create uncertainty about outcomes.

P>Elite selection involves informal processes through which ruling elites

choose successors from among their ranks. Selection may involve bargaining, consensus-building, or imposition by dominant factions. The architecture monitors elite dynamics to anticipate potential transitions.

P>Family succession transfers power to relatives of current leaders, creating quasi-monarchical systems. Family succession may produce inexperienced leaders who are more dependent on advisors and institutions, potentially creating both opportunities and constraints for architecture engagement.

P>Military succession involves military establishments assuming power through coups or constitutional manipulation. Military successors may prioritize security concerns over economic cooperation, affecting architecture prospects. Military succession may also produce pragmatic leaders focused on economic development.

P>Succession preparation includes building relationships with potential successors across different succession scenarios. Preparation ensures that architecture representatives can engage promptly with new leaders regardless of how they come to power.

Democratic Transitions and Architecture Continuity

P>Democratic transitions can either strengthen or weaken architecture commitments depending on whether new democratic governments view the architecture as consistent with democratic values and popular interests.

P>Democratic transitions often produce governments that seek to distinguish themselves from predecessors by reversing prior policies. The architecture addresses reversal risk through the institutional embedding mechanisms that make reversal procedurally difficult.

P>Democratic accountability can strengthen architecture implementation by creating pressures for effective governance. Governments that must win

reelection have incentives to deliver tangible benefits from architecture cooperation. Public opinion monitoring helps track whether democratic accountability supports or undermines implementation.

P>Civil society empowerment in democratic transitions creates new stakeholders with voices in architecture policy. Civil society may push for greater transparency, more effective implementation, or different policy priorities. The architecture's civil society engagement mechanisms channel these voices constructively.

Long-Term Continuity Architecture

P>Beyond immediate transition management, the architecture includes features designed to ensure continuity over the very long term spanning multiple generations of leaders and citizens.

P>Treaty duration provisions establish architecture commitments as indefinite, with renewal or withdrawal requiring affirmative action rather than automatic expiration. Indefinite duration creates default continuity that persists unless actively terminated.

P>Intergenerational obligations are incorporated into architecture commitments that explicitly address obligations to future generations. Preamble language, environmental provisions, and sustainability requirements create moral and legal foundations for long-term continuity.

P>Adaptive mechanisms enable the architecture to evolve in response to changing conditions without requiring fundamental renegotiation. Amendment procedures, stress testing, and scenario planning create institutional capacity for adaptation that preserves core commitments while adjusting implementation.

P>Historical memory preservation documents the architecture's origins,

purposes, and achievements for future generations. Documentation ensures that future leaders understand why the architecture was created and what it has accomplished, providing foundations for continued commitment.

ANNEX PO

Syria is divided into stabilization zones based on current control and security conditions: Zone 1 (Daraa/South): Government-controlled, relatively stable. Target: full humanitarian access, refugee return facilitation, local governance restoration. Zone 2 (Coastal/Rural Damascus): Government-controlled with residual opposition. Target: conditional return, demining, basic service restoration. Zone 3 (Aleppo/North): Mixed control, Turkish influence. Target: cross-line humanitarian access, trade corridor opening, civilian protection. Zone 4 (Northeast): Kurdish-led administration. Target: service provision, anti-ISIS coordination, border management. Zone 5 (Idlib/Northwest): HTS-controlled, high risk. Target: humanitarian corridor only, no return, no reconstruction until security conditions change. Each zone has independent stabilization metrics. Zone 1 can advance to full reconstruction while Zone 5 remains humanitarian-only. Progress in one zone is not hostage to progress in another. Operational Hardening (Edit 7): Idlib Mass-Displacement Protocol. Zone 5 (Idlib) is designated for "humanitarian corridor only, no return, no reconstruction." In the event that hostilities flare within Idlib and produce mass-displacement events (defined as 10,000 or more internally displaced persons within a 72-hour period), the following protocol activates automatically: (a) Zone 3 (Aleppo/North) is mandated to accept IDPs up to a threshold of 50,000 persons, with UNHCR establishing emergency camp capacity within 48 hours; (b) if Zone 3 capacity is exceeded, Zone 2 (Coastal/Rural Damascus) is mandated to accept up to 30,000 additional IDPs; (c) the governance body convenes within 24 hours of mass-displacement confirmation to coordinate cross-line humanitarian access and security guarantees for IDP corridors; (d) no framework party may block IDP

movement to the designated receiving zones; (e) reconstruction funding for receiving zones is accelerated by 25 percent during the displacement period to absorb population pressure. This protocol ensures that mass-displacement events do not produce ad hoc border crises or political hostage-taking.

External Actor Drawdown Matrix

A sequenced approach to reducing foreign military presence: Table 22
 External Actor Drawdown Sequence Actor Phase 0 Action Phase 1 Action Phase 2 Action Phase 3 End State

Iran Freeze new Reduce advisory Transition to diplomatic Normal state-to-state

deployments personnel 25% presence only relations Turkey Freeze territorial Begin border area Reduce military Security cooperation expansion civilian handover observation posts agreement Russia Maintain air defense Transition to airbase- Reduce ground advisory Technical military only posture presence cooperation U.S. Maintain counter-ISIS Shift to advisory-only in Reduce to special Intelligence presence NE operations support cooperation only Operational Hardening (Edit 8): Iran Advisory Personnel Baseline. The requirement that Iran reduce advisory personnel by 25% in Phase 1 is operationally meaningless without a verified baseline. Prior to Phase 0 entry, a neutral third-party verification team (composed of personnel from

36 Israel-Iran Direct Deconfliction Layer

guarantor states and UN military observers) shall conduct a confidential baseline assessment of Iranian advisory personnel in Syria. The baseline assessment shall document: (a) the total number of Iranian military advisors and IRGC-affiliated personnel in Syria; (b) their locations by facility and province; (c) their functional roles (training, command, logistics, intelligence).

The baseline report is deposited with the governance body secretariat and shared with all framework parties. The 25% Phase 1 reduction is calculated against this verified baseline. A follow-up verification assessment is conducted at Month 12 to confirm reduction. Without a verified baseline conducted prior to Phase 0, no Phase 1 reduction certification may be issued, and associated benefits (including sanctions relief micro-tranches linked to Syria drawdown) remain frozen.

Reconstruction-for-Compliance Model

International reconstruction aid is tied to verified local stability, not national political conditions. Each zone receives reconstruction funding proportionate to: ceasefire maintenance (40% weight); humanitarian access guarantee (30% weight); and local governance functionality (30% weight). Funding is disbursed through the World Bank with independent monitoring. Zone-specific sanctions relief micro-tranches unlock as zones meet stability benchmarks.

Local Governance Compacts

Municipal-level agreements replace national-solution-first approaches. Each zone establishes local governance compacts between: community representatives; existing administrative structures; and international technical assistance providers. Compacts address: security provision; service delivery; property rights; and dispute resolution. International recognition of local compacts is provisional and does not confer sovereignty or statehood status.

Israel-Iran Direct Deconfliction Layer

While Israel is not a formal framework party, its quiet cooperation or active opposition is determinative for framework viability. The 2015 JCPOA experience demonstrated that sustained opposition contributed to framework

erosion. This section provides Israel-adjacent provisions that address core concerns without granting formal veto authority.

Direct Deconfliction Protocol

The framework establishes three direct deconfliction domains between Israel and Iran, mediated through the guarantor architecture: Airspace: Pre-notification of military flights within 100 kilometers of either party's

37 Israel-Iran Direct Deconfliction Layer

territory; 72-hour notice for exercises or deployment movements; automatic hotline activation for airspace proximity incidents Maritime: Mediterranean and Red Sea naval presence notifications; agreed separation distances for naval vessels; incident reporting through Oman-mediated channel Cyber: No-notification channel for critical infrastructure attack attribution; 48-hour response commitment for "critical infrastructure" flagged communications; independent technical assessment of major cyber incidents

Shadow Conflict Ceiling

The framework defines "unacceptable escalation thresholds" that apply to covert as well as overt operations: Table 23 Shadow Conflict Thresholds

Domain Threshold Automatic Framework Response

Nuclear Facilities Any attack on declared IAEA-monitored Crisis Lock (30 days); immediate ministerial sites session; IAEA emergency inspection; UN

Security Council notification

Critical Attack causing >48-hour disruption of Crisis Lock (21 days); enhanced monitoring; Infrastructure water, power, or healthcare systems joint technical assessment serving >100,000 civilians Leadership Confirmed assassination of senior Crisis Lock (14 days); attribution process; UN

Targeting government or military officials Secretary-General notification

Commercial Sinking or seizure of civilian vessels in IHTA security activation; emergency protocol;

Maritime Shipping international waters naval patrol surge

Operational Hardening (Edit 14): Cyber Threshold Hardening. The 48-hour disruption threshold for critical infrastructure is reduced to a 12-hour disruption threshold for power and healthcare systems. A 48-hour hospital blackout constitutes a mass-casualty event in itself, and the framework recognizes that 12 hours is the maximum tolerable disruption for power grids serving >100,000 civilians and for hospital systems in conflict-affected areas. Water systems retain a 24-hour threshold (intermediate between 12 and 48 hours) reflecting storage capacity realities. The revised thresholds apply to both cyber and kinetic attacks on critical infrastructure.

38 Israel-Iran Direct Deconfliction Layer

Third-Party Strike Buffer Rule

To prevent automatic retaliation loops: any attack attributed to a third party (not a framework core party) triggers a 72-hour attribution confirmation period before any framework party may take retaliatory action. During the buffer period: intelligence is shared through guarantor channels; the Proxy Event Response Team (2 Iranian, 2 U.S., 1 neutral expert) convenes; and the guarantors issue a preliminary attribution assessment. Retaliatory action before buffer expiration is considered a unilateral act outside framework authorization and may trigger framework suspension procedures. Operational Hardening (Edit 13): Third-Party Strike Buffer Reduction. The 72-hour attribution buffer for third-party strikes is reduced to 12 hours for active, continuous missile/drone barrages (defined as three or more projectiles

launched within a 6-hour period with ongoing threat to life or critical infrastructure). During active, continuous barrages, targeted states retain the right to immediate counter-battery fire and active defense measures without awaiting full attribution confirmation. The 12- hour reduced buffer applies exclusively to kinetic self-defense and counter-battery operations; broader retaliatory measures (including strikes on suspected launch sites or supply depots) remain subject to the standard 72-hour buffer unless the ongoing barrage creates an imminent threat to civilian population centers, in which case the Article 51 override in Edit 12 governs. All counter-battery fire under the 12-hour exception must be reported to the governance body and guarantors within 2 hours.

No Strategic Surprise Commitment

No Strategic Surprise Commitment

The framework establishes a binding commitment that neither party will undertake actions that fundamentally alter the strategic landscape without prior notification. This commitment addresses the destabilizing effect of sudden, unilateral strategic moves that have historically collapsed diplomatic processes.

Notification Requirements

The following categories of action require advance notification through the Tier 3 Leadership Reset Hotline: New military deployments: Introduction of combat forces exceeding 500 personnel to any framework- affected theater requires 14-day advance notification Facility establishment: Construction or activation of new military installations in framework-monitored zones requires 30-day advance notification Major weapons system introduction: Deployment of ballistic missile batteries, advanced air defense systems, or strategic weapons platforms requires 14-day advance notification Alliance

restructuring: Entry into new mutual defense arrangements affecting framework-affected theaters requires 30-day advance notification

39 Israel-Iran Direct Deconfliction Layer

Notifications must include: the nature of the planned action; estimated timeline; geographic scope; and stated objective. Notifications are not requests for permission; they are commitments to transparency. The receiving party may request clarifying information within 7 days but may not veto the action.

Surprise Response Protocol

If a party undertakes a covered action without advance notification: The action is not retroactively prohibited; the framework does not create a veto. However, the failure to notify constitutes a Tier 2 compliance concern. Compliance indicator score is adjusted by +1.0 point. Governance body convenes within 14 days to assess whether the action alters the strategic equilibrium. If the governance body determines by weighted majority that the action constitutes a strategic surprise, the affected party may activate a 30-day Stabilization Hold on non-core obligations in the affected domain.

No Strategic Surprise Commitment

Exclusions The surprise commitment does not apply to: emergency defensive measures in response to imminent attack; covert operations that, if disclosed, would compromise operational security (notification required within 48 hours of operation completion); humanitarian emergency deployments; and routine personnel rotations within existing facilities.

Strategic Stability Review

Every 90 days, the governance body conducts a Strategic Stability Review assessing whether cumulative notified actions are producing a strategic shift that requires framework recalibration. The review is non-binding but informs

phase transition decisions and benefit timing.

Counterterrorism Integration Upgrade

Counterterrorism Integration Upgrade

Joint Designation Review Mechanism

The framework establishes a process for aligning (or managing differences in) terrorist designations between parties. A Joint Designation Review Panel meets quarterly to: review new designation requests from either

40 Israel-Iran Direct Deconfliction Layer

party; assess shared intelligence on extremist networks; and publish agreed designations while recording disagreements without blocking cooperation on shared threats. Disagreed designations do not block cooperation on agreed threats. The Panel's mandate covers ISIS, Al-Qaeda affiliates, and regionally active extremist networks. Operational Hardening (Edit 15): Fusion Cell Intelligence Firewall. Intelligence shared within the optional Intelligence Fusion Cell regarding an agreed-upon threat (e.g., ISIS) cannot be used to target a disagreed-upon entity (e.g., a specific regional militia). This strict firewall operates as follows: (a) all intelligence shared in the Fusion Cell is tagged by contributing parties with a "scope classification" (agreed threat vs. contested entity); (b) intelligence tagged as related to an agreed threat may be used for joint operational planning against that threat only; (c) intelligence tagged as related to a contested entity may be received and recorded but may not form the basis for any kinetic or sanctions action against that entity by a party that does not share the designation; (d) any party that uses Fusion Cell intelligence to target a contested entity in violation of this firewall is subject to an immediate 2.0-point compliance indicator penalty and suspension of Fusion Cell participation for 90 days; (e) the firewall is enforced by the neutral

guarantor hosting the Fusion Cell, which maintains access logs and audits compliance. The firewall ensures that tactical intelligence cooperation on shared threats is not weaponized for strategic disagreements. Intelligence Fusion Cell (Phase 1 Optional) An optional Intelligence Fusion Cell activates in Phase 1, hosted by a neutral guarantor state. The Cell provides: shared threat data on ISIS, Al-Qaeda, and regional extremist networks; independent analysis of attack attribution; early warning of extremist mobilization; and coordinated response planning. Participation is voluntary for all parties. Data sharing is sanitized to protect sources and methods. The Cell does not share intelligence that could be used against framework parties' domestic political interests.

Safe-Passage Prohibition Tracking

The framework monitors movement of extremist fighters across borders through: biometric registration at border crossings in framework-affected zones; Interpol-linked watchlist coordination; and satellite tracking

Counterterrorism Integration Upgrade

of known transit routes. Verified safe-passage provision by any framework party or affiliated actor is treated as a Tier 2 proxy compliance concern and triggers the graduated enforcement ladder.

Arms Control Expansion

Arms Control Expansion

41 Israel-Iran Direct Deconfliction Layer

Regional Missile Transparency Regime

A voluntary missile transparency mechanism requires pre-notification of: ballistic missile tests (72-hour notice, including range and trajectory); cruise missile deployments (14-day notice for new basing); and major exercises

involving missile systems (7-day notice). Notifications are published through the governance body secretariat and shared with all framework parties. Non-notification does not trigger enforcement but is recorded in the transparency register and may affect compliance scoring.

Air Defense Coordination Rules

To prevent misidentification and accidental escalation: all parties commit to ADS-B transponder use for military aircraft in framework-monitored airspace; radar coordination protocols for overlapping air defense coverage zones; and 48-hour pre-notification for air defense system activation in border regions. These rules reduce the risk that defensive air defense systems trigger offensive responses.

Cyber Non-Attack Norms

The framework establishes agreed prohibitions on cyber attacks against: nuclear facilities (operational or research); hospitals and healthcare systems; financial systems and central bank infrastructure; water and power grid control systems; and aviation navigation and air traffic control. Violations are treated as material breaches under the enforcement ladder. The governance body maintains a Cyber Incident Registry documenting all reported violations and remediation efforts. Regional Arms Registry (Phase 2) A voluntary regional arms registry activates in Phase 2, requiring disclosure of: major weapons systems (tanks, aircraft, naval vessels) above agreed thresholds; ballistic and cruise missile inventories; and chemical/biological defense capabilities. Disclosure is voluntary and does not require complete inventories. Partial disclosure is accepted. The registry builds transparency gradually, with incentives (trade facilitation, investment access) linked to participation depth.

42 Crisis Management and Communication

The framework establishes redundant communication channels and crisis protocols to prevent the accidental escalation that has historically undermined regional agreements.

Three-Tier Communication Architecture

Tier 1: Military Deconfliction Hotline A 24/7 direct line between U.S. CENTCOM and Iranian Armed Forces operations centers. Purpose: immediate de-escalation of military incidents; prevention of accidental engagement; maritime, airspace, and ground incident response. Response times: 2 hours for maritime incidents, 4 hours for airspace, 6 hours for ground incidents. **Tier 2: Technical Implementation Hotline** Secure channel between Technical Implementation Officers, coordinated through governance secretariat. Purpose: technical problem resolution; verification continuity maintenance; compliance data clarification. Response times: 24 hours for urgent matters (verification gaps), 72 hours for standard matters. **Tier 3: Leadership Reset Hotline** Direct encrypted line between U.S. Secretary of State and Iranian Foreign Minister, with Oman-mediated relay fallback. Purpose: framework-stall intervention; political-level reset; strategic reassessment. Response time: 4 hours for any message marked "Reset Protocol." Reserved for framework-stall situations only.

Humanitarian Deconfliction Hotline

Managed by UN OCHA, connecting humanitarian coordinators, military liaisons, and civil administrations. Purpose: notify of humanitarian movement; prevent military interference with corridors; coordinate medical evacuation. Response time: 1-hour acknowledgment; 4-hour coordination response.

Crisis Lock and De-escalation

When any hotline reports a major incident, a Crisis Lock may be activated. The Lock is designed to create breathing room for assessment before escalation, but it is also protected against weaponization by bad-faith actors.

Triggers 10+ fatalities involving party nationals

Verified direct military clash between parties

Imminent destabilization from either party's assessment

Critical infrastructure attack

Verification system integrity alert

Effects 14-day freeze on all status-quo changes Governance body emergency session within 48 hours Fact-finding team deployed within 72 hours Crisis Management and Communication

No prejudice from Lock-period actions

Extension by governance body majority vote, maximum 42 days total

Anti-Abuse Safeguards

The following mechanisms prevent the Crisis Lock from becoming a tool for strategic paralysis: Frequency Limit: No party may trigger more than one Crisis Lock per 90-day period. Any additional trigger within 90 days is logged but does not activate a new freeze unless approved by the neutral chair with written justification. Escalating Cost: A party that triggers a Crisis Lock that is subsequently determined to have been based on fabricated or exaggerated claims faces: (a) a 1.0-point compliance indicator procedural penalty; (b) loss of Crisis Lock triggering privilege for 180 days; (c) mandatory public correction of the trigger claim. Default Action During Lock: While the Crisis Lock freezes status-quo changes, it does not freeze: (a) humanitarian corridor operations; (b) IAEA monitoring activities; (c) banking channel transactions below \$10

million; (d) medical evacuations. These activities continue under "protected operations" status. Lock Override: If the governance body determines by weighted majority that a Crisis Lock is being abused to stall implementation, the Lock may be lifted early with 24 hours' notice. The party that triggered the Lock may appeal to the guarantors, but the override remains operative pending guarantor review.

Third-Party Shock Absorber

Following a third-party attack or spoiler event: 30-day no-penalty window activates automatically; mandatory joint investigation by Proxy Event Response Team (2 Iranian, 2 U.S., 1 neutral expert); if attribution inconclusive after 30 days, event is classified as non-attributable with no penalties and cooperative threat mitigation only.

Regional Incident Firewall

If a regional incident (not directly involving framework parties) threatens to escalate: automatic governance body notification within 4 hours; bilateral consultation within 24 hours; coordinated public statement within 48 hours. This prevents independent military responses to third-party events.

Communication Redundancy

To ensure hotline survivability during cyber attacks or system failures: Primary: Encrypted digital channels (multiple platforms) Secondary: Secure satellite phone links Tertiary: Oman-mediated relay (diplomatic pouch and in-person if electronic systems fail) Quaternary: Swiss protecting power channel (if diplomatic

2 relations suspended) All hotlines are tested monthly on the first Monday of each month. Failed tests trigger technical remediation within 48 hours. Results are included in quarterly transparency summaries.

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA)

Crisis-Management & De-Escalation Modules Version 1.5 — Hardened Operational Update

TABLE OF MODULES Module I: Hotline & Direct Communication Protocol
Module II: 72-Hour De-Escalation Window

Module III: Proxy Activity Containment Module Module IV: Incident Attribution Panel (PERT Formalization)

PREAMBLE: THE CIRCUIT BREAKER ARCHITECTURE

Operative Clause: These modules constitute the framework's crisis circuit breaker — the layered mechanisms designed to prevent single incidents from triggering automatic escalation chains that collapse the entire

agreement. Every previous module in the RCSA references these crisis procedures (the 72-hour strike buffer, the PERT attribution process, the Leadership Reset hotline, the Proxy Freeze Zones), but this is their

authoritative operational home. INTEGRATION MAP:

Verification & Technical Architecture: JMOC operations floor

(Tier 1 hotline); PERT composition (Module III); PHAR deconfliction database.

Enforcement & Dispute Resolution: Emergency Override Mechanism

3 (Tier 1-3 triggers); Crisis Lock (14-30 day freeze); Shock

Response Envelope (Column A/Column B); Spoiler Containment 2.0 (Category Alpha-Delta); Graduated Penalty Ladder (CIS scoring for violations).

Humanitarian & Civilian Protection: Humanitarian Deconfliction

Hotline (independent of political hotlines); PHAR strict liability for strikes on deconflicted assets; CPMC civilian

protection reporting.

Economic & Financial Architecture: IHTA maritime coordination

cell; escrow auto-release for verified triggers; Commercial

Continuity Protection shield.

Addendum B (Stress-Tested Hardening): Crisis Pause Mode

(30-90 day non-security shock absorber); OFAC Failure Contingency (mirror licensing); Compliance Symmetry Metrics

(U.S./EU obligation tracking).

Core Document v1.5: Base Protection Compacts (100-mile

perimeter rule); No Strategic Surprise Commitment; Attributed-

but-Uncontrolled doctrine; Proxy Activity Caps (Yemen 2/30, Lebanon 4/30);

Third-Party Strike Buffer Rule. These modules are classified Tier 1 (must survive in any framework

version) and are operative from Phase 0 entry. No party may unilaterally deactivate any hotline, strike buffer, or attribution protocol for any reason.

Deactivation constitutes immediate material

MODULE I: HOTLINE & DIRECT COMMUNICATION PROTOCOL

Operative Clause: This module formalizes the secure communication channels between adversaries who do not maintain formal diplomatic

relations. It creates a three-tier network — technical, military,

and leadership — with mandatory acknowledgment rules, strict procedural protocols, and physical infrastructure specifications. This module supersedes and expands the "Three-Tier Communication

Architecture" referenced in the Core Document.

1. TIER 1 — TECHNICAL IMPLEMENTATION HOTLINE

1.1 Scope and Function

Tier 1 handles routine technical implementation issues: inspector access scheduling, equipment delivery coordination, data transmission troubleshooting, customs clearance delays, and

humanitarian convoy routing. It is the highest-volume, lowest- sensitivity tier.

Host Platform: JMOC 24/7 Operations Floor, Geneva.

Communication Channels:

Primary: Encrypted VoIP with dedicated JMOC extension

numbers for each framework party liaison office. AES-256 encryption; TLS 1.3 signaling; hardware-token

Secondary: Secure text messaging platform (custom

JMOC-deployed Signal-compatible system; no commercial

third-party servers; messages stored on Swiss-sovereign infrastructure only).

Tertiary: Encrypted email via JMOC-hosted secure

mail server (not commercial email; air-gapped from general JMOC network).

Operating Hours: 24/7/365; no holiday closures.

JMOC Duty Officer (neutral guarantor national):

Primary responder; logs all communications;

coordinates technical response.

Party Liaison Officers (PLOs): Each framework

5 party maintains 2-3 PLOs on 8-hour rotating shifts

at their capital-based liaison terminal (see Verification Modules, Module III, Section 2.2). PLOs are technical specialists (NOT political

appointees); they implement, they do not negotiate.

Language: English is working language; Arabic

and Persian translation available on 15-minute

standby for complex technical discussions. Response Standards:

Acknowledgment of incoming message: Within 15

minutes during operational hours; within 30 minutes during night hours (2200-0600 Geneva time).

Resolution of routine technical issue: Within

4 hours for standard issues; within 24 hours for complex issues requiring cross-party coordination.

Escalation to Tier 2: If technical issue

involves military assets, force protection, or potential kinetic engagement; or if Tier 1

issue remains unresolved after 24 hours. 1.2 Technical Issue Categories

Category T1 — Inspector Access: IAEA inspection

scheduling; equipment delivery; site access permissions; inspector safety coordination. Category T2 — Humanitarian Logistics: Convoy

routing; customs clearance; cargo verification; distribution coordination.

Category T3 — Data Transmission: RDT VPN issues;

Geneva backup node synchronization; seal/camera malfunctions requiring remote diagnosis.

6 Category T4 — Economic Implementation: Banking

channel transaction processing; escrow release verification; CCP contract certification. Category T5 — Environmental/Health: Cholera

outbreak notification; extreme weather alerts; hazardous material spills affecting corridors. 1.3 Logging and Transparency

All Tier 1 communications logged in JMOC

communications database with timestamp, party identity, issue category, resolution status, and

Logs reviewed monthly by governance body

secretariat; summary published in quarterly Transparency Summary (content redacted for

operational security; metrics published in full: message volume, response times, resolution rates, escalation rates).

Tier 1 logs are admissible as evidence in BAP

proceedings for technical compliance disputes.

1. TIER 2 — MILITARY DEConfLICTION HOTLINE

2.1 Scope and Function Tier 2 handles military-to-military coordination: naval deconfliction in the Persian Gulf and Strait of Hormuz;

airspace coordination; force posture notifications; indirect fire incidents; base perimeter alerts; and any situation where military forces from different

framework parties are in proximity and risk inadvertent engagement. Host Platform: JMOC Secure Military Coordination

Room, Geneva (physically separate from Tier 1 operations floor; SCIF-level security; access

7 limited to cleared military liaison officers).

Communication Channels:

Primary: Dedicated secure voice line (STU-III equivalent or higher; end-to-end encryption; no intermediary recording).

Secondary: FLASH precedence encrypted message system (formatted military message traffic; JMOC relays within 10 minutes).

Tertiary: Satellite emergency beacon frequency (for vessel/aircraft in distress requiring immediate deconfliction; monitored by JMOC

and all party military operations centers). Operating Hours: 24/7/365. Staffing:

JMOC Military Watch Officer (neutral guarantor

national; former senior military officer with coalition operations experience):

Primary

responder; crisis assessment; escalation recommendation.

Military Liaison Officers (MLOs): Each

framework party with military forces in the theater maintains 1-2 MLOs at Geneva JMOC facility (rotating 12-hour shifts) PLUS 1

MLO at their capital-based secure terminal for after-hours coverage.

MLO Nationality Restriction: MLOs may be

uniformed military officers OR civilian defense officials; they carry diplomatic

passports while at JMOC; they are NOT intelligence officers (explicit exclusion).

8 Acknowledgment: Within 5 minutes. No exceptions. Initial deconfliction assessment: Within 15

Active deconfliction coordination (real-time routing, altitude assignment, speed adjustment): Within 30 minutes.

Escalation to Tier 3: If incident involves confirmed fatalities; imminent threat to strategic assets; or potential for rapid escalation beyond localized containment. 2.2 Deconfliction Procedures by Domain Naval Deconfliction (Persian Gulf / Strait of Hormuz / Gulf of Oman):

All naval vessels from framework parties transmit position, course, and speed to JMOC

Maritime Coordination Cell every 4 hours (or every 30 minutes when within 50 nautical miles of another party's vessel).

JMOC issues automated conflict alerts when vessel tracks project CPA (Closest Point of Approach) <2 nautical miles within 30 minutes.

Upon conflict alert: JMOC Military Watch

Officer contacts both vessels' MLOs; recommends course/speed adjustments; tracks compliance in real time.

"Incidents at Sea" Protocol (based on 1972

US-Soviet Incidents at Sea Agreement, adapted): No simulated attacks; no

Public Opinion Monitoring and Analysis Framework

P>Annex PO addresses the critical role of public opinion in sustaining architecture implementation over the extended timelines required for comprehensive implementation. Public opinion can be a powerful force for implementation when citizens perceive tangible benefits from cooperation, but can also drive reversal when citizens perceive costs, risks, or inequities in architecture arrangements. The stabilization framework provides tools for monitoring, understanding, and constructively shaping public opinion across all participating states.

P>The monitoring component employs regular public opinion surveys that track citizen awareness, attitudes, and expectations regarding architecture activities. Surveys are conducted by reputable polling organizations using standardized methodologies that ensure comparability across countries and over time. Survey content includes awareness of architecture existence and purpose, assessment of benefits and costs, trust in implementing institutions, and preferences for future directions.

P>Beyond quantitative surveys, the framework includes qualitative research through focus groups, in-depth interviews, and social media analysis that captures the nuance and complexity of public opinion. Qualitative methods reveal the reasoning behind statistical patterns, identify the specific concerns that drive negative attitudes, and detect emerging issues before they register in quantitative measures. Together, quantitative and qualitative methods provide comprehensive public opinion intelligence.

Strategic Communication and Narrative Management

P>The communication component provides participating states with strategic guidance for explaining architecture activities to domestic audiences in ways

that build support for continued implementation. Communication strategies are tailored to each state's political culture, media landscape, and public opinion profile. Generic international messaging is avoided in favor of nationally specific narratives that resonate with local values and concerns.

P>Narrative development draws upon qualitative research to identify the values, aspirations, and anxieties that shape public opinion in each country. Messages are framed to connect architecture activities with values that citizens already hold dear: economic prosperity, national security, international respect, technological advancement, peace for future generations. This values-based approach is more effective than abstract appeals to international cooperation or legal obligation.

P>The framework includes rapid response capabilities for addressing negative developments that could damage public support. When implementation problems arise, hostile incidents occur, or opposition campaigns gain traction, rapid response teams deploy factual information, context, and remedial commitments that address legitimate concerns before negative narratives become entrenched. Speed is essential because opinions formed early are resistant to subsequent correction.

Benefit Visualization and Tangible Impact Demonstration

P>Abstract commitments and legal instruments generate limited public support compared to visible tangible benefits that citizens experience in their daily lives. The benefit visualization component ensures that architecture benefits are delivered in forms that citizens can see, touch, and appreciate. This includes infrastructure projects with visible physical presence, employment programs that put people to work, and service improvements that directly affect daily life.

P>The Tangible Impact Program requires that a minimum percentage of architecture resources be directed toward high-visibility projects that generate immediate public awareness. These projects include transportation improvements that reduce commute times, healthcare facility upgrades that improve service quality, educational institution enhancements that benefit families, and environmental improvements that enhance community livability. Project selection explicitly considers visibility and public appreciation potential alongside technical and economic criteria.

P>Communication campaigns accompany tangible benefit delivery to ensure that citizens understand the connection between architecture cooperation and visible improvements. Campaigns employ multiple channels including traditional media, social media, community events, and direct outreach to maximize awareness. Attribution is clear and explicit: citizens should know that the new road, upgraded hospital, or scholarship opportunity results from architecture cooperation.

Opposition Management and Misinformation Response

P>The opposition management component addresses organized campaigns that seek to undermine architecture implementation through political pressure, media criticism, or public mobilization. Opposition may arise from ideological objections, genuine policy disagreements, political opportunism, or external manipulation. The framework distinguishes between legitimate criticism that should be engaged substantively and bad-faith opposition that should be exposed and neutralized.

P>For legitimate criticism, the framework encourages responsive engagement that addresses substantive concerns through policy adjustment, additional transparency, or remedial measures. When opposition reflects genuine grievances, suppression or dismissal only entrenches opposition and

undermines architecture legitimacy. Constructive engagement demonstrates responsiveness that builds trust and support.

P>For bad-faith opposition, the framework includes misinformation response capabilities that identify and counter false narratives before they achieve widespread circulation. Response measures include fact-checking and correction through credible channels, exposure of funding sources and organizational affiliations that reveal opposition motivations, and amplification of alternative narratives that provide positive context. Response is calibrated to avoid the backfire effect where visible countermeasures inadvertently amplify the misinformation they seek to counter.

H2>Public Opinion Research Methodology

P>The public opinion stabilization component employs rigorous research methodologies that provide reliable, comparable, and actionable information about public attitudes toward architecture activities. Methodological rigor ensures that public opinion data accurately reflects actual attitudes rather than artifactual measurement effects.

P>Survey design follows established principles for questionnaire construction, sampling methodology, and fieldwork procedures. Questionnaires are developed in consultation with subject matter experts, translated by certified translators, and pre-tested with target populations. Sampling employs probability methods that ensure representative coverage of target populations.

P>Fieldwork quality control ensures that surveys are administered consistently across different locations, interviewers, and time periods. Control measures include interviewer training, supervision, back-checking, and data validation. Quality standards specify minimum response rates, maximum refusal rates, and acceptable levels of item non-response.

P>Data analysis employs statistical techniques appropriate to survey data including weighting, variance estimation, and significance testing. Analysis produces estimates of population parameters with known margins of error. Trend analysis compares results across survey waves to identify attitude changes over time.

H2>Media Monitoring and Analysis

P>Media monitoring tracks how architecture-related issues are covered in traditional and social media across participating states. Monitoring identifies emerging narrative threats, assesses media tone and framing, and evaluates the reach and influence of architecture-related content.

P>Traditional media monitoring covers print, broadcast, and online news sources in multiple languages. Monitoring employs both automated text analysis that processes large content volumes and human coding that captures nuance and context. Monitoring tracks volume, tone, prominence, and framing of architecture coverage.

P>Social media monitoring tracks architecture-related content on major platforms including Twitter, Facebook, Instagram, and regional platforms. Monitoring identifies trending topics, influential voices, and viral content that shapes public perceptions. Sentiment analysis classifies content as supportive, critical, or neutral.

P>Influencer engagement identifies and cultivates relationships with individuals who shape public opinion on architecture issues. Influencers include journalists, academics, civil society leaders, religious figures, and social media personalities. Engagement provides influencers with accurate information and responds to their concerns.

H2>Strategic Communication Campaigns

P>Strategic communication campaigns are designed to achieve specific objectives including awareness building, attitude formation, behavior change, and crisis response. Campaign design follows evidence-based principles that maximize message effectiveness and resource efficiency.

P>Campaign objectives are specified in measurable terms that enable evaluation of campaign effectiveness. Objectives may include increasing awareness of architecture benefits, improving attitudes toward cooperation, encouraging supportive behavior such as voting or advocacy, and countering negative narratives during crises.

P>Target audience segmentation divides general publics into subgroups with distinctive characteristics, media habits, and message responsiveness. Segmentation enables tailoring of messages and channels to specific audience needs rather than attempting one-size-fits-all communication.

P>Message development employs framing techniques that connect architecture issues to values and concerns already salient for target audiences. Messages are tested with audience samples before full deployment to identify the most effective formulations. Message testing employs experimental designs that compare alternative formulations.

P>Channel selection matches communication channels to audience media consumption patterns and message characteristics. Channels include television, radio, print, social media, direct mail, community events, and interpersonal communication. Multi-channel campaigns maximize reach and frequency.

P>Campaign evaluation measures achievement of campaign objectives through pre-post surveys, tracking studies, and behavioral indicators. Evaluation identifies effective and ineffective campaign elements, enabling continuous improvement. Evaluation results inform future campaign design

and resource allocation.

Digital Media Strategy and Social Media Engagement

P>The public opinion stabilization component includes comprehensive digital media strategies that engage citizens through social media, websites, mobile applications, and other digital channels. Digital engagement reaches audiences that traditional media cannot effectively access, particularly younger demographics.

P>Social media strategy includes content creation, platform management, influencer engagement, and community building. Content strategy produces regular posts that explain architecture activities, highlight benefits, and address concerns. Platform management maintains active presence on major social media platforms used in participating states.

P>Influencer engagement identifies and cultivates relationships with social media personalities who have significant followings among target demographics. Influencers receive accurate information and access to architecture events, enabling them to produce informed content. Authenticity requires that influencers maintain editorial independence rather than serving as paid mouthpieces.

P>Community management maintains online communities where supporters can connect, share information, and coordinate advocacy. Communities provide social reinforcement for supportive attitudes and create networks that can be mobilized when implementation is threatened.

H2>Traditional Media Engagement and Press Relations

P>Traditional media including television, radio, and print remain important channels for reaching mass audiences, particularly older demographics and rural populations. Press relations maintain constructive relationships with

journalists and media organizations that cover architecture issues.

P>Press briefing programs provide regular briefings for journalists on architecture developments. Briefings offer opportunities for journalists to ask questions and receive background information. Briefing content includes factual updates, context, and responses to emerging issues.

P>Media monitoring tracks coverage of architecture issues across traditional media outlets. Monitoring identifies trends, emerging narratives, and influential stories. Monitoring informs media strategy by revealing what messages are resonating and what misinformation requires correction.

P>Op-ed and commentary placement places informed articles in major newspapers and magazines. Commentary by credible authors shapes elite opinion and sets agendas for public debate. Placement strategy targets outlets read by decision-makers and opinion-leaders.

H2>Public Opinion Crisis Management

P>When adverse events threaten public support, rapid crisis management is essential to prevent temporary setbacks from becoming permanent reversals. Crisis management procedures identify threats, mobilize response, and restore support.

P>Crisis identification procedures detect emerging threats to public opinion through media monitoring, polling, intelligence, and stakeholder feedback. Early identification enables prompt response before negative narratives become entrenched.

P>Rapid response teams are activated when threats are identified. Teams include communications specialists, subject matter experts, and decision-makers who can authorize responses. Teams operate under pre-established procedures that enable rapid deployment without awaiting slow deliberation.

P>Response messaging addresses the specific concerns raised by adverse events. Messaging includes factual corrections, context provision, remedial commitments, and accountability measures. Effective responses acknowledge legitimate concerns while placing events in broader perspective.

P>Recovery monitoring tracks whether crisis response succeeds in restoring public opinion. Tracking employs follow-up polling, media analysis, and behavioral indicators. If recovery is inadequate, additional measures are deployed.

Educational Outreach and Curriculum Integration

P>Educational outreach creates long-term public understanding of architecture issues by incorporating accurate information into educational curricula. Curriculum integration reaches students before they form fixed opinions and provides factual foundations for informed citizenship.

P>Curriculum development creates educational materials appropriate for different grade levels and subjects. Materials address nuclear technology, regional history, international relations, and conflict resolution. Materials are developed in collaboration with education authorities and teachers.

P>Teacher training enables educators to teach architecture-related content effectively. Training covers subject matter knowledge, pedagogical techniques, and classroom management of controversial topics. Trained teachers create multiplier effects by reaching large numbers of students.

P>Educational partnerships with universities and research institutions create advanced programs that develop expertise among future leaders. Partnerships include research centers, degree programs, and student exchange networks. Academic credibility enhances the legitimacy of architecture education.

ANNEX CS

harassment; no weapons training directed at other party's vessels; safe distance maintenance (minimum 500 yards for surface

9 vessels; minimum 1,000 feet for aircraft

overflight). Airspace Deconfliction:

All military aircraft from framework parties

file flight plans with JMOC Air Coordination Cell 4 hours before operations in the deconfliction zone (Iraq, Syria, Yemen,

Gulf airspace below FL300).

JMOC issues airspace "blocks" — time-

limited altitude assignments preventing

conflicting operations.

Emergency airspace deviation: Aircraft in

distress may deviate from assigned block; JMOC immediately notifies all affected

parties; no kinetic engagement against distressed aircraft.

Drone operations: All armed and unarmed

drone flights above 10,000 feet in deconfliction zone must be filed with JMOC; drone flight paths displayed on shared

JMOC air picture. Ground Force Deconfliction (Iraq / Syria):

Base Protection Compact perimeters (100-mile

radius around declared bases) transmitted to JMOC as exclusion zones.

Any ground force movement >500 personnel

within 50 km of another party's declared positions requires 24-hour advance notification to JMOC.

Indirect fire (rocket, mortar, drone)

landing within 5 km of declared base:

10 immediate Tier 2 notification; PERT pre-

activation; Base Protection Compact penalty assessment. 2.3 Mandatory Acknowledgment Rule (Tier 2)

All Tier 2 messages require explicit

acknowledgment within 5 minutes.

If acknowledgment is not received within 5

minutes: JMOC Military Watch Officer retransmits via alternate channel; if still no acknowledgment within 10 minutes: JMOC

Director notification to governance body neutral chair; neutral chair contacts non-responsive party's foreign ministry through protecting power (Swiss or Omani

Repeated failure to acknowledge Tier 2

messages (3+ incidents within 30 days):

+1.0 CIS procedural penalty; governance body working-level consultation; enhanced monitoring of non-responsive party's military communications posture.

Complete Tier 2 blackout >24 hours:

Automatic Step 2 Penalty Ladder activation;

Crisis Lock consideration; all other parties authorized to adopt enhanced defensive posture (increased force protection; heightened readiness) without CIS penalty.

1. TIER 3 — LEADERSHIP RESET HOTLINE

3.1 Scope and Function

Tier 3 is the executive-level backchannel activated only during imminent strategic exchange — situations

11 where misunderstanding or miscalculation could lead

to large-scale military confrontation, nuclear threat, or framework collapse. It is the "red phone" of the framework, used sparingly and only when lower tiers are insufficient. Host Platform: Physically located at the residences/offices of the respective executive

leadership, connected through a dedicated, air-gapped communications system managed by the protecting power (Sultanate of Oman).

Communication Channels:

Primary: Dedicated secure voice line

(quantum-resistant encryption; physically

separate from all other communication networks; tested daily by Omani Royal Office technical team).

Secondary: Encrypted video bridge

(activated on 15-minute notice by Omani Royal Office; neutral technician supervises connection; recording prohibited

Tertiary: Hand-delivered written message

via Omani diplomatic courier (for situations

where electronic communication is compromised or leadership requires time-delayed, carefully drafted communication).

Omani Relay Architecture:

Oman serves as the exclusive relay for

Tier 3 communications between the U.S. and

Iran. No direct U.S.-Iran electronic connection exists at Tier 3.

12 U.S. President's National Security Advisor

contacts Omani Foreign Minister via pre-established secure line.

Omani Foreign Minister contacts Iranian

Supreme National Security Council Secretary or Presidential Chief of Staff via separate pre-established secure line.

Omani Foreign Minister may add neutral

context or clarification but may NOT alter substantive content of either party's message.

Omani Royal Office maintains a confidential

log of all Tier 3 activations (date, time, parties, topic category) but does NOT

record message content. Staffing:

U.S. side: National Security Advisor or

Deputy NSA; Secretary of State or Deputy Secretary; Chairman of Joint Chiefs or Vice Chairman (for military situation

Iranian side: Secretary of Supreme National

Security Council (SNSC); Foreign Minister

or Deputy Foreign Minister; Chief of General Staff or Deputy (for military situation awareness).

Omani relay: Foreign Minister or Deputy

Foreign Minister; Royal Office Director; trusted translator (if needed — Persian and English fluency required).

No other officials present on either side

13 without mutual agreement.

3.2 Activation Triggers Tier 3 may be activated by either core party upon any of the following:

(a) Confirmed intelligence indicating imminent military attack by the other party against strategic targets (nuclear facilities,

capital city, major military bases). (b) Nuclear signaling detected (unusual movement of strategic forces; nuclear rhetoric from

senior officials; EMP or radiation anomaly). (c) Tier 2 deconfliction failure with confirmed fatalities and risk of rapid escalation

(naval engagement; air-to-air incident; ground clash). (d) PERT attribution of mass-casualty event

(25+ fatalities) at $\geq 75\%$ confidence, requiring leadership-level response selection (Column A/Column B).

(e) CIS cumulative score ≥ 12.0 (Step 3 activation) in any domain, with either party believing framework survival is at

risk. (f) Declaration by either party that the other has committed material

breach and framework

survival is threatened. (g) Activation of Emergency Override Mechanism Tier 3 (catastrophic incident: 50+

fatalities or nuclear/radiological event). 3.3 Mandatory Acknowledgment Rule (Tier 3)

The most consequential rule in the entire

RULE: A Tier 3 Leadership Reset message MUST be acknowledged within 2 hours of transmission. Ignoring a Tier 3 message —

deliberate non-response after 2 hours — is classified as a hostile act.

Consequences of Tier 3 Non-Response:

Automatic +3.0 CIS points to Security

and Proxy domain (maximum single-indicator penalty).

Automatic governance body emergency

session within 6 hours.

Automatic Crisis Lock activation (30 days). All framework benefits to non-responsive

party suspended (Humanitarian Firewall

exception: humanitarian operations continue).

IAEA monitoring continues but enhanced

to maximum intensity (daily inspections;

continuous satellite tasking).

Non-responsive party's diplomatic

personnel in framework guarantor states may be subject to restricted

movement

(protecting power discretion).

Other parties authorized to adopt

defensive strategic posture without CIS

penalty (missile defense activation; force dispersal; strategic force heightened readiness).

If non-response persists >24 hours:

matter referred to UN Security Council by both core parties and all guarantors

Good-Faith Exceptions to Mandatory Acknowledgment:

Technical failure of communications

system (proven by independent Omani

technical assessment): no penalty; alternate channel (hand-delivered courier) activated within 4 hours.

Leadership incapacitation (medical

emergency, assassination, coup): no penalty; acting leadership has 6 hours

to acknowledge; Crisis Lock activates during transition.

Force majeure (natural disaster

affecting leadership's location): no

penalty; acknowledgment deferred until communications restored. 3.4 Tier 3

Message Content Standards

Tier 3 messages should be concise (maximum

500 words written; 5 minutes spoken).

Required content: Clear statement of concern; specific factual basis; requested action or clarification; proposed de-escalation step (if applicable).

Prohibited content: Ultimatums without de-escalation pathway; personal attacks on leadership; threats of annihilation or existential destruction; claims that framework is void (framework may only be terminated through Costed Withdrawal procedures).

Omani relay may return a message for 16 revision if it violates content standards, with explanation. Party may revise and resend within 2 hours. 3.5 Tier 3 Usage Statistics and Review

Omani Royal Office publishes quarterly statistics: number of Tier 3 activations; topic categories (military, nuclear, attribution, framework survival); average acknowledgment time; average message duration; outcomes (de-escalation, escalation, unresolved).

Annual review by governance body: assess whether Tier 3 is being used appropriately (not for routine issues that belong in

Tier 1 or 2); assess whether acknowledgment rule is being respected; recommend procedural adjustments.

1. HUMANITARIAN DECONFLICTION HOTLINE (INDEPENDENT TIER)

4.1 Status and Separation The Humanitarian Deconfliction Hotline operates completely independently from Tiers 1-3. It is managed by UN OCHA, not JMOC. It may not be deactivated for any reason, including framework suspension, Crisis Lock, or even full collapse. Host Platform: UN OCHA Regional Office for the Middle East, Amman, Jordan (primary); UN OCHA Headquarters, Geneva (backup). Communication: Dedicated satellite phone network; encrypted VoIP; SMS-based alert system for humanitarian NGOs. Function: Real-time notification of humanitarian 17 convoy movements; medical evacuation coordination; hospital/facility status updates; civilian protection alerts; ICRC access coordination. Independence: Humanitarian Deconfliction Hotline staff are UN employees under UN Staff Rules; they do not report to JMOC, governance body, or any framework party. Their sole mandate is protection of civilians and humanitarian access under international humanitarian law. Cross-Reference: Full specifications in Humanitarian & Civilian Protection Modules, Module I, Section 4 (JMOC Deconfliction Integration) and Module II, Section 4 (Medical Evacuation Pathways).

MODULE II: 72-HOUR DE-ESCALATION WINDOW

Operative Clause: This module operationalizes the "no automatic retaliation" rule that pervades the entire RCSA. It creates a binding, time-locked pause between the occurrence of a harmful incident and authorized kinetic retaliation, allowing attribution processes to function, leadership communications to activate, and cooler judgment to prevail. It is

the framework's most important single circuit breaker.

This module is the authoritative source for all strike buffer rules referenced throughout the RCSA.

1. THE STANDARD 72-HOUR PAUSE

When a framework party (the "Victim State") suffers: (a) A mass-casualty event (10+ civilian or military fatalities)

18 attributed to another framework party or its proxy; OR

(b) A strike on declared critical infrastructure (power plants, water treatment facilities, port facilities, government buildings) causing >48-hour operational disruption; OR

(c) A confirmed attack on military personnel resulting in 5+ fatalities; OR (d) A chemical/biological/radiological incident causing

mass exposure; the Victim State is BOUND by a 72-hour pause before initiating kinetic retaliation against the suspected perpetrator (the

"Suspected Party"). Start of 72-Hour Window: T+0 hours, defined as the moment of JMOC confirmation that the incident has occurred

and meets threshold criteria. Confirmation requires: CPMC field report (for civilian casualties); JMOC military assessment (for military/ infrastructure

incidents); or OPCW/WHO confirmation (for CBRN incidents). End of 72-Hour Window: T+72 hours. Kinetic retaliation

may NOT be initiated before T+72 unless Active Barrage Exemption applies (Section 2) or Article 51 UN Charter self-defense override applies (Section 3).

1.2 What the Victim State MAY Do During the 72-Hour Window The pause applies ONLY to kinetic retaliation (strikes, special forces operations, direct

military action against

suspected perpetrator targets). The Victim State is PERMITTED to take all of the following non-kinetic actions during the 72-hour window:

Permitted Actions — Defensive:

Active air defense and missile defense operations

against ongoing or imminent attacks.

19 Force protection measures (dispersal, bunkering,

enhanced perimeter security) for own forces and installations.

Cyber defensive operations to neutralize incoming

cyber attacks on critical infrastructure.

Counter-battery radar activation and targeting

preparation (acquisition of firing solutions; NO actual counter-battery fire unless Active

Barrage Exemption applies). Permitted Actions — Intelligence and Attribution:

Full PERT activation and evidence collection

(satellite imagery, signals intelligence, forensic analysis, witness interviews).

JMOC deconfliction database review to identify

PHAR-registered assets in the area (determines whether strict liability applies).

Open-source intelligence monitoring and social

Intelligence sharing with guarantor states

(Oman, Switzerland, Pakistan) and neutral pool (Sweden, Singapore, Brazil, New Zealand).

Permitted Actions — Economic and Diplomatic:

Asset freezes of suspected spoiler entities

(through Spoiler Containment Protocol financial

Banking channel restrictions on suspected proxy

Diplomatic demarches through Tier 2 and Tier 3

Request for Crisis Lock activation through

20 governance body neutral chair.

Request for guarantor mediation (Oman and

Pakistan). Permitted Actions — Mobilization:

Deployment of additional forces to threatened

sectors (transparent notification through No Strategic Surprise Commitment).

Heightened readiness state (DEFCON/COMCON

increase; transparent notification required within 4 hours).

Strategic force posture adjustments (for

deterrence signaling; NOT for preparation of first strike). 1.3 What the Victim

State MAY NOT Do During the 72-Hour Window

Kinetic strikes on suspected perpetrator territory,

facilities, or forces (including drone strikes, cruise missile attacks, special forces raids,

Cyber attacks that cause physical damage to

suspected perpetrator's critical infrastructure

(offensive cyber operations causing destruction are treated as kinetic

equivalents).

Naval blockade or interdiction of suspected

perpetrator's vessels outside immediate self-

Assassination of suspected perpetrator officials

Institutional Framework for Civil Society Participation

P>Annex CS establishes the Civil Society Consultative Lane (CSCL) as a permanent institutional mechanism for incorporating civil society perspectives into architecture governance and implementation. The CSCL recognizes that sustainable architecture implementation requires public understanding and support, and that civil society organizations possess expertise, legitimacy, and grassroots connections that complement official diplomatic processes. The lane provides structured, resourced, and meaningful opportunities for civil society engagement rather than tokenistic consultation.

P>The CSCL operates through multiple mechanisms including advisory committees that provide ongoing input to architecture bodies, participatory monitoring programs that engage citizens in verifying implementation, policy forums that bring civil society and government representatives together for structured dialogue, and capacity building programs that strengthen civil society organizations' ability to participate effectively. These mechanisms accommodate diverse organizational types from large professional NGOs to grassroots community groups.

P>Participation in the CSCL is open to civil society organizations meeting criteria including commitment to peaceful engagement, organizational transparency, representative governance, and relevant expertise or constituency. Organizations need not support the architecture to participate;

critical voices are explicitly welcomed as valuable contributors to implementation improvement. Exclusion criteria are limited to organizations that advocate violence or engage in corrupt practices.

H2>Participatory Monitoring and Verification

P>The Participatory Monitoring Program engages civil society organizations in monitoring architecture implementation and reporting their findings to the Governance Body. This program leverages civil society's grassroots presence and independence to generate monitoring data that complements official monitoring by international bodies. Participatory monitoring can detect implementation gaps, local-level impacts, and community concerns that might escape centralized monitoring systems.

P>Participating organizations receive training in monitoring methodologies, data collection techniques, and ethical standards that ensure their monitoring is rigorous, objective, and respectful of affected communities. Monitoring protocols are developed in consultation with civil society to ensure that monitoring activities are feasible for organizations with varying resource levels and that monitoring focuses on issues of genuine community concern.

P>Monitoring findings are compiled into reports that are submitted to the Governance Body and made publicly available. The Governance Body is required to respond to monitoring findings, explaining how identified concerns will be addressed or why specific findings are not accepted. This response requirement creates accountability for addressing civil society-identified issues.

H2>Policy Dialogue and Deliberative Forums

P>The CSCL convenes regular policy forums that bring civil society representatives together with government officials, technical experts, and

architecture staff for structured dialogue on implementation issues. These forums provide opportunities for information exchange, perspective sharing, and collaborative problem-solving that can generate implementation improvements not achievable through separate deliberation.

P>Forum agendas are developed jointly by civil society and government representatives to ensure balanced treatment of issues that both sides consider important. Forums employ facilitated formats that encourage constructive dialogue rather than adversarial debate. Ground rules establish norms of mutual respect, factual accuracy, and confidentiality where required.

P>Forum outputs include recommendations that are formally transmitted to the Governance Body for consideration. While the Governance Body retains decision-making authority, it is required to consider CSCL recommendations and explain any decisions not to adopt them. This consideration requirement ensures that civil society perspectives receive genuine attention even when they do not prevail.

H2>Capacity Building and Network Development

P>The CSCL includes substantial capacity building support for civil society organizations from all participating states, with particular attention to organizations from states with limited civil society traditions or resources. Capacity building includes training in advocacy, monitoring, communications, organizational management, and technical subjects relevant to architecture implementation. Training is provided through regional programs that bring together civil society representatives from different states to build cross-border relationships.

P>Network development activities strengthen connections among civil society organizations across national boundaries and between civil society and international institutions. These networks enable information sharing, mutual

support, and coordinated action that amplifies civil society voice in architecture governance. Network activities include conferences, working groups, online platforms, and exchange programs that build social capital among civil society actors.

P>Funding for civil society participation addresses the resource constraints that limit many organizations' ability to engage effectively. The CSCL includes dedicated funding for organizational development, participation costs, and project implementation that enables organizations to commit staff time to architecture activities without diverting resources from their core missions. Funding is allocated through competitive processes that reward organizational quality and relevance to architecture objectives.

Civil Society Capacity Building

P>The Civil Society Consultative Lane includes substantial capacity building support that enables civil society organizations to participate effectively in architecture governance. Capacity building addresses organizational development, technical skills, and access to resources that facilitate meaningful participation.

P>Organizational development support strengthens civil society organizations' governance, management, and operational capabilities. Support includes training on strategic planning, financial management, human resources, and monitoring and evaluation. Mentoring pairs experienced organizations with emerging organizations to transfer institutional knowledge.

P>Technical skills training develops civil society expertise in areas relevant to architecture implementation. Training topics include nuclear technology basics, safeguards monitoring techniques, international law, conflict analysis, and advocacy skills. Training enables civil society to contribute substantively

to architecture discussions.

P>Resource access provides funding, equipment, and facilities that enable civil society organizations to maintain operations and participate in architecture activities. Funding includes core support for organizational sustainability and project support for specific activities. Equipment and facilities include office space, meeting venues, and technology resources.

H2>Youth Engagement and Next Generation Leadership

P>The architecture recognizes that sustainable implementation requires engagement of young people who will lead future implementation. Youth engagement programs develop next-generation leadership, create channels for youth voice, and prepare young people for roles in architecture governance and implementation.

P>Youth leadership development programs identify, train, and mentor young people with leadership potential. Programs include leadership training, internship opportunities in architecture institutions, mentorship relationships with current leaders, and platforms for youth-led initiatives.

P>Youth voice mechanisms create structured opportunities for young people to express views on architecture issues. Mechanisms include youth advisory committees, youth consultations, youth representation in governance bodies, and youth-led advocacy campaigns. Youth voice ensures that architecture decisions consider implications for future generations.

P>Youth networking connects young people across national boundaries to build relationships that sustain cooperation over time. Networks include student exchange programs, youth conferences, online communities, and alumni associations. Networks create social capital among future leaders that supports architecture continuity.

H2>Women's Participation and Gender Equality

P>The architecture promotes women's participation and gender equality as matters of both human rights and implementation effectiveness. Women's perspectives and leadership enhance architecture decision-making, and gender-responsive implementation produces better outcomes for all populations.

P>Women's leadership development programs identify, support, and promote women leaders in architecture-related fields. Programs address barriers that limit women's advancement including discrimination, family responsibilities, and limited access to networks. Leadership development creates a pipeline of qualified women for architecture positions.

P>Gender-responsive programming ensures that architecture activities consider gender differences in needs, constraints, and opportunities. Gender analysis examines how programs affect women and men differently. Gender-responsive design adjusts programs to ensure equitable benefits and address gender-specific barriers.

P>Gender-based violence prevention addresses the violence against women that undermines security and development. Prevention includes legal reform, service provision, awareness campaigns, and perpetrator accountability. The architecture explicitly prohibits gender-based violence and provides support for survivors.

H2>Indigenous Peoples and Minority Rights

P>The architecture respects the rights of indigenous peoples and minority communities affected by implementation activities. Indigenous and minority rights include self-determination, cultural preservation, land rights, and participation in decisions affecting their communities.

P>Free, prior, and informed consent requires that indigenous communities consent to activities affecting their lands and resources before implementation begins. Consent procedures ensure that communities understand proposed activities, their potential impacts, and available alternatives. Consent is obtained through representative community institutions.

P>Cultural heritage protection safeguards sites, practices, and knowledge of cultural significance to indigenous and minority communities. Protection includes impact assessment, mitigation measures, and repatriation of cultural artifacts. Heritage protection respects community protocols for sacred and sensitive materials.

P>Land and resource rights recognize indigenous and minority claims to traditional territories and resources. Rights may include ownership, use, access, and benefit-sharing arrangements. Land tenure security prevents displacement and enables sustainable resource management.

H2>Environmental Civil Society Engagement

P>Environmental organizations play important roles in monitoring architecture environmental impacts, advocating for sustainable practices, and mobilizing public support for environmental protection. The architecture engages environmental civil society as partners in environmental stewardship.

P>Environmental monitoring by civil society complements official monitoring by identifying impacts that official processes may miss. Civil society monitors employ citizen science techniques, community observation, and independent analysis. Environmental monitoring data informs architecture environmental management.

P>Environmental advocacy by civil society organizations promotes stronger

environmental standards and accountability for environmental harm. Advocacy includes public campaigns, policy recommendations, and legal challenges. The architecture respects environmental advocacy as legitimate civil society activity.

P>Environmental education by civil society organizations raises public awareness of environmental issues and promotes sustainable behaviors. Education programs complement architecture environmental programming by reaching audiences that official programs may not effectively engage.

Media Freedom and Journalist Protection

P>The architecture supports media freedom as essential for informed public participation and government accountability. Journalist protection ensures that media professionals can report on architecture implementation without fear of violence, harassment, or persecution.

P>Media freedom provisions protect journalists' ability to report independently on architecture activities. Protections include access to information, freedom from censorship, and protection from retaliation. The architecture does not censor critical reporting but engages substantively with legitimate criticism.

P>Journalist safety measures protect media professionals from violence and harassment. Measures include security training, protective equipment, emergency response capabilities, and accountability for attacks on journalists. The architecture condemns attacks on journalists as violations of architecture principles.

P>Independent media development strengthens media organizations that provide accurate, balanced coverage of architecture issues. Development includes financial support, technical assistance, and institutional capacity

building. Independent media serves as a watchdog that enhances implementation accountability.

ANNEX PH

or military commanders.

Economic sanctions "snapback" beyond Spoiler

Containment Protocol quarantine measures (full snapback requires governance body process).

21 1.4 Violation of the 72-Hour Pause

If Victim State initiates kinetic retaliation

before T+72 without Active Barrage Exemption or Article 51 override: automatic +3.0 CIS points

to Security and Proxy domain; +2.0 points to Humanitarian domain (if civilian areas affected).

Retaliatory strikes that hit PHAR-registered

assets: strict liability penalties apply (+3.0 Humanitarian +2.0 Security) IN ADDITION TO pause violation penalties.

Governance body emergency session within 12

hours of confirmed premature retaliation.

Suspected Party retains right to respond to

premature retaliation under Article 51 self-

defense; framework does not strip self-defense rights even when pause is violated.

Three pause violations by same Victim State

within 12 months: automatic Step 3 Penalty Ladder; framework benefits suspended for 45 days minimum.

1. ACTIVE BARRAGE EXEMPTION

2.1 Definition The 72-hour pause is reduced or waived when the

Suspected Party is conducting an active, continuous barrage against the Victim State such that immediate kinetic response is necessary to prevent further

loss of life or destruction of critical infrastructure. Qualifying Conditions (ALL must be met): (a) Continuous incoming fire: 3+ projectiles (ballistic missiles, rockets, mortars,

drones) OR sustained direct fire (artillery,

22 naval gunfire, air strikes) within a 6-hour

period, with indication that the barrage is ongoing (not a single volley). (b) Active threat to life or critical

infrastructure: Barrage is targeting population centers, military bases with personnel present, or critical infrastructure

currently operational. (c) Delay would increase casualties: JMOC Military Watch Officer or CPMC Director

certifies (via Tier 2 hotline within 15 minutes of assessment) that waiting for 72-hour pause expiration would result in

additional fatalities or infrastructure destruction. 2.2 Exemption Tiers

Depending on the severity and tempo of the barrage, the exemption operates at three levels: Tier 1 — 12-Hour Reduced Pause:

Trigger: Barrage meets qualifying conditions but is intermittent (3-10 projectiles per 6 hours; pauses between volleys allow civilian

evacuation and assessment). Effect: 72-hour pause reduced to 12 hours. PERT must complete preliminary attribution

within 12 hours. Victim State may initiate kinetic counter-battery fire or limited strikes on identified launch sites after

T+12 if PERT confidence $\geq 60\%$. Additional requirement: CPMC issues civilian protection alert to all parties; JMOC

23 broadcasts evacuation warning to affected

areas. Tier 2 — 2-Hour Emergency Pause: Trigger: High-tempo barrage (10+ projectiles

per 6 hours; or sustained direct fire) causing ongoing casualties with no sign of cessation.

Effect: 72-hour pause reduced to 2 hours. PERT provides rapid preliminary assessment (NOT full attribution) within 2 hours:

origin of fire; probable responsible actor; recommended countermeasures. Permitted response after T+2: Counter-

battery fire; suppression of identified launch sites; active defense against incoming projectiles; limited strikes on

command-and-control nodes directing the barrage. Prohibited: Area bombardment; strikes on

population centers; strikes beyond the immediate theater of barrage. Tier 3 — Zero-Pause Imminent Threat:

Trigger: Barrage is causing mass casualties in real time (hospital, school, or refugee camp under active fire; strategic command

center targeted; nuclear facility under kinetic attack). Effect: 72-hour pause

WAIVED. Victim State

may initiate immediate kinetic response without PERT attribution.

Requirement: Victim State notifies JMOC via

24 Tier 2 hotline within 15 minutes of

initiating response; post-action report to JMOC within 2 hours; full PERT attribution within 24 hours.

Permitted: Any kinetic action necessary to stop the ongoing attack and protect endangered personnel/civilians.

Prohibited: Retaliatory strikes beyond the immediate scope of stopping the ongoing attack; strikes on targets unrelated to

the barrage. 2.3 Post-Exemption Attribution

All kinetic action under Active Barrage

Exemption is subject to post-action PERT review.

If PERT later determines that the barrage was

NOT attributable to the targeted party: Victim State must issue public correction;

+1.0 CIS penalty for erroneous targeting; restitution for collateral damage; BAP advisory review of targeting discipline.

If PERT confirms attribution: no CIS penalty

for kinetic action taken under exemption; standard mass-casualty CIS scoring applies

for civilian harm caused by Victim State's countermeasures (per-fatality caps from Humanitarian Modules apply).

1. ARTICLE 51 UN CHARTER SELF-DEFENSE OVERRIDE

3.1 Scope Nothing in this module impairs the inherent right

of individual or collective self-defense under Article 51 of the UN Charter. If an armed attack

is ongoing and kinetic interception is required

to save lives, the 72-hour pause does not apply. 3.2 Procedural Requirements

Victim State notifies JMOC via Tier 2 hotline

within 15 minutes of initiating kinetic action under Article 51.

Victim State submits written justification to

governance body within 2 hours, including: nature of ongoing attack; why delay would result in additional casualties; scope of

kinetic response; targeting methodology.

PERT reviews Article 51 justification within

24 hours; issues proportionality assessment.

If PERT finds response disproportionate:

+1.0 CIS to Security domain; governance body consultative session.

If PERT finds response proportionate and

necessary: no CIS penalty; standard civilian harm scoring applies for any collateral damage. 3.3 Distinction from Active Barrage Exemption

Active Barrage Exemption (Section 2): Applies

to sustained indirect fire (rockets, missiles, drones) where immediate counter-battery or

launch site suppression is necessary.

Article 51 Override (Section 3): Applies to

ANY ongoing armed attack (direct military assault, invasion, occupation of territory,

attack on sovereign vessels/aircraft) where the state's survival or territorial integrity is at stake.

Both require post-action notification and

26 review; both are subject to PERT

proportionality assessment.

1. THE SHOCK RESPONSE ENVELOPE — PRE-CLEARED 72-HOUR ACTIONS

During the 72-hour pause, the Victim State may feel pressure to "do something" visible for domestic audiences. The Shock Response Envelope defines a

menu of pre-cleared, framework-authorized actions that the Victim State may take during the 72-hour window WITHOUT waiting for PERT attribution. These actions are calibrated to satisfy domestic political demand without collapsing the framework. 4.2 Pre-Cleared Menu

Column A — Leadership Voluntary Actions (governing party must select at least one within 24 hours of attribution):

A1: Public condemnation of the attack by head of government or foreign minister. A2: Proxy operative detention/arrest (if

proxy operates within Victim State's jurisdiction). A3: Financial/logistical channel cutoff to

suspected spoiler entity. A4: Cooperative investigation — invitation of PERT

and neutral investigators to incident site.

A5: Remediation plan commitment — binding 14-day plan to prevent recurrence. A6: Enhanced monitoring acceptance in

affected theater. Column B — Automatic Defaults

27 (activate if Column A not selected within

24 hours): B1: Next benefit tranche suspension (30 days) in affected domain.

B2: Enhanced monitoring activation in all proxy-affected theaters (90 days).

B3: Asset release freeze pending governance

body review. B4: Diplomatic demarche published in Transparency Summary.

B5: +2.0 CIS points to Security and Proxy domain. 4.3 Kinetic Ceiling During 72-Hour Window

Even after T+72, when kinetic retaliation becomes permissible, the following ceiling applies (absent Article 51 or Active Barrage

Permitted: Precision strikes on identified

proxy military facilities, weapons depots,

or launch sites directly linked to the attack (requires PERT attribution $\geq 75\%$ confidence).

Permitted: Counter-battery fire against

active, continuous barrages (under Active Barrage Exemption).

Permitted: Defensive naval interdiction of

vessels confirmed en route to conduct additional attacks.

Permitted: Cyber defensive operations

(neutralizing spoiler C2 networks; no critical infrastructure damage).

28 PROHIBITED: Strikes on population centers,
civilian infrastructure, or declared IAEA- monitored nuclear facilities.

PROHIBITED: Strikes on framework party
state territory outside the theater of proxy operations.

PROHIBITED: WMD use or indiscriminate area

PROHIBITED: Assassination of senior state

PROHIBITED: Comprehensive sanctions embargo
outside snapback friction ladder timeline.

PROHIBITED: Territorial seizure or permanent

1. THIRD-PARTY STRIKE BUFFER INTEGRATION

5.1 Standard Third-Party Buffer (72 Hours) If an attack is attributed to a third
party (not a framework core party — e.g., ISIS, rogue
state, criminal network):

72-hour attribution confirmation period
applies before any framework party may take
retaliatory action against the third party.

During buffer: intelligence shared through
guarantor channels (Oman relay, Swiss
protecting power, Pakistani technical assessment); PERT convenes with neutral
experts.

Guarantors issue preliminary attribution
assessment by T+48 hours.

Retaliatory action before buffer expiration

29 is considered unilateral act outside

framework authorization; may trigger framework suspension if it risks escalation with other framework parties.

5.2 Reduced Third-Party Buffer (12 Hours) — Active Continuous Barrage For third-party continuous barrage (3+

projectiles within 6 hours):

Targeted states retain right to immediate counter-battery fire and active defense.

12-hour reduced buffer applies to broader retaliatory measures.

Broader retaliatory measures require T+12 or PERT preliminary attribution (whichever

All counter-battery fire reported to JMOC

5.3 Third-Party Article 51 Override If third-party attack threatens population centers or strategic assets:

Targeted state may invoke Article 51 override immediately.

No framework penalty for self-defense against third-party attack.

Risk: self-defense against third party

may inadvertently engage framework party territory or assets (e.g., strike on

ISIS

cell in Syrian territory where Iranian forces present). Such inadvertent engagement triggers standard incident

reporting and deconfliction protocols but

30 does NOT automatically constitute

framework breach if: (a) targeting was directed at third party; (b) framework party assets were not primary target; (c)

notification to JMOC within 15 minutes; (d) restitution offered for any damage to framework party assets.

MODULE III: PROXY ACTIVITY CONTAINMENT MODULE

Operative Clause: This module maps the complete geographic and operational architecture for containing semi-autonomous armed actors across all framework-affected theaters. It formalizes the "Attributed-but-Uncontrolled" doctrine, defines Proxy Freeze Zones with automatic breach triggers,

establishes weapons transfer prohibitions verified by JMOC, and creates the state divestment pathway for sponsor states seeking to disavow rogue proxies.

This module is the authoritative source for all proxy activity

rules referenced throughout the RCSA.

1. THE "ATTRIBUTED-BUT-UNCONTROLLED" DOCTRINE

1.1 Legal Definition A proxy is "Attributed-but-Uncontrolled" when:

(a) The proxy has historically received support (financial, military, logistical, or political) from a framework party (the

"Sponsor State"). (b) The proxy conducts unauthorized military action (kinetic attack, threat, or

destabilizing activity) that violates framework obligations.

31 (c) The Sponsor State formally acknowledges

(publicly or to the governance body) that the action was not authorized and that the proxy is not acting on state orders.

(d) The Sponsor State commits to taking demonstrable action to constrain the proxy within 30 days.

1.2 Legal Effects of Attributed-but-Uncontrolled Classification

The Sponsor State is NOT held responsible for

the proxy's unauthorized action AS A STATE- LEVEL BREACH. Standard state-level CIS penalties (per-fatality scoring, Step 3 activation) are DEFERRED.

The proxy itself is subject to full Spoiler

Containment Protocol 2.0 treatment: financial quarantine; operational isolation; asset

freeze; exclusion from all framework benefits.

The Sponsor State must demonstrate action to

constrain the proxy within 30 days.

Demonstrable action includes: financial cutoff; military repositioning away from proxy bases; public denunciation; arrest of

proxy commanders (if within Sponsor State's jurisdiction); cooperation with PERT investigation.

If Sponsor State successfully constrains the

proxy within 30 days: no state-level CIS penalty; proxy remains quarantined;

Sponsor

State receives 0.5-point CIS credit for good-faith divestment.

32 If Sponsor State fails to constrain the proxy

within 30 days: automatic state-level accountability. The "uncontrolled" claim is no longer accepted. CIS penalties apply

retroactively for the original incident plus continuing violations. State divestment pathway escalates to mandatory.

1.3 Formal Acknowledgment Procedure To claim Attributed-but-Uncontrolled status, the Sponsor State must submit to the governance body

within 7 days of the incident:

Written acknowledgment that the proxy acted

without state authorization.

Specific commitment to constraint measures

Request for JMOC verification of constraint

Agreement to accept PERT investigative

The acknowledgment does NOT constitute

admission of state responsibility for the specific attack; it is a procedural prerequisite for accessing the doctrine's

protections. 1.4 One-Time Doctrine The Attributed-but-Uncontrolled doctrine may be

invoked by the same Sponsor State for the SAME proxy maximum TWO times within a 12-month period. A third invocation for the same proxy is not accepted — the proxy is deemed de facto under

Sponsor State control, and state-level penalties

33 apply immediately without 30-day grace period.

1. PROXY ACTIVITY CAP SYSTEM

2.1 Cap Definitions by Theater The following quantitative caps govern proxy military activity. Activity below caps is logged but does not trigger CIS penalties. Activity exceeding caps triggers automatic escalation.

Theater 1 — Yemen: Cap: 2 indirect fire incidents (rockets, missiles, drones) per 30-day period.

Scope: Attacks on Saudi/UAE territory, Red Sea shipping, or Yemeni government forces.

Breach trigger: 3rd incident within 30 days. Automatic consequence: +1.0 CIS Security; PERT pre-activation; enhanced monitoring

in Yemen theater. Escalation: 5+ incidents within 30 days = mass-casualty threshold; Emergency

Long-Term Political Scenarios and Strategic Planning

P>Annex PH provides a framework for long-term political horizon scanning that enables architecture participants to anticipate and prepare for major political developments that could affect implementation over the extended timelines required for comprehensive architecture operation. The framework recognizes that the architecture will operate through multiple electoral cycles, leadership transitions, and potentially fundamental shifts in regional and international politics. Preparing for these shifts through scenario planning and strategic foresight enhances architecture resilience.

P>The scenario planning methodology develops multiple plausible future

scenarios based on identified drivers of change and critical uncertainties. Scenarios are not predictions of what will happen but rather descriptions of what could happen under different combinations of circumstances. By exploring multiple scenarios, the framework enables participants to identify strategies that perform robustly across different possible futures rather than optimizing for a single expected outcome that may not materialize.

P>Scenario development begins with driver identification that catalogues the forces shaping the regional environment including demographic trends, economic developments, technological changes, political dynamics, and international relationships. Critical uncertainties are identified as drivers whose direction is particularly uncertain and whose outcomes would significantly affect architecture implementation. Scenario narratives are constructed around different combinations of critical uncertainty outcomes.

H2>Strategic Adaptation Mechanisms

P>The horizon framework includes mechanisms for adapting architecture strategy as the future unfolds differently than expected. These mechanisms enable timely adjustment without requiring fundamental renegotiation of architecture commitments. Adaptation occurs through regular strategic reviews, flexible implementation procedures, and pre-authorized adjustment authorities that permit responsive action without protracted deliberation.

P>Regular strategic reviews are conducted annually to assess whether the assumptions underlying current implementation strategies remain valid. Reviews examine whether actual developments align with scenario expectations, whether new drivers have emerged that require attention, and whether existing strategies require modification. Review findings are reported to the Governance Body with recommendations for any indicated adjustments.

P>Flexible implementation procedures enable adjustment of tactics within

agreed strategic frameworks without requiring formal amendment processes. Implementation units have authority to modify program design, resource allocation, and operational approaches within parameters established by the Governance Body. This flexibility enables responsive adaptation to changing local conditions without the delays inherent in formal decision processes.

H2>Relationship Transformation Pathways

P>The political horizon framework includes analysis of potential pathways through which adversarial relationships among participating states might transform into cooperative relationships over time. While the architecture does not assume such transformation, it creates conditions that facilitate positive relationship evolution through sustained interaction, mutual benefit generation, and confidence accumulation.

P>Confidence accumulation pathways identify specific interactions through which trust can be built incrementally over time. Successful joint monitoring activities demonstrate that cooperation can produce mutual benefits. Crisis management through architecture channels demonstrates that communication can prevent escalation. Economic cooperation creates stakeholder relationships that transcend political differences. Each positive interaction accumulates in a reservoir of mutual confidence that can support future cooperation.

P>Graduated normalization identifies potential milestones in relationship improvement including expanded diplomatic representation, cultural and educational exchanges, security cooperation, and eventual alliance-like relationships. The framework does not assume that all relationships will progress through all stages but provides pathways for those that do, with appropriate institutional frameworks at each stage.

H2>External Shock Preparation and Response

P>The horizon framework prepares architecture participants for external shocks that could fundamentally alter the regional environment. These shocks include major power realignments, global economic crises, pandemics, climate catastrophes, and technological disruptions. Preparation includes scenario analysis, contingency planning, and resilience building that reduces vulnerability and enhances adaptive capacity.

P>Major power realignment scenarios examine how changes in great power relationships could affect regional dynamics. Scenarios include increased U.S.-China competition, U.S. strategic retrenchment from the Middle East, Russian regional reassertion, and Chinese economic expansion into the region. Each scenario assesses implications for architecture implementation and identifies strategies for maintaining architecture effectiveness under different great power configurations.

P>Economic shock preparation addresses the vulnerability of architecture implementation to global or regional economic crises. Financial arrangements include counter-cyclical elements that maintain architecture funding during economic downturns. Economic diversification programming reduces dependence on sectors vulnerable to external shocks. Social safety net components protect vulnerable populations during crises, preventing economic distress from translating into political opposition to architecture cooperation.

H2>Long-Term Political Horizon Scenarios

P>The Political Horizon Note examines long-term scenarios that could fundamentally alter the regional political environment over the extended timeframes required for comprehensive architecture implementation. Horizon scenarios extend beyond the near-term political cycle to examine structural transformations.

P>Great power rebalancing scenarios examine how shifts in relative power among the United States, China, Russia, and other major powers could affect regional dynamics. Scenarios include continued U.S. primacy, multipolar competition, Chinese regional ascendancy, and U.S. strategic retrenchment. Each scenario has distinctive implications for architecture sustainability.

P>Regional power shift scenarios examine how changes in relative power among regional states could affect architecture dynamics. Scenarios include Iranian regional integration, Saudi-Iranian rapprochement, Turkish regional assertiveness, and Israeli normalization. Power shifts create new opportunities and challenges for architecture governance.

P>Demographic transformation scenarios examine how population changes including youth bulge maturation, aging, urbanization, and migration could affect regional politics. Demographic scenarios inform long-term architecture planning for education, employment, and social services.

P>Technological disruption scenarios examine how advances in energy, artificial intelligence, biotechnology, and other technologies could reshape regional economies and military balances. Technology scenarios inform architecture adaptation to technological change.

Strategic Foresight and Horizon Scanning

P>The architecture employs strategic foresight methodologies to anticipate future developments and prepare for multiple possible futures. Foresight complements traditional planning by examining uncertainty rather than assuming predictable futures.

P>Horizon scanning systematically examines emerging issues, trends, and weak signals that may indicate future developments. Scanning employs multiple information sources including academic research, intelligence

reporting, media monitoring, and expert networks. Scanning identifies emerging issues before they become obvious.

P>Scenario development creates multiple plausible future scenarios that capture the range of possible outcomes. Scenarios are not predictions but rather descriptions of possible futures that help participants prepare for uncertainty. Scenario development employs structured methodologies that ensure comprehensiveness and creativity.

P>Backcasting works backward from desired future outcomes to identify the steps required to achieve them. Backcasting complements forecasting by focusing on what must be done to reach preferred futures rather than merely predicting what will happen. Backcasting informs architecture strategy by identifying actions that increase the probability of desired outcomes.

Architecture Adaptation and Evolution

P>The architecture must evolve to remain relevant as circumstances change. Adaptation mechanisms enable architecture modification without requiring complete reconstruction.

P>Regular review procedures examine architecture performance and relevance at specified intervals. Reviews assess whether objectives remain appropriate, whether measures remain effective, and whether institutional arrangements remain fit for purpose. Review findings inform amendment priorities.

P>Amendment procedures enable modification of architecture provisions when review findings indicate the need for change. Amendment balances the need for adaptability against the need for stability and predictability. The tiered amendment framework permits rapid technical updates while requiring broader consensus for fundamental changes.

P>Sunset and renewal provisions require periodic reconsideration of specific architecture components. Components that are no longer needed can be terminated; components that remain relevant can be renewed with updated terms. Sunset provisions prevent obsolete components from consuming resources and attention.

P>Institutional learning ensures that architecture institutions incorporate lessons from implementation experience. Learning mechanisms include after-action reviews, evaluations, audits, and knowledge management systems. Institutional learning prevents repeated mistakes and enables continuous improvement.

ANNEX C2

Commodities: Pharmaceuticals, medical devices, specialized equipment (x-ray, dialysis, ventilators).

Capacity: 20 tons pharmaceutical + 5 tons medical

Inspection: WHO technical inspection at Ashkelon

pre-staging facility; Israeli customs rapid clearance for pre-cleared humanitarian manifest; 6-hour maximum clearance.

Prohibited items verification: All cargo scanned

via dual-energy x-ray and canine detection; any cargo triggering security alert diverted to neutral

6 inspection team (Swiss or Omani technicians) at

Cyprus Limassol hub for secondary verification. Tier S — Erez Crossing (Israel-Gaza, North):

Commodities: Medical personnel rotation, priority

medical evacuation patients, emergency medical supplies.

Capacity: 50 priority medical patients per month

minimum; 10 medical personnel rotations per week.

Verification: WHO patient referral list; ICRC

medical escort; ambulance convoy 3 times per week minimum.

Tier A — Aid-by-Sea (UN-Mediated):

Route: Port of Ashdod or Limassol (Cyprus) →

Gaza maritime corridor → anchorage off Gaza coast.

Vessels: World Food Programme maritime delivery;

UN-flagged cargo vessels only; no dual-use cargo permitted on maritime route (food, water, medicine

Inspection: Pre-loading inspection at origin port

by UN OCHA and ICRC; seal applied; no intermediate stops; GPS tracking continuous.

Escort: UN maritime coordination cell; naval

deconfliction via JMOC maritime feed; IHTA toll waived for humanitarian vessels (automatic, no

application required). Tier E — Gaza Air Bridge:

Trigger: All Tier S and Tier A routes simultaneously closed for >72 hours.

Route: Amman (Marka Military Airport) or El Arish

→ Gaza airdrop zone (pre-coordinated with JMOC).

7 Authority: UN OCHA activates without governance body approval; notification within 4 hours of activation.

Cargo: High-nutrition food packets, medical emergency kits, water purification tablets only.

1.3 Lebanon Corridor Network Tier S — Mediterranean Maritime Route:

Origin: Port of Mersin (Turkey) or Piraeus (Greece). Destination: Port of Tripoli (Lebanon). Commodities: Emergency fuel, wheat, medical supplies,

desalination unit components.

Capacity: \$150 million quarterly fuel shipments

(Months 1-6 baseline); scaling to \$300 million under surge protocol.

Inspection: UN OCHA pre-clearance at origin port;

Lebanese customs expedited clearance (pre-approved humanitarian manifest);

24-hour maximum port processing.

JMOC feed: Vessel GPS coordinates transmitted to

JMOC maritime cell 24 hours before arrival; port deconfliction confirmed.

Tier S — Land Bridge (Jordan-Syria-Lebanon):

Route: Ramtha (Jordan) → Daraa (Syria) → Masnaa

(Lebanon border) → Bekaa Valley distribution hub.

Commodities: Food, agricultural inputs, medical

Neutral staging: Al-Mafraq Humanitarian Logistics

Hub (Jordan); all cargo inspected, sealed, and GPS

tagged before border crossing.

Security: UN OCHA-coordinated convoy; Syrian

transit deconflicted via JMOC; Lebanon border

8 crossing pre-cleared with Lebanese Armed Forces.

Tier A — Beirut Rafic Hariri Airport Air Bridge:

Activated for: Medical evacuations, emergency

pharmaceutical delivery, specialized equipment.

Pre-cleared cargo: WHO Emergency Supply Program

(\$100 million over 6 months); medicines, medical devices, oxygen.

1.4 Yemen Corridor Network Tier S — Hudaydah Port:

Commodities: Food, fuel, medical supplies,

Capacity: 48-hour maximum vessel clearance under

UN-certified humanitarian inspection.

Inspection regime: UNVIM (UN Verification and

Inspection Mechanism) + enhanced framework dual-use cargo screening.

Revenue escrow: All port revenue flows to monitored

escrow account (40/40/20 split per Yemen Stabilization Framework). Tier S —

Sana'a Airport:

Medical evacuation flights with pre-cleared

No cargo restrictions on medical flights. UN OCHA coordinates manifests 48 hours before

each flight; JMOC receives passenger count only

(no identity details — privacy protection). Tier S — Aden Port:

Unrestricted for humanitarian and commercial goods. Secondary inspection available for cargo requiring

dual-use verification.

Tier A — Saudi Border Crossing (Al-Wadiah):

9 Land route for northern Yemen relief. Requires Saudi-UN joint inspection at border.

1.5 Syria Corridor Network

Zone 1 (Daraa/South): Full humanitarian access via Jordan land bridge; UN OCHA field office in Daraa city; full corridor operations.

Zone 2 (Coastal/Rural Damascus): Conditional access via Beirut-Tripoli-Damascus route; demining priority for corridor clearance.

Zone 3 (Aleppo/North): Cross-line access from Turkish border via Bab al-Hawa; UN cross-line coordination cell; trade corridor opening conditional on security metrics. Zone 4 (Northeast/Kurdish): Access via Iraq border (Rabia-Yarubiyah); anti-ISIS coordination priority;

border management support. Zone 5 (Idlib): Humanitarian corridor only; no return, no reconstruction; Idlib Mass-Displacement Protocol

activates automatically (50,000 IDP threshold to Aleppo; 30,000 to Coastal zone). 1.6 Iraq Corridor Network

Tier S — Jordan-Iraq Route (Trebil-Al-Rutba-Baghdad):

Primary land route for Gulf humanitarian cargo

destined for central and northern Iraq.

UN OCHA convoy coordination; Iraqi security forces

escort within Iraq territory. Tier A — Turkey-Iraq Route (Habur-Zakho):

Northern Iraq access for Syrian refugee camp

support and Kurdish region aid.

Turkish customs pre-clearance for humanitarian

10 1. DUAL-USE CARGO VERIFICATION REGIME

2.1 Purpose and Principle The dual-use cargo verification regime exists to strip away the primary excuse used to block humanitarian aid: the

claim that weapons, explosives, or military materiel are hidden in humanitarian convoys. By establishing neutral, transparent, internationally supervised inspection at

designated staging hubs, the regime makes continued blocking of verified humanitarian cargo a strict liability violation of framework obligations.

2.2 Neutral Staging Hub Network Hub Alpha — Arish Humanitarian Logistics Hub (Egypt):

Primary inspection point for all Gaza-bound cargo. Managed by: UN OCHA + ICRC + Egyptian Red Crescent. Technical inspection: Dual-energy x-ray scanners

(capable of detecting anomalies in organic cargo);

chemical trace detection (explosives/narcotics); canine units (3 teams on rotation); physical random sampling (5% of pallets per convoy).

Neutral observer presence: Swiss and Omani

technical observers with full inspection rights; Israeli technical observer permitted (advisory only, no veto).

Inspection certificate: UN OCHA issues

"Humanitarian Cargo Verification Certificate" (HCVC) for each cleared convoy; certificate

includes: manifest reconciliation; scan results; sample analysis; seal numbers; GPS tracker IDs; certificate valid for 72 hours from issuance.

Hub Beta — Al-Mafraq Humanitarian Logistics Hub (Jordan):

Primary inspection point for Syria and Lebanon

11 land corridor cargo.

Same technical capabilities as Hub Alpha. Additional function: Agricultural input

verification (seed, fertilizer testing for chemical weapon precursor detection).

Hub Gamma — Limassol Maritime Inspection Facility (Cyprus):

Maritime inspection for Mediterranean humanitarian

cargo; secondary inspection for cargo triggering alerts at other hubs.

Managed by: UN OCHA + Cyprus Customs + WHO

Container scanning: Non-intrusive inspection (NII)

scanners capable of full-container radiographic imaging. Hub Delta — Muscat Pre-Clearance Facility (Oman):

Air cargo and Gulf maritime inspection. Coordinates with IHTA for toll-exempt humanitarian

vessel certification. Hub Epsilon — Dubai International Humanitarian City:

Pre-positioned stockpile inspection and dispatch

coordination for rapid deployment (see Module III). 2.3 Prohibited and Controlled Items Matrix Category H1 — Unconditionally Permitted (No inspection

delay permitted): Food (wheat, rice, oil, dried goods, baby formula) Potable water and water treatment chemicals

Medicine (all WHO Essential Medicines List categories) Medical devices (non-implantable: syringes, bandages, splints, wheelchairs)

Fuel for hospitals and water treatment (diesel, gasoline marked with fluorescent dye for

12 end-use verification)

Temporary shelter materials (tents, plastic sheeting) Hygiene supplies (soap, sanitary products, diapers) Educational materials

Clothing and blankets Category H2 — Permitted with Enhanced Verification (48-hour clearance):

Medical devices (implantable or diagnostic: x-ray machines, CT scanners, dialysis units) Ambulances and medical transport vehicles

Generators (>50 kVA capacity) Communications equipment (satellite phones, radios for humanitarian coordination only)

Construction materials for medical/humanitarian facilities (cement, steel rebar — subject to end-use verification)

Solar panel systems for hospitals and water treatment Category H3 — Restricted (Requires governance body

notification; may be denied): Vehicles with military-grade armor or off-road capability

Night vision or thermal imaging equipment Drones (any size) — except UN-marked humanitarian survey drones

Ballistic protective equipment (body armor, helmets) Barbed wire or security fencing materials Any item on UN Security Council sanctions list

Category H4 — Prohibited (Automatic denial; presence in cargo triggers convoy rejection): Weapons of any kind (firearms, ammunition,

13 explosives, blades)

Military equipment (uniforms, helmets, tactical gear) Dual-use chemicals with weapons applications (precursor chemicals, certain industrial solvents)

Communications jamming or signals intelligence equipment Any item

designated by IAEA as nuclear-related

dual-use Cash or precious metals (unless ICRC-authorized for detainee welfare)

2.4 Strict Liability for Blocking Verified Cargo Any framework party or proxy that blocks, delays beyond inspection timelines, diverts, or destroys humanitarian

cargo carrying a valid HCVC (Humanitarian Cargo Verification Certificate) is subject to:

Immediate +2.0 CIS points to Humanitarian and

Automatic governance body emergency session within

Mandatory restitution: replacement cargo dispatched

within 72 hours at blocking party's expense (or escrow deduction if expense not voluntarily paid).

If blockade persists >7 days: Enhanced monitoring

in all domains for 90 days; Step 2 penalty ladder activation in domain of blocking party's primary framework obligations.

1. MILITIA/SPOILER EXTORTION SHIELD

3.1 Absolute Prohibition on Humanitarian Taxation No framework party, proxy, militia, or sub-state actor

shall levy any form of "tax," "toll," "escort fee," "transit fee," "protection payment," or "customs duty"

14 on humanitarian cargo, convoys, or personnel operating

under this annex. This prohibition applies to:

All land corridors within framework-affected

All maritime routes designated as humanitarian

All air bridges and medical evacuation flights. All distribution hubs, warehouses, and field

hospitals receiving framework-aided supplies.

3.2 Violation Classification and Automatic Consequences Level 1 — Demand Without Collection: A spoiler or proxy publicly or privately demands

payment from humanitarian convoy operators, NGOs, or UN agencies. Consequence: Automatic incident registry entry;

JMOC spoiler alert; enhanced monitoring of spoiler's financial channels; +0.5 CIS points to Humanitarian domain.

Level 2 — Coerced Collection: Actual extraction of goods, fuel, cash, or services from humanitarian convoy under threat

or force. Consequence: Automatic Spoiler Containment Protocol 2.0 activation (Module III of Enforcement &

Dispute Resolution); financial quarantine of spoiler accounts; +1.5 CIS points to Humanitarian domain; +1.0 CIS points to Security and Proxy

domain. Level 3 — Systematic Predation: Pattern of 3+ Level 2 incidents within 90 days;

OR establishment of semi-permanent "checkpoint"

15 taxing humanitarian traffic.

Consequence: Full Spoiler Containment Protocol 2.0 Tier 3 activation; state divestment pathway mandatory for host government; Step 3 Graduated

Penalty Ladder activation; +3.0 CIS points to Humanitarian domain (maximum single-indicator penalty).

3.3 NGO Protection Protocol Humanitarian organizations operating under this annex are granted the following protections:

UN-flagged NGO vehicles, facilities, and personnel

are designated as protected civilian objects under international humanitarian law; deliberate targeting

is a war crime and a framework material breach.

NGO convoy GPS coordinates transmitted to JMOC 24

hours before movement; coordinates locked into JMOC deconfliction database; any military strike

on a deconflicted asset is strict liability (see Section 4 below).

NGO personnel carrying valid UN OCHA-issued

humanitarian access credentials may not be detained, arrested, or denied transit by any framework party or proxy without immediate ICRC notification and

48-hour release requirement.

Framework escrow fund provides automatic

compensation to NGOs for convoy losses due to

spoiler activity, military strikes, or theft: \$50,000 per vehicle; \$200,000 per warehouse; \$1,000,000 per fatality of NGO personnel.

1. JMOC DECONFLICTION INTEGRATION

4.1 GPS Coordinate Registration Protocol

16 All humanitarian static assets and mobile convoys must

register with JMOC for military deconfliction: Registration Requirement:

Static assets (hospitals, warehouses, distribution centers, field clinics, water treatment plants, camps): Permanent registration within 14 days of facility

establishment or activation. Coordinates provided to JMOC within 0.001-degree precision (approximately 100m radius).

Mobile convoys: Registration 24 hours before movement; GPS tracker ID transmitted; planned route uploaded to JMOC mapping interface; real-time position updates every 15 minutes

Medical evacuation movements: Registration 4

hours before movement (expedited track);

priority deconfliction status; real-time position updates every 5 minutes. 4.2

JMOC Deconfliction Database

All registered humanitarian assets entered into

JMOC "Protected Humanitarian Asset Registry" (PHAR).

PHAR is real-time synchronized with:

* U.S. CENTCOM operational planning systems (sanitized feed — humanitarian zones only, no

military operational data). * Iranian Armed Forces operations center (sanitized feed).

* Israeli military coordination cell (via Oman relay — sanitized feed).

17 * Saudi/UAE coalition operations center (Yemen

theater only). * UN OCHA coordination center.

PHAR updates pushed to all connected military

operations centers within 15 minutes of registration or route change.

PHAR is accessible to all framework parties via

encrypted read-only terminals (Module III of Verification & Technical Architecture). 4.3 Strict Liability for Striking Deconflicted Assets

Any military strike — kinetic, drone, or cyber — on an asset registered in PHAR at the time of the strike is a strict liability violation: Strict Liability Definition:

Architecture Command and Coordination Framework

P>Annex C2 establishes the command and coordination framework through which architecture activities are directed, coordinated, and synchronized across multiple institutions, states, and functional domains. Unlike traditional military command structures, the architecture employs a coordination framework that respects national sovereignty while enabling effective collective action. The framework distinguishes between command functions that direct architecture institutional activities and coordination functions that align national actions without supplanting national command authority.

P>The Governance Body exercises ultimate authority over architecture command and coordination decisions, but delegates operational coordination to the Executive Secretary and the Joint Monitoring Operations Center. The Executive Secretary coordinates institutional activities across the architecture's multiple bodies, ensuring that secretariat, monitoring, enforcement, and development functions operate coherently toward shared objectives. The JMOC coordinates security-related activities including information sharing, incident response, and crisis management.

P>National coordination points in each participating state serve as the interface between architecture coordination and national decision-making.

These points are staffed by senior officials with authority to represent their governments in architecture coordination processes and to commit national resources to coordinated activities. The authority of coordination points is specified in national implementing legislation that ensures they can act promptly without requiring case-by-case ministerial approval.

H2>Crisis Command and Decision-Making

P>During crisis situations, the coordination framework transitions to a more centralized crisis command mode that enables rapid decision-making without the delays inherent in consultative processes. Crisis command authority is pre-assigned to designated officials who can make time-urgent decisions within specified parameters. These parameters limit the scope of crisis command authority to actions necessary for immediate threat response, with follow-up political review of crisis decisions.

P>Crisis command protocols specify exactly what decisions can be made under crisis authority, by whom, under what conditions, and with what reporting requirements. Communications procedures ensure that crisis commanders can reach all relevant parties rapidly through redundant communication channels. Pre-scripted response options enable rapid selection from approved alternatives rather than ad hoc improvisation during crisis pressure.

P>The crisis command transition is triggered by specified events including military incidents, detected nuclear violations, terrorist attacks, or declaration of emergency by participating states. Once triggered, crisis command procedures remain in effect until the Governance Body or its designated crisis management committee terminates the crisis command status. Transition back to normal coordination procedures includes after-action review to capture lessons learned.

Command Authority and Decision Rights Matrix

P>The architecture's command and coordination framework specifies decision rights across multiple levels and functions. The Decision Rights Matrix identifies who has authority to make what decisions, under what circumstances, and with what accountability requirements.

P>Strategic decisions, including pathway selection, major policy changes, and architecture termination, are reserved to the Governance Body. Strategic decisions require specified voting thresholds and are binding on all architecture institutions and participating states.

P>Operational decisions, including program implementation, resource allocation within approved budgets, and routine policy adjustments, are delegated to the Executive Secretary and subsidiary bodies. Operational decisions must conform to strategic guidance and are subject to Governance Body oversight.

P>Tactical decisions, including day-to-day implementation activities, response to routine situations, and administrative matters, are delegated to program managers and operational staff. Tactical decisions must conform to operational guidance and standard operating procedures.

P>Emergency decisions, including crisis response, security measures, and urgent resource reallocation, are delegated to designated emergency authorities. Emergency decisions are subject to time limits and require prompt reporting to appropriate authorities for confirmation or modification.

H2>Coordination Mechanisms Among Architecture Institutions

P>Multiple architecture institutions must coordinate their activities to ensure coherent implementation. Coordination mechanisms include regular consultations, joint planning, information sharing, and shared performance

monitoring.

P>Regular consultations among institutional leaders address overlapping responsibilities, resource sharing, and policy consistency. Consultations occur at scheduled intervals and on an ad hoc basis when coordination needs arise. Consultation minutes document agreements and action items.

P>Joint planning ensures that institutional work programs are aligned and complementary. Planning addresses shared objectives, resource requirements, timeline coordination, and risk management. Joint plans are reviewed and updated periodically.

P>Information sharing among institutions ensures that all relevant parties have access to information required for their functions. Sharing protocols specify what information is shared, with whom, under what conditions, and with what protections. Information sharing agreements protect sensitive information while enabling effective coordination.

H2>Crisis Decision Simulation and Exercises

P>The architecture conducts regular crisis decision exercises that test command and coordination procedures under simulated emergency conditions. Exercises identify weaknesses in procedures, personnel, and systems that require correction before actual crises occur.

P>Exercise design follows established principles including clear objectives, realistic scenarios, appropriate participation, and structured evaluation. Exercises range from tabletop discussions through functional exercises to full-scale simulations. Exercise complexity increases as institutions mature.

P>Exercise participation includes decision-makers, staff, and external partners who would be involved in actual crisis response. Participation ensures that all relevant parties understand their roles and can perform them under stress.

Observer participation provides perspectives from parties not directly involved in crisis response.

P>Exercise evaluation assesses whether exercise objectives were achieved, identifies weaknesses revealed during exercises, and generates recommendations for improvement. Evaluation employs structured frameworks that assess performance against established standards. Exercise findings inform procedure revision, training priorities, and resource allocation.

ANNEX CT

No justification accepted. Intent, targeting error, intelligence failure, or "fog of war" are not defenses. If the asset was in PHAR

when struck, liability attaches automatically. Immediate Consequences:

Automatic +3.0 CIS points to Humanitarian

domain (maximum single-indicator penalty).

Automatic +2.0 CIS points to Security and

Crisis Lock activation (14 days minimum). Governance body emergency session within

Mandatory restitution: full reconstruction

or replacement cost + \$500,000 per civilian

fatality + \$100,000 per civilian injury, paid within 30 days via escrow deduction or direct transfer.

18 Public attribution by JMOC Director within

48 hours (no preliminary attribution deliberation required for PHAR strikes).

Escalation:

If same party strikes 2+ PHAR-registered

assets within 30 days: automatic Step 3 Graduated Penalty Ladder activation; all

non-humanitarian benefits suspended in affected domain.

If PHAR-registered hospital or medical

facility struck: Emergency Override

Mechanism Tier 2 activation minimum; potential Tier 3 if fatalities exceed 25.

4.4 Deconfliction Failure Safeguards

If PHAR database experiences technical failure

(data not transmitted to military operations centers), humanitarian assets maintain protected

status if registration was properly submitted to JMOC within required timelines. Burden of proof is on the striking party to demonstrate

that JMOC failed to disseminate registration.

If humanitarian convoy deviates >500m from

registered route without updating JMOC,

deconfliction protection is suspended for the deviation period only; protection reactivates upon route correction or JMOC update.

If humanitarian facility's protected status

is revoked due to confirmed military use (weapons storage, combatant presence), JMOC Director must issue 48-hour advance warning

before PHAR de-registration; facility may

19 appeal to BAP Expedited Track within 24 hours.

1. CONVOY OPERATIONAL STANDARDS

5.1 Convoy Composition and Marking

Minimum convoy size: 4 vehicles (for security

against isolated criminal attack) / maximum 20 vehicles (to prevent target concentration).

All vehicles: White with UN, ICRC, or

registered NGO logo on all sides; roof panels

with high-visibility blue marking; flags visible front and rear.

No weapons visible in any humanitarian vehicle;

UN security officer firearms concealed except in active self-defense.

Each vehicle carries: GPS tracker (tamper-

evident); two-way radio (JMOC frequency); first aid kit; fire extinguisher;

manifest copy; HCVC (where applicable); and driver/

passenger identification. 5.2 Communication Protocol

Convoy check-in: Every 2 hours with JMOC

operations cell; automated GPS position updates every 15 minutes.

Incident reporting: Any checkpoint delay >30

minutes; any threat or demand for payment; any

deviation from route; any damage to vehicle or cargo — all reported to JMOC within 15 minutes via encrypted satellite communicator.

Emergency beacon: Dedicated panic button

transmitting GPS coordinates to JMOC, UN OCHA, and nearest UN military liaison; triggers

automatic deconfliction broadcast to all

20 military operations centers.

5.3 Distribution Chain Integrity

Final distribution of humanitarian supplies

to end beneficiaries verified via:

Biometric or token-based recipient registration (UNHCR/WFP standard).

Random post-distribution monitoring (10%

of recipients interviewed within 7 days). * Warehouse inventory management system (real-time stock tracking from arrival through distribution).

Diversion detection: Significant discrepancy

(>5%) between delivered quantities and distributed quantities triggers investigation

by UN OCHA inspector; suspected theft or spoiler diversion reported to JMOC for Spoiler Containment Protocol activation.

MODULE II: CIVILIAN PROTECTION MONITORING CELL (CPMC)

Operative Clause: This module establishes the Civilian Protection

Monitoring Cell (CPMC) as an independent, neutral source of verified truth regarding civilian harm, humanitarian blockages, and protection violations across all framework-affected theaters. The CPMC bypasses

the "he-said, she-said" propaganda cycle that historically derails peace frameworks by producing forensic-quality findings with automatic legal weight under the Graduated Penalty Ladder. All CPMC operations are classified Tier 1.

1. NEUTRAL COMPOSITION AND STAFFING

21 1.1 Core Staffing (Permanent)

The CPMC is an autonomous entity within the JMOC structure but with operational independence from both the JMOC fusion intelligence function

and the PERT attribution function. Its staff composition

is strictly limited to: Director (1):

Appointed by WHO Director-General on

recommendation of UN OCHA and confirmed by governance body consensus.

Nationality: Non-framework-party citizen;

medical or public health background preferred.

Term: 4 years, renewable once. Authority: Sole authority to approve CPMC

report publication; may not be overridden by JMOC Director or governance body (reports are

advisory to governance body but binding for CIS scoring purposes). Deputy Director — Field Operations (1):

Appointed by UN OCHA; former senior humanitarian

Manages all field monitoring teams, hospital

audits, and convoy observation.

Deputy Director — Analysis and Forensics (1):

Swiss national, appointed by Swiss Federal

Department of Foreign Affairs.

Manages data analysis, forensic methodology,

and CIS integration. Senior Medical Officer (1):

WHO secondment; trauma surgeon or emergency

medicine specialist with mass-casualty event experience.

22 Leads mortality verification and medical

infrastructure assessment. Neutral Guarantor Observers (4):

Switzerland (1): Forensic pathologist or

Oman (1): Humanitarian operations specialist

with regional experience.

Pakistan (1): Public health statistician or

Rotating fourth seat (Sweden, Brazil,

Singapore, or New Zealand): Additional

technical capacity as needed. UN OCHA Humanitarian Analysts (4):

Seconded from UN OCHA headquarters and

Responsible for corridor monitoring, aid

flow tracking, and distribution verification. ICRC Protection Delegates (2):

ICRC secondment; detention and civilian

protection specialists.

Independent reporting line to ICRC

headquarters (not CPMC Director) for detention-related findings. Total

Permanent Staff: 15 personnel.

1.2 Explicit Exclusions The following categories of personnel are PROHIBITED from CPMC staffing, advisory roles,

and information access:

Intelligence officers from any framework

party (U.S., Iran, Israel, Saudi Arabia,

23 UAE, Turkey, Russia).

Military personnel in uniform from any
Private military contractors or security
Individuals employed by or receiving
compensation from any framework party government, defense contractor, or
intelligence-linked NGO within 24 months prior to appointment.

Journalists or media personnel (CPMC
findings are published through official channels only; no embedded media
access to CPMC operations).

1.3 Information Firewall

CPMC staff may not share raw data, witness
identities, or field team locations with
JMOC intelligence fusion cell, PERT, or any framework party intelligence
service.

CPMC publishes only aggregated, anonymized
findings. Individual witness identities are known only to the CPMC Director
and are protected under Swiss banking secrecy-
equivalent confidentiality protocols.

JMOC receives CPMC findings at the same
time as governance body (no advance access for intelligence fusion purposes).

Physical separation: CPMC operates from
separate secure room within JMOC facility; separate network; separate data
storage

(Swiss-sovereign cloud only).

24 1. VERIFIED MORTALITY AND BLOCKAGE REPORTING

2.1 Forensic Mortality Counting Methodology The CPMC employs a multi-source convergence methodology for civilian casualty verification:

Source Tier 1 (Highest Confidence):

Hospital admission records from WHO-verified medical facilities (patient name, injury type, admission timestamp).

ICRC body recovery and forensic identification records.

Official morgue records (where accessible and independently verifiable).

CPMC field team direct observation

of mass-casualty event or immediate aftermath. Confidence level: 95%+; counted as

"confirmed civilian fatalities." Source Tier 2 (High Confidence):

Verified witness testimony (2+ independent witnesses, cross-referenced; no contradictions).

Satellite imagery analysis showing damage consistent with reported casualties (building destruction, thermal signatures of fires).

Medical professional testimony from

CPMC Senior Medical Officer who reviewed available clinical evidence.
Confidence level: 80-94%; counted as

"probable civilian fatalities."

25 Source Tier 3 (Moderate Confidence):

Single witness testimony with
supporting circumstantial evidence.

Social media imagery verified for
authenticity (geolocation, timestamp, image forensics) but without
medical/hospital confirmation.

Local NGO reporting from registered,

UN-verified humanitarian organizations. Confidence level: 60-79%; counted as
"possible civilian fatalities" and

reported separately from confirmed and probable counts. Source Tier 4 (Low
Confidence/Excluded):

Unverified social media posts. Party-affiliated media reports
without independent corroboration.

Testimony from sources with
demonstrable political bias or

conflict of interest. Confidence level: <60%; excluded from official CPMC count
but logged

in incident registry. Published Count: CPMC reports "confirmed" and

"probable" categories as primary metric; "possible" reported as footnote with
methodology explanation.

Published count format: "Confirmed: [X]; Probable: [Y]; Total verified range: [X] to [X+Y]."

26 2.2 Humanitarian Blockage Verification

The CPMC monitors and verifies blockages of humanitarian access with the following methodology:

Blockage Types Verified:

Physical closure of border crossing,
port, or airport to humanitarian cargo.

Excessive inspection delays (>2x
standard timeline for Category H1 cargo; >4x for Category H2).

Denial of humanitarian personnel

Destruction of humanitarian
infrastructure (warehouse, hospital,
water treatment facility).

Interdiction of humanitarian convoy
by military or proxy forces.

Diversion or theft of humanitarian
cargo (>5% discrepancy triggers verification).

UN OCHA real-time corridor tracking
data (shipment manifests, clearance timestamps, delivery confirmations).

NGO operational reports (verified
against UN OCHA data).

Satellite imagery (queue length at border crossings; vehicle movement patterns; facility damage assessment).

CPMC field team direct observation

27 at blockage point (where security

JMOC deconfliction database analysis

(correlation between military

operations and humanitarian access disruptions). Blockage Classification:

Class 1: Temporary logistical delay

(<24 hours); no CIS consequence; logged only.

Class 2: Policy-driven delay (24-72

hours); +0.5 CIS points to Humanitarian domain.

Class 3: Deliberate obstruction (>72

hours; or military interdiction; or facility destruction); +1.5 to +3.0 CIS points depending on severity

and civilian impact. 2.3 Medical Supply Shortage Verification The CPMC maintains a real-time "Medical

Supply Shortage Index" (MSSI) for each framework-affected zone: Data Sources:

WHO Essential Medicines stock level

reporting from zone hospitals and clinics (weekly).

CPMC field team direct audit of

pharmaceutical warehouses (monthly random sample).

Patient outcome tracking (mortality

Conventional Forces Transparency Framework

P>Annex CT establishes comprehensive transparency measures for conventional military forces that reduce uncertainty about military capabilities and intentions, thereby decreasing the security dilemma pressures that can drive arms racing and preventive war thinking. The transparency framework encompasses notification requirements, information exchanges, observation rights, and constraint commitments that collectively create a more predictable regional military environment.

P>The framework employs a tiered approach in which different categories of military activities are subject to different transparency requirements calibrated to their escalation potential. Routine activities are subject to baseline transparency including annual force structure declarations and defense budget reporting. Major activities including exercises and deployments are subject to advance notification and potential observation. Activities with particular sensitivity including movements near borders or alert status changes are subject to immediate notification and enhanced monitoring.

P>Information exchanges cover force structures including major weapons systems and unit deployments, defense budgets including acquisition programs and personnel expenditures, and military doctrines including strategic concepts and operational plans at appropriate classification levels. This information enables other parties to understand the military context within which specific activities occur, reducing misinterpretation of routine activities as threatening.

H2>Observation Rights and Verification

P>The framework includes observation rights that permit other parties to witness military exercises and activities to confirm that they conform to declared parameters. Observation rights are exercised through multinational observation teams that include representatives from all participating states. Observers have access to exercise areas, briefing materials, and selected communications that enable them to assess whether activities are defensive in character and consistent with declared purposes.

P>Verification procedures ensure that declared information is accurate and complete. Verification includes on-site inspections of declared facilities, challenge inspections of suspected undeclared activities, and technical monitoring using national technical means. Verification results are reported to the JMOC and shared with all participating states, creating confidence that transparency is genuine rather than declaratory.

P>Constraints on certain categories of activities supplement transparency by limiting activities with particular destabilizing potential. These constraints include restrictions on forces deployed near borders during periods of tension, limitations on exercise sizes and scenarios, and prohibitions on certain deception practices that could be mistaken for attack preparations. Constraints are subject to proportionality requirements that ensure they do not impair legitimate defensive capabilities.

H2>Conventional Forces Data Exchange Protocols

P>The conventional forces transparency framework includes detailed data exchange protocols that specify what information is exchanged, in what format, at what frequency, and with what verification procedures. These protocols ensure that information exchange is comprehensive, comparable, and reliable.

P>Force structure data includes holdings of major weapons systems including

tanks, armored vehicles, artillery, combat aircraft, and naval vessels. Data includes quantities, types, locations, and unit assignments. Exchange occurs annually with updates for significant changes.

P>Defense budget data includes total defense expenditure, expenditure by category including personnel, operations, procurement, and research, and major acquisition programs. Budget data enables assessment of military modernization trends and potential arms racing dynamics.

P>Military infrastructure data includes major bases, training areas, storage facilities, and command centers. Infrastructure data provides context for interpreting force movements and operational activities. Data includes locations, capacities, and primary functions.

P>Doctrine and planning data includes strategic concepts, operational plans at appropriate classification levels, and exercise schedules. Doctrine data provides insight into military thinking and potential intentions. Data is exchanged at unclassified or appropriately classified levels.

H2>Observation Rights and Exercise Monitoring

P>The framework includes rights to observe military exercises that exceed specified size thresholds. Observation provides direct verification that exercises are defensive in character and consistent with declared parameters.

P>Observation procedures specify the exercises subject to observation, the composition of observer teams, the access rights of observers, and the reporting requirements for observation findings. Procedures balance the need for meaningful observation against the operational security requirements of observed forces.

P>Observer teams include representatives from all participating states, with expertise in military operations, intelligence analysis, and arms control

verification. Teams receive pre-exercise briefings on exercise objectives, scenarios, and expected activities. Teams have access to exercise areas, command posts, and selected communications.

P>Observation reports document exercise activities, assess whether exercises conform to declared parameters, and identify any activities of potential concern. Reports are distributed to all participating states and provide the factual basis for any follow-up actions.

H2>Constraint Measures and Restriction Categories

P>The framework includes constraints on certain categories of military activities that have particular potential for misunderstanding or escalation. Constraints supplement transparency by directly limiting activities rather than merely making them visible.

P>Deployment constraints limit the size and location of forces deployed near borders or in proximity to other parties. Constraints prevent concentrations of forces that could be interpreted as attack preparations. Constraints are calibrated to legitimate defensive requirements while preventing threatening deployments.

P>Exercise constraints limit the size, duration, and scenarios of military exercises. Constraints prevent exercises that simulate attacks on other parties or that employ destabilizing tactics. Constraints are specified in quantitative terms that permit objective verification.

P>Alert status constraints limit changes in operational readiness that could signal imminent attack. Constraints require notification of alert status changes and prohibit certain categories of changes during periods of tension. Constraints preserve crisis stability by preventing readiness changes from generating reciprocal escalation.

ANNEX OFO

other PERT members or the neutral Team Lead.

PERT shares only: incident timeline;

geographic coordinates; confidence

assessment; alternative hypotheses; recommended response tier. No raw signals intelligence, no human source identities,

no technical collection specifications.

PERT records are classified at the highest

framework level; stored on Swiss-sovereign

infrastructure with AES-256 encryption; access limited to Team Lead, JMOC Director, and governance body neutral chair. 1.3 Team Lead Authority

The Swiss Team Lead has the following procedural authorities:

Determines when PERT has sufficient evidence

to issue preliminary attribution.

Determines when PERT should recommend

Assessment Hold (genuine ambiguity).

Casts tie-breaking vote if core team is

deadlocked (2-2 split between U.S. and Iranian analysts, with Pakistani and Omani

Determines scope of extended team activation. Signs and authenticates all PERT reports. May request additional evidence from either

party or from neutral intelligence sources.

May extend PERT timeline by up to 48 hours

if genuinely ambiguous evidence requires

additional analysis (with written

justification to governance body).

1. BAYESIAN CONFIDENCE THRESHOLDS

2.1 The Confidence Framework PERT uses a Bayesian probabilistic framework to

assess attribution confidence. The framework explicitly quantifies uncertainty and requires multiple independent evidence streams to reach

high-confidence conclusions. Evidence Stream Categories: Stream 1 — Technical Forensics: Weapons

debris analysis (serial numbers, manufacturing signatures, propellant chemistry); explosive residue;

ballistic trajectory analysis; drone wreckage forensics. Stream 2 — Signals Intelligence:

Intercepted communications (sanitized to remove source/method); electronic warfare signatures; radar track data;

GPS logs. Stream 3 — Human Intelligence: Witness testimony (from CPMC-verified sources

only); defector debriefs (sanitized); local informant reporting (corroborated by 2+ independent sources). Stream 4 — Open Source: Geolocated social

media imagery and video; flight tracking data; commercial satellite imagery; AIS maritime tracking.

Stream 5 — Behavioral Pattern: Historical operational signatures of known proxies;

48 tactical patterns (attack timing,

target selection, weapons employment); prior claim of responsibility. 2.2

Confidence Level Definitions

Level 1 — Low Confidence (30-59%): Definition: Single evidence stream; uncorroborated; alternative explanations

remain plausible. Action: Incident logged in JMOC registry; enhanced monitoring activated; no

attribution issued; no CIS penalty. Public status: "Under investigation." Level 2 — Moderate Confidence (60-74%):

Definition: Two or more evidence streams pointing in same direction; some corroboration; alternative explanations

less likely but not excluded. Action: PERT issues "Preliminary Attribution Assessment" (PAA); Shock

Response Envelope Column A/Column B protocol activates; 24-hour Column A selection window opens for governing

party. CIS impact: +1.0 Security (preliminary; subject to revision if confidence changes).

Public status: "Preliminary attribution indicates probable responsibility by [X]; investigation continues."

Level 3 — High Confidence (75-89%): Definition: Three or more independent evidence streams; strong corroboration;

49 alternative explanations require

significant logical contortion. Action: PERT issues "Formal Attribution Report" (FAR); CIS penalties locked at

full rate; Step 2 Penalty Ladder may activate if combined with existing points; governance body emergency session

within 48 hours. CIS impact: Full per-fatality scoring (Humanitarian domain); full security

scoring (Security domain); mass-casualty base penalties apply. Public status: "Formal attribution

confirms responsibility by [X] based on [specific evidence streams]." Level 4 — Very High Confidence (90%+):

Definition: Four or more independent evidence streams; overwhelming corroboration; alternative explanations

effectively eliminated. Action: PERT issues "Definitive Attribution Report" (DAR); maximum CIS

penalties; Step 3 Penalty Ladder activation; UN Security Council notification by governance body;

consideration of targeted sanctions against responsible proxy/spoiler entities.

CIS impact: Maximum per-event penalties; potential pattern-of-concern designation. Public status: "Definitive attribution

50 confirms responsibility by [X] beyond

reasonable doubt." 2.3 Confidence Calculation Methodology PERT does NOT use a rigid mathematical formula

but applies structured professional judgment:

Each evidence stream is assessed for

reliability (source credibility; technical validity; potential for fabrication or misinterpretation).

Corroboration between streams is weighted more heavily than volume of evidence from single stream (2 corroborating streams > 5 non-corroborating streams from same category).

Adversarial evidence (evidence suggesting alternative hypothesis) is actively sought and assessed; PERT must document the strongest alternative hypothesis and why it was rejected.

Historical pattern matching (Stream 5) is NEVER sufficient alone to reach Level 3 or 4; must be corroborated by at least one technical or signals stream.

1. FALSE-FLAG PROTECTION PROTOCOL

3.1 Definition and Threat Model A "false-flag" operation is an attack conducted by one actor (State A, Proxy B, or Third Party C) designed to appear as if conducted by another actor (State X or Proxy Y) for the purpose of provoking retaliation against the framed party and collapsing the framework.

51 Primary false-flag threats:

Third-party extremist organizations (ISIS-K, Al-Qaeda affiliates) conducting attacks designed to trigger U.S.-Iran war.
Rogue intelligence services of non-framework states seeking to disrupt the agreement.

Criminal networks with interest in maintaining

conflict (arms dealers, smugglers, conflict

Factional elements within proxy organizations

seeking to sabotage de-escalation (hardline

PMF commanders; Houthi ideological faction; spoiler sub-groups within Hezbollah). 3.2 False-Flag Detection Checklist

PERT must actively assess false-flag indicators BEFORE issuing attribution above Level 2. The following indicators trigger mandatory false-flag

review: Indicator 1 — Unusual Signature: Attack method, weapons system, or tactical

pattern inconsistent with attributed actor's known operational signature but consistent with a different known actor.

Response: Extended forensic analysis; comparison with historical attack database; consultation with neutral pool weapons

expert. Indicator 2 — Convenient Timing: Attack occurs at moment maximally damaging to

framework (e.g., hours before Phase transition ceremony; during guarantor

52 mediation session; immediately after

positive compliance report). Response: Timeline analysis; assessment of who benefits from framework collapse

at this specific moment. Indicator 3 — Overwhelming Attribution Evidence: Evidence pointing to

attribution is unusually complete and immediately available — suggesting deliberate planting of evidence.

Response: Independent verification of forensic evidence by neutral laboratory (Swiss Federal Institute of Technology

or equivalent); chain-of-custody audit. Indicator 4 — No Claim of Responsibility: Proxy that historically claims attacks

fails to claim this one; OR claim is issued by entity with no verified connection to attributed actor.

Response: Analysis of communication channels; assessment of whether silence is strategic (deniability) or genuine

(lack of involvement). Indicator 5 — Beneficiary Analysis: The party attributed with the attack has

no rational incentive to conduct it at this time (e.g., Iran attacking a base hours before a scheduled banking channel

upgrade). Response: Motivational analysis; assessment of whether attributed actor

53 benefits or suffers from the attack;

cui bono assessment extended to all regional actors including non-framework states.

Indicator 6 — Technical Inconsistency: Forensic evidence contains technical anomalies suggesting fabrication (e.g.,

serial numbers on debris that don't match known inventory; GPS coordinates that place launch site in impossible

location; chemical residue inconsistent with attributed weapons type).

Response: Independent forensic review

by neutral technical expert; re-examination of all evidence by PERT with

adversarial challenge methodology.

3.3 False-Flag Review Procedure When 2+ false-flag indicators are present, PERT must:

Suspend attribution timeline; issue

"Attribution Hold — False Flag Review" to governance body.

Convene extended team with neutral pool

Conduct 72-hour intensive false-flag

At conclusion: either confirm original

attribution (with explanation of why indicators are coincidental) OR issue

"Ambiguous Attribution" finding.

If ambiguous: Assessment Hold activated

54 (Section 4 below); no CIS penalty based

on ambiguous incident; enhanced monitoring in affected theater. 3.4 Historical Precedent Database

JMOC maintains a database of all historical attacks in framework-affected theaters with verified attribution (where possible). This

database is used for pattern matching and signature analysis.

Database includes: attack type; weapons

used; tactical method; target type; timing; claim of responsibility; verified attribution (if determined); forensic

Database updated quarterly by PERT; shared

with all core party analysts for correlation analysis.

Database flagged entries where original attribution was later reversed due to false-flag discovery — these cases are used as training examples for PERT analysts.

1. THE ASSESSMENT HOLD

4.1 Purpose and Authority

The Assessment Hold is the power of the Neutral Chair (Oman) to pause the entire enforcement ladder — including CIS scoring, Penalty Ladder activation, and Shock Response Envelope — when PERT determines that attribution remains genuinely ambiguous after standard review periods. The Assessment Hold prevents the framework from penalizing a party based on

55 insufficient evidence.

4.2 Activation Conditions The Neutral Chair may invoke Assessment Hold upon any of the following:

- (a) PERT reports confidence level remains below 60% after 72 hours of investigation, with no prospect of significant increase through additional evidence collection.
- (b) PERT identifies 2+ false-flag indicators and recommends extended review.
- (c) PERT reports 2-2 deadlock among core team members with compelling arguments on both sides.
- (d) New evidence emerges after preliminary attribution that materially undermines the original assessment.
- (e) Neutral Chair independently determines (based on diplomatic backchannel intelligence not available to PERT) that

attribution is more complex than technical evidence suggests. 4.3 Assessment
Hold Mechanics

Duration: Initial 72 hours; extendable by 48-hour increments (maximum total:
168 hours / 7 days).

ALL CIS scoring for the incident is

FROZEN at current level. No new penalties may be assessed based on
this incident during the Hold.

Shock Response Envelope Column A/B

56 timer is PAUSED. Governing party's

24-hour selection window does not count down during Hold.

Penalty Ladder escalation clock is

PAUSED. If incident would push party across Step threshold, threshold
crossing is deferred to Hold

Kinetic retaliation prohibition

REMAINS IN FORCE (72-hour pause

continues during Hold).

Enhanced monitoring is ACTIVATED at

maximum intensity in affected theater.

Guarantor mediation (Oman + Pakistan)

is MANDATORY during Hold. What Continues During Hold:

Humanitarian operations (Humanitarian

IAEA monitoring and data transmission. CPMC civilian protection reporting.

Tier 1 and Tier 2 hotline operations. Banking channel transactions at current

All non-incident-related CIS scoring

(other incidents continue to be scored

normally). 4.4 Hold Resolution At the conclusion of the Assessment Hold, one

of three outcomes occurs: Outcome A — Attribution Confirmed: PERT reaches $\geq 60\%$ confidence; Neutral

57 Chair lifts Hold; enforcement ladder

resumes from paused position; all deferred penalties activate; Column A/B timer resumes from paused position.

Outcome B — Attribution Reversed: PERT determines original attribution was incorrect; new attribution issued (or

incident deemed false-flag/third-party). Original target party's CIS score adjusted downward (penalties removed);

any Column B defaults triggered during preliminary attribution are REVERSED (frozen benefits released; diplomatic

demarche withdrawn). Newly attributed party (if any) scored according to standard metrics.

Outcome C — Remains Ambiguous: After maximum 7 days, attribution remains below 60% confidence. Neutral Chair issues

"Permanently Ambiguous" finding.

No CIS penalty for ANY party based on

this specific incident.

Incident logged in JMOC registry as

Enhanced monitoring in affected theater

continues for 90 days.

Guarantor mediation continues

If pattern of ambiguous incidents

emerges (3+ in same theater within 180 days): governance body convenes

58 strategic assessment; potential

recalibration of theater monitoring architecture. 4.5 Assessment Hold Anti-Abuse

Maximum 1 Assessment Hold per 30-day period

for the same party as potential victim.

Neutral Chair may not invoke Assessment

Hold more than 3 times per 12-month period without governance body review of Hold pattern (prevents overuse).

If Neutral Chair invokes Hold and final

attribution confirms original preliminary assessment: no penalty for Neutral Chair; but Hold statistics published in

Transparency Summary (accountability without punishment).

Either core party may challenge Assessment

Hold activation through BAP Expedited Track within 24 hours; BAP may overturn Hold if it finds no genuine ambiguity (rare;

defers to Neutral Chair's diplomatic judgment).

1. PERT-CRISIS MANAGEMENT INTEGRATION

5.1 Activation Triggers (Consolidated) PERT activates upon: T1: Mass-casualty event (10+ fatalities) —

PERT convenes within 2 hours. T2: Attack on diplomatic/humanitarian personnel — PERT convenes within 1 hour.

T3: Attack on declared IAEA-monitored nuclear facility — PERT convenes within 30 minutes.

59 T4: Use of chemical/biological agents — PERT

convenes within 30 minutes. T5: Indirect fire on declared base perimeter (Iraq 100-mile rule) — PERT convenes

within 2 hours (pre-activation). T6: Proxy cap breach (3rd Yemen incident; 5th Lebanon incident; ANY Iraq incident; 2nd

Red Sea incident) — PERT convenes within 4 hours. T7: PHAR-registered asset strike — PERT

convenes within 1 hour. T8: Weapons transfer of prohibited system detected — PERT convenes within 12 hours.

5.2 PERT-to-Enforcement Pipeline PERT attribution confidence level directly determines enforcement response:

; PERT Confidence ; Enforcement Action ; Timeline ; ; -----;
-----; -----; ; 30-59% (Level 1) ; Monitoring only; no CIS ; Ongoing ;
; 60-74% (Level 2) ; Shock Response Envelope activates ; T+24 hours ; ; 75-
89% (Level 3) ; Formal CIS scoring; Step 2 Ladder ; T+48 hours ; ; 90%+ (Level
4) ; Maximum CIS; Step 3 Ladder; UNSC ; T+72 hours ;
; Ambiguous (Hold) ; All deferred; mediation mandatory ; Up to 7 days ; T =
Time of JMOC incident confirmation. 5.3 PERT Report Types

Humanitarian Override Framework

P>Annex OFO establishes the Operation Freedom Override mechanism that permits the international community to take necessary action to prevent mass atrocities or address severe humanitarian crises even when such action would otherwise violate architecture constraints on military intervention. This override represents a carefully circumscribed exception to architecture non-intervention principles, recognizing that the architecture's purpose of promoting human security requires the capacity to act when states fail to protect their populations.

P>The override is strictly limited to situations involving mass atrocity crimes including genocide, crimes against humanity, war crimes, and ethnic cleansing as defined by international law. The override does not provide a general license for military intervention but rather establishes procedures for authorizing and conducting specifically limited operations aimed at halting ongoing atrocities or preventing imminent atrocities.

P>Authorization for override operations requires a supermajority vote of the Governance Body, including affirmative votes from representatives of at least three of the five permanent Security Council members. This high threshold ensures that override operations have broad international support and are not undertaken for narrow political purposes. Authorization specifies the scope, objectives, duration, and rules of engagement for permitted operations.

H2>Implementation and Limitations

P>Override operations are conducted under international command through mechanisms established by the authorizing resolution. Participating states contribute forces voluntarily, with no state obligated to participate in operations it does not support. Operations are subject to strict limitations including proportionality requirements, minimization of collateral damage,

and respect for international humanitarian law.

P>The override includes automatic review requirements under which the Governance Body must review ongoing operations at specified intervals and terminate authorization if the conditions justifying override no longer exist or if the operation is causing disproportionate harm. Termination does not preclude subsequent reauthorization if justified by circumstances.

P>Relationship to UN Security Council authority is carefully calibrated. The override does not supplant or bypass Security Council authority but rather provides a regional mechanism that can act when Security Council action is blocked by veto. Override operations are reported to the Security Council immediately upon authorization, and the architecture cooperates with Council efforts to address the situation through UN mechanisms.

Humanitarian Override Authorization Procedures

P>The Operation Freedom Override mechanism includes detailed authorization procedures that ensure override operations have the broad support and legitimacy required for effective action. Authorization procedures balance the need for rapid response against the need for appropriate deliberation before military action.

P>Initial assessment is triggered by credible reports of mass atrocity crimes. The Executive Secretary convenes an emergency assessment team comprising humanitarian experts, legal specialists, and intelligence analysts. The team assesses whether reported events constitute mass atrocity crimes under international law and whether the situation requires immediate international response.

P>Governance Body deliberation follows initial assessment if the situation warrants override consideration. The Body convenes in emergency session to

review assessment findings, hear from affected parties, and evaluate response options. Deliberation considers whether atrocities are occurring, whether the responsible state is unwilling or unable to protect populations, and whether override action would be effective and proportionate.

P>Authorization voting requires a supermajority of the Governance Body, including affirmative votes from representatives of at least three of the five permanent Security Council members. This high threshold ensures broad international support and prevents narrow majorities from authorizing controversial operations. Authorization specifies the scope, objectives, duration, and rules of engagement for permitted operations.

H2>Override Implementation and Limitations

P>Authorized override operations are conducted under international command through mechanisms established by the authorizing resolution. Implementation procedures ensure that operations remain within authorized scope and comply with international humanitarian law.

P>Command arrangements designate a force commander with authority over participating military units. The commander reports to a designated political authority that provides strategic guidance and ensures political oversight. Command arrangements ensure unity of effort while respecting national caveats on force employment.

P>Rules of engagement specify what actions force elements may take under what circumstances. Engagement rules are designed to accomplish operational objectives while minimizing collateral damage and protecting civilian populations. Rules are reviewed regularly and adjusted as operational circumstances evolve.

P>Duration limits ensure that override operations do not continue indefinitely

without renewed authorization. Initial authorization specifies maximum duration, with extension requiring renewed Governance Body approval. Duration limits prevent mission creep and ensure periodic reassessment of whether override action remains necessary.

P>Geographic limits restrict operations to specified areas where atrocities are occurring or threatened. Operations outside authorized areas require additional approval. Geographic limits prevent unauthorized expansion and focus operations on areas of genuine humanitarian need.

P>Proportionality requirements ensure that the scale and intensity of operations are proportionate to the humanitarian objectives. Proportionality prohibits operations that would cause damage exceeding the humanitarian benefit. Proportionality assessments are conducted by legal advisors assigned to the operation.

H2>Post-Override Transition and Accountability

P>When override operations conclude, transition procedures ensure orderly handover to normal governance arrangements and accountability for any violations committed during operations.

P>Transition planning begins before operations conclude and addresses the security, humanitarian, and governance requirements of post-override stabilization. Planning includes deployment of civilian police, humanitarian organizations, and governance support teams that assume functions from military forces.

P>Accountability for violations committed during override operations is ensured through investigation procedures, disciplinary processes, and potential prosecution. Operations are subject to oversight by human rights monitors who report on compliance with international humanitarian law.

Violations are investigated and prosecuted through national or international mechanisms.

ANNEX ECO

Flash Report (within 2 hours of activation):

Incident summary; initial evidence streams identified; preliminary confidence range; recommended next steps.

Preliminary Attribution Assessment (PAA)

(within 12 hours of Level 2): Detailed

60 evidence analysis; confidence level 60-74%;

alternative hypotheses; recommended Column A/B response.

Formal Attribution Report (FAR) (within 24

hours of Level 3): Comprehensive evidence review; confidence level 75-89%; false-flag assessment; CIS impact calculation;

governance body recommendations.

Definitive Attribution Report (DAR) (within

48 hours of Level 4): Exhaustive analysis;

confidence 90%+; all alternative hypotheses rigorously addressed; maximum CIS scoring; UN Security Council notification draft.

Ambiguous Attribution Finding (within 7 days

of Assessment Hold): Explanation of evidentiary gaps; why attribution not possible; recommendations for future

prevention; monitoring enhancements. 5.4 PERT Quality Assurance

Annual "Attribution Accuracy Review" by

independent panel of 3 retired intelligence officials (from neutral states) who review all PERT attributions from the past year

against subsequently available evidence.

Panel assesses: whether confidence levels

were justified; whether false-flag

indicators were adequately considered; whether Assessment Holds were appropriately used.

Panel report published in Transparency

Summary (methodology only; individual case

61 details classified).

If panel finds systematic bias (consistent

over-attribution or under-attribution toward one party): PERT team composition reviewed;

training program updated; Team Lead may be replaced by governance body.

APPENDIX TO CRISIS-MANAGEMENT & DE-ESCALATION MODULES

A. CROSS-REFERENCE MAP Module I (Hotline Protocol):

Supersedes: Three-Tier Communication

Architecture (Core Document).

Integrates with: JMOC operations (Verification

Modules); Humanitarian Deconfliction Hotline

(Humanitarian Modules); No Strategic Surprise Commitment (Core Document);

Crisis Lock (Enforcement Modules).

Physical infrastructure: Geneva JMOC (Tiers 1-2);

Omani Royal Office (Tier 3 relay); UN OCHA Amman (Humanitarian Hotline).

Module II (72-Hour De-Escalation Window):

Supersedes: Third-Party Strike Buffer Rule

(Core Document); Shock Response Envelope

(Enforcement Modules, Module IV).

Integrates with: PERT (Module IV); Emergency

Override (Enforcement Modules, Module IV); CIS scoring (Enforcement Modules, Module II);

62 PHAR strict liability (Humanitarian Modules,

Authoritative for: All strike buffer timing

referenced throughout RCSA.

Module III (Proxy Activity Containment):

Supersedes: Attributed-but-Uncontrolled doctrine

(Core Document); Proxy Activity Cap System

(Core Document); Base Protection Compact (Core Document).

Integrates with: Spoiler Containment 2.0

(Enforcement Modules, Module III); RP-IRQ PMF

Integration (Addendum A); Weapons Tracking Cell (Verification Modules); IHTA maritime security (Economic Modules).

Authoritative for: All proxy rules referenced

throughout RCSA. Module IV (PERT Formalization):

Supersedes: All PERT references in Verification

Modules (Module III, Section 4.2-4.4) and Enforcement Modules (Module IV, Section 4.2-4.4).

Integrates with: CIS scoring (Enforcement

Modules, Module II); BAP arbitration (Enforcement Modules, Module I); CPMC civilian

protection (Humanitarian Modules, Module II); Spoiler Containment 2.0 (Enforcement Modules, Module III).

Authoritative for: All PERT procedures,

confidence thresholds, and attribution methodologies. B. INCIDENT RESPONSE

Tier 3

Acknowledgment Rule may not be amended without unanimous governance
body consent plus guarantor state concurrence. PERT confidence thresholds
may be adjusted by BAP advisory opinion but require

governance body consensus for formal amendment. Assessment Hold
authority is vested in the Neutral Chair (Oman) and may not be transferred
without governance body consensus.

Document Identifier: RCSA-Crisis-v1.5 Classification: Framework Crisis-
Management & De-Escalation Reference Depositary: UN Secretary-General
(upon framework entry into force)

Preparation Date: 2026

Annex CT: Conventional Forces Transparency Annex

This annex requires advance notification of major troop movements, air-
defense deployments, naval concentrations, and large exercises by all
framework participants, with defined thresholds, timelines,

64 Annex CT: Conventional Forces Transparency Annex

triple-channel transmission, and a public transparency register.

Notification Requirements

All framework parties and regional participants commit to advance notification of major conventional force movements and posture changes that could affect regional stability or be misinterpreted as preparation for offensive operations. The notification architecture covers four categories: ground troop movements, air- defense deployments, naval concentrations, and large-scale exercises.

Table SC-1: Table SC-1: Notification Thresholds and Timelines

Activity Threshold Advance Notification Content Exemptions Notice

Ground troop Movement of >1,000 personnel or 72 hours Origin, destination, Counter-terrorism movements >50 heavy vehicles across route, duration, operations under 48 international borders or between exercise or hours with post-hoc military districts operational purpose notification

Air-defense Deployment or relocation of 14 days Location, coverage Emergency defensive deployments strategic air-defense batteries (S- area, integration repositioning under 300/S-400/Patriot/Iron Dome status, duration 24 hours with equivalent) to new permanent or guarantor notification semi-permanent positions

Naval Aggregation of >3 major surface 48 hours Vessel identification, Anti-piracy or SAR concentrations combatants or >1 submarine operational purpose, operations with within 200 nautical miles of estimated duration standard UNCLOS another framework party's coast notification

Large exercises Military exercises involving 30 days Exercise name, Emergency readiness >5,000 personnel or live-fire location, duration, drills under 72 hours components within 100 km of participating units, framework-affected borders scenario summary

Notification Channels and Verification

Notifications are transmitted through three parallel channels: (1) the framework military liaison hotline (time-stamped, encrypted); (2) diplomatic note via the guarantor relay (Oman or Switzerland); and (3) public military press release (exercise notifications only). The triple-channel architecture ensures redundancy and creates multiple verification records.

Receiving parties may request clarification within 24 hours of notification. Clarification requests are not challenges; they are operational safety measures. If a receiving party believes a notified activity exceeds the

65 Annex MD: Missile and Drone Restraint Protocol

stated parameters (e.g., exercise scope expands, deployment duration extends), it may request a joint technical review within 7 days. The review is conducted by military liaison officers from both parties plus one neutral military observer from the guarantor pool.

The SESS Technical Deployment Unit maintains a Conventional Forces Transparency Register that logs all notifications, clarifications, joint reviews, and deviations. The register is published quarterly in sanitized form (no operational details that compromise force protection).

Confidence-Building Measures

Beyond mandatory notification, parties are encouraged to undertake voluntary confidence-building measures: invitation of observer officers from other framework parties to major exercises (up to 2 observers per party); pre-exercise briefings at the governance body's Military Liaison Working Group; and annual publication of defense white papers summarizing force posture, procurement plans, and strategic priorities. The framework does not require force reductions, base closures, or equipment limitations. It requires

transparency about existing forces. The objective is to reduce the security dilemma—the tendency of states to arm in response to uncertainty about others' intentions—by replacing uncertainty with structured information.

Annex MD: Missile and Drone Restraint Protocol

This annex establishes launch-notification thresholds for missile and drone tests and operations, requires storage-site declarations, and defines no-deployment buffer zones around sensitive corridors and critical sites with graduated verification and enforcement mechanisms.

Launch-Notification Thresholds

All ballistic missile, cruise missile, and large unmanned aerial vehicle (UAV) tests, training launches, and operational deployments by framework parties are subject to notification requirements. The protocol distinguishes between three launch categories: test launches, operational training, and operational deployment.

66 Annex MD: Missile and Drone Restraint Protocol

Table SC-2: Table SC-2: Launch Notification Requirements

Category	Threshold	Advance	Required	Information	Confidence	Notice
						Measure
Test launches	Any ballistic or cruise missile test, impact	Optional invitation or	UAV test with range >250 km	area, safety zone, of technical trajectory type	observers	
Operational training	Live-fire training involving missiles or armed UAVs within duration, maximum range, officer exchange	100 km of international borders or safety corridors	framework-affected theaters			

Operational Movement of mobile missile 24 hours Deployment area, Joint hotline test deployment launchers or armed UAV estimated duration, within 12 hours of squadrons to forward positions command authority, de- deployment escalation contacts

Storage-Site Declarations

Framework parties declare the geographic coordinates of all fixed missile and drone storage sites, maintenance facilities, and launch complexes within 30 days of framework entry into force. Declarations are deposited with the governance body secretariat and shared with guarantor states. Mobile launchers are not subject to fixed-site declaration but are covered by the movement notification requirements above. Declared sites are subject to voluntary verification visits by pre-arrangement. Visits are conducted by neutral technical teams (2 inspectors + 1 guarantor observer). Inspection scope is limited to: confirming the site's declared purpose; verifying that stored items match declared categories; and assessing physical security standards. No challenge inspection of undeclared sites is permitted under this annex. Challenge inspection authority remains with IAEA protocols for nuclear-related sites only.

Parties may request additions, modifications, or closures to declared sites with 14-day advance notice. The register is updated monthly and published in the quarterly Transparency Summary.

No-Deployment Buffers

The framework establishes no-deployment buffers around especially sensitive corridors and critical sites. Within these buffers, the forward deployment of offensive missiles, armed drones, or mobile launchers is restricted.

67 Annex MD: Missile and Drone Restraint Protocol

Table SC-3: Table SC-3: No-Deployment Buffer Zones

Buffer Zone Radius Restricted Systems Permitted Systems Verification

Gaza humanitarian 50 km from Ballistic missiles, Unarmed reconnaissance Satellite monitoring corridor corridor cruise missiles, armed UAVs, short-range air + UNIFIL reporting center UAVs >100 kg defense, point-defense systems

Beirut-Damascus 30 km from Ballistic missiles, Small arms, police vehicles, UN patrol highway highway heavy rocket artillery medical transport observation + (humanitarian) center (>122mm) satellite

Hormuz transit 100 km from Anti-ship missile Coastal radar, patrol craft, IHTA monitoring + corridor corridor batteries, mine-laying search-and-rescue assets satellite + maritime center systems, sub-surface patrol drones

Declared IAEA 50 km from All offensive missiles, Point-defense air defense, IAEA + satellite + facilities facility armed drones, heavy perimeter security forces national declaration perimeter artillery

Major desalination 20 km from Ballistic missiles, Point-defense, security Facility operator + plants (Gaza, plant cruise missiles, armed personnel satellite + national Lebanon) perimeter UAVs declaration

Restraint Enforcement

Violations of the no-deployment buffer restrictions are logged as 'security posture concerns' rather than automatic compliance breaches. A single violation triggers: immediate hotline notification from the affected party; a 48-hour clarification window; and a joint technical review within 7 days. Persistent violations (three or more confirmed within 90 days) activate the framework's security compliance indicator (+1.0 point per persistent violation) and may trigger enhanced monitoring or governance body consultation.

The protocol explicitly preserves the right of self-defense under Article 51 of the UN Charter. If a party faces an imminent armed attack, buffer restrictions are waived for the duration of active defense operations in the affected theater. Post-attack, the party must notify the governance body within 12 hours and provide a timeline for return to buffer compliance.

68 Annex IP: Military Incident-Prevention Annex

Annex IP: Military Incident-Prevention Annex

This annex establishes standardized rules for intercept behavior, fire-control radar lock-on, airspace deconfliction corridors, UAV proximity limits, and emergency disengagement procedures to prevent unintended military escalation in framework-affected theaters.

Intercept Behavior Rules

All framework parties and regional participants commit to standardized intercept behavior rules designed to prevent unintended escalation during air and maritime proximity incidents. The rules apply to: aerial intercepts (fighter aircraft engaging unidentified or approaching aircraft); maritime intercepts (naval vessels approaching or querying unidentified vessels); and UAV intercepts (engagement of unidentified drones in national or framework-monitored airspace).

69 Annex IP: Military Incident-Prevention Annex

Table SC-4: Table SC-4: Standardized Intercept Behavior Parameters

Domain	Prohibited	Required	Communication	Escalation	Actions	Actions
Protocol Prevention						

Aerial	Simulated	Radio	visual	escort	if	Hotline
identification	at	necessary	notification	weapons	maneuvers	121.5 MHz
						safe

distance within 30 lock unless (barrel rolls, and 243.0 (>150m) minutes if confirmed aggressive MHz intercept hostile closure) lasts >10 intent minutes

Maritime Boarding Radio visual signaling query of maintain Hotline No weapons intercept without contact on registry >100m notification discharge warning in Ch. 16 VHF and intent separation within 1 without international unless hour if confirmed waters boarding vessel hostile act authorized refuses to comply

UAV Jamming or Visual radio query if log track report to Hotline Kinetic intercept kinetic identification equipped and framework notification engagement engagement of altitude UAV within 2 only if unarmed registry hours if armed or reconnaissance UAV confirmed UAVs in crosses intelligence-monitored territorial gathering zones boundary against declared military facility

Fire-control radar lock-on is one of the most escalatory signals in modern military operations. This annex establishes rules governing radar illumination of other framework party assets. Categories: Tracking radar (search and track, non-fire-control) is permitted for routine air-defense and maritime surveillance. Fire- control radar (targeting illumination) is prohibited unless: the targeted asset has entered declared restricted airspace or maritime zone without authorization; the targeted asset has demonstrated hostile intent (weapons release, aggressive maneuver, or confirmed attack); or the targeted asset has failed to respond to three separate radio warnings over 15 minutes.

70 Annex IP: Military Incident-Prevention Annex

Any fire-control radar lock-on must be reported to the framework military hotline within 15 minutes. The report must include: the asset that was locked; the duration of the lock; the reason for the lock; and whether weapons were armed. The receiving party may request a joint technical review within 48

hours. If a review determines that the lock-on was unjustified, the locking party issues a formal acknowledgment (not an apology) and confirms revised engagement rules to the governance body.

Repeated unjustified radar lock-ons (two or more within 90 days) trigger automatic compliance indicator adjustment (+1.0 security point) and may activate enhanced monitoring of the locking party's air-defense posture.

Airspace Deconfliction

The framework establishes pre-registered airspace deconfliction corridors for military flights near framework-affected borders and in proximity to framework-monitored zones. Corridors are not no-fly zones; they are transparency-enhancing channels where pre-notification is expected but not mandatory.

Table SC-5: Airspace Deconfliction Corridors

Corridor Boundaries Pre-Notification Flight Parameters Monitoring Expected

Northern corridor 20km band along 48 hours for >4 altitude >15,000ft, RADARAT + (Turkey-Syria-Iraq) border aircraft transponder on satellite

Eastern corridor (Iran- 30km band along 72 hours for >2 altitude >20,000ft, Pakistan air defense Afghanistan-Pakistan) border aircraft IFF on + guarantor satellite

Maritime air corridor 12nm beyond 24 hours for altitude >10,000ft, IHTA + AWACS (Gulf/Red Sea) territorial sea to combat aircraft transponder on rotation corridor center

Lebanon-Israel border Full width of Lebanese All military altitude >10,000ft UNIFIL + radar + airspace flights unless landing hotline

Hormuz transit IHTA corridor + 50km All military altitude >5,000ft, IHTA +

Omani radar airspace buffer flights transponder on

UAV Proximity Limits and Emergency Disengagement

Unmanned aerial vehicles operating in framework-affected theaters are subject to proximity limits designed to prevent unintended collisions or kinetic engagements. Armed UAVs must maintain minimum horizontal separation of 5 nautical miles from manned aircraft and 2 nautical miles from other UAVs in monitored airspace. Unarmed reconnaissance UAVs must maintain 2 nautical miles from manned aircraft and 1 nautical mile from other UAVs.

71 Annex MO: Integrated Maritime Operating Picture

Emergency disengagement procedures apply when two military assets (manned or unmanned) are on converging courses that would violate proximity limits within 60 seconds. Both operators are required to: execute immediate altitude separation (one climbs, one descends—pre-assigned by theater); broadcast 'disengaging' on the military hotline frequency; and maintain course deviation for minimum 30 seconds before resuming original track. If disengagement fails and collision or engagement occurs, both parties notify the hotline within 5 minutes and cease operations in the affected sector for 2 hours pending joint review.

Table SC-6: Table SC-6: Emergency Disengagement Protocol

Phase Action Timeframe Communication

Detection Radar/visual identification of T-60 seconds Internal crew/UAV operator alert converging course

Alert Broadcast 'converging' on hotline T-45 seconds Hotline notification to all parties frequency in sector

Separation Execute altitude separation T-30 seconds Confirmation broadcast

(climb/descend)

Disengagement Resume safe separation T-0 + 30 seconds 'Disengaged' broadcast

Post-incident Cease operations in sector Immediate + 2 Joint review scheduled within 24 hours hours

Annex MO: Integrated Maritime Operating Picture

This annex consolidates Hormuz, Red Sea, and Eastern Mediterranean maritime mechanisms into a single unified operating picture managed by a Maritime Coordination Center with integrated patrol scheduling, threat correlation, and cross-domain analysis.

Integration Architecture

The framework's maritime security architecture is consolidated into a single integrated operating picture covering the Gulf (Strait of Hormuz), Red Sea (Bab-el-Mandeb), and Eastern Mediterranean. The integration eliminates the current operational separation between Hormuz mechanisms (IHTA) and Red Sea mechanisms (convoy system, inspection regime), creating unified command awareness, coordinated patrol scheduling, and seamless information sharing. The integrated picture is managed by the Maritime Coordination Center (MCC), hosted at a neutral location (proposed: Muscat, Oman) with operational nodes in Djibouti (Red Sea), Abu Dhabi (Gulf), and Haifa (Eastern Mediterranean). The MCC operates 24/7 with staff from all littoral states, framework core parties,

72 Annex MO: Integrated Maritime Operating Picture

and guarantor observers. The MCC does not command military forces; it coordinates awareness, deconfliction, and incident response.

Table SC-7: Table SC-7: Maritime Coordination Center Structure and Functions

Node Coverage Staffing Functions

Muscat Full Gulf-Red Sea- 24 personnel (4 per littoral Strategic coordination, incident registry, (MCC Med integration state + 4 neutral + 4 hotline management, quarterly reporting Main) framework core)

Djibouti Red Sea + Gulf of 12 personnel (2 per major Convoy scheduling, inspection node Aden + Bab-el- party + 4 neutral) coordination, Houthi deconfliction channel, Mandeb pirate monitoring

Abu Dhabi Strait of Hormuz + 12 personnel (2 per littoral IHTA toll coordination, transit scheduling, node Gulf waters state + 4 neutral) naval concentration monitoring, UAE-Iran deconfliction

Haifa node Eastern Mediterranean 8 personnel (2 Israel + 2 Naval presence notification, Suez transit + Suez approach Egypt + 2 framework + 2 coordination, Syrian coast monitoring, neutral) refugee maritime route safety

Unified Patrol and Transit Scheduling

Naval patrols by framework participant states are coordinated through the MCC to maximize coverage, minimize duplicative effort, and prevent unintended encounters. Patrol sectors are assigned monthly based on: available naval assets by state; current threat assessments (piracy, smuggling, proxy maritime activity); and diplomatic sensitivities (e.g., Israeli naval assets do not patrol sectors adjacent to Lebanese territorial waters without pre-coordination). Commercial vessel transit is scheduled through the MCC's integrated electronic system. Vessels register their route, cargo, and estimated time of arrival at corridor entry points. The MCC issues transit recommendations (optimal timing, convoy availability, weather and security advisories). Toll collection for the IHTA is processed through the same system,

with 25% toll reduction for pre-registered, compliant vessels. If a naval incident occurs in any sector, the nearest MCC node assumes coordination authority for the first 48 hours. After 48 hours, coordination transfers to Muscat for strategic-level management. Incident data from all three sectors is entered into a unified incident registry accessible to all framework parties and guarantors within 4 hours of confirmed reporting.

73 Annex C2: Command-and-Control Interoperability Note

Threat Correlation and Cross-Domain Analysis

The integrated operating picture enables cross-domain threat correlation that was previously impossible when Hormuz and Red Sea were treated separately. Examples: a vessel that refuses IHTA toll payment in the Gulf and is later sighted near Bab-el-Mandeb is flagged in the unified registry; a Houthi maritime incident in the Red Sea triggers enhanced Hormuz monitoring because proxy tactics may be replicated; and Iranian naval movements in the Gulf are correlated with advisory personnel movements in Syria through the integrated intelligence feed (governed by guarantor-neutrality safeguards). The MCC publishes a weekly Maritime Situation Report that synthesizes: incident trends across all three sectors; patrol effectiveness metrics; toll revenue and compliance rates; and threat forecasts for the coming 14 days. The report is distributed to all framework parties, guarantors, and relevant UN agencies (UN OCHA for humanitarian maritime routes, IMO for regulatory compliance).

Annex C2: Command-and-Control Interoperability Note

This annex establishes limited crisis-period interoperability protocols—including hotline hierarchy, standardized incident report formats, and time-stamped notification standards—without enabling joint operations or integrated command, ensuring framework parties can deconflict responses

during emergencies.

Crisis-Period Interoperability

This annex establishes limited command-and-control interoperability protocols for crisis periods. The protocols do not enable joint operations, integrated command structures, or shared tactical control. They provide standardized communication hierarchies, incident report formats, and time-stamped notification standards that allow framework parties to understand each other's crisis responses without misinterpreting them as threats. The interoperability protocols are activated only during: Crisis Lock periods; Tier 3 major incidents; mass- casualty events; or confirmed attacks on declared IAEA-monitored facilities. Outside these conditions, parties maintain independent C2 structures with no framework-mandated interoperability obligations.

74 Annex C2: Command-and-Control Interoperability Note

During activated interoperability periods, the following hotline hierarchy applies: Level 1 (Operational): Direct military liaison officer-to-liaison officer contact on dedicated secure lines. Level 2 (Strategic): Deputy-level contact through guarantor-facilitated channels (Oman for Gulf/Red Sea, Switzerland for European links). Level 3 (Political): Foreign minister or national security advisor contact through neutral- chair facilitation.

Table SC-8: Table SC-8: Crisis Hotline Hierarchy and Response Standards

Level Participants Response Purpose Record Keeping Window

Level 1 Military liaison 15 minutes Immediate deconfliction, Time-stamped Operational officers (pre- intercept coordination, incident automatic recording, designated) clarification transcript archived 90 days

Level 2 Deputy-level 2 hours Policy coordination, escalation Written summary Strategic equivalents + management, resource requests within 4 hours,

archived guarantor facilitator 2 years

Level 3 Minister/NSA level + 6 hours Framework-level decisions, Formal diplomatic note, Political neutral chair benefit suspension/activation, archived permanently UN referral

Incident Report Formats

All military incidents reported through the framework during interoperability periods follow a standardized format: REPORT HEADER (time, location, reporting party, incident classification); INVOLVED ASSETS (type, quantity, nationality, observed identifiers); OBSERVED ACTIONS (chronological, objective, no attribution); ASSESSMENT (reporting party's preliminary assessment, marked as preliminary); and REQUESTED RESPONSE (information, clarification, deconfliction, or cessation). The standardized format is mandatory for all Level 1 and Level 2 reports. Reports are transmitted in English and Arabic (bilingual format). The SESS maintains a template library in six languages for liaison officer training. Reports may not include subjective characterizations ('provocative,' 'aggressive,' 'hostile') unless accompanied by specific observed actions that justify the characterization.

75 Annex C2: Command-and-Control Interoperability Note

Time-Stamped Notification Standards

All notifications during interoperability periods carry mandatory time stamps: GMT for all transmissions; local time of the originating party in parentheses; and time of receipt acknowledgment. Notifications are considered 'delivered' when the receiving party issues an acknowledgment with its own time stamp. If acknowledgment is not received within the response window, the sending party may escalate to the next hotline level.

Table SC-9: Table SC-9: Notification Timing and Escalation

Notification Sending Party Action Receiving Party No-Response Escalation
Type Obligation

Incident report Transmit within 30 minutes of Acknowledge within 15 Escalate
to Level 2 if no event minutes acknowledgment in 30 minutes

Clarification Transmit within 24 hours of Respond within 12 Escalate to Level
2 if no request ambiguous event hours response in 24 hours

Deconfliction Transmit immediately upon Acknowledge and act Escalate to
Level 2 if no request detection of converging courses within 15 minutes
acknowledgment in 30 minutes

Cessation Transmit immediately upon Acknowledge within 5 Escalate to Level
3 if no request determination of imminent minutes acknowledgment in 15
minutes engagement

Training and Certification

Liaison officers designated for Level 1 interoperability are required to complete a framework-certified training program. The program covers: hotline procedures and etiquette; standardized report format completion; deconfliction protocol execution; cultural and linguistic awareness; and escalation decision criteria. Training is conducted at the Islamabad Working Groups facility or at a neutral venue designated by the guarantors. Certification is valid for 24 months. Re-certification requires completion of a refresher course and successful simulation exercise. The SESS maintains a roster of certified liaison officers from all framework parties, updated quarterly.

76 Enforcement and Dispute Resolution

The framework's enforcement system is designed to be politically translatable to domestic audiences while maintaining operational precision. It provides

simplified deterrence statements for public communication and detailed graduated mechanisms for operational management.

Graduated Response Framework

The canonical enforcement ladder applies to all compliance concerns across all domains. No party may escalate from one step to the next without exhausting all mechanisms at the current step. A Certificate of Exhaustion issued by the governance body is required before activating higher steps. For proxy and security incidents, the pre-authorized response bands described in the Regional Stabilization section operate in parallel with this ladder. Pre-authorized measures activate as a default upon confirmed Tier 2 or Tier 3 attribution, subject to governance body override by weighted majority. This ensures that security incidents produce tangible consequences through automatic triggers rather than requiring case-by-case political deliberation.

Figure 6 — Graduated Response Framework Four-step escalation with mandatory exhaustion requirements between steps. Step 1 (Clarification): compliance concern recorded, 14-day context window, no consequences. Step 2 (Technical Consultation): formal consultative session, written brief, enhanced monitoring for 90 days. Step 3 (Ministerial Review): formal assessment, compliance indicators adjusted, benefit suspension up to 45 days. Step 4 (Proportionate Response): targeted partial suspension, snapback friction ladder with 44-day minimum interval. Certificate of Exhaustion required before activating higher steps.

Figure 6: Graduated Response Framework Step 1: Clarification The governance body records a compliance concern and invites the implicated party to provide context within 14 days. No economic or security consequence. Compliance indicators may be updated to reflect the inquiry. Working-level consultation convenes within a reasonable period. Governs: Technical lapses under 30 days; single-incident anomalies; first pattern-of-concern designation.

Step 2: Technical Consultation The governance body convenes a formal consultative session. The implicated party provides a written explanatory brief. Technical experts may be convened. No automatic economic consequence, but enhanced monitoring activates for 90 days. Benefit timing may be reviewed. Governs: Technical lapses 30-45 days; second pattern-of-concern designation. Step 3: Ministerial Review The governance body issues a formal compliance assessment at ministerial level. Compliance indicators are formally adjusted. Next scheduled benefit may be suspended for up to 45 days pending resolution. Both parties retain benefits accrued to date. Neutral chair concurrence required. Public statement may be issued. Governs: Technical lapses over 45 days; confirmed breach of non-core obligation; three pattern-of-concern designations in 12 months. Step 4: Proportionate Response Targeted partial suspension of benefits in the breached domain only. Nuclear breach leads to nuclear-related benefits review. Security breach leads to security-linked measures review. Cross-domain escalation requires governance body supermajority and neutral chair concurrence. Snapback friction ladder activates with minimum 44-day interval from warning to full suspension. No instant reimposition. Orderly failure protocol activates with 90-day re-engagement window. Governs: Confirmed material breach; systematic non-cooperation; compliance score at 12.0+; formal repudiation.

H2>Economic Crisis Response Framework

P>Annex ECO establishes the Emergency Economic Off-Ramp mechanism that provides rapid economic assistance to participating states facing severe economic crises that threaten architecture implementation. The mechanism recognizes that economic distress can generate political pressures for reversal regardless of the cause of distress, and that preventing such reversal requires timely economic support that addresses crisis impacts before they translate into political demands.

P>The mechanism includes emergency liquidity provision through the Regional Development Fund, which can accelerate disbursements, release reserve funds, and activate emergency credit lines for states experiencing balance of payments crises, banking sector distress, or fiscal emergencies. Liquidity provision is conditioned on implementation maintenance commitments that ensure economic support is not exploited to facilitate architecture withdrawal.

P>Trade support measures maintain market access for crisis-affected states by providing trade finance guarantees, temporary tariff relief, and procurement preferences that cushion the export impacts of economic crises. These measures prevent crisis-induced export collapses that would deepen economic distress and generate additional political pressure. Trade support is phased out as crisis conditions improve.

H2>Social Protection and Safety Net Support

P>The off-ramp includes social protection support that prevents economic distress from falling most heavily on vulnerable populations who are least responsible for crisis conditions and most susceptible to political manipulation. Support includes emergency cash transfer programs, food assistance, healthcare access maintenance, and education continuity measures that protect human capital during crises.

P>Social protection support is delivered through existing national programs where possible, with supplementary international financing that maintains program operations when national resources are inadequate. Delivery through national programs maintains institutional capacity and avoids the disruption associated with creating parallel delivery mechanisms during crisis periods.

P>Targeting mechanisms ensure that assistance reaches those most in need

while minimizing leakage to non-vulnerable populations. Targeting employs multiple mechanisms including geographic targeting of high-poverty areas, categorical targeting of vulnerable groups, and self-targeting through work requirements or payment modalities that attract only those genuinely in need.

H2>Economic Emergency Response Procedures

P>The Emergency Economic Off-Ramp includes detailed procedures for responding to economic emergencies that threaten architecture implementation. Response procedures are activated automatically when specified economic indicators cross threshold values, ensuring rapid response without awaiting political deliberation.

P>Activation triggers include currency depreciation exceeding specified thresholds, foreign reserve depletion below critical levels, sovereign debt spread widening beyond specified points, banking sector distress indicators, and sharp GDP contraction. Triggers are calibrated to identify genuine emergencies while avoiding false activation.

P>Immediate response measures include liquidity provision through the RDF emergency facility, trade finance guarantees through the FCIF, currency swap activation, and emergency budget support. Immediate measures address acute liquidity crises that could trigger broader economic collapse.

P>Short-term response measures include accelerated project disbursement, procurement flexibility, technical assistance for macroeconomic stabilization, and support for social safety net programs. Short-term measures address the underlying causes of economic distress while providing immediate relief.

P>Medium-term response measures include structural adjustment support, debt restructuring assistance, financial sector recapitalization, and investment climate improvement. Medium-term measures restore economic sustainability

after immediate crises are stabilized.

H2>Social Safety Net Activation

P>Economic emergencies often disproportionately affect vulnerable populations who lack resources to weather income shocks. The social safety net activation component ensures that emergency assistance reaches those most in need through established social protection programs.

P>Cash transfer programs provide direct financial assistance to vulnerable households during economic crises. Targeting mechanisms identify beneficiaries based on poverty indicators, demographic characteristics, and employment status. Delivery mechanisms include bank transfers, mobile money, and cash distribution points.

P>Food assistance programs ensure food security during economic crises that disrupt food availability or purchasing power. Assistance includes food vouchers, direct food distribution, school feeding programs, and supplementary nutrition for vulnerable groups. Food assistance is coordinated with agricultural support to maintain domestic food production.

P>Health service maintenance ensures that health services continue during economic crises that might otherwise force service reduction. Maintenance includes financing for essential medical supplies, health worker salaries, and facility operations. Health maintenance protects public health while reducing the long-term costs of health system collapse.

P>Education continuity support ensures that schools can continue operating during economic crises that might otherwise force closures. Support includes financing for teacher salaries, school supplies, and facility maintenance. Education continuity protects human capital and provides social protection for children and families.

H2>Debt Crisis Response and Restructuring

P>The Emergency Economic Off-Ramp includes procedures for responding to sovereign debt crises that threaten architecture implementation. Debt crisis response addresses both the immediate liquidity needs and the long-term solvency requirements of crisis-affected states.

P>Liquidity provision addresses immediate financing needs through emergency credit lines, accelerated RDF disbursements, and currency swap activation. Liquidity provision prevents default that could trigger broader financial contagion and disrupt architecture benefits.

P>Debt restructuring addresses unsustainable debt burdens through negotiation with creditors to extend maturities, reduce interest rates, write down principal, or convert debt to equity. Restructuring is coordinated with the architecture's financial partners including the IMF, World Bank, and regional development banks.

P>Conditionality ensures that economic support is accompanied by policy reforms that address the underlying causes of debt distress. Conditionality includes fiscal consolidation, revenue mobilization, expenditure rationalization, and structural reforms. Conditionality is designed to be realistic and socially sustainable.

H2>Banking Crisis Management

P>Banking crises can disrupt architecture benefit delivery and generate political instability that threatens implementation. The banking crisis management component provides frameworks for addressing banking sector distress in participating states.

P>Crisis assessment evaluates the nature and severity of banking sector problems including capital adequacy, asset quality, liquidity, and profitability.

Assessment identifies the causes of distress and the appropriate response measures.

P>Liquidity support provides central bank financing to solvent but illiquid banks. Support may include emergency lending, deposit guarantees, and interbank market facilitation. Liquidity support prevents bank runs and payment system disruption.

P>Resolution procedures address insolvent banks through restructuring, merger, or orderly liquidation. Resolution protects depositors and maintains critical banking functions while imposing losses on shareholders and creditors. Resolution frameworks are specified in national legislation.

P>Recapitalization injects capital into banks that need stronger balance sheets. Recapitalization may use public funds, private investment, or asset resolution mechanisms. Recapitalization conditions address governance, risk management, and operational restructuring.

H2>Commodity Price Shock Response

P>Commodity price shocks can severely affect participating states dependent on commodity exports or imports. The commodity shock response component provides mechanisms for cushioning shock impacts.

P>Export price shock response addresses situations where commodity export prices decline sharply. Response includes emergency budget support, social safety net expansion, and economic diversification acceleration. Response helps commodity-dependent states weather price downturns without abandoning architecture commitments.

P>Import price shock response addresses situations where commodity import prices increase sharply. Response includes targeted subsidies, strategic reserve release, and efficiency improvement programs. Response reduces the cost

impacts on consumers and businesses.

P>Price stabilization mechanisms reduce commodity price volatility through buffer stocks, futures market operations, and export/import management. Stabilization prevents extreme price swings that generate economic and political instability.

ANNEX SPA

Every mechanism is assigned one of three priority tiers: Tier 1 (must survive in any version): Nuclear cap compliance; monitoring; ceasefire; humanitarian access; transit governance; governance body existence; core definitions Tier 2 (negotiable, conditional): Benefit timing; proxy freeze specifics; border arrangement pathway; regional burden-sharing ratios; normalization acceleration Tier 3 (optional, context-specific): Modular programs; technology cooperation; tourism corridors; detailed reconstruction governance Enforcement and Dispute Resolution

Actions that do not constitute material breaches but undermine framework purpose are addressed through defined gray-zone banding:

Table 8 Gray-Zone Incident Banding

Band Description Response

Band 1: Single isolated incident; technical Governance body records incident; no consequence

Monitoring explanation plausible

Band 2: Two or more related incidents without Consultative session; no economic consequence;

Consultation clear attribution factual record produced

Band 3: Three or more incidents with credible Formal finding; benefit delay up to 30 days; enhanced Response attribution forming pattern monitoring; public statement option Band 4: Cumulative or serious; approaches Referred to standard breach response process

Escalation formal compliance concern

False Positive Protection

If a violation finding is subsequently demonstrated incorrect, benefit delays are restored retroactively with economic value made whole. The finding is annotated in the Precedent Registry. No compliance indicator points from the false-positive finding are retained.

Verification Abuse Guardrail

To protect against excessive inspection requests: complementary access inspections are capped at five per year at standard review levels; requests above the cap require governance body majority approval; inspection requests without specific technical basis are returned for supplementary justification; Iran may designate up to five sensitive-period windows per year with extended notice. Cumulative delay may not exceed 72 hours for declared sites.

2 Enforcement and Dispute Resolution

Election Quiet Period

A formal "Quiet Period" activates during major national elections, legislative blockage, or executive constraint. Effects: new obligation activation paused; existing obligations continue without breach classification; benefits continue at 50 percent; escalation actions suspended; monitoring and governance body operation continue; deadlines paused. Maximum one Quiet Period per 12-month period per party; maximum 60 days without governance body approval.

Tiered Arbitration Architecture

The dispute resolution system replaces fully binding arbitration as the first recourse with a tiered system that is more politically acceptable and

historically more likely to produce durable compliance. Stage 1: Advisory Determination The Joint Technical Panel issues a non-binding advisory determination on any dispute unresolved through governance body consultations. Findings are published in the Transparency Summary. Either party may publicly note its view without triggering compliance consequence. Stage 2: Binding Determination (Mutual Opt-In) If both parties agree in writing within 30 days of a Stage 1 determination to accept binding arbitration, a three-person panel is constituted: one party-appointed arbitrator each, one chair from the standing neutral pool. Panel decisions are final and binding. Stage 3: UN Secretary- General Reference If Stage 2 is not invoked but the dispute remains unresolved and pertains to a core obligation, either party may refer the matter to the UN Secretary-General for non-binding recommendation. The recommendation is published. Either party may decline without framework collapse.

While withdrawal is permitted and does not constitute bad faith, it is not consequence-free: Withdrawal from a module suspends associated benefits effective from notice receipt

Benefits accrued up to notice date are retained

30-day governance body review assesses whether withdrawal reflects compliance concern, political will gap, or operational failure Minimum 30 days' notice for module withdrawal; 12 months for full framework withdrawal Re-entry available after 30-day re-baseline period with governance body certification

Orderly Failure Protocol

If the framework collapses, ordered reversion applies rather than unmanaged crisis: IAEA monitoring of declared facilities continues under existing safeguards agreement Humanitarian access channels remain open

3 Enforcement and Dispute Resolution

at pre-framework levels under UN mandates

Transit continues under UNCLOS freedom of passage

Commercial Continuity Protection for certified contracts continues for 24 months 90-day re-engagement window during which no new escalatory actions are taken

Diplomatic continuity channels remain operational

Detention, Hostage, and Detainee Resolution Mechanism Detention, Hostage, and Detainee Resolution Mechanism The Detention, Hostage, and Detainee Resolution Mechanism (DHRM) is a core framework track operating from Day 1, co-equal with nuclear, economic, and humanitarian tracks. Hostage issues are not side deals; they are central stabilizers that build trust through demonstrated reciprocity. The mechanism covers all detention categories across framework-affected theaters: Gaza, Lebanon, Iraq, Syria, and Iran.

Three-Tier Hostage Exchange Model

Exchanges are staged by priority tier, preventing deadlock through graduated progress: Table 24 Hostage Exchange Tiers

Tier Category Priority Timeline

Tier Women, children, elderly, wounded, medical Immediate Days 1-14 (First exchange window) 1 emergencies Tier Civilian adult detainees; dual nationals; High Days 15-60 (Second exchange 2 humanitarian workers window) Tier Military and security detainees; prisoners of war; Conditional Days 60- 180 or Phase 1 (Third 3 complex cases exchange window)

Rolling Exchange Windows

Instead of one massive all-or-nothing deal, the framework operates continuous

small-batch releases tied to compliance cycles: Exchange Window 1: Days 7-14. Tier 1 releases. Verified by ICRC. Count: 5-10 releases per batch minimum. Exchange Window 2: Days 21-30. Tier 1 completion, Tier 2 initiation. Count: 10-20 releases. Exchange Window 3: Days 45-60. Tier 2 completion. Count: 15-25 releases. Exchange Window 4: Days 75-90. Tier 3 initiation if conditions permit. Count: case-by-case. Ongoing Cycle: Every 30-day review cycle, the DHRM working group reviews new cases, proof-of-life status, and exchange readiness. Rolling windows prevent all-or-nothing collapse and deny political opponents a single moment to sabotage. Progress is incremental and often invisible, reducing the political stakes of each release.

Detention, Hostage, and Detainee Resolution Mechanism

4 Enforcement and Dispute Resolution

Hostage-for-Benefit Trigger Mechanism

Exchanges are linked to framework benefits through carefully calibrated triggers that incentivize cooperation without rewarding hostage-taking: Tier 1 exchange completion unlocks: enhanced humanitarian corridor capacity; medical supply priority routing; and ICRC access expansion Tier 2 exchange completion unlocks: banking channel transaction limit increase; asset release schedule acceleration; and reconstruction fund pre-positioning Tier 3 exchange completion unlocks: sectoral sanctions relief tranche; civilian aviation access; and academic exchange normalization

Anti-Incentive Safeguard

The value of benefits unlocked per release is capped at a level that does not make hostage-taking economically rational. The framework explicitly states that hostage-taking for the purpose of unlocking benefits is a material breach that triggers immediate enforcement. New hostage-taking after framework

entry voids all pending exchange benefits for the responsible party.

Humanitarian Decoupling Clause

Even if exchange negotiations fail or stall, the following protections remain operative:

Medical access to all detainees continues through ICRC without conditions

Proof-of-life verification continues on 30-day cycles

Family communication rights are maintained

Legal representation access is guaranteed

Humanitarian conditions (food, water, shelter, sanitation) are monitored This decoupling prevents detainees from being used as pure leverage assets. Their humanitarian treatment is not contingent on exchange success.

Multi-Theater Detainee Registry

A centralized Detainee Registry covers all framework-affected theaters: Gaza Track: Israeli-held Palestinian detainees; Palestinian-held Israeli detainees; civilian internees Iran Track: Dual nationals held in Iran; Iranian nationals held abroad Lebanon Track: Cross-border detainees from 2006 conflict and subsequent incidents

5 Enforcement and Dispute Resolution

Iraq Track: ISIS-affiliated detainees; security detainees; missing persons from conflict Syria Track: Political detainees; missing persons; children in detention Detention, Hostage, and Detainee Resolution Mechanism The Registry is maintained by the ICRC with framework secretariat support. It is not public to protect detainee security but is accessible to all framework parties and guarantors. Registry entries include: identity; detention status; legal classification; health condition; and exchange eligibility.

Universal Detention Categories

The framework standardizes detention terminology to eliminate semantic manipulation: Hostage: Civilian held for political leverage; detention is the primary objective Detainee: Person held pending legal process or security assessment; detention is protective or investigative Prisoner of War: Military combatant captured during armed conflict; governed by Third Geneva Convention Missing Person: Individual whose fate is unknown; may be alive, deceased, or detained Civilian Internee: Civilian detained for security reasons in occupied territory; governed by Fourth

Classification determines applicable protections, exchange sequencing, and legal status. Disputes over classification are resolved by the ICRC with governance body oversight.

Proof-of-Life Protocol

Mandatory verification requirements: Initial proof-of-life within 7 days of framework entry for all registered detainees Renewed proof-of-life every 30 days for Tier 1; every 60 days for Tier 2; every 90 days for Tier 3 Proof-of-life includes: video confirmation (minimum 30 seconds); medical status report; and approximate location verification (city or district level) Failure to provide proof-of-life within required windows triggers: ICRC escalation; governance body notification; and potential compliance indicator adjustment

Third-Party Custody Option

For high-risk exchanges where direct handover poses security concerns to either party, the framework provides a third-party custody mechanism: Detainees are transferred to ICRC or guarantor-state custody at a neutral location (Geneva, Muscat, or Islamabad) Third-party custody lasts 24-72 hours maximum During custody, ICRC verifies identity, health status, and voluntary

consent for transfer Final release occurs only after both parties confirm receipt of their respective exchanged individuals Detention, Hostage, and Detainee Resolution Mechanism Third-party custody reduces last-minute deal collapses and security fears during transfer.

6 Hostage-Taking Deterrence Clause

If new hostage-taking occurs after framework entry: Automatic suspension of the specific benefit category most recently unlocked by the responsible party Immediate compliance escalation to Step 2 (Technical Consultation) ICRC and governance body investigation within 72 hours Existing exchange process for previously detained individuals continues uninterrupted

New cases are added to the Registry and treated as separate matters

The clause is designed to deter new hostage-taking without harming current detainees. It creates a clear cost for the behavior while protecting ongoing humanitarian processes.

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA)
Enforcement & Dispute Resolution Modules Version 1.5 — Hardened
Operational Update

TABLE OF MODULES Module I: Binding Arbitration Panel

Module II: Graduated Penalty Ladder Module III: Spoiler Containment Protocol
2.0 Module IV: Emergency Override Mechanism

MODULE I: BINDING ARBITRATION PANEL

Operative Clause: This module establishes the permanent Binding Arbitration Panel (BAP) as the terminal dispute resolution authority under the RCSA. The BAP supersedes the framework's Tiered Arbitration Architecture (Stages 1-3) when activated by mutual consent or governance body override. It is designed

7 to produce definitive, enforceable resolutions to disputes that would otherwise paralyze implementation or trigger unilateral escalation. All BAP procedures are classified Tier 1.

1. JURISDICTION AND SCOPE OF AUTHORITY

1.1 Legally Binding Rulings The following categories of dispute, when submitted to the BAP by mutual consent of the disputing parties or by governance body override, produce

rulings that are final, binding, and enforceable under international law: (a) Escrow and Asset Unfreezing: Disputes over the release, freezing, or reallocation of funds held in framework escrow

accounts, including the \$500 million Escrow Shield, the Yemen Reconstruction Fund, and the Lebanon Stabilization Facility. BAP rulings on escrow unfreezing are immediately

operative upon transmission to the depositary institution. (b) IAEA Access Interpretations: Technical disputes over the scope, timing, or methodology of IAEA inspections, complementary

access, or environmental sampling under the IAEA Integration Annex (Module I of Verification & Technical Architecture). The BAP does not substitute for IAEA technical authority but

interprets framework-specific access obligations where the IAEA Additional Protocol and framework text diverge. (c) Compliance Indicator Score Adjustments: Challenges to the

quantitative scoring of the Compliance Indicators System (CIS), including domain weighting, indicator classification, or pattern-of-concern designations. BAP may order score recalculation, penalty reversal, or credit for remedial

actions. (d) Benefit Tranche Timing and Scope: Disputes over whether a party has met the conditions for activation of a specific

sanctions relief tranche, banking channel expansion, or asset release micro-tranche. BAP may order tranche release,

8 delay, or conditional hold with verification requirements.

(e) Facility Conversion Milestones: Disputes over whether Fordow IMIRC conversion milestones or Natanz centrifuge R&D limits have been met, including certification of decontamination

completion, equipment removal verification, or scientific advisory board constitution. (f) Sovereign Immunity Waiver Scope: Disputes over the

applicability of the limited sovereign immunity waiver to specific arbitration proceedings, asset attachment, or counter-claims under the RCSA Dispute Resolution Protocol.

1.2 Advisory-Only Rulings The following categories produce BAP determinations that are authoritative but not legally binding on the parties. Advisory rulings are published in

the quarterly Transparency Summary and inform governance body deliberation: (a) Attribution of Covert Proxy Activity: BAP may review PERT attribution methodology and issue an advisory opinion

on the weight of evidence, confidence levels, and alternative hypotheses. The PERT retains operational attribution authority; BAP does not override preliminary

or formal attribution decisions but may recommend reassessment. (b) Strategic Stability Assessment: BAP may issue advisory

opinions on whether cumulative notified actions (under the No Strategic

Surprise Commitment) constitute a strategic shift requiring framework recalibration. The opinion is

non-binding but triggers mandatory governance body review within 14 days.

(c) Humanitarian Access Disputes: BAP advisory opinions on

corridor routing, camp conditions, or medical evacuation disputes. UN agencies retain operational authority; BAP provides interpretive guidance.

9 (d) Gray-Zone Incident Banding: Advisory classification of

ambiguous incidents into Band 1-4 (Monitoring, Consultation, Response, Escalation) when the governance body is deadlocked. 1.3 Excluded Jurisdiction

The BAP has no authority over:

Decisions on military response authorization or use of force. Structural framework amendments or annex activation. Snapback suspension or full framework withdrawal (these

remain governance body prerogatives, subject to Costed Withdrawal procedures).

Matters exclusively within IAEA statutory authority under the NPT and IAEA Statute.

1. COMPOSITION AND APPOINTMENT

2.1 Permanent Panel Structure

The BAP consists of five members, constituting a standing panel with staggered terms: Chair (1 member):

Nationality: Swiss citizen (reflecting Switzerland's institutional continuity guarantor role).

Qualifications: Former judge of the International Court

of Justice, International Criminal Court, or equivalent international tribunal;
minimum 15 years of international arbitration experience.

Appointment: Nominated by Swiss Federal Council;

confirmed by unanimous governance body vote; 5-year renewable term;
removal only for incapacity, gross

misconduct, or neutrality compromise confirmed by remaining guarantors.

Function: Casts tie-breaking votes; manages panel

procedural calendar; issues procedural orders;

authenticates final awards.

10 Guarantor-Nominated Members (2 members):

Member A: Nominated by Pakistan; confirmed by

governance body consensus. Pakistani nationality or OIC-member-state
nationality preferred.

Qualifications: international arbitrator or senior international legal academic;
expertise in Islamic international law or regional security law.

Member B: Nominated by Oman; confirmed by governance

body consensus. Omani or Arab-state nationality preferred. Qualifications:
international arbitrator

or former senior diplomat; expertise in Gulf security architecture and energy
law.

Term: 4 years, staggered (Member A appointed Year 1;

Member B appointed Year 3). Renewable once.

Mutually Agreed International Legal Experts (2 members):

Both appointed by consensus of U.S. and Iranian

framework deputies from a pre-qualified roster.

Roster construction: Within 60 days of framework entry,

each party nominates 5 candidates; joint interviews conducted by governance body secretariat; final

roster of 8 approved by consensus.

Roster criteria: Minimum 10 years international

arbitration practice (ICSID, PCA, ICC, or UNCLOS

annex VII); nuclear non-proliferation or sanctions law experience preferred;

no citizenship of any framework party state (U.S., Iran, Saudi Arabia,

UAE, Israel, or other regional participant).

Term: 3 years, renewable once. Both members

appointed simultaneously at framework entry; reappointment staggered by 18 months to maintain

11 2.2 Alternate Members

Each standing member shall designate an alternate of equivalent qualifications who may substitute in case of incapacity, conflict, or recusal.

Alternate designation filed with governance body

secretariat within 30 days of principal appointment. 2.3 Neutrality and Independence Safeguards

All BAP members sign binding neutrality declaration upon

appointment, enforceable under Swiss federal law and framework-specific

arbitration regulations.

No member may accept employment, consulting, or advisory

engagement from any framework party, guarantor government, or major framework contractor during term plus 2-year cooling-off period.

Annual financial disclosure to Swiss Federal Department

of Foreign Affairs; disclosures reviewed by governance body secretariat.

Challenge procedure: Either party may challenge a

member for perceived partiality within 7 days of case assignment. Challenge reviewed by remaining 4 members; 3-of-4 vote required for removal from specific case.

If challenge succeeds, alternate substitutes; if alternate also challenged, governance body appoints emergency arbitrator from standing pool within 7 days.

1. PROCEDURAL ARCHITECTURE AND RIGID TIMELINES

Submission: Written Request for Arbitration filed with

BAP Registry (physically located at Permanent Court of Arbitration, Peace Palace, The Hague, with satellite registry at UN Geneva). Filing fee: \$25,000 (split equally between disputing parties unless BAP orders

12 Registry: Managed by PCA Secretariat under Swiss-Dutch

joint custody agreement; all filings encrypted via TLS 1.3; physical docket maintained in fireproof vault with dual-key access.

Notice: BAP Registry serves notice to respondent

within 24 hours of filing; respondent files acknowledgment within 72 hours.

Counter-claims: Permitted if arising directly from framework obligations; filed within 14 days of acknowledgment; counter-claim fee: \$15,000. 3.2 Expedited Track — Operational Disputes

Applicable to: escrow unfreezing, benefit tranche timing, IAEA access scheduling disputes, compliance indicator scoring, gray-zone banding.

Day 1: Request filed; notice served; respondent acknowledges. Day 3: BAP Chair assigns 3-member sub-panel

(Chair + one guarantor member + one mutually agreed expert). Sub-panel confirmed within 24 hours; any challenge resolved by Day 5.

Day 5: Case management conference (video or in-person at The Hague). Procedural order issued: evidence submission deadlines; hearing date; witness schedule. Day 7: Claimant submits evidence bundle (max 200 pages + exhibits).

Day 10: Respondent submits evidence bundle (max 200 pages + exhibits). Day 12: Hearing (1-day maximum; 4 hours per side; no oral reply without leave). Witnesses examined via video-link; affidavit testimony accepted for technical experts.

Day 14: Final award issued. Award includes: operative ruling; factual findings; legal reasoning (summary, not exhaustive); enforcement instructions; and compliance deadline. Extensions: Permitted only by unanimous sub-panel vote with written justification citing extraordinary procedural complexity. Maximum single extension: 7 days. Total expedited timeline may not exceed 21 days.

3.3 Standard Track — Structural Breaches Applicable to: facility conversion milestone disputes, sovereign immunity waiver scope, pattern-of-concern

legitimacy challenges, multi-domain cumulative compliance assessments. Day 1: Request filed; notice served.

Day 5: Respondent acknowledgment and preliminary objections (if any). Day 10: BAP Chair assigns full 5-member panel.

Case management conference. Procedural order issued. Day 15: Claimant memorial (max 400 pages +

exhibits). Day 25: Respondent counter-memorial (max 400 pages + exhibits).

Day 30: Hearing (2-day maximum; 6 hours per side). Expert witnesses examined; tribunal-appointed expert may be designated if technical dispute requires independent assessment. Day 35: Post-hearing briefs (optional; 20 pages maximum; 5 days after hearing close).

Day 40: Final award issued.

Extensions: Permitted by 4-of-5 panel vote with written justification. Maximum single extension: 14 days. Total standard timeline may not exceed 60 days.

3.4 Emergency Interim Measures Either party may request interim measures before full award:

Request filed with BAP Chair at any point after Day 1. Chair decides within 48 hours whether interim measure

is "urgent and necessary to prevent irreparable harm."

If granted, 3-member emergency sub-panel convened

within 72 hours; interim order issued within 5 days of request.

Interim measures may include: temporary escrow
unfreezing for humanitarian emergency; suspension of disputed benefit
tranche pending full hearing;
temporary IAEA access order; or preservation of evidence.

Interim orders automatically expire upon final award
issuance unless explicitly extended by final award.

1. ENFORCEMENT AND RECOGNITION

4.1 Binding Award Enforcement BAP awards on binding jurisdiction matters
are enforceable under:

New York Convention (1958) on Recognition and
Enforcement of Foreign Arbitral Awards — all framework parties and
guarantor states are convention

ICSID Convention (1965) for investment-related
disputes arising from framework-authorized commercial

Swiss Federal Act on Private International Law

(PILA), Chapter 12 — provides Swiss domestic

15 enforcement mechanism for awards seated in

Iranian Arbitration Law (1997) and U.S. Federal

Arbitration Act (9 U.S.C.) for domestic execution

in core party jurisdictions. 4.2 Asset Attachment For escrow and monetary
award enforcement:

BAP transmits certified award to depositary

institution (Swiss bank or World Bank trust) within 24 hours of issuance.

Institution executes award within 48 hours unless

H2>Proxy Actor Identification and Tracking

P>Annex SPA provides the comprehensive framework for identifying, tracking, and managing proxy actors who operate in the region with varying degrees of state support and direction. The framework recognizes that proxy relationships are often deliberately ambiguous, with sponsor states maintaining plausible deniability while benefiting from proxy activities that advance their interests. This ambiguity complicates both attribution and response, requiring sophisticated analytical tools and carefully designed policy mechanisms.

P>The identification methodology employs multiple indicators including financial flows from potential sponsors to suspect groups, supply chain analysis that traces weapons and equipment to their sources, communications intelligence that reveals command relationships, and behavioral analysis that identifies operational patterns consistent with state direction. No single indicator is dispositive; attribution conclusions are based on cumulative assessment of multiple indicators.

P>Tracking capabilities maintain current awareness of proxy actor locations, capabilities, activities, and relationships. Tracking employs a combination of intelligence collection, open-source monitoring, and regional reporting networks that provide granular awareness of proxy dynamics. Tracking data is maintained in a secure database accessible to authorized architecture personnel for analysis and response planning.

H2>Proxy Constraint Mechanisms

P>The framework includes multiple mechanisms for constraining proxy

activities that threaten architecture implementation. Constraint mechanisms are graduated based on the severity of proxy activities and the degree of state involvement in their conduct. Graduated responses ensure that constraint is proportionate to threat and that escalation is calibrated rather than automatic.

P>Diplomatic constraint involves formal communications to sponsor states regarding proxy activities, demands for cessation, and warnings of consequences for continued proxy operations. Diplomatic constraint can proceed through bilateral channels, architecture institutional channels, or UN mechanisms depending on circumstances and the identity of the sponsor state.

P>Economic constraint targets the financial and material support networks that enable proxy operations. This includes sanctions on entities providing support to proxy groups, interdiction of weapons and material supplies, and financial tracking that exposes and disrupts funding channels. Economic constraint requires international cooperation to be effective, as proxy support networks typically operate across multiple jurisdictions.

H2>Spoiler Containment Protocol 2.0

P>The Spoiler Containment Protocol 2.0 provides comprehensive measures for identifying, monitoring, and neutralizing actors who seek to undermine the architecture through violence, subversion, or political obstruction. The protocol recognizes that spoilers may include architecture parties who signed the architecture but seek to undermine it, non-parties who oppose the architecture for ideological or strategic reasons, and transnational actors who exploit architecture processes for their own purposes.

P>Inside spoilers are addressed through the architecture's compliance and enforcement mechanisms, which create consequences for parties who violate their commitments. However, the protocol also includes political engagement strategies that address the underlying grievances driving inside spoiler

behavior. Some inside spoilers act from genuine concern about architecture impacts on their interests; addressing legitimate concerns can convert spoilers into supporters.

P>Outside spoilers require a combination of deterrence, isolation, and counter-mobilization. Deterrence raises the costs of spoiler activities through security measures and threat of response. Isolation denies spoilers the political legitimacy and material support they require for effective opposition. Counter-mobilization builds pro-architecture coalitions that can overwhelm spoiler influence in political competition.

H2>Proxy Actor Financial Tracking

P>The proxy actor identification framework includes detailed financial tracking procedures that trace funding flows from state sponsors through intermediary entities to operational groups. Financial tracking exploits the reality that even sophisticated proxy operations require resources that flow through trackable channels.

P>Banking data analysis examines transaction records, correspondent banking relationships, and account ownership structures to identify suspicious financial flows. Cross-border transaction monitoring tracks funds moving between jurisdictions. Suspicious activity reports from financial institutions provide leads for investigation.

P>Cryptocurrency tracking addresses the growing use of digital currencies for proxy financing. Blockchain analysis traces transaction flows and identifies exchange points. Virtual asset service provider monitoring tracks conversion between cryptocurrencies and fiat currencies.

P>Trade-based money laundering analysis examines commercial transactions that may conceal fund transfers. Over-invoicing, under-invoicing, and

fictitious trade create opportunities for disguised payments. Trade data analysis identifies anomalous patterns indicative of money laundering.

H2>Proxy Technology and Supply Chain Tracking

P>Proxy actors require weapons, equipment, and technology that flow through supply chains vulnerable to tracking and interdiction. Supply chain tracking addresses the material dimension of proxy support.

P>Arms transfer monitoring tracks the flow of conventional weapons to proxy actors. Monitoring employs customs data, end-user verification, shipping manifests, and intelligence collection. Regional arms control mechanisms supplement international frameworks.

P>Dual-use technology controls restrict technology transfers that could enhance proxy capabilities. Controls include export licensing, end-use verification, and technology protection measures. The architecture harmonizes national controls and shares information on suspicious technology inquiries.

P>Materials tracking monitors the flow of precursor chemicals, explosives components, and other materials used in proxy operations. Tracking includes chemical industry reporting, customs inspection, and forensic analysis of recovered materials.

H2>Proxy Cyber Activity Attribution

P>Proxy actors increasingly employ cyber operations that exploit the attribution challenges of cyberspace. The cyber attribution framework addresses these challenges through technical, behavioral, and contextual indicators.

P>Technical indicators include malware signatures, command and control infrastructure, exploitation techniques, and digital artifacts that link

operations to specific actors. Technical forensics examines code, network traffic, and system artifacts for attribution clues.

P>Behavioral indicators include operational patterns, targeting preferences, timing, and tradecraft that distinguish different actors. Behavioral analysis compares observed operations against known actor profiles to identify likely attribution.

P>Contextual indicators include strategic motives, political timing, and relationship to other activities that suggest actor identity. Contextual analysis evaluates who benefits from an operation and who possesses the required capabilities and access.

P>Attribution confidence levels distinguish between technical indicators that suggest possible attribution, behavioral patterns that indicate probable attribution, and comprehensive evidence that establishes highly likely attribution. Attribution statements specify confidence levels to enable appropriate response calibration.

H2>Spoiler Engagement and Conversion Strategies

P>Beyond containment, the architecture includes engagement strategies that seek to convert spoilers into supporters or at least neutralize their opposition. Engagement addresses the underlying grievances that drive spoiler behavior.

P>Inside spoiler engagement identifies specific grievances driving architecture party opposition and addresses them through policy adjustment, additional benefits, or procedural modifications. Engagement requires distinguishing between spoilers motivated by genuine grievances and those motivated by irreconcilable opposition.

P>Outside spoiler engagement addresses the interests and capabilities of non-party actors who oppose the architecture. Engagement may include political

dialogue, security guarantees, economic incentives, or isolation strategies depending on spoiler characteristics and responsiveness.

P>Ideological spoiler engagement addresses actors motivated by opposition to the architecture's fundamental principles. Ideological spoilers may not be convertible through material incentives but may be neutralized through exposure of their ideology's failures, support for moderate alternatives, or security measures that limit their operational capacity.

ANNEX NPA

stay granted by BAP or governance body.

Attachment against commercial assets used in

framework-related activity permitted under limited

sovereign immunity waiver; attachment against diplomatic property, central bank reserves held for sovereign monetary functions, and military property

explicitly prohibited. 4.3 Non-Compliance Consequences If a party fails to comply with a binding BAP award within

the compliance deadline:

Automatic compliance indicator penalty: +2.0 points

per week of non-compliance.

Governance body convenes within 7 days to assess

whether non-compliance is technical (capacity) or political (willful).

If political non-compliance confirmed by weighted

majority (60% + neutral chair), Step 3 (Ministerial Review) of Graduated Penalty Ladder activates automatically.

Persistent non-compliance beyond 30 days: matter

16 referred to UN Security Council under framework

Filing fees: Split equally unless BAP orders

Panel fees: \$2,500 per day per member (expedited);

\$3,500 per day per member (standard). BAP Registry

administrative fee: 15% of panel fees.

Expert witness fees: Actual cost; capped at \$10,000

per witness unless extraordinary technical complexity

Party legal costs: Not recoverable unless BAP finds

frivolous or abusive prosecution; in such cases,

offending party pays 50% of respondent legal fees. 5.2 Funding Source BAP operations funded from framework administrative budget

(estimated \$1.5 million annually). Filing fees and panel fees paid by disputing parties into BAP Trust Account at Swiss National Bank; surplus after case completion rolled

into framework administrative reserve. 5.3 BAP Funding Leverage and Payment Enforcement If a party fails to pay its assessed BAP filing fees or

framework administrative dues within 14 days of invoice, the depositary institution (Swiss National Bank, acting as BAP Trust Account custodian) is authorized to automatically

deduct the required funds from that party's cleared escrow accounts or frozen asset micro-tranches. The deduction requires only JMOB Director certification of non-payment;

no additional governance body vote or party consent is required. Deductions are limited to the exact amount of

17 unpaid fees plus a 10% administrative recovery charge;

deduction may not exceed 5% of the party's total escrow balance in any 30-day period. If escrow or micro-tranche funds are insufficient, the non-paying party's next

scheduled benefit tranche is automatically reduced by the outstanding fee amount. This clause ensures that BAP operations cannot be starved of funds as a delaying tactic

during pending arbitration.

MODULE II: GRADUATED PENALTY LADDER

Operative Clause: This module operationalizes the Compliance Indicators System (CIS) into a predictable, automatic, and reversible sequence of proportional consequences. The ladder ensures that violations produce

measured, domain-specific responses rather than framework-wide collapse. All steps are triggered by quantitative CIS thresholds unless explicitly overridden by governance body supermajority. This module governs all framework domains simultaneously and is classified Tier 1.

1. COMPLIANCE INDICATORS SYSTEM (CIS) — FULL SPECIFICATION

1.1 Domain Structure and Scoring The CIS tracks four domains with distinct weights and indicators:

Domain A — Nuclear and Verification (3 points per indicator) A1: Enrichment level compliance (verified below cap) A2: IAEA inspector access adherence (no refusals)

A3: Stockpile status (within 300 kg ceiling) A4: Facility conversion progress (Fordow IMIRC timeline) A5: Supply chain transparency (centrifuge production reporting)

A6: Data continuity guarantee (no interruptions >48 hours) A7: Challenge inspection cooperation (72-hour access)

18 A8: Advanced centrifuge R&D compliance (Natanz PFEP only)

Maximum Domain Score: 24 points Domain B — Security and Proxy (2 points per indicator) B1: Proxy operational activity (incidents below theater cap)

B2: Maritime incidents (Hormuz/Red Sea compliance) B3: Militia compliance (Iraq PMF integration progress) B4: Force deployment status (declared posture adherence)

B5: Cross-border rocket/drone launches (Yemen, Lebanon caps) B6: Safe-passage prohibition (no extremist facilitation) B7: Counterterrorism cooperation (intelligence sharing)

B8: Base protection compact adherence (Iraq perimeter rules) Maximum Domain Score: 16 points Domain C — Economic and Sanctions (2 points per indicator)

C1: Relief delivery (tranche timing and scope) C2: Asset release (escrow drawdown compliance) C3: Banking functionality (correspondent channel operation)

C4: Transit operational status (Hormuz toll compliance) C5: Market reintegration (oil, petrochemical, mineral exports) C6: World Bank/IMF facility compliance (macro conditions)

C7: Commercial continuity protection (contract enforcement) C8: Insurance normalization (pool participation) Maximum Domain Score: 16 points

Domain D — Humanitarian and Regional (1 point per indicator) D1: Humanitarian access (corridor throughput) D2: Reconstruction disbursement (zone-specific funding)

D3: Ceasefire trends (Yemen, Syria, Lebanon) D4: Local governance legitimacy (municipal compact functionality) D5: Refugee return safety (Zone A/B verification)

D6: Medical evacuation pathway integrity D7: Detainee registry maintenance and proof-of-life D8: Hostage exchange window adherence

19 Maximum Domain Score: 8 points

1.2 Cumulative Scoring Methodology

Total Framework Score: Sum of all indicator scores

Maximum Theoretical Score: 64 points. Pattern-of-Concern Multiplier: Three or more

indicators across two consecutive 30-day review cycles demonstrating coordinated pattern adds +1.0 cumulative bonus to total score (not domain score)

for assessment purposes only. 1.3 Scoring Thresholds and Automatic Triggers

The following thresholds are quantitative tripwires. Upon

attainment, the specified consequence activates without requiring JIG consensus vote, unless explicitly overridden by supermajority (75% + neutral chair) within 72 hours of

automatic trigger notification. ; Cumulative Score ; Automatic Activation ; Override Window ; ; -----; -----; -----;

; 5.0 points ; Enhanced Review (Step 1 upgrade) ; 72 hours ; ; 8.0 points ; Formal Assessment + Step 2 activation ; 72 hours ; ; 12.0 points ; Snapback Consideration + Step 3 activation ; 72 hours ;

; 16.0 points ; Step 4 activation (Proportionate Response) ; No override ; ; 20.0+ points ; Systemic Breach Protocol; framework survival ; Governance body ; ; ; assessment within 7 days ; emergency session;

Domain-Specific Triggers (operate independently of cumulative score):

Any single Domain A indicator at 3.0+ points:

Automatic enhanced IAEA monitoring.

Any single Domain B indicator at 4.0+ points:

Automatic Proxy Event Response Team pre-activation.

Domain C at 6.0+ points: Automatic banking channel

20 enhanced scrutiny; Treasury OFAC joint review.

Domain D at 4.0+ points: Automatic UN OCHA

humanitarian conditions assessment.

1. STEP-BY-STEP PENALTY SEQUENCE

2.1 Step 1: Enhanced Review (Clarification) Trigger: 5.0 cumulative points OR any single indicator at 3.0+ points OR first pattern-of-concern designation.

Governance body records formal compliance concern
in Precedent Registry.

14-day context window opens: implicated party

invited to provide written explanation, technical documentation, or remediation plan.

Working-level consultation convenes within 7

days at neutral venue (Geneva or Muscat).

Enhanced monitoring activated for affected

domain: daily reporting (vs. weekly); alternate-

day satellite tasking; additional environmental sampling.

No economic consequence. No benefit suspension.

Compliance indicators updated to reflect inquiry

Public status: "Technical clarification under review." No formal breach designation.

Governance Override: Any party may request governance body override of Step 1 activation within 72 hours. Override requires 60% + neutral chair. If override

succeeds, concern downgraded to informal monitoring; if override fails, Step 1 proceeds. 2.2 Step 2: Formal Assessment + Benefit Freeze

Trigger: 8.0 cumulative points OR two pattern-of-concern

21 designations within 12 months OR technical lapse

uncured after 45 days OR single indicator at 5.0+ points. Automatic Measures:

Governance body issues formal compliance assessment

at ministerial level (U.S. Deputy Secretary / Iranian Deputy Foreign Minister).

Compliance indicators formally adjusted; score

recalculation published within 7 days.

Next scheduled benefit tranche frozen for 30 days

in the breached domain only. Cross-domain freeze

requires separate 60% + chair vote. * Nuclear breach: freezes next nuclear-related benefit (e.g., advanced centrifuge R&D access

expansion, fuel supply guarantee acceleration). * Security breach: freezes next security-linked benefit (e.g., proxy freeze zone expansion,

base protection compact extension). * Economic breach: freezes next relief tranche (e.g., Tranche 2 banking expansion, Tranche 3

sectoral relief). * Humanitarian breach: freezes next reconstruction fund disbursement in affected zone.

Enhanced monitoring maintained at Step 1 intensity

Public statement issued by governance body

secretariat within 14 days; wording pre-cleared by both parties. Partial Benefit Protection:

Benefits accrued to date are retained; freeze applies only to next scheduled tranche.

22 Humanitarian corridor operations, IAEA monitoring

funding, and medical evacuation pathways remain operative regardless of domain freeze.

Banking channel transactions below \$10 million

per transfer continue during freeze. 2.3 Step 3: Parameter Reversion + Domain Suspension Trigger: 12.0 cumulative points OR three pattern-of-

concern designations within 12 months OR confirmed material breach of non-core obligation OR compliance score at 12.0+ points for 30 consecutive days.

Targeted partial suspension of benefits in the

breached domain for up to 45 days.

Phase parameter reversion: affected domain

reverts to previous phase parameters. * Example: If nuclear enrichment exceeded 5% cap in Phase 1, enrichment permission reverts to

Phase 0 parameters (3.67% cap; external fuel guarantee required for any elevation). * Example: If proxy activity exceeded Yemen cap

(2 launches in 30 days), Yemen stabilization module reverts to Phase 0 ceasefire-only parameters; reconstruction fund frozen

pending 60 days of verified compliance.

Snapback friction ladder activates: minimum 44-day

interval from warning to full suspension. Warning

issued at Day 1 of Step 3; if no remediation by Day 44, full domain suspension operative.

Orderly failure protocol pre-activated: 90-day

re-engagement window opened; diplomatic channels

remain operational; IAEA monitoring continues.

23 Public statement: "Targeted domain suspension

pursuant to verified compliance concern." Reversibility Gate:

If party demonstrates verified remediation within

45-day suspension window: domain suspension lifted; benefits resume at 100%; reversion reversed; 0.5 point credit applied to CIS for

good-faith remediation.

If remediation incomplete after 45 days:

suspension extended; governance body convenes Step 4 assessment.

2.4 Step 4: Proportionate Response + Full Domain Suspension Trigger: 16.0 cumulative points OR confirmed material breach of core obligation OR systematic non-cooperation

OR formal repudiation of framework obligations. Automatic Measures:

Full suspension of all benefits in the breached

domain. Cross-domain escalation requires governance body supermajority (75% + neutral chair) and is not automatic.

Targeted partial suspension of benefits in

adjacent domains may be recommended by governance body but requires separate vote.

No instant reimposition of pre-framework

sanctions; instead, "snapback friction ladder" operates with 90-day warning-to-full interval.

Days 1-30: Formal warning; enhanced monitoring; no economic change. Days 31-60: Partial relief reduction (benefits at 50%).

* Days 61-90: Full relief suspension; pre-

24 framework sanctions baseline restored unless

governance body intervenes.

Orderly failure protocol fully activated:

Commercial Continuity Protection for certified

contracts continues for 24 months; IAEA monitoring continues under existing safeguards agreement; humanitarian corridors remain open

Governance body may refer matter to UN Security

Council for non-binding advisory input.

No-Override Rule: Step 4 may not be overridden by weighted majority. Only unanimous governance body consensus + guarantor concurrence can halt Step 4 activation.

1. REVERSIBILITY AND "CURE" MECHANISMS

3.1 Remediation Credit System Parties may reduce their CIS score through verified

Technical remediation within 7 days of breach

detection: -1.0 point per indicator.

Submission of root-cause analysis and corrective

action plan within 14 days: -0.5 points per domain.

Independent third-party verification of corrective

action completion: -1.0 point per indicator.

Public transparency gesture (e.g., invitation of

additional inspectors, voluntary facility tour for neutral media): -0.5 points per event.

Maximum remediation credit per 30-day cycle: 3.0

points total. 3.2 Retroactive Benefit Recovery

When a penalized party achieves verified compliance

Step 2 freeze: Frozen tranche released within 14

days of restoration confirmation; economic value made whole with interest at LIBOR + 2% for delay

Step 3 reversion: Phase parameters restored to

pre-breach level within 30 days; associated

benefits unlocked at next scheduled cycle.

Step 4 suspension: Benefits resume at 100% upon

governance body certification of sustained 60-day compliance; snapback

friction ladder reversed

within 90 days; no retroactive compensation for suspended period.

False Positive Protection: If penalty was based on

incorrect violation finding, benefits restored retroactively with full economic compensation (including lost opportunity costs calculated by

IMF technical team).

3.3 Compliance Restoration Certification

Verification of restoration conducted by IAEA (for

nuclear domain), JMOC (for security domain), World Bank/IMF (for economic domain), or UN OCHA (for humanitarian domain).

Certification requires 30 days of sustained

compliance post-remediation for Step 2 and 3 reversal; 60 days for Step 4 reversal.

The verifying body (IAEA/JMOC/World Bank/UN OCHA)

must issue its compliance restoration certification within 72 hours of the end of the observation period. Failure to issue the certification automatically

triggers the Silence Procedure (72-hour auto-adoption)

26 favoring the penalized party — meaning the

restoration is deemed approved unless another party objects in writing within 72 hours.

Certification transmitted to governance body

secretariat; Silence Procedure applies (72-hour auto-adoption unless objection).

If objection filed, governance body convenes

within 7 days; restoration decision by weighted majority (60% + chair).

1. CERTIFICATE OF EXHAUSTION REQUIREMENT

No party may escalate from one penalty step to the next

without exhausting all mechanisms at the current step. A Certificate of Exhaustion issued by the governance body secretariat is required before Step 2, 3, or 4 activation.

The Certificate confirms:

All working-level consultations completed at prior

Written explanatory brief received from implicated

party (or 14-day response window expired without response).

Enhanced monitoring data reviewed by Verification

Liaison Sub-Committee.

Neutral chair has issued procedural determination

that current step mechanisms are exhausted.

Exception: Mass-casualty events and confirmed attacks on declared IAEA-monitored nuclear facilities bypass exhaustion requirement and activate Emergency Override

Mechanism (Module IV).

1. DEADLOCK PENALTY CLOCK INTEGRATION

H2>Temporary Nuclear Constraint Mechanisms

P>Annex NPA establishes the Nuclear Pause Architecture that provides mechanisms for temporary nuclear constraint commitments that can be adopted as confidence-building measures even when comprehensive pathway

commitments are not immediately achievable. The pause concept recognizes that politics may not permit comprehensive agreements at present but that temporary, reversible constraints can still generate valuable confidence and create conditions for more comprehensive commitments later.

P>The pause mechanism includes temporary enrichment caps, testing moratoriums, and deployment restraints that parties can adopt on a time-limited basis with automatic expiration unless explicitly renewed. These temporary constraints provide immediate non-proliferation benefits while avoiding the political difficulties associated with permanent commitments. The temporary nature of pause commitments makes them easier to negotiate and implement.

P>Renewal procedures require affirmative political decisions to continue pause commitments beyond their initial terms. Renewal decisions are informed by compliance assessments, benefit delivery evaluations, and political circumstance reviews that determine whether pause conditions remain appropriate. The renewal requirement ensures that pause commitments do not outlive the political conditions that made them possible.

H2>Pause-to-Pathway Transition

P>The pause architecture includes structured procedures for transitioning from temporary pause commitments to comprehensive pathway commitments when political conditions permit. The transition framework identifies which pause commitments can be converted to pathway commitments, what additional commitments would be required, and what benefits would be provided in exchange for the additional constraints.

P>Transition is incentivized through benefit enhancement that rewards parties moving from temporary to permanent commitments. Enhanced benefits reflect the greater non-proliferation value of permanent constraints

and the increased confidence that other parties can place in commitments that will not automatically expire. Benefit enhancement is calibrated to the additional constraints undertaken through pathway adoption.

P>Graduated transition enables parties to move incrementally from pause to pathway commitments rather than making the transition in a single step. Graduated transition preserves political flexibility while progressively increasing constraint levels and corresponding benefits. Each graduation step requires verification of prior commitments before additional constraints are undertaken.

Pause Duration and Renewal Mechanisms

P>The Nuclear Pause Architecture establishes specific durations for pause commitments, with renewal procedures that enable extension if conditions warrant. Duration design balances the need for pause stability against the need for political flexibility.

P>Initial pause durations are established through specified time periods that provide sufficient pause stability without committing parties to permanent constraints. Initial periods are typically shorter than comprehensive pathway commitments, reflecting the more limited nature of pause obligations.

P>Renewal procedures require affirmative political decisions to continue pause commitments beyond initial periods. Renewal decisions are informed by compliance assessments, benefit delivery evaluations, and political circumstance reviews. The renewal requirement ensures that pause commitments do not outlive the political conditions that made them possible.

P>Automatic expiration provisions ensure that pause commitments terminate unless explicitly renewed, creating a default in favor of termination rather than continuation. Automatic expiration protects parties from being bound by

commitments that have lost political support but remain technically in force.

H2>Pause Verification and Monitoring

P>Pause commitments require verification that is less intensive than comprehensive pathway verification but sufficient to provide confidence in compliance. Verification design balances resource requirements against assurance levels.

P>Baseline verification establishes the initial status of constrained activities before pause commencement. Baseline documentation provides the reference point against which subsequent monitoring assesses compliance. Baseline verification includes inventory, inspection, and documentation of constrained capabilities.

P>Ongoing monitoring tracks compliance with pause constraints through periodic inspections, remote monitoring, and information analysis. Monitoring frequency is lower than for comprehensive pathways but sufficient to detect significant violations. Monitoring can be intensified if compliance concerns arise.

P>Challenge inspection rights enable investigation of suspected pause violations at undeclared locations. Challenge procedures balance the need for effective verification against protections against frivolous or abusive challenges.

H2>Pause Benefits and Incentives

P>Pause commitments generate corresponding benefits that create incentives for compliance and political support for continuation. Benefits are calibrated to the scope of pause constraints and the political difficulty of sustaining them.

P>Initial benefits are front-loaded to generate early political support for pause commencement. Benefits may include limited sanctions relief, confidence-

building measures, and diplomatic engagement. Front-loaded benefits demonstrate good faith and create constituencies with vested interests in pause continuation.

P>Sustained benefits continue throughout the pause period to maintain incentives for compliance. Benefits may include continued sanctions relief, expanded trade, technical cooperation, and institutional engagement. Sustained benefits prevent erosion of political support over time.

P>Enhanced benefits may be provided for parties that extend pause commitments beyond initial periods or that adopt additional constraints. Enhancement rewards good faith and creates incentives for progressive deepening of commitments.

H2>Pause-to-Pathway Transition Procedures

P>The architecture includes structured procedures for transitioning from temporary pause commitments to comprehensive pathway commitments when political conditions support more permanent arrangements.

P>Transition assessment evaluates whether conditions support pathway adoption, including political will, verification readiness, benefit expectation, and compliance history. Assessment is conducted by the Governance Body with technical support from the SESS and IAEA.

P>Transition negotiation addresses the specific terms of pathway adoption, including the selected pathway, quantitative parameters, verification arrangements, benefit structures, and implementation timelines. Negotiation may involve modification of standard pathway terms to accommodate circumstances.

P>Transition verification confirms that pause commitments are being maintained during transition negotiations and that pathway commitments can

be effectively implemented upon adoption. Verification prevents parties from exploiting transition periods to prepare for violation.

P>Transition implementation executes the shift from pause to pathway commitments, including legal instruments, institutional arrangements, and verification activation. Implementation is phased to ensure continuity of constraints during the transition.

ANNEX RIL

The Deadlock Penalty Clock (Risk Architecture section)

interacts with the Penalty Ladder as follows:

27 A party blocking more than three compliance

determinations in a single 30-day cycle triggers automatic Deadlock Penalty Clock review.

If review confirms procedural abuse or strategic

stalling: +0.5 points per blocked decision above threshold, added to CIS cumulative score.

These procedural penalty points may activate Step 1

or Step 2 automatically if they push cumulative score

Procedural penalty points may be "cured" only by

ceasing blocking pattern for two consecutive cycles;

no other remediation credit applies.

MODULE III: SPOILER CONTAINMENT PROTOCOL 2.0

Operative Clause: This module supersedes and expands the Semi-Autonomous Actor Protocol and the existing Spoiler Quarantine mechanisms in RCSA v1.5.

It establishes precise evidentiary thresholds, surgical isolation tools, and

state divestment pathways for managing semi-autonomous actors — including rogue militia factions, hostile domestic ministries, third-party maritime saboteurs, and transnational spoiler networks — without collapsing the

entire framework. This module is classified Tier 1 and is operative from Phase

0 entry.

1. SPOILER DEFINITION AND CLASSIFICATION

1.1 Spoiler Categories A "spoiler" is defined as any actor — state-affiliated, sub-state, or third-party — that undertakes action designed to undermine framework

implementation, provoke framework party retaliation, or collapse

28 confidence in compliance mechanisms. Spoilers are classified into four

categories with distinct containment protocols: Category Alpha — Localized Proxy Militia: Definition: Semi-autonomous armed faction operating

within a framework party's territory or sphere of influence that conducts unauthorized military action (rocket fire, IED attacks, drone strikes, maritime

harassment) without confirmed state command-and- control authorization.

Examples: Rogue PMF unit in Iraq; unauthorized Houthi

sub-group; uncontrolled Lebanese border militia element. Category Beta —

Rogue Domestic Institution: Definition: Government ministry, agency, or

institutional actor that actively obstructs framework implementation through bureaucratic sabotage, physical blocking of inspectors, or

unauthorized policy declarations contrary to framework obligations.

Examples: Iranian ministry blocking IAEA equipment

installation; Iraqi ministry withholding PMF registry data; U.S. Treasury sub-office freezing humanitarian transactions without authorization.

Category Gamma — Third-Party Maritime/Commercial Saboteur: Definition:

Non-framework state or commercial entity conducting sabotage, interdiction, or sanctions

evasion that undermines framework maritime security or economic channels.
Examples: Unaffiliated Somali pirate network;

third-state intelligence front conducting false-flag vessel attack; sanctions-evading shipping network using UAE port facilities.

29 Category Delta — Transnational Network:

Definition: Extremist organization, criminal network, or state intelligence proxy operating across multiple framework-affected theaters with intent to disrupt framework implementation. Examples: ISIS resurgence cell targeting framework humanitarian corridors; criminal network

facilitating uranium diversion; cyber actor targeting JMOC infrastructure.

1. SPOILER TRIGGER THRESHOLDS

2.1 Evidentiary Thresholds by Category Category Alpha (Proxy Militia): Tier 1 Trigger (Monitoring): Single confirmed

incident (rocket, IED, drone, maritime harassment) with credible but unconfirmed attribution to specific faction. Activates incident registry

logging and enhanced theater monitoring. Tier 2 Trigger (Quarantine): Two or more confirmed incidents within 30 days demonstrating consistent

operational signature; OR single incident causing 5+ civilian casualties; OR confirmed weapons transfer to the faction from state-linked channels.

Activates targeted quarantine measures. Tier 3 Trigger (State Accountability): Three or more incidents within 90 days; OR single incident causing 25+ fatalities; OR confirmed operational

orders from state-affiliated institution. Activates Graduated Penalty Ladder Step 2+ and state divestment pathway requirement.

Category Beta (Rogue Institution): Tier 1 Trigger: Single unauthorized obstruction

30 (inspector delay >24 hours; equipment confiscation;

data transmission block). Activates Technical Implementation Hotline resolution. Tier 2 Trigger: Sustained obstruction pattern (3+

incidents within 30 days); OR physical prevention of IAEA access for >72 hours; OR unauthorized public declaration contradicting framework

obligations by institutional official at director-general level or above. Activates institutional quarantine and governance body

formal consultation. Tier 3 Trigger: Institutional obstruction causing verification gap >14 days; OR institution

coordinating with external spoiler network; OR institution formally repudiating framework obligations. Activates state divestment pathway

and potential Step 3 penalty ladder. Category Gamma (Third-Party Saboteur): Tier 1 Trigger: Single maritime incident (vessel

harassment, GPS spoofing, unauthorized boarding) with no framework party attribution. Activates IMO notification and IHTA security alert.

Tier 2 Trigger: Pattern of maritime incidents (2+ within 30 days) with credible technical signature linking to known non-framework state or

criminal network; OR confirmed sabotage of framework commercial shipping. Activates joint naval patrol surge and targeted port denial.

Tier 3 Trigger: Sinking or seizure of commercial vessel; OR confirmed attack causing >\$10 million commercial damage; OR use of military-grade

31 weapons by non-state actor against framework

shipping. Activates full Third-Party Strike Buffer protocol and potential Crisis Lock. Category Delta (Transnational Network):

Tier 1 Trigger: Intelligence reporting of network mobilization targeting framework infrastructure. Activates intelligence fusion

cell alert. Tier 2 Trigger: Confirmed network presence in framework-affected zone; OR confirmed

reconnaissance of framework facility. Activates enhanced security posture and infrastructure hardening.

Tier 3 Trigger: Confirmed network attack on framework facility, corridor, or personnel; OR confirmed network facilitation of weapons

transfer to framework spoiler. Activates counterterrorism enforcement ladder and potential cross-border cooperative action.

1. QUARANTINE MECHANISMS

3.1 Surgical Isolation Architecture The quarantine is designed to isolate the spoiler without

harming the compliant state or collapsing the broader framework. Quarantine measures are targeted, reversible, and domain-specific. Financial Quarantine (applicable to Alpha, Beta, Gamma):

Targeted asset freeze: Specific bank accounts,

front companies, or financial channels identified as funding the spoiler are frozen

by framework banking partners (correspondent bank, Swiss clearing hub, World Bank escrow

Freeze scope: Only accounts directly linked

to spoiler operations via JMOC financial intelligence analysis. No freeze of sovereign

state accounts, central bank reserves, or general treasury.

Freeze duration: Initial 30 days; renewable

by JMOC Director for additional 30-day periods if spoiler activity continues; maximum 180 days without governance body review.

Due process: Spoiler entity notified via

neutral guarantor channel; 14-day appeal to BAP (Binding Arbitration Panel) Expedited Track; BAP may order unfreeze if evidence insufficient.

Virtual asset quarantine: Targeted wallet

addresses identified by the JMOC financial tracking cell will be added to the OFAC SDN

list and shared with regional Virtual Asset Service Providers (VASPs). Any exchange facilitating transactions with quarantined

wallets is subject to immediate removal from the framework's Tier 2 banking channel expansion and denial of IHTA tolling

registration for vessels linked to that exchange's beneficial owners. Contractual Quarantine (applicable to Alpha, Beta):

Suspension of specific infrastructure contracts,

logistics agreements, or procurement awards tied to the spoiler entity.

Example: If rogue PMF unit controls a trucking

company receiving framework reconstruction

33 contracts, those specific contracts are suspended;

other contracts with unrelated Iraqi entities continue.

Suspension requires JMOC verification of direct

spoiler-contract linkage; 7-day notice to host government; host government may substitute alternative contractor within 14 days to avoid

service interruption. Operational Quarantine (applicable to Alpha, Gamma, Delta):

Targeted denial of framework benefits to spoiler

personnel or affiliated entities.

Example: Individual fighters of rogue militia

unit ineligible for PMF salary normalization; unit excluded from base protection compact

perimeter rules (other units retain protection).

Maritime application: Vessels owned or operated

by confirmed Gamma saboteur denied IHTA tolling

registration; denial published to all compliant ports; vessel may still transit but excluded from framework compliance benefits (toll reduction,

priority processing). Information Quarantine (applicable to Beta, Delta):

For rogue domestic institutions: Sanitized

data feeds to that institution restricted to non-sensitive domains; institution removed from technical implementation working groups.

For transnational networks: Intelligence

sharing through Fusion Cell restricted to counter-network operations only; network intelligence tagged with "no kinetic use

against framework parties" firewall.

34 3.2 Humanitarian Shield

Quarantine measures may not affect:

Humanitarian corridor operations (Gaza, Lebanon,

Medical supply routing and pharmaceutical shipments. Refugee camp support funding and WASH operations. ICRC, UN OCHA, WHO operational funding and access. IAEA inspector safety and mission continuity

(even if Beta institution is quarantined, IAEA

access continues via alternative channels).

1. STATE DIVESTMENT PATHWAY

4.1 Purpose and Principle

When a spoiler is confirmed as operating within or with tacit support from a framework party's institutional structure, the host government has a structured diplomatic

off-ramp to formally disavow and neutralize the spoiler without triggering state-level penalties. The pathway provides political cover for the host government while

maintaining framework accountability. 4.2 Divestment Procedure Stage 1 — Formal Acknowledgment (within 7 days of

Tier 2 or 3 trigger): Host government issues public or private (governance body-only) acknowledgment that spoiler activity is

occurring and is not authorized by central framework-committed institutions.

Private acknowledgment sufficient for Category

Alpha (militia) and Category Gamma (third-party); public acknowledgment required for Category Beta (rogue institution) and Category Delta (transnational network with state links).

35 Acknowledgment does not constitute admission of state responsibility; it is framed as "awareness of unauthorized activity." Stage 2 — Commitment to Constrain (within 14 days):

Host government submits written commitment to governance body detailing:

Specific measures to constrain spoiler

(arrest warrants, financial cutoff orders, military repositioning, administrative suspension of rogue officials).

Timeline for measure implementation (not to exceed 30 days for Alpha; 60 days for Beta).

Verification methodology (JMOC monitoring, IAEA inspection, UN team deployment).

Commitment classified as "binding framework obligation" if submitted by designated framework institution (Iranian Presidency, U.S. Department of State, Iraqi Council of Ministers). Stage 3 — Demonstrated Action (within 30-60 days):

Host government implements committed measures; JMOC verifies implementation via:

Satellite monitoring of spoiler facility

Financial tracking of asset freeze

Inspector verification of institutional

compliance restoration.

Incident registry confirmation of zero

spoiler activity for 30 consecutive days.

36 If verified: spoiler reclassified from

"active" to "neutralized"; quarantine lifted; no CIS penalty applied to host state; state receives 0.5-point CIS credit for good-faith

divestment. Stage 4 — Remediation and Reintegration (if applicable): For Alpha spoilers (militia): Individual fighters

who cease activity may be eligible for PMF integration pathway (if Iraqi) or amnesty track (if applicable). Spoiler commanders subject to

individual sanctions unless they cooperate with disarmament. For Beta spoilers (institution): Institution may

be reintegrated after 90 days of verified compliance; responsible officials removed or transferred; new designated liaison appointed to

framework working groups. 4.3 Failure to Divest — Escalation Consequences If host government fails to complete Stage 2 or Stage 3:

Day 14 (no Stage 2 submission): Automatic +1.0

CIS point to Security and Proxy domain.

Day 30 (no Stage 3 action): Automatic Step 2

penalty ladder activation (benefit freeze in

Day 60 (no verified neutralization): Automatic

Step 3 penalty ladder activation (parameter

reversion in affected domain).

Day 90 (persistent inaction): Spoiler activity

reclassified as state-level compliance concern;

"Attributed-but-Uncontrolled" doctrine applies; state responsible for pattern reduction per Semi-

37 Autonomous Actor Protocol.

1. ANTI-INCENTIVE SAFEGUARDS

5.1 Spoiling Deterrence The framework explicitly disincentivizes actors from undertaking spoiler activity:

Any faction that initiates spoiler activity is

permanently ineligible for framework economic

benefits (salary normalization, infrastructure investment, reconstruction contracts).

Spoiler commanders and identified operatives

added to framework Proscribed Actor Registry;

registry shared with INTERPOL, UN Security Council sanctions committees, and regional intelligence fusion cells.

Spoiler assets seized or frozen transferred to

framework Victims Compensation Fund (if civilian casualties) or Yemen/Lebanon Reconstruction Fund

(if infrastructure damage). 5.2 False Spoiler Protection To prevent framework parties from weaponizing spoiler

designation against political opponents:

Spoiler designation requires JMOC fusion engine

confirmation with 75% confidence; BAP Expedited

Track appeal available within 14 days.

If designation subsequently demonstrated incorrect:

quarantine lifted retroactively; seized assets

returned with interest; false designating party subject to +1.0 CIS procedural penalty.

Three false designations by same party within 12

months triggers governance body review of that

38 MODULE IV: EMERGENCY OVERRIDE MECHANISM

Operative Clause: This module operationalizes the Shock Response Envelope and Crisis Lock mechanisms into a comprehensive emergency protocol for

managing mass-casualty events, severe crises, and extreme domestic political pressure scenarios. It defines exact activation triggers, Crisis Lock mechanics, protected operations that survive the Lock, and a pre-cleared

retaliation menu that permits limited, framework-authorized responses without triggering framework collapse. This module is classified Tier 1 and supersedes standard Graduated Penalty Ladder exhaustion requirements

1. ACTIVATION TRIGGERS

1.1 Tier 1 Trigger — Significant Incident

Definition: Mass-casualty attack resulting in 10-24 fatalities; OR attack on critical infrastructure causing >48-hour disruption (12-hour for power/health systems per Operational Hardening Edit 14); OR

confirmed use of chemical/biological agents limited in scope; OR verified direct military clash between framework core parties resulting in fatalities.

Activation: Crisis Lock (14 days); emergency governance body session within 48 hours; enhanced monitoring in affected theater.

Political Override: Either party may request accelerated review; no veto on Lock activation. 1.2 Tier 2 Trigger — Major Incident

Definition: Attack resulting in 25-49 fatalities; OR critical infrastructure destruction affecting >100,000

39 civilians; OR sinking/seizure of civilian vessel in

international waters; OR confirmed assassination of senior government/military official; OR use of chemical/biological agents causing mass casualties.

Activation: Crisis Lock (21 days); suspension of next scheduled benefit tranche in affected domain; fact-finding team deployment within 72 hours; public

attribution process initiated. Political Override: Governance body may override tranche suspension by weighted majority (60% + chair)

within 7 days. 1.3 Tier 3 Trigger — Catastrophic Incident Definition: Attack resulting in 50+ fatalities; OR

mass-casualty attack on civilian target; OR attack on declared IAEA-monitored nuclear facility; OR use of nuclear/radiological material; OR sustained missile/

drone barrage threatening population centers. Activation: Crisis Lock (30 days); domain-specific benefit freeze; full governance body ministerial

session within 72 hours; pre-authorized proportionate package activation; UN Security Council notification by both parties.

Political Override: No override on Lock activation. Benefit freeze may be lifted only by unanimous governance body vote after certified remediation plan.

1.4 Special Category Triggers Attack on IAEA Monitored Nuclear Facility:
Threshold: Any kinetic, cyber, or sabotage attack

on declared IAEA-monitored site. Activation: Crisis Lock (30 days); IAEA emergency inspection within 48 hours; JMOC nuclear domain

40 alert; UN Security Council notification.

Shock Response Window: 6 hours (shortest response window in framework).

Attack on Diplomatic or Humanitarian Personnel:

Threshold: Confirmed attack on framework-accredited diplomats, IAEA inspectors, ICRC delegates, UN humanitarian workers, or medical evacuation convoy

personnel. Activation: Crisis Lock (21 days); ICRC/UN OCHA investigation; PERT activation; 12-hour Shock

H2>Regional Integration Architecture

P>Annex RIL addresses the relationship between the architecture and broader regional integration processes, recognizing that security cooperation is most sustainable when embedded in comprehensive regional relationships that include economic, political, and social dimensions. The framework promotes architecture linkages to regional trade arrangements, infrastructure networks, institutional cooperation, and people-to-people exchanges that create multiple cooperation strands resistant to disruption of any single strand.

P>The economic integration component promotes architecture linkages to regional trade agreements, customs unions, and common market arrangements. These linkages multiply the economic stakes of architecture participation by extending benefits beyond security-specific arrangements to encompass broader economic cooperation. Economic integration also creates business constituencies with vested interests in regional stability that support

architecture implementation.

P>Institutional integration involves embedding architecture institutions within broader regional institutional frameworks rather than maintaining architecture bodies as standalone entities. Integration options range from formal merger with regional organizations to cooperative agreements that coordinate architecture and regional organization activities. Integration reduces institutional overhead while enhancing architecture legitimacy through association with established regional bodies.

H2>Legitimacy Building and International Recognition

P>The legitimacy framework ensures that the architecture achieves and maintains the international recognition that underpins its effectiveness. Legitimacy derives from multiple sources including treaty-based legal authority, UN depositary functions, broad international participation, demonstrated implementation effectiveness, and alignment with international norms including non-proliferation, human rights, and sustainable development.

P>UN system integration enhances legitimacy through architecture association with the United Nations and its specialized agencies. Integration mechanisms include UN Security Council endorsement of architecture objectives, IAEA assumption of verification responsibilities, and specialized agency involvement in architecture technical programs. UN integration also provides access to UN resources and institutional infrastructure.

P>International recognition involves obtaining acknowledgment of architecture legitimacy from states and organizations beyond the core participating parties. Recognition from major powers not directly involved in the architecture, multilateral organizations, and influential non-governmental actors enhances architecture credibility and expands the international costs of

violation or withdrawal. Recognition campaigns target specific states and organizations whose support would be particularly valuable.

H2>Regional Identity and Constituency Building

P>The constituency building component creates domestic and regional populations with vested interests in architecture success. Constituency building goes beyond interest group mobilization to encompass identity formation in which support for regional cooperation becomes part of how individuals and groups define themselves. This identity-based support is more durable than purely interest-based support because it persists even when specific benefits fluctuate.

P>Regional identity promotion involves cultural, educational, and media programs that foster identification with the region as a whole alongside national identities. These programs include student exchanges, cultural festivals, media collaborations, and sporting events that create personal relationships and shared experiences across national boundaries. Regional identity complements rather than replaces national identity, creating dual identification that supports cooperation.

P>Youth engagement ensures that the next generation of leaders and citizens possesses the skills, relationships, and values required for sustained regional cooperation. Youth programs include scholarships, leadership development, entrepreneurship support, and volunteer opportunities that engage young people in architecture activities. Early engagement creates lifelong commitments to cooperation that persist through political and generational transitions.

H2>Regional Identity Formation and Cultural Integration

P>Regional identity formation creates psychological foundations for sustained

cooperation by fostering identification with the region alongside national identities. Cultural integration builds shared experiences, mutual understanding, and interpersonal relationships that support political cooperation.

P>Cultural programs promote regional cultural expression and appreciation. Programs include cultural festivals, artist exchanges, heritage preservation, and media collaborations that celebrate regional cultural diversity while identifying common themes. Cultural programming creates positive emotional associations with regional cooperation.

P>Educational integration connects educational systems across participating states through curriculum harmonization, student exchanges, and joint research programs. Integrated education develops shared knowledge frameworks and creates personal relationships among future leaders. Educational integration proceeds gradually, respecting national curriculum autonomy while promoting convergence on shared objectives.

P>Media cooperation supports independent media that provide accurate information about regional developments and architecture implementation. Cooperation includes journalist training, media outlet development, content sharing, and protection of media freedom. Free media holds governments accountable and provides citizens with information required for informed participation.

P>Sporting and cultural events create opportunities for positive regional interaction that transcends political differences. Regional sporting competitions, cultural olympiads, and youth camps build personal relationships and shared experiences. Events are designed to be inclusive, avoiding domination by any single state or group.

H2>Legitimacy Building Through Effectiveness

P>The most powerful source of architecture legitimacy is demonstrated effectiveness in achieving its objectives. Effectiveness legitimacy arises when participants and observers conclude that the architecture delivers tangible benefits that justify its existence and justify continued commitment.

P>Effectiveness metrics measure achievement of architecture objectives across nuclear, security, economic, and humanitarian dimensions. Metrics include nuclear breakout timelines, incident prevention rates, trade volume growth, development project completion, and humanitarian access maintenance. Metrics are published regularly to demonstrate progress.

P>Success communication ensures that effectiveness achievements are visible to the publics whose support sustains architecture participation. Communication translates technical metrics into accessible narratives that demonstrate concrete benefits. Success stories illustrate abstract metrics with real examples.

P>Adaptive improvement responds to effectiveness shortfalls by adjusting programs, resources, and strategies. Willingness to acknowledge and address shortcomings builds credibility that enhances legitimacy. Architecture institutions that demonstrate responsiveness to performance problems generate greater trust than those that ignore or deny problems.

H2>Regional Organization Partnerships

P>The architecture seeks partnerships with existing regional organizations including the Arab League, the Gulf Cooperation Council, the Organization of Islamic Cooperation, and other relevant bodies. Partnerships leverage existing institutional infrastructure, benefit from organizational expertise, and enhance architecture legitimacy through association with established regional bodies.

P>Partnership modalities range from informal consultation through cooperative agreements to formal institutional integration. Informal consultation involves regular dialogue and information sharing without formal commitments. Cooperative agreements specify areas of collaboration and coordination mechanisms. Formal integration involves merger or subordination of architecture institutions within regional organizations.

P>Complementarity principles ensure that architecture partnerships enhance rather than duplicate existing regional organization functions. The architecture does not create parallel institutions where adequate ones already exist but rather creates mechanisms that bridge gaps and address specific requirements falling outside existing mandates.

P>Capacity support for regional organizations strengthens their ability to engage effectively with architecture activities. Support includes technical assistance, funding, and institutional development that builds regional organization capabilities. Strengthened regional organizations serve as more effective architecture partners.

H2>Regional Economic Integration and Trade Architecture

P>The Regional Integration and Legitimacy annex promotes deeper economic integration among participating states as a foundation for sustained political cooperation. Economic integration creates interdependence that raises the costs of confrontation and creates constituencies with vested interests in continued cooperation.

P>Trade integration reduces barriers to cross-border commerce through tariff reduction, regulatory harmonization, and trade facilitation. Integration proceeds from preferential trade arrangements through free trade areas toward customs unions and common markets. The pace of integration reflects political willingness and administrative capacity.

P>Investment integration enables cross-border capital flows that create ownership stakes in neighboring economies. Integration includes investment protection, dispute resolution, and market access commitments. Integrated investment creates business constituencies that oppose disruption of cooperative relationships.

P>Labor mobility enables workers to move across borders for employment opportunities. Mobility arrangements address work permits, professional qualification recognition, social security portability, and migration management. Labor mobility reduces unemployment and addresses labor shortages while creating personal connections across borders.

H2>Regional Infrastructure Connectivity

P>Infrastructure connectivity creates physical links that facilitate economic integration and regional interaction. The architecture supports infrastructure development that connects participating states through transportation, energy, telecommunications, and water networks.

P>Transportation connectivity includes roads, railways, ports, and airports that enable the movement of people and goods across borders. Connectivity projects focus on missing links that currently prevent seamless regional transportation. Standardization ensures interoperability across national networks.

P>Energy connectivity includes electricity grids, natural gas pipelines, and oil pipelines that enable regional energy trade. Grid interconnection permits electricity trade that balances supply and demand across the region. Pipeline networks provide alternative supply routes that enhance energy security.

P>Telecommunications connectivity includes cross-border fiber optic links, mobile roaming agreements, and internet exchange points that enable

regional digital communication. Connectivity reduces communication costs and enables regional digital services.

H2>Regional Governance and Democratic Accountability

P>Regional legitimacy requires democratic accountability that ensures regional institutions serve the interests of regional populations rather than elite preferences. Democratic mechanisms include representation, participation, transparency, and accountability.

P>Regional parliamentary bodies provide representative forums for regional policy deliberation. Parliamentary bodies may be advisory or may possess legislative authority depending on the degree of integration. Parliamentary oversight holds regional executives accountable.

P>Citizen participation mechanisms enable direct public engagement with regional decision-making. Mechanisms include public consultations, referenda, petitions, and civil society representation. Participation ensures that regional policies reflect public preferences.

P>Transparency requirements ensure that regional institutions operate openly and that citizens can access information about regional activities. Transparency includes publication of decisions, budgets, and performance data. Transparency enables accountability and informed public engagement.

ANNEX PR

Use of camp facilities (clinics, schools, warehouses) for military purposes.

Camp residents engaging in military operations from or through the camp.

Camp perimeter used as defensive position or observation post by armed groups.

Militia "taxation" or extortion of camp residents. Permitted Security Presence:

63 UNHCR/UN police community officers (unarmed or small arms only for self- defense).

Host state police with UNHCR accompaniment (for criminal law enforcement only, not political intelligence).

Private security guards contracted by UN agencies (armed with small arms only; rules of engagement: self- defense and camp perimeter protection).

4.2 Camp Monitoring and Enforcement

UNHCR Protection Officers conduct weekly camp security audits: search for weapons; interview residents about recruitment threats; inspect facilities for military use.

CPMC conducts monthly independent camp security assessment with unannounced visits.

Satellite monitoring: JMOC analyzes

commercial satellite imagery of camp perimeters for vehicle patterns consistent with weapons transport or military

Community reporting: Anonymous reporting

system (SMS hotline) for camp residents to report armed group activity without

fear of reprisal. 4.3 Enforcement Escalation for Camp Militarization Level 1 — Suspicion:

Intelligence or community report of

64 possible armed group activity in camp.

Response: Enhanced UNHCR monitoring; CPMC spot inspection within 48 hours; no CIS consequence unless verified.

Level 2 — Confirmed Presence: UNHCR or CPMC verifies presence of armed individuals, weapons, or military

equipment in camp perimeter. Response: Automatic +1.5 CIS points to Humanitarian domain; host state notified

and required to disarm/remove armed elements within 7 days; camp placed on enhanced monitoring.

Level 3 — Active Militarization: Confirmed recruitment, weapons storage, or military operations from camp; OR

armed group using camp as launch site for attacks. Response: Automatic +3.0 CIS points

(maximum) to Humanitarian domain; +2.0 to Security and Proxy domain; Step 2 Penalty Ladder activation; host state

required to neutralize armed presence within 14 days or Spoiler Containment Protocol 2.0 activates; camp may be

evacuated to alternative location under UNHCR protection if civilian safety compromised.

Level 4 — Attack Origination: Confirmed attack on framework party or civilian target launched from camp

65 by armed group using camp residents as

human shields. Response: Emergency Override Mechanism Tier 2 activation; CPMC issues immediate

civilian protection alert; UN OCHA activates Rapid Aid Deployment for camp residents at risk of retaliatory

strike; all framework parties prohibited from striking camp without 72-hour UN security team clearance (PHAR

deconfliction protection applies to camp even if Level 4 militarization confirmed — civilians remain protected).

Level 4 Imminent Threat Exception: The 72-hour clearance requirement is waived only when all of the following

conditions are simultaneously met: (a) Armed group is conducting an active, continuous attack (3+

projectiles or sustained direct fire) from within the camp perimeter against a civilian

target outside the camp. (b) CPMC Director or UN OCHA Director confirms (via

Humanitarian Deconfliction Hotline) that the attack is ongoing and that delay would

result in additional civilian fatalities outside the camp. (c) Targeting is limited strictly

66 to the identified launch point,

weapons depot, or armed group position within the camp; no area bombardment or strike on

camp infrastructure not directly linked to the active attack. (d) Prior warning is issued to

camp residents via all available channels (loudspeaker, SMS alert, UN OCHA notification) with

minimum 15 minutes evacuation time before kinetic action, unless the attack tempo makes

delay impossible (certified by on-scene UN security officer). (e) Post-strike, full CPMC access

to the site within 24 hours for civilian harm assessment. Any strike under this exception that

causes civilian casualties triggers standard per-fatality CIS scoring (Module II, Section 3.1). Three

Level 4 exception strikes by the same party within 12 months triggers governance body mandatory review of

that party's targeting discipline. 4.4 Camp Demilitarization Support Host states and UNHCR receive framework support

to maintain camp civilian character:

Security infrastructure: Perimeter fencing, lighting, access control gates funded from 67 burden-sharing offsets.

Alternative livelihood programs: Vocational training, cash-for-work, and education programs to reduce vulnerability to armed

Community governance: Elected camp committees with structured role in camp management, reducing militia influence.

Intelligence sharing: JMOC provides sanitized alerts to UNHCR about potential armed group infiltration patterns (no raw intelligence; no source identification).

1. REGIONAL COORDINATION AND DATA SHARING

5.1 Regional Refugee Coordination Platform

A standing coordination platform manages refugee and IDP flows across all framework-affected theaters:

Chaired by: UNHCR Regional Representative (Middle East and North Africa).

Members: Host state refugee agency directors (Jordan, Lebanon, Iraq, Turkey, Egypt); UN OCHA; CPMC; IOM; WFP; UNICEF; framework guarantor observers (Switzerland,

Meets: Monthly (routine); weekly during

Functions: Population tracking; burden

offset calculation; safe return assessment coordination; camp security information sharing; documentation standardization.

5.2 Displacement Early Warning System

68 A quantitative early warning system triggers

proactive response before displacement becomes a crisis:

Yellow alert: Intelligence indicators of

impending military operation or security deterioration in zone with >50,000 civilian population. Activates: contingency planning;

stockpile pre-positioning; host state notification.

Orange alert: Confirmed military build-up;

OR 1,000+ civilians displaced within 7 days. Activates: Rapid Aid Deployment pre- authorization; burden-sharing offset pre- calculation; camp preparation.

Red alert: Active combat in civilian area;

OR 5,000+ displaced within 7 days (refugee surge trigger). Activates: full Rapid Aid

Deployment; automatic burden-sharing offset release; Emergency Override notification. 5.3 Data Standards and Transparency

All refugee and IDP population data

collected using UNHCR standard registration and profiling tools.

Biometric registration (iris scan or

fingerprint) for all individuals aged 5+ to prevent duplicate registration and

ensure accurate population counts.

Monthly population statistics published

by UNHCR on framework transparency portal.

Anonymized data shared with governance

body for burden-sharing calculations;

69 individual data protected under UNHCR

data protection standards.

CPMC audits population data annually for

accuracy and protection against

APPENDIX TO HUMANITARIAN & CIVILIAN PROTECTION MODULES

A. MODULE CROSS-REFERENCE MAP Module I (Corridor Logistics):

Integrates with: JMOC (GPS

deconfliction); Spoiler Containment

2.0 (extortion violations); CIS scoring (blockage penalties); BAP (HCVC dispute resolution).

Operational lead: UN OCHA (primary);

JMOC (deconfliction); CPMC (blockage verification).

Integrates with: CIS (automatic

scoring); Graduated Penalty Ladder

(escalation triggers); BAP (evidence admissibility); Emergency Override (mass-casualty reporting).

Operational lead: CPMC Director

(WHO/UN OCHA joint appointment). Module III (Rapid Aid Deployment):

Integrates with: Escrow & Disposition

70 Governance Architecture

Annex (automated releases); IAEA

Integration Annex (no nuclear conditionality); CIS (no scoring impact — humanitarian firewalled);

White Channel (OFAC licensing).

Operational lead: UN OCHA Director;

World Bank escrow administrator.

Module IV (Refugee & IDP):

Integrates with: Burden-sharing offsets

(economic architecture); Spoiler

Containment (camp demilitarization); Safe Return Conditions (verification architecture); Civil documentation (data protection firewall).

Operational lead: UNHCR High

Commissioner; CPMC (protection monitoring).

Governance Architecture

The framework establishes a single governance body for Phase 0-1, evolving into broader institutions only as the framework matures. This evolutionary approach ensures that parties need only negotiate one institutional framework at entry, reducing negotiation complexity and institutional resistance.

71 Governance Architecture

Joint Implementation Group

Figure 4 — Governance Architecture Evolution Single body evolves through three institutional phases. Phase 0-1: Joint Implementation Group (JIG) — streamlined single body with U.S. and Iranian deputy-level representation, neutral chair from Oman, and five-person professional secretariat. Phase 2: Joint Commission — expanded regional participation with all JIG functions retained plus additional regional state representation. Phase 3: Regional Coordination Council — permanent regional governance architecture with full institutional continuity. Figure 4: Governance Architecture Evolution The Joint Implementation Group (JIG) is the sole Phase 0-1 governance, compliance, and dispute resolution authority. The JIG operates under the triple guarantor architecture described in the Risk Architecture section, with Oman serving as operational mediator, Switzerland as institutional continuity guarantor, and Pakistan as regional security guarantor.

Table 6 Joint Implementation Group Structure

Role Representative Function

Voting Members	United States (Deputy Secretary level); Iran	Decision-making on all operational matters (Deputy Foreign Minister level)
Neutral Chair	Oman (Pakistan as alternate)	Meeting facilitation; compromise proposals; emergency session convening
Secretariat	Five-person professional staff (neutral	

Administrative support, compliance nationalities) tracking, public reporting
Functional Sub- Working-level experts from parties Compliance tracking,
verification liaison,

Committees dispute resolution

All decisions require consensus of both voting members as the default mode. If consensus is impossible, the neutral chair convenes an emergency session, presents compromise proposals, and facilitates a seven-day mediation period. If still no consensus after two attempts separated by at least 7 days, the governance body may invoke the weighted majority override mechanism described in the Risk Architecture section (supermajority of 60 percent plus neutral chair concurrence for operational decisions; 75 percent for compliance determinations). If override is not invoked, the matter is referred to the UN Secretary-General for advisory opinion (non-binding), and the automatic procedural fallback activates after 21 days of unresolved status. The consensus default is maintained for: structural changes to the framework; new annex activation;

72 Governance Architecture

benefit tranche authorization; and compliance determinations at Step 3 or above. All other operational decisions are eligible for override.

Weekly standing meetings: Every Monday, Geneva time, at UN headquarters. Duration: 2 hours. Agenda: compliance review, incident reports, cycle assessment. Monthly plenary: First Monday of each month. Extended format with deputies present. Compliance certification and public statement. Quarterly ministerial review: Full-day session at rotating neutral venues (Muscat, Geneva, Doha). Emergency sessions: Within 24 hours of any party request marked "Emergency."

Institutional Evolution

The governance body evolves as the framework matures: Phase 0-1: Joint Implementation Group — streamlined single body Phase 2: Joint Commission — expanded regional participation, retains all JIG functions Phase 3: Regional Coordination Council — permanent regional governance architecture

Functional Sub-Committees

These working groups are internal to the governance body and have no independent decision-making authority: Compliance Tracking Sub-Committee: Maintains indicator scores and records Verification Liaison Sub-Committee: Interfaces with IAEA and technical teams Dispute Resolution Sub-Committee: Manages the tiered consultation process

Humanitarian Working Group: Coordinates access monitoring and funding Economic Cooperation Sub- Committee: Tracks trade corridor and project finance

Each party maintains designated personnel: senior negotiator (minimum 20 percent FTE); technical implementation officer (minimum 50 percent FTE during Phase 0); legal and compliance officer (minimum 25 percent FTE); military liaison officer (Phase 1+); humanitarian liaison officer (25 percent FTE minimum). Operating costs are shared equally between parties (estimated Phase 0 budget: \$2 million annually).

73 Economic and Financial Architecture

Economic and Financial Architecture

The financial architecture is designed to make regional economic cooperation bankable, insurable, and investable. Without credible financial mechanisms, even politically sound frameworks fail because private capital will not enter markets perceived as high-risk.

Escrow and Guarantee Mechanisms

Figure 5 — Projected Economic Impact by Phase Cumulative visible gains and infrastructure investment across framework implementation. Phase 0 (\$15B+): humanitarian corridor activation, pilot asset release, banking channel restoration, medical supply routing. Phase 1 (\$58B+): oil market reintegration, trade corridor expansion, infrastructure financing, sectoral sanctions relief. Phase 2 (\$100B+): regional development bank lending, investment normalization, diaspora capital flows, technology transfer. Phase 3 (\$300B+ decade total): full economic integration, sovereign credit normalization, permanent institutional architecture. Figure 5: Projected Economic Impact by Phase The framework deploys a three-layer financial protection system: Layer 1: Escrow Shield A pre-funded escrow account of \$500 million is established at a neutral institution at framework entry into force. The account is sourced from sovereign assets held in third- country accounts, not from donor appropriations. Funds are available exclusively for medicine, medical devices, food, agricultural inputs, and emergency humanitarian procurement. Drawdown requires certification of humanitarian end-use by UN OCHA or ICRC. Asset release tranches are structured as escrow transfers, not direct payments. Each tranche is moved from frozen status into a designated escrow account upon compliance certification. This structure provides political cover for all parties: assets are demonstrably committed before they are accessible. Layer 2: Multilateral Guarantees The World Bank provides Partial Risk Guarantees covering 35 percent of loan value for major infrastructure projects. This reduces commercial bank interest rates from approximately 12 percent to 6-7 percent, dramatically improving project economics. Coverage scenarios include: sanctions reimposition, host government contract breach, political violence or insecurity, and major regulatory change.

Table 7 World Bank Guarantee Coverage Limits

Per-project cap \$2-3 billion Portfolio cap \$10-12 billion total Single-country cap \$4-5 billion Duration 20 years Layer 3: Investor Confidence Certification A quarterly Investor Confidence Index is published by an independent rating agency, providing transparent assessment of framework risk for institutional investors. The index combines nuclear compliance (40 percent), economic project performance (30 percent), political stability (20 percent), and multilateral institution support (10 percent).

74 Economic and Financial Architecture

Economic Access and Integration Architecture

The framework establishes a comprehensive economic access architecture that operates below the political radar of sanctions relief while delivering tangible benefits. These mechanisms are framed as compliance- based standardization, trade facilitation, and risk stabilization rather than political normalization.

Financial System Access

Tiered SWIFT Normalization: Transaction categories expand over time based on verified compliance. Tier 1 (Phase 0): humanitarian and medical payments. Tier 2 (Phase 1): food, agriculture, aviation safety. Tier 3 (Phase 2): petrochemicals, minerals, industrial inputs. Each tier activation requires 60 days of verified compliance in the prior tier. Pre-Cleared Transaction Corridors: Treasury issues formal guidance establishing automatic legal clarity for medicine, food, and aviation sectors. Banks receive pre-clearance determinations within 30 days. Positive responses constitute protection against subsequent designation. Multilateral Payment Clearing Hub: A Swiss-administered clearing system processes regional trade settlements in multiple currencies, reducing dependence on dollar-based correspondent banking. The hub operates under Swiss regulatory supervision with framework party

representation on the oversight board. Central Bank Technical Cooperation: Liquidity management support, anti-money laundering system modernization, and financial transparency training. Technical cooperation is framed as financial stability support, not political concession.

Trade and Logistics Integration

Transit Efficiency Corridors: Priority customs processing and reduced inspection delays for compliant states. Framed as trade facilitation reform under WTO standards. Port Modernization Access: Ports meeting transparency standards receive priority infrastructure financing through the Regional Development Bank. Framed as global supply chain integration. Aviation Safety and Parts Access: Spare parts and maintenance licenses for civilian aircraft. Framed as civil aviation safety compliance under ICAO standards. Insurance Normalization Pool: Multilateral insurance backing for shipping and infrastructure projects, reducing risk premiums. Framed as risk stabilization mechanism.

Energy and Industrial Cooperation

Grid Stabilization Cooperation: Cross-border electricity balancing agreements between Iran, Iraq, and Turkey. Framed as energy reliability coordination. Refining and Petrochemical Upgrades: Access to efficiency technology and emissions reduction systems. Framed as environmental modernization. Strategic Reserve Swap: Countries store fuel in each other's facilities, creating interdependence without political

75 Economic and Financial Architecture

commitment. Framed as energy security cooperation. Industrial Spare Parts Channel: Controlled access to machinery and maintenance inputs for manufacturing. Framed as industrial continuity support.

Investment and Capital Access

Risk Guarantee Expansion: World Bank Partial Risk Guarantee coverage increases with compliance milestones. Framed as investment de-risking. Regional Infrastructure Fast-Track: Pre-approved rail, port, and pipeline projects receive expedited financing. Framed as priority development pipeline. Sovereign Credit Normalization: Gradual improvement in credit ratings and borrowing access tied to compliance metrics. Framed as macroeconomic stabilization. Diaspora Investment Channel: Safe legal pathways for expatriates to invest in home-country projects. Framed as remittance optimization.

Technology and Knowledge Exchange

Academic and Technical Exchange: Engineering, medical research, and nuclear safety cooperation. Framed as scientific cooperation. Digital Infrastructure Access: Cloud services and cybersecurity support. Framed as critical infrastructure protection. Standards Alignment: ISO compliance and financial reporting standards. Framed as global market compatibility. Business Travel Facilitation: Expedited visas for vetted commercial actors. Framed as trade enablement.

Multilateral Financial Institutions

IMF Macroeconomic Stability Facility

The IMF provides a \$5 billion standby credit line to ensure fragile states do not collapse economically during framework operation. Conditions include maintaining inflation at or below 10 percent, currency stabilization, framework compliance, and modest structural reforms. If conditions are met, the standby is available immediately during economic crisis. If violated, standby is suspended as a monitoring function, not a punitive measure.

Regional Development Bank

A dedicated regional development bank provides long-term project financing (20-30 year loans at concessional rates), currency swaps for trade settlement, trade finance, equity investment in major projects, and technical assistance. Capitalization: \$10 billion over three years. Lending capacity: \$10-15 billion annually.

76 Sovereign Immunity Waiver for Dispute Resolution

All framework participants agree to a limited sovereign immunity waiver applicable exclusively to arbitration and adjudication proceedings conducted under the framework's dispute resolution mechanism. The waiver covers: Arbitration tribunals established under the RCSA Dispute Resolution Protocol, with enforcement governed by the New York Convention or the ICSID Convention as applicable; Commercial disputes arising from framework-authorized transactions, including loan defaults under Regional Development Bank facilities, trade finance obligations, and investment protection agreements; Counter-claims and set-off defenses raised in good faith within the same proceedings, provided they arise directly from the framework relationship; Attachment or execution against commercial assets used in framework-related activity, excluding military property, diplomatic premises, and central bank reserves held for sovereign monetary functions. The waiver does not extend to: (a) pre-judgment attachment without tribunal authorization; (b) criminal jurisdiction or extraterritorial regulatory enforcement; (c) third-party claims unrelated to framework obligations; or (d) assets designated as immune under bilateral investment treaties or international custom.

Any dispute over the scope of waiver application is resolved by the tribunal itself under the principle of kompetenz-kompetenz, with appeal to the

Permanent Court of Arbitration for threshold jurisdictional rulings within 30 days.

Commercial Continuity Protection

Companies engaging in framework-authorized transactions receive: Sanctions reimposition escrow shield (24-month buffer) World Bank guarantee backstop (interest rate reduction) Regional Development Bank equity participation (10-20 percent stake sharing downside risk) Force majeure insurance (coverage for political violence, sanctions, government contract breach) Currency hedging support (exchange rate protection for projects in volatile currencies)

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA) Economic & Financial Architecture Modules Version 1.5 — Hardened Operational Update

TABLE OF MODULES Module I: Regional Development Fund Charter

77 Module II: Sanctions Synchronization Module

Module III: Trade Corridor Activation Annex Module IV: Energy Interdependence Module

PREAMBLE: NEGOTIATING POSITION SYNTHESIS AND MIDDLE GROUND

Operative Clause: This block of modules translates the framework's political architecture into binding economic and financial instruments. In drafting these

provisions, the following synthesis of the U.S. nine-point proposal and Iran's fourteen-point counterproposal governs all design decisions: U.S. Position (Nine-Point Framework):

(1) Complete dismantlement of enrichment infrastructure; (2) Termination of proxy support (Hezbollah, Hamas, Houthis); (3) Full reopening of Strait of Hormuz;

(4) Two-month ceasefire observation period; (5) Binding limits on ballistic missile program; (6) Unrestricted IAEA access including military sites; (7) Permanent (non-expiring) nuclear restrictions; (8) International assistance for civilian nuclear power reactors; (9) Limited interim enrichment until regional consortium operational.

Iranian Position (Fourteen-Point Counterproposal): (1) Permanent cessation of all hostilities within 30 days; (2) Withdrawal of U.S. forces from Iran's periphery;

(3) Firm international security guarantees against future aggression; (4) Lifting of naval blockade; (5) Complete removal of all U.S. and international sanctions; (6) Release of all frozen Iranian assets; (7) Compensatory payments for sanctions damages; (8) End to fighting in Lebanon and all regional fronts;

78 (9) New multilateral mechanism governing Strait of Hormuz;

(10) Binding U.S. non-aggression commitment; (11) Recognition of Iran's right to peaceful nuclear enrichment; (12) Restoration of normal banking and trade ties;

(13) International attention to Israel's undeclared nuclear arsenal; (14) Regional powers as framework guarantors. Middle Ground Architecture:

Sanctions relief is tranche-based and conditionally linked to

H2>Project Evaluation and Prioritization Framework

P>Annex PR establishes the framework for evaluating and prioritizing projects financed through the Regional Development Fund and other architecture financial mechanisms. The framework ensures that limited resources are directed toward projects that generate maximum benefit for regional stability and prosperity. Evaluation criteria balance economic impact, security

relevance, political feasibility, and implementation capacity considerations.

P>Economic impact assessment examines a project's contribution to employment generation, income growth, productivity improvement, and economic diversification. Projects with larger economic multipliers, broader employment effects, and stronger linkages to regional value chains receive higher priority. Economic assessment employs standard methodologies including cost-benefit analysis, economic impact modeling, and sensitivity analysis.

P>Security relevance assessment examines a project's contribution to architecture security objectives. Projects located in areas of high security concern, that address root causes of instability, or that create constituencies for cooperation in strategically important populations receive enhanced priority. Security assessment draws on intelligence analysis and security expertise to identify projects with maximum security impact.

H2>Implementation Readiness and Risk Assessment

P>Implementation readiness assessment evaluates whether proposed projects have adequate preparation including feasibility studies, environmental assessments, stakeholder consultation, implementation capacity, and financing arrangements. Projects with stronger implementation readiness can proceed more rapidly to generate visible benefits. Projects with weak readiness require additional preparation that delays implementation.

P>Risk assessment identifies factors that could cause projects to fail or underperform including political risks, technical risks, financial risks, and environmental risks. Risk assessment includes both probability estimation and impact assessment to identify the most significant risks requiring mitigation. Projects with unmanageable risks are rejected or redesigned to reduce risk exposure.

P>The prioritization scoring system combines evaluation criteria into composite scores that enable ranking of project proposals. Scoring employs weighted averages that reflect the relative importance of different criteria for different project categories. Weights are established by the Fund Council based on strategic priorities and can be adjusted as priorities evolve.

H2>Project Portfolio Management and Optimization

P>The Project Priority Rulebook includes portfolio management procedures that optimize the overall project portfolio across multiple criteria. Portfolio management ensures that the mix of projects funded through the RDF and other architecture mechanisms achieves balanced coverage of priorities, manages risk effectively, and maintains implementation momentum.

P>Portfolio balance assesses whether the project portfolio covers priority sectors equitably, serves all participating states, addresses both immediate needs and long-term development, and includes projects at different stages of readiness. Imbalanced portfolios are adjusted through project selection criteria that weight underrepresented categories more heavily.

P>Risk management at the portfolio level ensures that the overall project portfolio does not concentrate risk in particular sectors, states, or implementation conditions. Portfolio risk assessment examines correlations among project risks and identifies concentrations that could produce multiple simultaneous failures. Risk diversification ensures that portfolio performance is robust against individual project setbacks.

P>Pipeline management maintains a flow of projects at different preparation stages to ensure continuous implementation. Pipeline stages include concept development, pre-feasibility, feasibility, design, procurement, and implementation. Pipeline management ensures that projects are ready for funding when resources become available and that resources are not left idle

for lack of prepared projects.

Results Framework and Performance Measurement

P>The results framework specifies the outputs, outcomes, and impacts that projects are expected to achieve and the indicators used to measure achievement. The framework enables evidence-based management that allocates resources to effective interventions and discontinues ineffective ones.

P>Output indicators measure the direct products of project activities including infrastructure built, services delivered, and training conducted. Output measurement is relatively straightforward and provides early evidence of implementation progress.

P>Outcome indicators measure the intermediate effects of project outputs including access to services, behavioral changes, and capacity improvements. Outcome measurement requires more sophisticated evaluation designs that attribute effects to project activities rather than external factors.

P>Impact indicators measure the long-term effects of projects on ultimate objectives including economic growth, health improvements, and stability enhancement. Impact measurement requires longitudinal designs that track changes over extended periods and control for confounding factors.

P>Performance measurement systems collect, analyze, and report indicator data in formats accessible to decision-makers. Systems include monitoring data from routine project reporting, evaluation data from special studies, and research data from independent investigations. Performance information feeds into project adjustment, resource allocation, and learning processes.

ANNEX ER

Small-scale desalination: 50 million cubic meters per year; solar-powered (reduces fuel dependence).

Cost: \$500 million; funded from Humanitarian Emergency Escrow and international donors.

123 Timeline: 18 months. Water pricing: Free to Gaza municipality (fully

2.3 Lebanon Water Infrastructure

Rehabilitation of Litani River water treatment facilities: \$200 million; RDF Window C.

Coastal desalination plant (Tripoli): 100 million cubic meters per year; \$800 million; RDF Window C + Lebanese government co-financing.

Litani River pollution remediation: \$150 million; critical for southern Lebanon agricultural recovery and IDP return conditions.

2.4 Yemen Water Security

Urban water system rehabilitation (Sana'a, Aden, Hudaydah): \$400 million; RDF Window C + Yemen Reconstruction Fund.

Solar-powered groundwater pumping systems for rural communities: \$200 million.

Wastewater treatment plants for cholera

prevention: \$150 million (linked to Rapid Aid Deployment Trigger B4). 2.5
Shared Water Governance

Jordan River Basin Commission: Reactivated with
framework-party membership (Israel, Jordan, Palestine, Syria); water
allocation disputes
resolved through BAP arbitration; framework provides political umbrella for
technical cooperation.

Euphrates-Tigris coordination: Iraq, Syria,
Turkey technical working group on dam
124 management and flow guarantees; framework
secretariat facilitates (no binding allocation — strictly technical coordination).
No party may use water infrastructure as
leverage in non-water disputes (Humanitarian Firewall extension to water
security).

1. PETROCHEMICAL EXPORT PARAMETERS

3.1 Phase-by-Phase Export Framework Iranian petrochemical exports are
permitted under graduated volume caps, pricing floors, and revenue
escrow requirements. This provides Iran with the export revenue it demands
while creating verifiable constraints that address proliferation and
destabilization concerns.

Phase 0 (Entry to 90 Days):

Export volume: 0 bpd (complete export ban
maintained during initial verification

Exception: Humanitarian fuel swaps (Iranian fuel for humanitarian operations in framework-affected zones) permitted up to 100,000 bpd equivalent; monitored by UN OCHA; no revenue to Iran.

Phase 1 (90 Days to 12 Months):

Export volume cap: 500,000 bpd oil equivalent (crude oil, condensate, and refined products combined).

Pricing floor: \$45 per barrel (Brent equivalent); if market price falls below floor, RDF Window D provides price support subsidy to maintain Iranian 125 revenue at floor-equivalent level.

Revenue escrow: 30% of gross export revenue deposited in RDF-monitored escrow account; released quarterly upon IAEA and JMOC compliance certification.

Permitted buyers: All non-sanctions-listed entities; no restriction on destination country (China, India, EU, Japan, South Korea all eligible).

Shipping: Iranian-flagged vessels permitted if IHTA-certified; foreign-flagged vessels preferred for first 12 months (builds market confidence).

Insurance: Framework escrow fund provides

maritime insurance backstop for Iranian export shipments (Lloyd's of London or equivalent underwriter; \$500M policy).

Phase 2 (12 Months to 24 Months):

Export volume cap: 1.0 million bpd. Pricing floor: \$50 per barrel. Revenue escrow: 20% (reduced from 30%). Additional products: Natural gas exports

(LNG and pipeline) permitted up to 50 million cubic feet per day.

Petrochemical products (methanol, urea,

polyethylene) permitted for export without volume cap (non-oil revenue diversification). Phase 3 (24 Months onward):

Export volume cap: 1.5 million bpd (pre-

sanctions baseline level).

Pricing floor: \$55 per barrel.

126 Revenue escrow: 10% (minimal holdback for

compliance assurance).

Natural gas exports: Up to 150 mmcf/d

(including exports to Iraq under Section 1.4 above).

International upstream investment permitted

(foreign companies may invest in Iranian oil and gas field development).

Steady State (36+ Months, Full Framework

Export volume: No cap (full restoration

of pre-sanctions export capacity;

estimated 2.1-2.3 million bpd achievable with investment).

Revenue escrow: 0% (full revenue repatriation to Iran).

Full international energy market

participation including futures trading,

joint ventures, and technology transfer. 3.2 Revenue Monitoring and Verification

All Iranian petrochemical exports must be

registered with IHTA Petroleum Tracking System

(IPTS): vessel name, cargo volume, buyer identity, price, loading port, discharge port.

IHTA verifies export volumes monthly against

satellite imagery (tanker loading at Iranian ports), AIS tracking, and buyer country import statistics.

Discrepancy >5% between declared and verified

exports triggers investigation; >10% discrepancy triggers automatic escrow hold and Step 1

127 Penalty Ladder activation.

Revenue escrow administered by World Bank:

Iranian Central Bank submits monthly export revenue report; World Bank cross-checks against

IHTA volume data and market price indices; escrow percentage calculated and held; balance released to Iranian Central Bank within 15

business days of quarter end. 3.3 Revenue Use Restrictions (Escrowed Portion)

The escrowed portion of export revenue (30%/20%/10%

depending on phase) may be used only for:

RDF project co-financing (infrastructure,

reconstruction, energy projects in framework- affected states).

IHTA operational expenses (maritime security,

environmental compliance, toll collection systems).

Humanitarian Emergency Escrow replenishment. NOT for: military procurement; IRGC or proxy

funding; nuclear program activities outside IAEA-approved parameters.

World Bank fiduciary oversight ensures

escrowed funds are not diverted to prohibited uses. Confirmed diversion: +3.0

CIS points; immediate petrochemical export suspension;

BAP Expedited Track review.

1. PIPELINE COOPERATION FRAMEWORKS

4.1 Proposed Regional Gas Pipeline

A framework-facilitated regional natural gas pipeline creates long-term structural interdependence: Route Concept: Iranian South Pars gas field →

128 Iraq (Basra) → Kuwait → Saudi Eastern

Province → Bahrain/Qatar interconnect.

Phase 1: Iran-Iraq segment (100 km; 2 bcf/day

capacity); \$800 million; RDF Window D +

Phase 2: Iraq-Kuwait-Saudi segment (350 km;

3 bcf/day capacity); \$2.5 billion; Saudi

PIF + Kuwait Investment Authority + RDF.

Total capacity: 5 billion cubic feet per day

(enough to displace 50% of regional LNG imports).

Pricing: Hub-based pricing linked to regional

spot market; 10-year take-or-pay contracts with price review every 3 years.

Governance: Pipeline owned by joint venture

(Iran 25%, Iraq 20%, Kuwait 15%, Saudi Arabia 25%, Qatar 10%, Bahrain 5%);
operated

by neutral management contractor (Shell, TotalEnergies, or equivalent neutral
operator).

Framework protection: Pipeline designated as

critical shared infrastructure; sabotage triggers +3.0 CIS and emergency
response.

4.2 Iraq-Turkey Oil Pipeline Rehabilitation

Rehabilitate and secure the Iraq-Turkey

Pipeline (ITP) for Kurdish region and federal Iraqi oil exports.

Capacity target: 1 million bpd. Cost: \$1.5 billion; RDF Window B + KRG

Revenue sharing: Federal Iraqi government 75%;

129 KRG 25%; deposited in monitored escrow at

Turkish Central Bank.

Security: UN-mandated pipeline protection force (neutral personnel) for 100 km most vulnerable segment.

4.3 Lebanon-Regional Gas Interconnection

Offshore gas pipeline from Israeli Leviathan and/or Egyptian Zohr fields to Lebanon (via Cyprus or direct maritime route).

Capacity: 200-500 mmcf/d. Cost: \$600 million. Framework facilitation: RDF provides political risk insurance for investors; neutral operator manages (TotalEnergies or ENI); revenue sharing between supplier states and Lebanon.

Conditionality: Lebanon receives gas only under framework active status; if Lebanon withdraws from framework, gas supply subject to standard commercial renegotiation (not automatic cutoff — framework does not create energy dependency as political weapon).

APPENDIX TO ECONOMIC & FINANCIAL ARCHITECTURE MODULES

A. NEGOTIATING POSITION SYNTHESIS MATRIX The following matrix shows how each provision in these modules addresses specific demands from the U.S. nine-point proposal and Iran's fourteen-

point counterproposal: ; U.S. Demand ; Iranian Demand ; Module Provision ;

130 ; -----; -----; -----;

; Dismantle enrichment (1) ; Enrichment rights (11) ; Dynamic Cap Ladder (Verification Modules): phased conditional enrichment caps rather than zero

or unlimited ; ; End proxy support (2) ; End hostilities (1,8) ; Proxy Activity Cap System (Core) + PMF Integration (RP- IRQ) + Proxy Freeze Zones ; ; Open Hormuz (3) ; Hormuz governance (9) ; IHTA: multilateral tolling authority with Iranian institutional voice ; ; Ceasefire period (4) ; End war in 30 days (1) ; Phase 0 entry at framework signature; compliance-verified advancement ; ; Missile limits (5) ; Security guarantees (3,10) ; No Strategic Surprise Commitment + CIS penalties for missile violations ;

; Unrestricted inspections (6) ; Sovereign dignity ; 72-hour challenge inspection + managed access (Verification Modules, Module I) ; ; Permanent restrictions (7) ; No expiration ; Tier 1 classification of core provisions; 5-year renewal review ;

; Civilian nuclear help (8) ; Nuclear energy rights ; Fordow IMIRC + international advisory board + fuel supply guarantees ;

; Limited interim enrichment (9) ; Full enrichment rights ; Phase 1-3 conditional caps; Phase 3 up to 20% with Board approval ; ; — ; Lift naval blockade (4) ; IHTA operational freedom + banking channel restoration ;

; — ; Remove all sanctions (5) ; Eight-tranche relief architecture; full removal at Tranche 8 ; ; — ; Release frozen assets (6) ; Micro-tranche release system (\$100B over 10+ years) ; ; — ; Compensatory payments (7) ; Reconstruction investment via RDF (not reparations) ;

; — ; US withdrawal (2) ; Phased force posture transitions (No Strategic Surprise) ; B. ESCROW HIERARCHY SUMMARY ; Sub-Fund ; Capitalization ; Administrator ; Release Trigger ;

; -----; -----; -----; -----; ; 1. Humanitarian Emergency ; \$500M (auto-replenished) ; World Bank + UN OCHA ; Rapid Aid Deployment triggers ;

; 2. Yemen Reconstruction ; \$2B → \$4B ; World Bank + UNDP ; 60-day ceasefire certification ; ; 3. Lebanon Stabilization ; \$1.5B → \$3B ; World Bank + CDR + UN OCHA ; CPMC humanitarian need verification ; ; 4. Rapid Response Reserve ; \$100M ; Swiss National Bank + CPMC ; Emergency bridge financing ; ; 5. PIF Infrastructure Pool ; \$1.5B → \$4B ; Saudi PIF + World Bank ; JMOC compliance milestone certification ;

131 C. SANCTIONS TRANCHE RELIEF SEQUENCE

; Tranche ; Compliance Milestone ; Key Relief Delivered ; ; -----; -----; -----; ; 0 ; Framework signature ; Humanitarian White Channel only ;

; Steady ; No cap ; Market ; 0% ; Full market participation ; F. DOCUMENT CONTROL These modules are classified Tier 1 (must survive in any framework version).

132 Structural amendments require governance body consensus. Technical clarifications may be issued by the Economic Cooperation Sub-Committee (World Bank chair) via Silence Procedure (72-hour auto-adoption if no objection). All modifications recorded in the Precedent Registry.

Sanctions relief provisions may not be unilaterally revoked by any single party; revocation requires governance body supermajority (75% + neutral chair) or BAP binding ruling.

[CROSS-REFERENCE NOTE FOR BLOCK 4 HARMONIZATION: Block 4 (Humanitarian & Civilian Protection Modules) references the Lebanon Stabilization Facility and the PIF Regional Infrastructure Investment

Pool as funding sources for host-nation burden-sharing offsets. The definitions, governance structures, and release authorities for both instruments in this module (Block 5) govern those references. Any

amendment to Sub-Fund 3 or Sub-Fund 5 in this module requires simultaneous review of Block 4 Module IV, Section 1.1 for harmonization.]

Document Identifier: RCSA-Econ-v1.5 Classification: Framework Economic & Financial Architecture Reference Depositary: UN Secretary-General (upon framework entry into force)

Preparation Date: 2026

133 Annex FR: Financing Reality Annex

This annex establishes a mandatory three-tier classification system—Committed, Conditional, Aspirational—for every financial figure in the RCSA economic architecture, ensuring that projected decade-scale gains are structurally separated from actually locked capital and that no stakeholder can misrepresent planning figures as enforceable obligations.

Classification Framework

All financial figures appearing in the RCSA economic architecture are classified under one of three designations: Committed, Conditional, or Aspirational. This annex establishes uniform definitions and tagging requirements applicable to every fund, sub-fund, escrow account, credit line, guarantee facility, and corridor budget referenced in the framework.

Committed capital is defined as funds that have been appropriated by a contributing state or institution, deposited into a designated account, or formally allocated through an enforceable instrument of transfer. Committed funds may not be clawed back except through the framework's established suspension or enforcement procedures. Conditional capital is defined as funds that have been pledged or authorized by a competent authority but remain subject to verified compliance milestones, legislative notification windows, or institutional board approval before transfer. Aspirational capital is defined as funds that have been referenced in planning documents, diplomatic statements, or long-term projections but carry no current appropriation,

pledge, or enforcement pathway.

Table FR-1: Table FR-1: Capital Classification Definitions and Evidentiary Requirements

Category Evidentiary Standard Binding Mechanism Recall Conditions

Committed Appropriation recorded in national budget or Depositary receipt or escrow funding Framework enforcement board resolution agreement suspension only

Conditional Pledge letter or cabinet/ministerial authorization Milestone-linked disbursement Non-achievement of certified protocol milestone

Aspirational Strategic communication or planning document None Unilateral at any time

Every financial table in the framework shall carry a parenthetical classification tag after every monetary figure. Example: '\$500M (Committed)' or '\$2-3B annually (Conditional)'. The Governance Body Secretariat maintains a live Financial Transparency Register that lists every tagged figure, its current classification, the date of last classification review, and the next scheduled review date.

Decade-Scale Gain Separation

The RCSA economic architecture references cumulative projected impacts over a ten-year horizon. These figures serve strategic planning purposes but must not be presented as current capital commitments. This section creates structural separation between decade-scale projections and presently locked capital. Annex FR: Financing Reality Annex

Table FR-2: Table FR-2: Decade-Scale Projections vs. Locked Capital

Phase Projected 10-Year Cumulative Currently Locked (Committed + Gap

(Aspirational) Conditional)

Phase 0 (Months \$15B+ \$2.5B (Committed) + \$1.5B \$11B 1-6) (Conditional)
aspirational

Phase 1 (Months \$58B+ \$8B (Committed) + \$12B \$38B 7-18) (Conditional)
aspirational

Phase 2 (Months \$100B+ \$15B (Committed) + \$25B \$60B 19-36) (Conditional)
aspirational

Phase 3 (Months \$300B+ decade \$45B (Committed) + \$55B \$200B 37+)
(Conditional) aspirational

The gap between aspirational and locked capital is not treated as a framework deficiency. It is treated as a transparent planning variable. At each 90-day review cycle, the Economic Cooperation Sub-Committee shall publish a Gap Analysis Statement that identifies which aspirational projections have moved to conditional or committed status, which have been deferred, and which have been removed from planning.

Reclassification Procedures

Capital may move upward through the classification ladder (Aspirational to Conditional, Conditional to Committed) only through documented, auditable procedures. Downward reclassification (Committed to Conditional, Conditional to Aspirational, or any classification to Cancelled) requires governance body notification and, for committed funds, a 30-day objection window.

Aspirational to Conditional: Requires written pledge from competent national authority or board resolution from multilateral institution; deposited with governance body secretariat; subject to 15-day transparency publication before effective Conditional to Committed: Requires appropriation or deposit; certification by independent auditor; notification to all framework parties

within 7 days Committed to Conditional (downgrade): Permitted only where: (a) a party triggers a formal framework suspension in accordance with graduated response procedures; (b) a domestic legislative body formally rescinds appropriation after framework entry; or (c) an external force majeure event (UN-recognized conflict, natural disaster, or sovereign insolvency) makes continued funding legally impossible Any downgrade triggers automatic review of linked project timelines and corridor activation schedules

2 Annex 4W: Unified Governance Matrix — Who Pays, Administers, Signs, and Audits

Escrow and Guarantee Reality Tags

The \$500 million escrow shield referenced in the Economic and Financial Architecture is classified as Conditional. Funds are pre-identified from sovereign asset pools but are not transferred into the escrow account until framework entry into force. The World Bank Partial Risk Guarantee (\$10-12 billion portfolio cap) is classified as Conditional. Board approval is required for each guarantee activation, and coverage is extended only after project-level due diligence. The IMF \$5 billion standby credit line is classified as Committed upon framework entry into force, subject to standard IMF conditionality (inflation ceiling, currency stabilization, structural reform benchmarks). The standby is not a framework invention; it is an existing IMF facility made accessible through framework-linked macroeconomic stabilization agreements.

The Regional Development Bank \$10 billion capitalization target is classified as Aspirational for the full amount. The first \$2 billion tranche is classified as Conditional, subject to founding member deposit agreements. The remaining \$8 billion is classified as Aspirational, dependent on demonstrated lending

performance, callable capital subscriptions, and capital market access.

Transparency and Reporting

The Financial Transparency Register is published quarterly in three tiers: Public Summary (all figures with classification tags, no party-specific detail); Party Briefing (committed and conditional figures by contributing party, with contact points for verification); and Auditor Pool (full transaction-level data available to pre-approved forensic audit firms under non-disclosure agreement). Any party may request a classification challenge within 14 days of register publication. The challenge is reviewed by the Economic Cooperation Sub-Committee with independent auditor participation. Classification disputes unresolved within 30 days are elevated to the governance body plenary. No classification dispute may delay committed fund disbursement; disputed amounts remain locked pending resolution.

Annex 4W: Unified Governance Matrix — Who Pays, Administers, Signs, and Audits

This annex provides a single unified reference for the four governing dimensions—Payer, Administrator, Signatory, and Auditor—of every fund, sub-fund, corridor, escrow, guarantee, and credit facility in the

ANNEX ER: ENFORCEMENT RESOURCING AND CAPACITY

Resource Requirements for Effective Enforcement

Effective enforcement of architecture commitments requires adequate resources allocated to monitoring, compliance assessment, consequence implementation, and dispute resolution. This section examines the resource

requirements for each enforcement function and the mechanisms that ensure enforcement resources remain adequate as architecture implementation proceeds.

P>Monitoring resources include personnel, equipment, travel, and technology required for verification activities. IAEA verification is funded through the IAEA regular budget and voluntary contributions, with architecture-specific monitoring funded through architecture assessed contributions. Resource requirements scale with the number of facilities monitored, the frequency of inspections, and the sophistication of monitoring technologies employed.

P>Compliance assessment resources include analytical personnel, information technology, database management, and reporting capabilities. The SESS Compliance Directorate requires qualified analysts with expertise in nuclear technology, data analysis, and international law. Analytical tools include data fusion software, statistical analysis packages, and secure communication systems.

P>Consequence implementation resources include legal expertise for sanctions administration, financial tracking capabilities, and diplomatic infrastructure for coordinating multilateral responses. Sanctions administration requires specialized expertise in financial regulation, export control, and international law. The architecture maintains consequence implementation capabilities through the SESS Consequences Directorate.

H2>Funding Sources and Sustainability

P>Enforcement funding derives from multiple sources including architecture assessed contributions, voluntary contributions from states seeking enhanced enforcement, IAEA assessed and voluntary contributions, and in-kind contributions of personnel, facilities, and technical capabilities. The diversified funding base reduces dependence on any single source and provides resilience

against funding disruptions.

P>Assessed contributions provide predictable baseline funding for core enforcement functions. Contribution levels are established by the Governance Body based on budget proposals developed by the SESS. Contribution formulas consider state GDP, benefit received, and architecture stake to ensure equitable distribution without overburdening any state.

P>Voluntary contributions supplement assessed funding for enhanced capabilities or special initiatives. Contributing states may direct voluntary contributions to specific enforcement functions or programs. Voluntary contributions enable enforcement enhancement beyond baseline levels but do not substitute for assessed contributions that fund core functions.

P>In-kind contributions provide personnel, facilities, equipment, or technical capabilities rather than financial resources. In-kind contributions are valued at market rates for contribution credit purposes. The architecture maintains records of in-kind contributions to ensure transparency and equitable burden sharing.

H2>Human Resources and Expert Development

P>Enforcement effectiveness depends on qualified personnel with the technical expertise, analytical skills, and diplomatic judgment required for complex monitoring and compliance assessment. The human resources framework ensures that enforcement institutions can recruit, develop, and retain qualified personnel.

P>Recruitment employs competitive selection processes that identify candidates with required qualifications. Position descriptions specify competencies including technical knowledge, analytical capabilities, communication skills, and personal integrity. Selection panels include

representatives from multiple states to ensure recruitment fairness.

P>Professional development maintains and enhances personnel capabilities through training, rotation, and career progression. Training programs cover technical subjects, analytical methods, diplomatic skills, and ethical standards. Rotation among functions and institutions broadens experience and prevents insularity. Career progression provides advancement opportunities that retain qualified personnel.

P>Retention strategies address competition from private sector employers and national governments for qualified personnel. Compensation packages are benchmarked against comparable positions in international organizations and national governments. Non-monetary benefits including professional development, international exposure, and mission-driven work environment support retention.

H2>Technology and Infrastructure Investment

P>Enforcement capabilities require substantial investment in monitoring technology, information systems, secure facilities, and transportation infrastructure. The technology investment framework prioritizes investments that generate the greatest enforcement improvement per unit of cost.

P>Monitoring technology investments include remote sensing systems, radiation detection equipment, environmental sampling capabilities, and secure communications. Technology investments are guided by threat assessment that identifies the highest-priority monitoring requirements. Emerging technology evaluation identifies innovations that could enhance enforcement capabilities.

P>Information systems investments include secure databases, analytical platforms, data visualization tools, and knowledge management systems.

Systems architecture ensures interoperability among enforcement institutions while maintaining security against unauthorized access. Cloud computing and mobile technologies enhance flexibility and accessibility.

P>Facility investments include secure office space, laboratory capabilities, training facilities, and crisis operations centers. Facilities are designed to support enforcement functions while protecting sensitive information and activities. Geographic distribution of facilities provides regional coverage that reduces response times and travel costs.

DETAILED IMPLEMENTATION PROTOCOLS

Phase 0 Implementation Protocol

The Phase 0 implementation protocol establishes the operational procedures for the Foundation phase of the Regional Cooperation and Stability Architecture. This protocol is designed to ensure that all Phase 0 activities are conducted in a manner that is efficient, transparent, and consistent with the framework's core principles. The protocol covers all aspects of Phase 0 implementation, including the establishment of nuclear monitoring infrastructure, the restoration of banking channels, the opening of humanitarian aid corridors, and the creation of institutional frameworks for subsequent phases.

The implementation of Phase 0 begins with the formal entry into force of the framework, which occurs upon signature by the core parties and deposit with the UN Secretary-General. Within 24 hours of entry into force, the governance body secretariat notifies all framework parties, guarantors, and relevant international organizations. Within 72 hours, the IAEA begins deployment of inspectors to Iran. Within 7 days, the first humanitarian corridor opens. Within 30 days, the first banking channel is restored. These timelines are designed to create immediate, visible progress that builds political momentum.

Nuclear monitoring infrastructure deployment follows a specific sequence. First, the IAEA establishes a resident office in Tehran with 20 inspectors on continuous assignment. Second, permanent monitoring stations are installed at all declared nuclear sites with real-time data transmission capability. Third, the Joint Monitoring Operations Center deploys 12 technical specialists to Iran

with independent verification equipment. Fourth, satellite monitoring tasking is coordinated among framework parties. Fifth, environmental sampling stations are established within 50 kilometers of all nuclear sites.

Banking channel restoration follows a parallel sequence. First, one Iranian bank is designated for Tier 1 reconnection. Second, correspondent banking relationships are established with banks in Oman, Switzerland, and Pakistan. Third, transaction monitoring systems are activated to ensure compliance with framework requirements. Fourth, humanitarian payment processing begins through the reconnected channels. Fifth, commercial transaction processing is tested and activated.

Humanitarian aid corridor opening follows a third parallel sequence. First, corridor routes are surveyed and secured in coordination with all relevant parties. Second, aid warehouses are established at corridor entry points. Third, transportation contracts are awarded for aid delivery. Fourth, beneficiary registration systems are established. Fifth, aid distribution begins with priority given to the most vulnerable populations.

Phase 1 Implementation Protocol

The Phase 1 implementation protocol advances sectoral relief and regional economic integration. This protocol builds on the infrastructure established in Phase 0 and expands the scope of cooperation to include oil market reintegration, trade corridor development, and infrastructure project initiation. Phase 1 represents the transition from foundational cooperation to tangible economic benefits.

Oil market reintegration follows a graduated approach. First, Iran's oil export volume is increased to 1.5 million barrels per day. Second, payment mechanisms are established that ensure transparent revenue flow. Third,

international oil purchasers are certified for framework compliance. Fourth, shipping insurance and logistics are arranged through framework channels. Fifth, revenue transparency mechanisms are activated to ensure that oil revenues are used for legitimate purposes.

Trade corridor development involves the establishment of secure transportation routes for commercial goods between Iran and regional partners. First, border crossing procedures are streamlined. Second, customs cooperation agreements are implemented. Third, cargo inspection protocols are harmonized. Fourth, trade financing mechanisms are activated. Fifth, commercial dispute resolution procedures are established.

Infrastructure project initiation through the Regional Development Fund follows a structured approval process. First, project proposals are submitted by framework parties or eligible entities. Second, technical feasibility assessments are conducted by RDF staff. Third, compliance verification ensures that projects meet framework standards. Fourth, financing packages are structured with appropriate conditionality. Fifth, project implementation begins with milestone-based disbursement.

Verification Procedures

The framework's verification procedures are designed to be comprehensive, intrusive, and fair. They apply to all framework parties proportionately, ensuring that no party faces disproportionate scrutiny. The verification architecture includes IAEA inspections, JMOC technical verification, satellite monitoring, environmental sampling, procurement monitoring, and financial tracking.

IAEA inspections follow a structured protocol. Declared facilities are inspected on a schedule that ranges from daily (for active enrichment or reprocessing

facilities) to quarterly (for research facilities). Unannounced inspections may occur at any facility with as little as two hours notice. Challenge inspections of undeclared sites require 24 hours notice and may be requested by any framework party with reasonable suspicion. All inspection results are reported to the governance body secretariat within 48 hours.

JMOC technical verification operates independently of the IAEA and provides a second layer of monitoring. JMOC technical specialists are deployed to Iran with equipment that includes gamma spectroscopy, neutron detection, mass spectrometry, and environmental sampling capabilities. JMOC maintains its own database of verification data that is shared with the governance body but not controlled by any single party.

Satellite monitoring provides wide-area coverage that complements ground-based inspections. Commercial and government satellite assets are tasked to provide daily imagery of known and suspected nuclear sites. Automatic change detection algorithms flag anomalies for human review. Thermal imaging detects heat signatures that may indicate undeclared activity. Radar imaging provides all-weather monitoring capability.

Compliance Assessment Procedures

Compliance assessment follows a multi-step process designed to be thorough, fair, and timely. First, data collection: IAEA inspectors, JMOC specialists, and national technical means collect verification data on an ongoing basis. Second, data analysis: the SESS analytical team reviews collected data for indications of compliance or non-compliance. Third, preliminary assessment: SESS issues a draft compliance assessment to the governance body secretariat. Fourth, party consultation: the assessed party has 14 days to review the assessment and provide comments. Fifth, final certification: the governance body issues a formal compliance certification based on the SESS assessment and party

comments.

The compliance assessment process is designed to distinguish between technical violations, procedural lapses, and material breaches. Technical violations are minor deviations that do not affect the overall compliance picture and are addressed through corrective action plans. Procedural lapses are failures to follow required procedures that do not result in substantive non-compliance and are addressed through administrative measures. Material breaches are significant failures to comply with core obligations that trigger the enforcement ladder.

The 30-day review cycle provides regular checkpoints for compliance assessment. At each cycle boundary, SESS publishes a compliance status report that summarizes all verification data, identifies any areas of concern, and recommends actions for the coming cycle. These reports are shared with all framework parties and published in the quarterly Transparency Summary.

Enforcement Procedures

The framework's enforcement procedures are designed to be graduated, proportionate, and predictable. They escalate from diplomatic measures to economic sanctions to international legal action, providing multiple opportunities for corrective action before the most severe consequences are applied. The enforcement ladder is the core mechanism that ensures compliance without resorting to military force.

Step 1 of the enforcement ladder is diplomatic engagement. When a compliance concern is identified, the governance body initiates formal consultation with the concerned party. The consultation seeks to understand the reasons for the concern and to develop a corrective action plan. Step 1 does not involve any economic consequences and is designed to resolve issues

through dialogue.

Step 2 is benefit adjustment. If diplomatic engagement fails to resolve the concern within 30 days, the governance body may adjust benefit delivery. This may include delaying tranche activation, reducing benefit levels, or suspending non-essential benefits. Step 2 is designed to create economic incentives for compliance without causing humanitarian harm.

Step 3 is sanctions snapback. If benefit adjustment fails to achieve compliance within 60 days, the governance body may recommend sanctions snapback to the UN Security Council. Snapback reinstates all sanctions that were lifted as part of the framework. Step 3 is a severe measure that is reserved for material breaches of core obligations.

Step 4 is international legal action. If the concerned party refuses to comply even after sanctions snapback, the governance body may authorize legal action in international forums. This may include proceedings at the International Court of Justice, arbitration under the framework's Binding Arbitration Panel, or action through the UN Security Council.

Dispute Resolution Procedures

The framework provides multiple mechanisms for resolving disputes between parties. These mechanisms are designed to be accessible, efficient, and fair. They range from informal consultation to formal arbitration, providing parties with options that match the seriousness of their dispute.

Informal consultation is the first step in dispute resolution. Any party may request consultation with another party through the governance body secretariat. The secretariat facilitates the consultation and provides neutral venue and support. Informal consultation is confidential and does not create formal records.

Formal mediation is available when informal consultation fails to resolve a dispute. The neutral chair of the governance body serves as mediator, or may appoint a mediator from a roster of qualified individuals. Formal mediation produces a written record and may result in a non-binding recommendation.

Binding arbitration is available for disputes that cannot be resolved through mediation. The framework's Binding Arbitration Panel consists of nine arbitrators: three appointed by each core party and three neutral arbitrators. Cases are heard by panels of three: one appointee from each party and one neutral chair. Arbitration awards are final and binding.

Crisis Management Procedures

The framework includes comprehensive crisis management procedures designed to prevent minor incidents from escalating into major crises. These procedures cover a range of scenarios, from technical compliance issues to security incidents to political crises.

Technical crisis management addresses situations where verification systems detect anomalies or potential violations. The JMOC maintains a 24/7 crisis response capability that can deploy technical teams to any location within 24 hours. The governance body maintains an emergency communication system that allows immediate contact between all parties.

Security crisis management addresses situations where military or paramilitary incidents threaten framework stability. The Hotline system provides direct communication between military commands at all times. The guarantors maintain crisis response teams that can deploy to the region within 48 hours. The UN Security Council is notified of any security crisis within 12 hours.

Political crisis management addresses situations where domestic political

developments threaten framework participation. The Political-Durability Module provides early warning of political crises and recommends mitigation strategies. The guarantors maintain diplomatic channels with all relevant political actors. The framework's institutional binding provisions are designed to survive political transitions.

COMPREHENSIVE IMPLEMENTATION PROTOCOLS

Institutional Establishment Procedures

The implementation of the Regional Cooperation and Stability Architecture requires the systematic establishment of multiple interlocking institutions, each with distinct mandates, governance structures, and operational requirements. This section provides detailed protocols for the establishment of these institutions, ensuring that the institutional infrastructure is in place before substantive implementation begins. The sequencing of institutional establishment is designed to create early visible progress while building the capacity required for more complex implementation activities.

The first phase of institutional establishment focuses on the creation of the Governance Body and its supporting secretariat. The Governance Body convenes within thirty days of architecture signature, with the depositary (UN Secretary-General) responsible for issuing the convening notification and providing initial secretariat services until a permanent secretariat is established. The initial session addresses organizational matters including the adoption of rules of procedure, the appointment of the Executive Secretary, and the establishment of subsidiary bodies required for immediate functioning.

The second phase establishes the technical implementation bodies including the Joint Monitoring Operations Center, the Regional Development Fund Management Unit, and the Standing Enforcement Support Secretariat. These bodies require longer lead times for staffing, facility preparation, and system deployment, and their establishment proceeds in parallel with the commencement of early implementation activities that do not require their full operational capability.

Personnel Recruitment and Training Framework

The architecture's institutions require substantial human resources with specialized expertise in nuclear technology, international law, regional security, project management, and diplomatic practice. The personnel framework establishes recruitment procedures that ensure competence, independence, and geographical diversity among architecture staff. All appointments are made on the basis of merit, with due regard for equitable geographical distribution and gender balance.

The recruitment process for senior positions involves international advertisement, structured assessment by selection panels comprising representatives from multiple participating states, and appointment by the Governance Body. Senior positions include the Executive Secretary, the Directors of the JMOC, SESS, and RDF Management Unit, and the Chairs of the Binding Arbitration Panel. These positions require Security Council confirmation to ensure that appointees possess the necessary independence and authority.

Staff training programs ensure that all architecture personnel possess the competencies required for their roles. Training content includes technical subjects relevant to specific positions, diplomatic skills for engagement with national authorities, crisis management procedures, and ethical standards

governing conduct. Training is provided through a combination of centralized programs at architecture headquarters and decentralized programs delivered in participating states.

Information Technology Infrastructure

The architecture's monitoring, verification, and coordination functions depend on robust information technology infrastructure that ensures secure, reliable, and timely information flows among all architecture institutions and participating states. The IT infrastructure framework establishes standards for system architecture, data security, interoperability, and business continuity that apply to all architecture information systems.

The Secure Communications Network provides encrypted voice, video, and data communications among all architecture institutions and designated national contact points. The network employs multiple transmission pathways including dedicated terrestrial lines, satellite links, and internet-based virtual private networks to ensure connectivity under all operating conditions. Communications security employs end-to-end encryption with key management procedures that prevent unauthorized access to sensitive communications.

The Information Management System integrates data from multiple sources into a unified architecture database that supports monitoring, analysis, and reporting functions. The system employs advanced database technologies that ensure data integrity, support complex analytical queries, and provide real-time dashboards for senior decision-makers. Data governance procedures establish rules for data classification, access authorization, retention, and destruction that protect sensitive information while ensuring that authorized users can access the data they need.

Physical Security and Business Continuity

Architecture institutions and personnel operate in a potentially hostile security environment that requires comprehensive physical security measures. The physical security framework establishes standards for facility protection, personnel security, travel security, and emergency response that apply across all architecture operations. These standards are calibrated to the threat environment in specific locations, with enhanced measures applied in higher-threat areas.

Facility security includes perimeter protection, access control, intrusion detection, and surveillance systems at all architecture premises. Critical facilities including the JMOC headquarters and secure communications nodes employ multiple layers of physical protection designed to resist sophisticated attacks. Security personnel are engaged through qualified private security firms or, in high-threat locations, through arrangements with host government security services.

P>Business continuity planning ensures that architecture functions can continue under adverse conditions including natural disasters, terrorist attacks, pandemics, and armed conflict. Continuity plans address personnel evacuation, system redundancy, data backup, alternative operating locations, and communications alternatives that enable minimum essential functions to continue even when primary facilities and systems are unavailable. Regular exercises test continuity plans and identify areas requiring improvement.

Transition from Previous Arrangements

Where the architecture supersedes previous agreements or arrangements, implementation protocols must address the orderly transition from old to new frameworks. These protocols ensure continuity of essential functions during

the transition period, clarify the status of obligations and commitments undertaken under previous arrangements, and manage the relationship between architecture institutions and their predecessors.

Transition protocols identify specific predecessor institutions and agreements that are superseded by the architecture, specify the timeline for transition activities, and assign responsibility for managing transition processes. The protocols address practical matters including the transfer of records and assets, the reappointment or release of predecessor staff, and the novation of contracts and financial obligations from predecessor institutions to architecture institutions.

Legal continuity provisions ensure that rights and obligations arising under predecessor arrangements are appropriately addressed under the new architecture. These provisions protect the legitimate expectations of parties that acted in reliance on previous commitments while ensuring that the architecture's new framework is not undermined by inherited obligations that conflict with its provisions. Specific transition arrangements are negotiated for each predecessor arrangement based on its nature and the architecture's relationship to it.

Quality Assurance and Performance Monitoring

P>Implementation quality assurance ensures that architecture activities meet established standards and achieve intended results. The quality assurance framework includes performance indicators, monitoring procedures, evaluation methodologies, and continuous improvement mechanisms that maintain implementation effectiveness throughout the architecture lifecycle.

P>Performance indicators provide measurable benchmarks for assessing implementation progress and results. Indicators are developed for each

architecture component, with baselines established at implementation commencement and targets set for specified timeframes. Indicator selection balances comprehensiveness against data collection burden, focusing on indicators that genuinely reflect implementation progress rather than those merely easy to measure.

P>Monitoring procedures track performance indicator values on regular schedules, identify deviations from expected trajectories, and trigger corrective action when deviations exceed specified thresholds. Monitoring combines quantitative data collection with qualitative assessment that captures contextual factors affecting implementation. Independent monitoring by external entities validates self-reported data.

P>Evaluation methodologies assess implementation effectiveness, efficiency, relevance, and sustainability. Evaluations employ mixed methods combining quantitative impact assessment with qualitative process analysis. Independence from implementing entities ensures objective evaluation. Evaluation findings inform program adjustments, resource allocation decisions, and architecture amendments.

H2>Stakeholder Engagement and Grievance Mechanisms

P>Effective implementation requires constructive engagement with stakeholders who affect or are affected by architecture activities. The stakeholder engagement framework identifies relevant stakeholders, establishes engagement mechanisms, and creates grievance procedures that enable affected parties to seek remedies for implementation-related harms.

P>Stakeholder mapping identifies individuals, groups, and organizations with interests in architecture implementation. Mapping considers both direct stakeholders such as implementing agencies and beneficiary communities, and indirect stakeholders including affected businesses, civil society

organizations, and neighboring states. Stakeholder analysis assesses stakeholder interests, influence, and potential impact on implementation.

P>Engagement mechanisms create structured opportunities for stakeholder input into implementation decisions. Consultation procedures solicit stakeholder views on planned activities. Participation mechanisms enable stakeholders to contribute to activity design and implementation. Partnership arrangements formalize ongoing stakeholder involvement in specific components.

P>Grievance mechanisms provide accessible channels through which affected parties can raise concerns about implementation and seek remedies. Grievance procedures are designed to be accessible to vulnerable populations including illiterate persons, remote communities, and marginalized groups. Resolution procedures aim for prompt, fair, and culturally appropriate remedies. Appeals procedures enable escalation when initial resolution is unsatisfactory.

H2>Supply Chain and Procurement Management

P>Architecture implementation requires procurement of substantial goods and services from external suppliers. The procurement management framework ensures that procurement is conducted transparently, competitively, and efficiently, achieving value for money while supporting architecture objectives including capacity building and local economic development.

P>Procurement procedures follow international best practices including competitive bidding, transparent evaluation criteria, contract management, and supplier performance monitoring. Procurement thresholds determine the procedures required for different contract values, with more rigorous procedures for higher-value contracts. E-procurement systems increase

transparency and reduce transaction costs.

P>Local content requirements promote participation of suppliers from participating states in architecture procurement. Requirements include preferences for local suppliers meeting technical standards, joint venture requirements that transfer technology to local partners, and capacity building programs that enable local suppliers to meet architecture procurement standards. Local content requirements balance economic development objectives against quality and cost considerations.

P>Supply chain risk management identifies and mitigates risks that could disrupt procurement and implementation. Risk categories include supplier financial distress, geopolitical disruptions, transportation failures, and quality defects. Mitigation measures include supplier diversification, safety stock maintenance, alternative sourcing arrangements, and supplier financial monitoring.

H2>Technology Systems and Data Management

P>Modern implementation requires robust technology systems for information management, communication, financial management, and monitoring. The technology systems framework ensures that architecture institutions and implementing agencies have appropriate technology capabilities that support effective implementation.

P>Core technology systems include enterprise resource planning for financial and administrative management, project management information systems for implementation tracking, geographic information systems for spatial data management, and business intelligence tools for performance analytics. System selection balances functionality against cost, complexity, and sustainability considerations.

P>Data management establishes standards for data collection, storage, quality, sharing, and protection. Data standards ensure comparability across different sources and systems. Data quality procedures identify and correct errors, gaps, and inconsistencies. Data sharing protocols enable appropriate information exchange while protecting confidentiality and security. Data protection measures comply with applicable privacy regulations.

P>Digital transformation supports progressive adoption of digital technologies that improve implementation efficiency and effectiveness. Transformation priorities include mobile applications for field data collection, cloud-based collaboration tools for distributed teams, artificial intelligence for data analysis, and blockchain for transparency and traceability. Transformation proceeds incrementally, building on demonstrated success before scaling.

Health, Safety, and Security Protocols

P>Implementation activities must protect the health and safety of personnel and affected communities while maintaining security against threats. The health, safety, and security framework establishes standards and procedures that minimize risks to people and assets involved in or affected by architecture activities.

P>Occupational health and safety standards protect workers involved in architecture implementation. Standards address common construction and operational hazards as well as sector-specific risks including radiation exposure at nuclear facilities, chemical hazards in industrial projects, and biological hazards in healthcare programs. Safety training, protective equipment, and emergency procedures reduce incident risks.

P>Community health and safety addresses risks that implementation activities pose to surrounding communities. Impact assessments identify potential

community health and safety effects before activity commencement. Mitigation measures reduce identified risks to acceptable levels. Emergency response procedures protect communities if incidents occur despite preventive measures.

P>Security protocols protect personnel, facilities, and information against threats including terrorism, criminal activity, espionage, and cyber attack. Security standards are calibrated to threat levels in specific locations and for specific activities. Security measures include physical protection, access controls, personnel vetting, travel security, and information security. Security awareness training enables personnel to recognize and respond to security threats.

MODEL LEGAL INSTRUMENTS

Framework Depositary Instrument

The Framework Depositary Instrument is the legal instrument that establishes the Regional Cooperation and Stability Architecture as a binding international agreement. It is deposited with the UN Secretary-General upon entry into force and registered under Article 102 of the UN Charter. The instrument creates legal obligations that are independent of the political continuity of any signatory government.

The Depositary Instrument specifies the following: the names and designations of the signatory parties; the date and place of signature; the date of entry into force; the procedures for amendment; the procedures for withdrawal; the role of the depositary; and the authentic texts of the agreement. The instrument is signed by the heads of state or government of the core parties, with witnesses from the guarantor states and the UN Secretary-General.

Implementing Legislation Template

The Implementing Legislation Template provides a model for framework parties to draft domestic legislation that gives effect to their framework obligations. The template is advisory, not mandatory, and may be adapted to meet the specific constitutional and legal requirements of each party. The template covers: designation of framework institutions; appointment of framework officers; domestic enforcement mechanisms; reporting requirements; and coordination with international bodies.

For the United States, implementing legislation would typically take the form of a congressional-executive agreement or, if the Senate consents, a treaty. The

legislation would designate the Department of State as the lead implementing agency, authorize sanctions relief, and establish reporting requirements. The legislation would also address the relationship between framework obligations and existing sanctions statutes.

For Iran, implementing legislation would require approval by the Majlis and the Guardian Council. The legislation would designate the Supreme National Security Council as the coordinating body, authorize cooperation with the IAEA, and establish domestic enforcement mechanisms. The legislation would also address the relationship between framework obligations and Iran's existing nuclear legislation.

Bilateral Confidentiality Agreement

The Bilateral Confidentiality Agreement governs the handling of sensitive information exchanged between framework parties in the course of implementation. The agreement applies to all information classified as confidential by the originating party, including intelligence data, proprietary technology, and internal deliberations.

The agreement establishes the following principles: information classified as confidential by the originating party must be handled in accordance with the originating party's classification requirements; confidential information may only be shared with individuals who have a need to know and who are authorized to receive it; confidential information may not be shared with third parties without the originating party's consent; and confidential information must be returned or destroyed upon termination of the framework or upon request.

Verification Access Agreement

The Verification Access Agreement governs the rights and responsibilities of inspectors and monitored parties during verification activities. The agreement is concluded between the IAEA, the JMOC, and the framework parties, and specifies the legal framework within which verification activities are conducted.

The agreement establishes: the right of inspectors to access all declared and, under challenge inspection procedures, undeclared sites; the obligation of monitored parties to provide access within specified timeframes; the procedures for taking and analyzing samples; the handling of inspector safety and security; the privileges and immunities of inspectors; and the procedures for resolving access disputes.

Dispute Settlement Agreement

The Dispute Settlement Agreement establishes the procedures for resolving disputes between framework parties. The agreement provides for a graduated dispute resolution process that begins with consultation and ends with binding arbitration. The agreement is designed to ensure that disputes are resolved efficiently and fairly, without disrupting the broader framework.

The agreement establishes: the obligation of parties to attempt to resolve disputes through consultation; the procedures for requesting mediation; the composition and procedures of the Binding Arbitration Panel; the enforcement of arbitration awards; and the relationship between framework dispute resolution and other international legal forums.

Sanctions Relief Authorization

The Sanctions Relief Authorization is the legal instrument through which sanctions are lifted in accordance with framework provisions. The

authorization is issued by the competent authorities of the sanctioning states upon certification by the governance body that the relevant compliance milestones have been achieved.

The authorization specifies: the sanctions being lifted; the effective date of the lifting; the conditions for continued relief; the procedures for reinstating sanctions in case of non-compliance; and the reporting requirements for monitoring the implementation of relief. The authorization is published in the official gazettes of the sanctioning states and notified to the UN Security Council.

Regional Development Fund Charter

The Regional Development Fund Charter establishes the RDF as an international financial institution. The charter specifies the fund's mandate, governance structure, operational procedures, and financial management framework. The charter is adopted by the governance body and registered with the UN.

The charter establishes: the purpose of the fund, which is to finance projects that promote regional stability and economic development; the governance structure, including the Board of Governors, the Executive Director, and the independent oversight committee; the procedures for project approval and disbursement; the financial management framework, including auditing and reporting requirements; and the procedures for amendment and termination.

Commercial Continuity Protection Agreement

The Commercial Continuity Protection Agreement protects private-sector contracts that are entered into in reliance on the framework. The agreement provides that such contracts may not be terminated or penalized solely

because of framework-related sanctions relief or reimposition.

The agreement establishes: the criteria for CCP certification; the procedures for applying for and obtaining certification; the protections afforded to certified contracts; the procedures for resolving disputes involving certified contracts; and the relationship between CCP protections and national sanctions laws. The agreement is designed to provide the legal certainty that private-sector actors need to invest in framework-related activities.

Nuclear Materials Transfer Agreement

The Nuclear Materials Transfer Agreement governs the transfer of nuclear materials from Iran to international control. The agreement specifies the procedures for inventory, packaging, transport, storage, and disposition of all categories of nuclear materials covered by the framework.

The agreement establishes: the procedures for conducting initial inventory; the standards for packaging and labeling; the procedures for transport, including security requirements; the procedures for receipt and storage at international facilities; the procedures for disposition, including down-blending, transfer, and storage; and the verification procedures for each stage of the transfer process.

Scientific Cooperation Agreement

The Scientific Cooperation Agreement establishes the framework for international scientific cooperation with Iran in the nuclear and related fields. The agreement is designed to provide Iranian scientists with opportunities for legitimate research while preventing the diversion of scientific knowledge to weapons programs.

The agreement establishes: the areas of scientific cooperation that are

permitted; the procedures for initiating and conducting cooperative research; the handling of intellectual property; the procedures for vetting participants; the reporting requirements; and the procedures for terminating cooperation if compliance concerns arise.

LEGAL INSTRUMENTS AND TREATY ARCHITECTURE

The Architecture Treaty as International Legal Instrument

The Regional Cooperation and Stability Architecture is established through a comprehensive treaty instrument that creates binding international legal obligations for all parties. This section examines the legal structure of the treaty, its relationship to other international legal obligations, its mechanisms for entry into force and amendment, and the legal frameworks that govern its implementation. Understanding these legal dimensions is essential for appreciating both the architecture's authority and its limitations.

P>The treaty employs a framework agreement structure in which the principal treaty establishes the overall institutional architecture, common provisions, and general obligations, while detailed technical commitments are set forth in annexes and protocols that have the same legal status as the principal treaty. This structure enables comprehensive coverage of complex subject matter while maintaining a clear hierarchy among different types of provisions. All annexes are integral parts of the treaty, and parties cannot selectively accept the principal treaty while rejecting annexes.

P>The treaty establishes the UN Secretary-General as depositary, with specified depositary functions including receiving instruments of ratification and accession, maintaining the authoritative treaty text, and certifying the status

of parties. The depositary role provides the architecture with institutional permanence and neutral administration that transcends the political fortunes of individual participating states. The Secretary-General exercises depositary functions in accordance with established international practice as codified in the Vienna Convention on the Law of Treaties.

H2>Entry into Force and Accession Procedures

P>The treaty's entry into force is conditioned on ratification by specified states whose participation is essential for the architecture's effectiveness. The entry into force conditions reflect a judgment that the architecture requires participation by certain key states to achieve its security objectives, and that premature entry into force with incomplete participation could create a false impression of comprehensive coverage while leaving critical gaps. The specified states include Iran, the United States, and the three E3 states (France, Germany, and United Kingdom).

P>Ratification procedures require each state to follow its domestic constitutional processes for treaty approval, which may include parliamentary approval, executive action, or referendum depending on national constitutional requirements. The treaty does not purport to override domestic constitutional requirements but rather accommodates them through procedures that enable each state to implement the treaty in accordance with its own legal system. This accommodation recognizes that sustainable international commitments must rest on domestic legal foundations.

P>Accession procedures enable states that did not participate in the negotiation or initial signature to become parties through a simplified procedure that does not require reopening negotiations on treaty terms. Accession is available to any state that meets criteria including peaceful intent, safeguards compliance, and willingness to undertake architecture obligations.

The accession process includes technical assessment, political consultation with existing parties, and the negotiation of accession-specific terms if required.

H2>Amendment Procedures and Evolution

P>The treaty includes detailed amendment procedures that balance the need for adaptability against the need for stability. The balance reflects a recognition that the architecture must evolve to address changing circumstances, but that frequent or easy amendment could undermine the predictability that makes commitments credible. The amendment framework distinguishes between different categories of provisions with different amendment requirements calibrated to their significance.

P>Amendments to the principal treaty require ratification by all parties, ensuring that no state can be bound by modified obligations without its consent. This requirement protects parties against amendments that would fundamentally alter the bargain they accepted. Amendments to technical annexes require approval by a supermajority of parties but do not require unanimous ratification, enabling technical updates without allowing individual states to obstruct necessary adaptations.

P>The Simplified Amendment Procedure enables rapid modification of specific technical parameters without full amendment processes. This procedure is limited to modifications that do not alter fundamental obligations or the overall balance of the architecture, such as adjustments to quantitative limits based on changed technical assessments or updates to implementation timelines based on experience. The simplified procedure requires expert assessment, notification to all parties, and the absence of objection from any party within a specified timeframe.

H2>Relationship with Existing International Law

P>The treaty is designed to operate within the broader framework of international law, complementing and reinforcing existing legal obligations rather than contradicting or replacing them. The treaty explicitly acknowledges its relationship to the Nuclear Non-Proliferation Treaty, UN Security Council resolutions, IAEA safeguards agreements, and other relevant international instruments. This integration ensures that architecture obligations are consistent with broader international legal requirements.

P>The treaty does not affect the rights and obligations of parties under the NPT, which remains the foundational legal framework for nuclear non-proliferation. Architecture nuclear commitments are structured as additional undertakings that go beyond NPT requirements rather than as substitutes for NPT obligations. This structure ensures that NPT obligations continue to apply regardless of architecture status, providing a legal floor below which commitments cannot decline.

P>Similarly, the treaty operates alongside UN Security Council resolutions on Iran and regional security, with specific provisions addressing the relationship between architecture commitments and resolution requirements. Where architecture commitments exceed resolution requirements, the architecture provisions apply. Where resolution requirements exceed architecture commitments, resolution requirements continue to apply. This parallel operation ensures comprehensive legal coverage without gaps or contradictions.

H2>Dispute Resolution and Legal Interpretation

P>The treaty establishes a comprehensive dispute resolution hierarchy that provides multiple forums for addressing disagreements at different levels of significance and urgency. The hierarchy begins with direct consultation between parties, progresses through good offices and mediation by the

Executive Secretary or other neutral third parties, continues through binding arbitration under Annex BA, and culminates in referral to the International Court of Justice for matters involving interpretation of the treaty text.

P>Legal interpretation principles are specified to guide all architecture bodies in construing treaty provisions. These principles include the primacy of the treaty text, consideration of context and object and purpose, recourse to supplementary means of interpretation including travaux préparatoires, and the requirement that interpretations must be consistent with good faith. These principles ensure coherent interpretation across different architecture bodies and over time.

P>The Authoritative Interpretation mechanism enables the Governance Body to issue binding interpretations of treaty provisions when disputes over meaning threaten implementation. These interpretations require consensus or supermajority approval, ensuring that they represent genuine collective understandings rather than the views of individual parties. Authoritative interpretations are deposited with the Secretary-General and become part of the architecture's interpretive framework.

State Responsibility and International Liability

P>The architecture's legal framework addresses questions of state responsibility and international liability that arise when architecture activities cause harm or when states fail to fulfill their architecture obligations. The legal analysis draws upon the International Law Commission's Articles on State Responsibility and applicable international jurisprudence.

P>State responsibility attaches when a state commits an internationally wrongful act that constitutes a breach of an international obligation attributable to that state. Under the architecture, internationally wrongful acts

include violations of nuclear constraints, failure to cooperate with verification, non-payment of assessed contributions, and obstruction of architecture institutions. Attribution follows standard international law principles including attribution to organs of the state and entities exercising governmental authority.

P>Consequences of internationally wrongful acts include cessation of the wrongful conduct, non-repetition assurances, and reparation for harm caused. Cessation requires the state to return to compliance with its obligations. Non-repetition may include legal or institutional reforms that prevent future violations. Reparation may take the form of restitution, compensation, or satisfaction depending on the nature of the harm.

P>Countermeasures are permissible responses by injured states to induce cessation of wrongful conduct. Architecture consequence mechanisms including sanctions restoration constitute lawful countermeasures provided they are proportional to the wrongful act and intended to induce compliance. Countermeasures must be temporary and reversible upon compliance restoration.

Privileges and Immunities of Architecture Institutions

P>Architecture institutions require appropriate privileges and immunities to function effectively in the territories of participating states. These privileges and immunities protect institutional independence, enable effective operation, and ensure that architecture personnel can perform their duties without undue interference from national authorities.

P>Institutional privileges include legal personality, capacity to contract, acquire property, and institute legal proceedings. Immunities include immunity from legal process for official acts, inviolability of premises and

archives, and exemption from direct taxes on institutional operations. These privileges and immunities are comparable to those accorded to international organizations under established international practice.

P>Personnel privileges include immunity from criminal jurisdiction for official acts, immunity from civil jurisdiction for acts performed in official capacity, exemption from immigration restrictions, and exemption from taxation on institutional salaries. These privileges protect personnel from harassment or prosecution motivated by their official functions while maintaining accountability through institutional disciplinary procedures and waiver of immunity for non-official acts.

P>Premises inviolability protects architecture facilities from unauthorized entry, search, or seizure by national authorities. Inviolability ensures that sensitive information and equipment are secure and that architecture operations can continue without disruption. Inviolability is subject to emergency exceptions for fire protection and public safety, with cooperation between architecture security and local authorities.

Dispute Settlement Procedures in Detail

P>The architecture provides multiple dispute settlement mechanisms that address different types of disputes through procedures appropriate to their nature and significance. This section provides detailed examination of each mechanism and the relationships among them.

P>Consultation is the first step in all dispute settlement procedures. Parties to a dispute are required to engage in direct consultation with a view to reaching a mutually satisfactory resolution. Consultation must be initiated promptly after the dispute arises and must be conducted in good faith. The Executive Secretary may facilitate consultations upon request but does not impose

solutions.

P>Good offices involve informal assistance by a neutral third party in bringing disputing parties together and facilitating communication. The Executive Secretary routinely provides good offices for architecture disputes. Good offices do not include formal proposals for dispute resolution but rather create conditions conducive to negotiated settlement.

P>Mediation involves a more active third-party role in which the mediator proposes solutions and works with parties to reach agreement. Mediation is conducted by mediators agreed upon by the parties or appointed by the Executive Secretary if parties cannot agree. Mediation proceedings are confidential, and mediator proposals are non-binding unless parties accept them.

P>Binding arbitration under Annex BA provides authoritative resolution of disputes that cannot be settled through consultation, good offices, or mediation. Arbitration proceedings follow established international arbitration procedures with modifications for architecture-specific requirements. Arbitral awards are final and binding, with limited review for procedural irregularities.

P>International Court of Justice jurisdiction is available for disputes concerning interpretation of the architecture treaty when parties have accepted ICJ jurisdiction. ICJ proceedings provide authoritative interpretation of treaty provisions but may not be suitable for technical disputes requiring specialized expertise. ICJ jurisdiction complements rather than replaces arbitration for most architecture disputes.

Relationship with Domestic Legal Systems

P>The architecture's relationship with domestic legal systems varies across

participating states depending on constitutional provisions for treaty implementation. This section examines the principal approaches to giving domestic legal effect to architecture obligations and the implications for implementation.

P>Monist systems automatically incorporate treaty obligations into domestic law upon ratification. In monist states, architecture obligations become directly enforceable in domestic courts without implementing legislation. Monist implementation simplifies the process of giving domestic effect to architecture obligations but may create conflicts between treaty obligations and pre-existing domestic legislation.

P>Dualist systems require specific implementing legislation to give treaty obligations domestic legal effect. In dualist states, architecture obligations are not domestically enforceable until parliament enacts implementing legislation. Dualist implementation provides clearer domestic legal basis for architecture obligations but introduces delays and political risks associated with legislative processes.

P>Hybrid systems combine elements of monism and dualism, with some treaty provisions automatically incorporated while others require implementing legislation. The architecture accommodates hybrid systems by identifying which provisions require implementing legislation and providing model legislation that states can adapt to their specific legal systems.

P>Conflict resolution addresses situations where architecture obligations conflict with pre-existing domestic legislation. Supremacy clauses in implementing legislation establish architecture obligation priority over conflicting domestic law. Constitutional amendments may be required when conflicts involve constitutional provisions. Transitional provisions manage the period between conflict identification and resolution.

H2>Legal Interpretation Principles and Practice

P>The architecture's legal provisions require interpretation when their meaning is unclear or when they must be applied to circumstances not explicitly anticipated. This section examines the principles and practice of legal interpretation under the architecture.

P>The Vienna Convention on the Law of Treaties provides the foundational interpretive framework. Article 31 requires interpretation in good faith in accordance with the ordinary meaning of treaty terms in context and in light of the treaty's object and purpose. Article 32 permits recourse to supplementary means of interpretation including travaux préparatoires when interpretation under Article 31 leaves meaning ambiguous or leads to manifestly absurd results.

P>Architecture-specific interpretive principles include the principle of effectiveness, which requires interpretation that gives meaning to all treaty provisions rather than rendering any provision superfluous. The principle of integration requires harmonious interpretation of all architecture instruments as a single legal system. The principle of evolutionary interpretation permits consideration of changed circumstances when treaty terms are inherently evolutionary.

P>Authoritative interpretation by the Governance Body provides definitive resolution of interpretive disputes. Authoritative interpretation requires supermajority approval and is binding on all parties. The procedure for requesting authoritative interpretation, the standard of proof required, and the effect on pending disputes are specified in the rules of procedure.

DETAILED FINANCIAL ARCHITECTURE

Regional Development Fund Structure

The Regional Development Fund is structured as a multi-window financing facility that provides funding for projects across different sectors and at different stages of development. The fund's structure is designed to maximize flexibility while maintaining accountability and ensuring that resources are directed toward the highest-impact activities.

Window A: Emergency Humanitarian Financing. This window provides rapid financing for humanitarian projects in crisis-affected areas. Projects funded through Window A are subject to streamlined approval procedures that allow disbursement within 14 days of application. Window A is capitalized at \$5 billion and is replenished annually.

Window B: Development Project Financing. This window provides medium-term financing for development projects that promote economic growth and stability. Projects funded through Window B are subject to standard approval procedures that include technical feasibility assessment, compliance verification, and financial due diligence. Window B is capitalized at \$15 billion.

Window C: Private Sector Investment Facility. This window provides risk-sharing mechanisms that encourage private-sector investment in framework-related activities. Window C offers loan guarantees, equity participation, and insurance products. Window C is capitalized at \$5 billion.

Window D: Technical Assistance Facility. This window provides financing for technical assistance, capacity building, and institutional development.

Window D supports activities such as training programs, advisory services, and technology transfer. Window D is capitalized at \$2 billion.

Window E: Conflict Zone Premium. This window provides additional financing for projects in areas affected by active conflict. Window E offers premium pricing, enhanced security support, and accelerated disbursement. Window E is capitalized at \$3 billion.

Escrow and Disbursement Mechanisms

The framework's escrow and disbursement mechanisms are designed to ensure that funds are released only upon verified compliance. The mechanisms create a direct link between compliance and benefit delivery, providing tangible incentives for cooperation.

The escrow system operates as follows: funds are deposited into escrow accounts managed by the RDF; disbursement triggers are defined for each tranche and linked to specific compliance milestones; the IAEA and JMOC verify that milestones have been achieved; the governance body certifies achievement; and the RDF releases funds upon certification.

The disbursement mechanisms include: direct disbursement to government accounts for sovereign projects; disbursement to contractors for specific projects; disbursement through commercial banks for trade financing; and disbursement through humanitarian organizations for aid delivery. Each disbursement mechanism includes verification and reporting requirements.

Compliance-Linked Financing

Compliance-linked financing is the core innovation of the framework's financial architecture. It creates a direct and visible connection between compliance and benefit delivery, ensuring that resources flow only to verified

cooperative behavior.

The compliance link operates through a scoring system. Each framework party receives a compliance score based on its performance across multiple indicators. The score determines the level of financing available, the speed of disbursement, and the terms of financing. High scores unlock preferential terms, while low scores trigger restrictions.

The compliance indicators include: nuclear verification metrics; humanitarian access metrics; banking channel metrics; proxy activity metrics; and economic cooperation metrics. Each indicator is weighted according to its importance and difficulty of achievement. The scoring system is transparent and subject to independent audit.

Mirror Licensing Financial Protocols

The Mirror Licensing Regime includes specific financial protocols that ensure continuity of sanctions relief even if U.S. implementation is delayed. These protocols are designed to prevent a single point of failure in the sanctions relief architecture.

The protocols include: pre-positioned sanctions relief instruments in EU, UK, Swiss, and Omani jurisdictions; coordinated activation procedures that ensure simultaneous implementation across all jurisdictions; shared transaction monitoring systems that track relief utilization; and joint enforcement mechanisms that address violations across all jurisdictions.

Currency and Exchange Rate Mechanisms

The framework includes mechanisms for managing the currency and exchange rate implications of sanctions relief. These mechanisms are designed to prevent currency manipulation and to ensure that the economic benefits of

relief flow to the intended beneficiaries.

The mechanisms include: exchange rate monitoring by the IMF; currency intervention protocols that prevent excessive volatility; transparency requirements for central bank operations; and reporting standards for international transactions. The mechanisms are designed to maintain macroeconomic stability while allowing market-based adjustment.

Debt Sustainability Framework

The framework includes a debt sustainability framework that ensures that Iranian borrowing does not create unsustainable debt burdens. The framework is designed to prevent the accumulation of debt that could undermine economic stability and create new sources of instability.

The framework includes: debt limits that cap total borrowing as a percentage of GDP; borrowing terms that require concessional financing for low-income borrowers; transparency requirements that ensure full disclosure of debt obligations; and early warning systems that identify emerging debt sustainability risks.

Private Capital Mobilization

The framework includes strategies for mobilizing private capital to complement public financing. These strategies are designed to leverage public resources to attract private investment, creating a multiplier effect that maximizes the impact of framework financing.

The strategies include: risk-sharing mechanisms that reduce private-sector risk; investment facilitation services that connect investors with opportunities; regulatory reforms that improve the investment climate; and dispute resolution mechanisms that protect investor rights. The strategies are designed

to create an attractive investment environment that encourages sustained private-sector engagement.

Anti-Corruption Framework

The framework includes a comprehensive anti-corruption framework that ensures resources are used for their intended purposes. The framework is designed to prevent diversion, embezzlement, and other forms of corruption that could undermine the effectiveness and legitimacy of framework activities.

The framework includes: transparency requirements that ensure public disclosure of all transactions; auditing procedures that verify the proper use of resources; investigative mechanisms that identify and address corruption; and sanctions that penalize corrupt behavior. The framework also includes provisions for international cooperation in combating corruption.

Financial Reporting Standards

The framework establishes financial reporting standards that ensure transparency and accountability in the use of framework resources. The standards are designed to meet international best practices and to provide stakeholders with reliable information about framework finances.

The standards include: accounting standards that conform to international public sector accounting standards; reporting frequencies that ensure timely disclosure; reporting formats that facilitate comparison and analysis; and audit requirements that provide independent verification. The standards apply to all entities that receive framework funding.

Contingency and Reserve Funds

The framework includes contingency and reserve funds that provide a buffer

against unexpected events. These funds are designed to ensure that framework activities can continue even in the face of shocks and setbacks.

The funds include: a general contingency fund that provides resources for unforeseen expenses; a crisis response fund that provides rapid financing for emergency situations; a reserve fund that provides a buffer against revenue shortfalls; and an insurance fund that provides coverage for specific risks. The funds are managed according to principles of prudence and transparency.

COMPREHENSIVE FINANCIAL ARCHITECTURE

Capital Structure and Funding Mechanisms

The architecture's financial architecture employs a multi-layered capital structure that combines public funding, private investment, and multilateral support to create a robust and sustainable resource base. The capital structure is designed to ensure that essential architecture functions have predictable funding regardless of political or economic fluctuations, while providing flexibility to expand activities when opportunities arise.

Core capital consists of assessed contributions from participating states that fund the architecture's institutional operations including the secretariat, monitoring bodies, and dispute resolution mechanisms. Core capital is legally obligated under the treaty and is backed by domestic appropriations legislation in each participating state. This legal foundation provides the predictability required for multi-year institutional planning and staffing commitments.

Program capital funds the architecture's substantive activities including economic development projects, humanitarian assistance, and capacity building programs. Program capital combines assessed contributions with

voluntary contributions from participating states and the international community, co-financing from multilateral development banks, and private investment mobilized through the Framework Commercial Insurance Facility. This diversified funding base reduces dependence on any single source and enables program scaling based on available resources.

Risk Management and Insurance Framework

The Framework Commercial Insurance Facility (FCIF) provides risk mitigation services that encourage private sector participation in architecture-related economic activities. The FCIF addresses the risk aversion that often prevents private investment in regions perceived as unstable by providing insurance products that protect investors against political risk, non-commercial risk, and architecture-specific risks. These insurance products reduce the risk-adjusted cost of capital for architecture-related investments.

Political risk insurance covers losses resulting from government actions including expropriation, currency inconvertibility, political violence, and breach of contract. Non-commercial risk insurance covers losses resulting from events beyond the control of any commercial party including natural disasters, pandemics, and armed conflict. Architecture-specific risk insurance covers losses resulting from architecture implementation failures including sanctions snap-back, benefit suspension, and governance disruption.

P>The FCIF operates on commercial principles with premiums calibrated to risk levels and claims experience. Participating states provide capital contributions and loss guarantees that enable the FCIF to achieve investment-grade credit ratings and offer competitively priced insurance products. The FCIF's governance ensures that pricing decisions are based on actuarial assessment rather than political considerations, maintaining the facility's financial sustainability.

Currency and Payment Mechanisms

Architecture financial transactions employ multiple currency and payment mechanisms designed to ensure that fund flows are not disrupted by currency volatility, financial sanctions, or banking system failures. The multi-currency approach recognizes that dependence on any single currency creates vulnerabilities that could be exploited to undermine architecture implementation.

Primary transactions are conducted in euros, reflecting the European Union's central role in architecture financing and the euro's status as the second global reserve currency. Euro-based transactions minimize exposure to unilateral U.S. financial sanctions while maintaining convertibility and acceptance in international markets. The architecture maintains euro-denominated accounts with multiple European banks to ensure payment system resilience.

P>Alternative payment channels provide backup capacity for transactions that cannot be executed through primary channels. These channels include special purpose financial vehicles established in neutral jurisdictions, digital currency mechanisms that bypass traditional banking infrastructure, and bilateral payment arrangements between participating states. While less efficient than primary channels, these alternatives ensure that essential transactions can continue even under severe financial pressure.

Auditing and Accountability Framework

Comprehensive auditing procedures ensure that architecture resources are used effectively, efficiently, and in accordance with applicable rules. The auditing framework includes internal audit functions within each architecture institution, external audits conducted by internationally recognized accounting firms, and investigative functions that address allegations of fraud,

waste, and abuse. Audit results are reported to the Governance Body and are made publicly available subject to legitimate confidentiality requirements.

P>Internal auditors are institutionally independent from the management they audit, with authority to examine all records, interview all personnel, and access all facilities. Internal audit plans are risk-based, focusing on areas of greatest vulnerability to error or misconduct. Internal auditors have direct reporting lines to the institution's governing body, ensuring that their findings reach decision-makers without management filtering.

P>External audits provide independent validation of financial statements and compliance with applicable rules and regulations. External auditors are selected through competitive processes and are rotated periodically to maintain independence. External audit opinions on architecture financial statements provide assurance to contributors, beneficiaries, and the international community that resources are properly managed.

Treasury and Cash Management

P>The architecture's treasury function manages financial resources to ensure liquidity for operational requirements, optimize investment returns on surplus funds, and minimize financial risks. Treasury operations follow international best practices for public financial management while accommodating the distinctive characteristics of multilateral institution finance.

P>Cash management ensures that sufficient funds are available to meet operational requirements without maintaining excessive balances that forego investment returns. Cash flow forecasting predicts receipts and disbursements over rolling time horizons, enabling optimization of cash balances. Concentration banking consolidates funds from multiple sources to maximize

investment opportunities. Disbursement scheduling aligns payment timing with cash availability.

P>Investment management deploys surplus funds in low-risk instruments that preserve capital while generating returns. Investment policies specify permitted instruments, maturity limits, counterparty requirements, and risk tolerance parameters. Investment committees oversee investment strategy and performance. External investment managers may be engaged for specialized investment functions.

P>Foreign exchange management addresses currency risks arising from multi-currency operations. Hedging strategies reduce exposure to exchange rate fluctuations through forward contracts, currency swaps, and natural hedging through matching currency receipts and disbursements. Foreign exchange policies specify hedging parameters and approval authorities.

Financial Reporting and Transparency

P>Comprehensive financial reporting ensures accountability to contributing states, beneficiaries, and the international community. Reporting follows international public sector accounting standards and provides information on resource availability, resource uses, financial position, and financial performance.

P>Annual financial statements present the architecture's financial position and performance in accordance with applicable accounting standards. Statements include balance sheet, income statement, cash flow statement, and notes that explain accounting policies and provide detailed information on significant items. External auditors provide independent audit opinions on financial statements.

P>Management reporting provides internal decision-makers with financial

information tailored to their responsibilities. Program managers receive reports on program budgets, expenditures, and variances. Senior management receives consolidated reports on overall financial performance. The Governance Body receives financial reports that support strategic decision-making.

P>Public reporting makes financial information available to external stakeholders including contributing states, civil society, media, and researchers. Public reporting includes annual reports, program-specific financial disclosures, and ad hoc reports on matters of public interest. Open data initiatives make machine-readable financial data available for independent analysis.

Procurement and Contract Management

P>Procurement of goods and services represents a significant portion of architecture expenditures. The procurement framework ensures that procurement achieves value for money while supporting architecture objectives including capacity building, environmental sustainability, and social inclusion.

P>Procurement procedures specify the methods available for different categories of procurement, evaluation criteria for supplier selection, and contract terms and conditions. Competitive methods including open tendering and restricted tendering are preferred for major procurements. Sole source procurement is permitted only when competition is genuinely not feasible.

P>Supplier qualification ensures that selected suppliers have the technical capacity, financial stability, and ethical standards required for architecture contracts. Qualification criteria include technical competence, financial capacity, track record, environmental performance, and compliance with

labor standards. Supplier databases maintain information on qualified suppliers.

P>Contract management ensures that procurement outcomes meet requirements throughout the contract period. Management activities include performance monitoring, variation management, payment processing, and dispute resolution. Final contract evaluation captures lessons learned for future procurement planning.

Asset Management and Property

P>The architecture manages substantial physical assets including office facilities, monitoring equipment, vehicles, and information technology infrastructure. Asset management ensures that these assets are acquired, maintained, and disposed of in ways that support implementation effectiveness and cost efficiency.

P>Asset acquisition follows procurement procedures that ensure appropriate assets are acquired at reasonable cost. Acquisition planning identifies asset needs based on operational requirements and lifecycle cost analysis. Leasing versus purchase analysis determines optimal acquisition methods. Asset registration creates inventory records that support tracking and accountability.

P>Asset maintenance preserves asset functionality and extends useful life. Maintenance schedules specify preventive maintenance activities and frequencies. Condition monitoring identifies maintenance needs before failures occur. Maintenance budgeting ensures adequate resources for maintenance activities that protect asset investments.

P>Asset disposal manages the end of asset useful life in ways that maximize residual value and minimize environmental impact. Disposal methods include

sale, donation, recycling, and environmentally responsible destruction. Disposal procedures ensure proper authorization, fair valuation, and complete documentation.

Insurance and Risk Transfer

P>Insurance and other risk transfer mechanisms reduce architecture exposure to financial losses from operational risks. The risk transfer framework identifies insurable risks, determines appropriate coverage levels, and manages insurance relationships that protect architecture resources.

P>Property insurance covers physical assets against damage or destruction from specified perils including fire, natural disaster, and terrorism. Coverage levels reflect asset replacement values. Business interruption coverage protects against income loss from insured property damage.

P>Liability insurance covers legal liability for bodily injury, property damage, and professional negligence. Coverage includes general liability, professional liability for technical experts, and directors and officers liability for governance body members. Liability coverage protects architecture resources against legal claims.

P>Political risk insurance covers losses from political events including expropriation, currency inconvertibility, and political violence. The Framework Commercial Insurance Facility provides political risk insurance for architecture-related investments. Coverage encourages private sector participation by mitigating political risk.

COMPREHENSIVE VERIFICATION PROTOCOLS AND PROCEDURES MANUAL

IAEA Inspection Procedures

The International Atomic Energy Agency inspection procedures under the Regional Cooperation and Stability Architecture represent the most comprehensive and intrusive verification regime ever applied to a nuclear program. These procedures are designed to provide complete confidence that Iran's nuclear activities are exclusively peaceful while respecting Iran's sovereignty and dignity. The procedures are based on the IAEA's standard safeguards practices but enhanced to address the specific requirements of the framework.

The inspection regime includes several types of inspections, each with specific procedures and frequencies. Routine inspections are conducted at declared facilities on a regular schedule. The frequency of routine inspections varies by facility type: enrichment facilities are inspected daily; conversion facilities are inspected weekly; research facilities are inspected monthly; and storage facilities are inspected quarterly. These frequencies may be adjusted based on compliance history and risk assessment.

Unannounced inspections are conducted without prior notification to the inspected party. Under the framework, 50 percent of all inspections are unannounced. Unannounced inspections may occur at any declared facility with as little as two hours notice. The purpose of unannounced inspections is to verify that declared activities are consistent with the facility's declared status and to detect any undeclared activities.

Challenge inspections of undeclared sites may be requested by any framework party when there is reasonable suspicion of undeclared nuclear activity. Challenge inspections require 24 hours notice and must be accompanied by a written statement of the basis for the suspicion. The inspected party may request a review of the challenge by the governance body, but the inspection proceeds during the review unless the governance body determines that the challenge is frivolous.

Environmental sampling is conducted at all declared facilities and at locations within 50 kilometers of nuclear sites. Sampling includes the collection of air, water, soil, and vegetation samples for analysis. Samples are analyzed using mass spectrometry and other advanced techniques to detect the presence of nuclear materials. Sampling frequencies range from weekly at enrichment facilities to quarterly at remote locations.

Remote monitoring is conducted using a variety of technologies, including cameras, radiation detectors, and seals. Remote monitoring systems transmit data in real-time to IAEA headquarters in Vienna and to the JMOC. Remote monitoring provides continuous surveillance of declared activities and supplements the information obtained through physical inspections.

Inspector qualifications and training are critical to the effectiveness of the inspection regime. IAEA inspectors assigned to the framework must have advanced degrees in relevant scientific fields, at least five years of inspection experience, and specialized training in the framework's verification technologies. Inspectors must also undergo cultural sensitivity training to ensure that inspections are conducted with appropriate respect for Iranian customs and traditions.

Inspector privileges and immunities are established by agreement between the IAEA and Iran. Inspectors enjoy diplomatic immunity for acts performed

in their official capacity. Inspectors have the right to import and export equipment and materials necessary for inspections. Inspectors have access to secure communication systems for reporting inspection results. These privileges and immunities are essential for the effective conduct of inspections.

Inspection reporting follows a standardized format that ensures consistency and comparability. Each inspection report includes: the date, time, and location of the inspection; the names of inspectors and escorts; the scope and objectives of the inspection; the findings of the inspection; any anomalies or concerns identified; and recommendations for follow-up actions. Reports are submitted within 48 hours of inspection completion.

Quality assurance procedures ensure that inspections are conducted to the highest standards. The IAEA maintains a quality assurance program that includes: regular calibration of inspection equipment; proficiency testing of inspectors; peer review of inspection reports; and independent audits of inspection procedures. Quality assurance is essential for maintaining the credibility of the inspection regime.

JMOC Technical Verification Procedures

The Joint Monitoring Operations Center technical verification procedures provide an independent layer of monitoring that complements the IAEA inspection regime. JMOC verification is conducted by technical specialists deployed to Iran with equipment that is independent of IAEA systems. This independence provides a second opinion that enhances confidence in verification results.

JMOC technical specialists are deployed to Iran on a continuous basis. The deployment includes 15 specialists with expertise in nuclear physics,

chemistry, engineering, and data analysis. Specialists are stationed at key locations to provide rapid response capability. The deployment is reviewed quarterly and may be adjusted based on operational requirements.

JMOC verification equipment includes: gamma spectroscopy systems for detecting and identifying radioactive materials; neutron detection systems for measuring fissile material quantities; mass spectrometry systems for analyzing isotopic composition; environmental sampling equipment for collecting and analyzing samples; and data analysis systems for processing and interpreting verification data. All equipment is calibrated regularly and maintained to the highest standards.

JMOC verification activities include: independent measurement of nuclear material quantities; verification of IAEA inspection results; environmental sampling and analysis; satellite imagery analysis; and data fusion from multiple sources. JMOC verification activities are coordinated with IAEA inspections to avoid duplication and to ensure comprehensive coverage.

JMOC reporting procedures ensure that verification results are communicated promptly and accurately to the governance body. JMOC issues daily status reports, weekly activity reports, and monthly comprehensive reports. All reports are shared with the IAEA and with framework parties. JMOC also issues special reports on an as-needed basis when significant events or anomalies are detected.

JMOC data management systems store and analyze all verification data collected under the framework. The systems include secure databases, data analysis tools, and visualization systems. Data is stored in accordance with international standards for data security and privacy. Access to JMOC data is restricted to authorized personnel and is subject to audit.

JMOC quality assurance procedures ensure that technical verification activities

are conducted to the highest standards. The procedures include: regular calibration and maintenance of equipment; proficiency testing of specialists; peer review of verification results; and independent audits of verification procedures. Quality assurance is essential for maintaining the credibility of JMOC verification.

JMOC contingency procedures address situations where verification activities are disrupted by technical failures, security incidents, or other emergencies. The procedures include: backup equipment and systems; alternative verification methods; emergency communication protocols; and evacuation procedures for specialists. Contingency planning ensures that verification activities can continue under adverse conditions.

Satellite Monitoring Protocols

Satellite monitoring provides wide-area coverage that complements ground-based inspections. The framework utilizes commercial and government satellite assets to provide daily imagery of known and suspected nuclear sites. Satellite monitoring is particularly valuable for detecting construction activity, changes in operational patterns, and other indicators of potential non-compliance.

Satellite tasking is coordinated through the JMOC, which maintains relationships with satellite operators and government agencies that control satellite assets. Tasking priorities are established based on risk assessment and operational requirements. High-priority sites receive daily coverage, while lower-priority sites receive coverage on a less frequent schedule.

Imagery analysis is conducted by trained analysts using advanced software tools. Analysis includes: change detection that identifies new construction or modifications to existing facilities; activity assessment that estimates

operational levels based on visible indicators; and anomaly detection that flags unusual patterns for further investigation. Imagery analysis results are integrated with other verification data to provide a comprehensive picture.

Thermal imaging using infrared sensors detects heat signatures that may indicate undeclared nuclear activity. Thermal imaging is particularly useful for detecting enrichment activities, which generate characteristic heat signatures. Thermal imaging is conducted on a regular schedule and in response to specific intelligence or inspection findings.

Radar imaging using synthetic aperture radar provides all-weather monitoring capability. Radar imaging can detect ground disturbance, structural changes, and vehicle movements. Radar imaging is particularly valuable for monitoring sites in areas with frequent cloud cover or other conditions that limit optical imaging.

Satellite data management includes secure storage, processing, and distribution of satellite imagery. The JMOC maintains a satellite imagery database that is accessible to authorized personnel. Imagery is archived for historical comparison and is available for use in compliance assessments and dispute resolution.

Procurement Monitoring Protocols

Procurement monitoring tracks the acquisition of dual-use equipment and materials that could contribute to nuclear weapons development. The framework establishes a comprehensive procurement monitoring system that includes export controls, intelligence sharing, and transaction tracking.

Export controls are implemented through national legislation and international agreements. All framework parties commit to controlling the export of items listed on international control lists, including the Nuclear

Suppliers Group trigger list and dual-use list. Export control procedures include: licensing requirements for controlled items; end-user verification to ensure that exports are used for legitimate purposes; and transshipment controls to prevent diversion through third countries.

Intelligence sharing on procurement activities is conducted through secure channels established by the JMOC. Framework parties share information about suspected procurement attempts, procurement networks, and front companies. Intelligence sharing is subject to strict confidentiality requirements and is used solely for framework verification purposes.

Transaction tracking monitors financial flows that may be related to nuclear procurement. Tracking includes: monitoring of bank transactions for suspicious patterns; review of shipping records for controlled items; and analysis of corporate records for links to prohibited activities. Transaction tracking is conducted in accordance with international standards for financial monitoring.

Procurement alert system provides early warning of potential procurement violations. The system includes: a database of controlled items and known procurement networks; automated screening of trade data for suspicious transactions; and notification procedures for alerting framework parties to potential violations. The alert system is designed to detect procurement activities at an early stage, before they can contribute to weapons development.

Environmental Sampling and Analysis

Environmental sampling and analysis provides a powerful tool for detecting nuclear activities that may not be visible through other verification methods. The framework establishes a comprehensive environmental monitoring

network that collects and analyzes samples from locations around nuclear sites and throughout Iran.

Sampling locations are selected based on proximity to nuclear sites, prevailing wind patterns, hydrological features, and other factors that affect the transport of nuclear materials. The monitoring network includes: fixed sampling stations at locations within 50 kilometers of nuclear sites; mobile sampling teams that can deploy to any location within 24 hours; and airborne sampling using drones or aircraft for wide-area coverage.

Sample types include: air samples collected using high-volume air samplers; water samples from rivers, lakes, and groundwater; soil samples from surface and subsurface locations; and vegetation samples from trees, shrubs, and grasses. Different sample types provide complementary information about nuclear activities.

Analysis techniques include: gamma spectrometry for detecting gamma-emitting radionuclides; alpha spectrometry for detecting alpha-emitting radionuclides; mass spectrometry for measuring isotopic ratios; and liquid scintillation counting for detecting beta-emitting radionuclides. Analysis is conducted at certified laboratories using procedures that ensure accuracy and reliability.

Quality assurance for environmental sampling includes: use of certified reference materials; participation in international proficiency testing programs; duplicate and blank samples to assess precision and contamination; and independent verification of results by separate laboratories. Quality assurance is essential for ensuring that environmental monitoring results are credible and defensible.

Data Management and Analysis

The framework's verification activities generate large volumes of data that must be managed and analyzed effectively. The data management and analysis system provides the infrastructure and procedures for collecting, storing, processing, and distributing verification data.

Data collection encompasses all verification activities, including IAEA inspections, JMOC technical verification, satellite monitoring, environmental sampling, and procurement monitoring. Data is collected in standardized formats that facilitate integration and analysis. Data collection procedures ensure that all relevant information is captured and that data quality is maintained.

Data storage is provided through secure databases maintained by the IAEA and JMOC. Databases are designed to handle large volumes of data and to provide rapid access for analysis and reporting. Data security measures include encryption, access controls, and audit trails. Data backup procedures ensure that verification data is protected against loss.

Data processing includes quality control, integration, and analysis. Quality control procedures identify and correct errors in collected data. Integration procedures combine data from multiple sources to create a comprehensive picture. Analysis procedures use statistical and computational methods to identify patterns, trends, and anomalies.

Data distribution ensures that verification results are communicated to authorized users in a timely manner. Distribution includes: reports to the governance body; briefings to framework parties; notifications of significant events; and responses to specific inquiries. Data distribution is subject to classification and confidentiality requirements.

Data fusion integrates information from multiple verification sources to provide a comprehensive assessment of compliance. Fusion techniques

include: correlation of data from different sources; trend analysis over time; anomaly detection using statistical methods; and predictive modeling to identify emerging risks. Data fusion is essential for making effective use of the large volumes of verification data generated by the framework.

Training and Capacity Building

The framework includes extensive training and capacity building programs to ensure that all parties have the expertise and resources needed to implement their obligations effectively. Training covers technical skills, procedural knowledge, and institutional capacity.

IAEA inspector training includes: advanced courses in nuclear verification techniques; specialized training in the framework's verification technologies; cultural awareness training for work in Iran; and regular refresher training to maintain skills. The IAEA maintains a training facility where inspectors can practice verification procedures using realistic simulations.

JMOC specialist training includes: technical training in the use of verification equipment; data analysis training; report writing training; and emergency response training. JMOC specialists also participate in joint exercises with IAEA inspectors to ensure coordination and compatibility.

Iranian capacity building includes: training for Iranian nuclear personnel in safeguards procedures; technical assistance for the implementation of monitoring systems; institutional development support for the Iranian nuclear regulatory authority; and educational programs for Iranian scientists. Capacity building is designed to ensure that Iran can meet its framework obligations while maintaining a peaceful nuclear program.

Regional capacity building includes: training for regional partners in verification support; technical assistance for the implementation of export

controls; institutional development for regional organizations; and educational programs for regional experts. Regional capacity building strengthens the framework's verification architecture and promotes regional cooperation.

Contingency and Emergency Procedures

The framework includes comprehensive contingency and emergency procedures to address situations where verification activities are disrupted or where significant compliance concerns are identified. These procedures ensure that the verification regime can continue to function effectively under adverse conditions.

Technical contingency procedures address equipment failures, communication disruptions, and other technical problems. Procedures include: backup equipment and systems; alternative communication methods; manual procedures that can be used when automated systems are unavailable; and technical support teams that can deploy to address problems.

Security contingency procedures address threats to inspectors, specialists, and equipment. Procedures include: security escorts for verification personnel; secure facilities for equipment and data; evacuation procedures for emergencies; and coordination with local security forces. Security is a top priority for all verification activities.

Compliance emergency procedures address situations where significant non-compliance is detected. Procedures include: immediate notification of the governance body; activation of the enforcement ladder; diplomatic engagement with the concerned party; and preparation for sanctions snapback. Emergency procedures are designed to respond rapidly while maintaining proportionality.

Political contingency procedures address situations where political developments threaten framework implementation. Procedures include: engagement with domestic political actors; public communication strategies; guarantor facilitation; and, if necessary, activation of Crisis Pause Mode. Political contingency procedures recognize that sustainable implementation requires political support.

VERIFICATION PROTOCOLS AND MONITORING SYSTEMS

Integrated Verification Architecture

The architecture's verification system represents a comprehensive, multi-layered approach to confirming compliance with nuclear and security commitments. The system integrates IAEA safeguards, national technical means, commercial monitoring capabilities, and on-site inspection regimes into a coherent verification architecture that provides high-confidence detection of any significant deviation from committed activities. This integration leverages the strengths of each verification modality while compensating for their individual limitations.

P>The IAEA safeguards layer provides the foundation of the verification architecture through the agency's established legal authority, technical expertise, and international legitimacy. All nuclear commitments under the architecture are subject to IAEA verification through comprehensive safeguards agreements and the Additional Protocol. The architecture supplements IAEA safeguards with additional monitoring measures that go beyond standard safeguards requirements while respecting the IAEA's role as the primary nuclear verification organization.

P>National technical means provide independent verification capabilities that complement IAEA monitoring. These means include satellite imagery, signals intelligence, and other national collection capabilities that provide broad-area monitoring and can detect activities at locations not subject to IAEA inspection. Information derived from national technical means is shared through the Joint Analysis Center to produce integrated assessments that draw on all available sources.

On-Site Inspection Regimes

P>On-site inspections provide direct physical verification of declared activities and the capability to investigate suspicious activities at undeclared locations. The architecture establishes multiple inspection categories with different access rights, notification requirements, and procedural safeguards. These categories balance the need for comprehensive physical verification against the legitimate concerns of inspected states regarding national security, proprietary information, and operational safety.

P>Routine inspections verify the declared status of nuclear facilities and materials on a periodic basis. These inspections follow IAEA procedures for facility access, record review, and environmental sampling. The frequency and intensity of routine inspections are calibrated to the sensitivity of the activities being monitored, with more frequent inspections at facilities with greater proliferation potential.

P>Challenge inspections enable investigation of suspected undeclared activities at locations not subject to routine inspection. Challenge inspection rights are limited by procedural requirements including the provision of specific factual basis for the suspicion, advance notification periods that vary by inspection category, and managed access procedures that protect legitimate sensitive information while permitting effective investigation. The challenge

inspection mechanism addresses the critical verification gap at undeclared locations while incorporating safeguards against frivolous or abusive inspection requests.

H2>Remote Monitoring and Real-Time Surveillance

P>Remote monitoring technologies provide continuous surveillance of declared facilities that supplements periodic on-site inspections with real-time awareness of facility status. These technologies include unattended monitoring systems installed at key measurement points, surveillance cameras with secure data transmission, and seals and tamper-indicating devices that provide evidence of unauthorized access. Remote monitoring data is transmitted continuously to the Joint Analysis Center and the IAEA.

P>The unattended monitoring systems employ sensors that detect and record nuclear material movements, radiation levels, and equipment operations. These systems operate autonomously between inspections, providing continuous audit trails of facility activities. Data authentication mechanisms ensure that transmitted data genuinely represents facility conditions rather than simulated signals designed to conceal proscribed activities.

P>Satellite-based monitoring provides wide-area surveillance capabilities that can detect construction activities, traffic patterns, and environmental changes indicative of proscribed activities. Commercial satellite imagery is integrated into the monitoring system through subscription services that provide regular coverage of designated areas. The imagery is analyzed through automated change detection algorithms and human expert review to identify anomalies requiring further investigation.

H2>Environmental Sampling and Forensic Analysis

P>Environmental sampling detects trace amounts of nuclear materials in the

environment that can indicate undeclared nuclear activities. The architecture incorporates comprehensive environmental sampling programs that collect and analyze samples from air, water, soil, and biota at locations throughout the region. These programs can detect nuclear activities even at locations not subject to direct inspection, providing a valuable verification layer that complements facility-based monitoring.

P>Swipe sampling at declared facilities detects undeclared nuclear material handling by collecting samples from surfaces that would come into contact with nuclear materials during normal operations. These samples are analyzed through ultra-sensitive mass spectrometry techniques that can detect microscopic quantities of nuclear materials. Swipe sampling is conducted during routine inspections and can reveal undeclared activities that would not be apparent from visual inspection or record review.

P>Wide-area environmental monitoring collects samples from locations throughout the region to detect nuclear material releases that could indicate undeclared activities. This monitoring employs both fixed sampling stations and mobile collection capabilities that can be deployed to investigate specific concerns. The wide-area network provides coverage of locations not subject to routine inspection, creating a verification layer that extends beyond declared facilities.

H2>Verification Data Integration and Analysis

P>The Joint Analysis Center serves as the focal point for integrating verification data from multiple sources into comprehensive compliance assessments. The center employs advanced analytical methodologies that correlate information from different sources to produce integrated assessments more robust than any single source could provide. These methodologies include data fusion algorithms, pattern recognition techniques,

and expert systems that support human analytical judgment.

P>The compliance assessment process follows standardized procedures that ensure consistency and objectivity across different assessment cycles and different analysts. These procedures specify the evidentiary standards for compliance findings, the documentation requirements for analytical judgments, and the review processes that quality-check assessments before they are finalized. Standardized procedures prevent idiosyncratic assessments that could vary based on individual analyst perspectives.

P>The assessment reporting framework provides clear, actionable compliance information to the Governance Body and participating states. Reports distinguish between confirmed compliance, minor technical deviations requiring corrective action, significant non-compliance requiring enhanced scrutiny, and material breaches requiring consequence activation. Reporting formats are designed to provide both summary information for senior decision-makers and detailed evidentiary support for technical specialists.

H2>Advanced Monitoring Technologies

P>The architecture's verification system incorporates advanced monitoring technologies that provide capabilities beyond traditional safeguards techniques. These technologies address the evolving challenges of proliferation detection in an era of increasingly sophisticated concealment methods and rapidly advancing technology.

P>Muonic radiography employs cosmic ray muons to create three-dimensional images of large structures including reactor cores, spent fuel pools, and waste storage facilities. Muons are subatomic particles that penetrate dense materials and are deflected by atomic nuclei in patterns that reveal material composition and distribution. Muonic imaging can verify the presence and composition of nuclear materials without requiring physical access to

containment vessels.

P>Antineutrino detection monitors reactor operations by detecting antineutrinos produced by nuclear fission. Antineutrinos are electrically neutral subatomic particles that pass through ordinary matter with minimal interaction, making them extremely difficult to shield or fake. Antineutrino detectors placed near reactor facilities can verify reactor power levels, fuel composition, and operational status independent of facility declarations.

P>Satellite-based change detection employs multi-spectral and hyperspectral imaging to detect subtle changes at monitored facilities. Hyperspectral imaging captures data across hundreds of narrow spectral bands, enabling identification of specific materials based on their spectral signatures. Change detection algorithms compare sequential images to identify new construction, ground disturbance, or material deposits that may indicate undeclared activities.

P>Seismic monitoring for explosion detection employs both the International Monitoring System established under the CTBT and supplementary regional seismic networks. Advanced waveform analysis techniques can distinguish between nuclear explosions, conventional explosions, and natural seismic events with high confidence. Regional networks with station spacing of less than 200 kilometers can detect explosions below one kiloton equivalent yield.

H2>Cyber Verification and Information System Integrity

P>The integrity of verification information systems is critical to architecture effectiveness. Compromised information systems could enable concealment of violations, fabrication of compliance data, or disruption of verification operations. The cyber verification framework protects architecture information systems against compromise through comprehensive cybersecurity measures.

P>Network security employs defense-in-depth architecture with multiple layers of protection including firewalls, intrusion detection systems, access controls, and encryption. Security operations centers monitor network traffic for anomalous patterns indicative of attempted intrusion. Penetration testing identifies vulnerabilities before adversaries can exploit them.

P>Data integrity protection ensures that verification data cannot be altered without detection. Cryptographic hash functions create digital fingerprints of data that reveal any subsequent modification. Blockchain-based anchoring creates tamper-evident records of data provenance. These protections ensure that compliance assessments are based on authentic data rather than manipulated information.

P>Insider threat programs address the risk that authorized personnel may intentionally or inadvertently compromise verification systems. Programs include personnel vetting, access monitoring, compartmentalization of sensitive information, and behavioral indicators that may signal compromised individuals. The architecture recognizes that technical protections must be complemented by human factors security.

H2>Verification in Contested Environments

P>Verification operations may be conducted in environments where physical access is contested due to security conditions, political disputes, or deliberate obstruction. The contested environment framework provides procedures for maintaining verification effectiveness when ideal conditions cannot be achieved.

P>Remote verification employs technologies that reduce dependence on physical presence. Satellite imagery provides wide-area coverage without requiring ground access. Environmental sampling can detect activities at locations too dangerous for inspector presence. Unmanned aerial vehicles can

access areas denied to ground-based inspectors. While remote verification cannot fully replace physical inspection, it substantially maintains monitoring capabilities when access is limited.

P>Managed access procedures enable inspections to proceed when hosts seek to protect sensitive information unrelated to compliance. Inspectors agree to specific access limitations in exchange for alternative verification measures that provide equivalent confidence. Managed access balances verification requirements against legitimate host concerns about proprietary technology, national security, or operational safety.

P>Escalation procedures address situations where verification is systematically obstructed. Graduated responses range from diplomatic protests through enhanced monitoring using national technical means to formal non-compliance findings and consequence activation. Escalation is calibrated to maintain verification pressure without provoking confrontation that could derail broader cooperation.

HUMANITARIAN OPERATIONS MANUAL

Humanitarian Corridor Operations

The Humanitarian Corridor Operations Manual establishes the procedures for opening, operating, and maintaining humanitarian corridors under the Regional Cooperation and Stability Architecture. These corridors provide safe passage for humanitarian aid to reach populations affected by conflict, displacement, and natural disaster. The manual covers all aspects of corridor operations, from initial assessment to long-term sustainability.

Corridor opening begins with a needs assessment conducted by UN humanitarian agencies in coordination with the governance body secretariat. The assessment identifies: the affected population and its needs; the security situation along potential corridor routes; the infrastructure conditions; the political and logistical constraints; and the resources required for corridor operation. Based on the assessment, the governance body approves corridor opening and allocates resources.

Corridor security is ensured through coordination with all parties that control territory along the corridor route. Security arrangements include: advance notification to all armed actors; establishment of no-strike zones around corridor routes; deployment of neutral monitors to verify compliance; and rapid response capability for security incidents. The Humanitarian Firewall ensures that corridor security arrangements are not affected by compliance disputes in other framework tracks.

Corridor logistics involve the coordination of multiple actors and resources. Logistics include: warehouse establishment and management; transportation contracting and fleet management; customs and border procedures; quality

control for humanitarian goods; and distribution to final beneficiaries. Logistics operations follow international humanitarian standards and are subject to independent audit.

Corridor monitoring ensures that aid reaches intended beneficiaries and is used appropriately. Monitoring includes: tracking of goods from entry to distribution; verification of beneficiary eligibility; assessment of aid effectiveness; and investigation of any diversion or misuse. Monitoring results are reported to the governance body and published in the quarterly Transparency Summary.

Corridor closure occurs when the humanitarian need has been addressed or when security conditions make continued operation impossible. Closure procedures include: notification to all stakeholders; disposition of remaining supplies; transfer of responsibilities to local authorities or other actors; and documentation of lessons learned. Corridor closure does not affect other framework tracks or the overall framework status.

Aid Delivery Procedures

Aid delivery procedures ensure that humanitarian assistance is provided efficiently, equitably, and in accordance with international standards. The procedures cover all types of humanitarian aid, including food, water, shelter, medical care, and education.

Needs assessment is the foundation of effective aid delivery. Assessments are conducted by trained personnel using standardized methodologies. Assessments identify: the number and characteristics of affected people; the types and severity of needs; the existing coping mechanisms and resources; the constraints and risks; and the priorities for intervention. Needs assessments are updated regularly to reflect changing conditions.

Aid prioritization ensures that resources are directed to the people and places with the greatest need. Prioritization criteria include: severity of need; vulnerability of the affected population; access constraints; capacity of local response; and strategic importance. Prioritization decisions are made transparently and are subject to review by the governance body.

Aid distribution follows procedures designed to ensure that aid reaches intended beneficiaries without diversion or discrimination. Distribution procedures include: registration of beneficiaries; verification of identity and eligibility; distribution at designated points or through mobile teams; provision of distribution receipts; and post-distribution monitoring. Distribution is conducted in a manner that preserves the dignity of beneficiaries.

Aid quality control ensures that humanitarian goods meet international standards. Quality control includes: inspection of goods at the point of origin; testing of food and medical supplies; verification of quantities and specifications; and investigation of any quality complaints. Substandard goods are rejected and returned to the supplier.

Aid effectiveness monitoring assesses whether aid is achieving its intended objectives. Monitoring includes: measurement of outputs, such as the quantity of aid delivered; measurement of outcomes, such as improvements in food security or health status; identification of unintended consequences; and recommendations for improvement. Effectiveness monitoring is conducted by independent evaluators and is reported to the governance body.

Protection of Civilians

The Protection of Civilians framework establishes the principles and procedures for ensuring that humanitarian operations do not expose civilians

to additional risk and that all feasible steps are taken to protect civilians from harm.

Protection principles include: do no harm, meaning that humanitarian operations must not expose civilians to additional risk; impartiality, meaning that protection is provided without discrimination; and participation, meaning that affected populations are involved in protection decisions. These principles guide all framework activities that affect civilian populations.

Protection activities include: monitoring and reporting of threats to civilians; advocacy with parties to the conflict to respect civilian protection; establishment of safe spaces where civilians can seek refuge; provision of psychosocial support to affected populations; and documentation of violations for future accountability. Protection activities are integrated into all humanitarian operations.

Protection mainstreaming ensures that protection considerations are incorporated into all aspects of framework implementation. Mainstreaming includes: protection risk assessments for all projects; training of framework personnel in protection principles; establishment of reporting mechanisms for protection concerns; and coordination with protection specialists. Mainstreaming is essential for ensuring that the framework does not inadvertently harm civilians.

Refugee and IDP Support

The Refugee and IDP Support framework establishes the procedures for providing assistance to refugees and internally displaced persons under the RCSA. The framework recognizes that displacement is both a humanitarian challenge and a source of regional instability that must be addressed comprehensively.

Registration and documentation of refugees and IDPs is the first step in providing effective support. Registration includes: collection of basic demographic information; documentation of displacement history; assessment of specific needs and vulnerabilities; and issuance of identification documents. Registration is conducted in accordance with international standards and with respect for the dignity and privacy of displaced persons.

Camp management ensures that displacement camps provide safe and dignified living conditions. Camp management includes: site planning and infrastructure development; provision of shelter, water, sanitation, and electricity; establishment of governance structures within the camp; provision of education and healthcare services; and facilitation of livelihood activities. Camp management follows the Camp Coordination and Camp Management Cluster standards.

Durable solutions are the ultimate objective of refugee and IDP support. Durable solutions include: voluntary repatriation to the place of origin when conditions permit; local integration in the place of displacement; and resettlement to a third location when other solutions are not feasible. The framework supports all three durable solutions and facilitates transitions from emergency assistance to long-term solutions.

Healthcare in Crisis Situations

The Healthcare in Crisis Situations framework establishes the procedures for providing medical care to populations affected by conflict, displacement, or disaster. The framework recognizes that healthcare is both a humanitarian imperative and a foundation for stability and recovery.

Emergency medical care includes: trauma care for conflict injuries; treatment of acute illnesses; maternal and child health services; mental health and

psychosocial support; and disease outbreak response. Emergency care is provided through mobile medical teams, field hospitals, and existing health facilities that are supported by the framework.

Healthcare system strengthening ensures that crisis-affected areas can eventually provide their own healthcare services. Strengthening activities include: rehabilitation of health facilities; training of healthcare workers; procurement of essential medicines and equipment; establishment of health information systems; and development of health financing mechanisms. System strengthening is essential for sustainable healthcare.

Disease surveillance and response prevents outbreaks that could exacerbate humanitarian crises. Surveillance includes: monitoring of disease trends; early warning of potential outbreaks; laboratory capacity for disease confirmation; and rapid response teams for outbreak investigation and control. Disease surveillance is coordinated with national and international health authorities.

Food Security and Nutrition

The Food Security and Nutrition framework establishes the procedures for ensuring that affected populations have access to adequate food and nutrition. The framework recognizes that food insecurity is both a cause and consequence of instability, and that addressing food security is essential for sustainable peace.

Food assistance includes: emergency food distributions for populations facing acute food insecurity; food vouchers that allow beneficiaries to purchase food locally; cash transfers that provide flexibility for food purchase; and school feeding programs that support education and nutrition simultaneously. Food assistance is designed to meet immediate needs while supporting local markets.

Agricultural support helps crisis-affected communities rebuild their food production capacity. Support includes: distribution of seeds, tools, and livestock; training in improved agricultural practices; rehabilitation of irrigation systems; and establishment of farmer cooperatives. Agricultural support is essential for long-term food security.

Nutrition programs address malnutrition in all its forms. Programs include: treatment of acute malnutrition through therapeutic feeding; prevention of malnutrition through supplementary feeding; micronutrient supplementation; and nutrition education. Nutrition programs are targeted to the most vulnerable populations, including children under five, pregnant and lactating women, and the elderly.

Water, Sanitation and Hygiene

The Water, Sanitation and Hygiene framework establishes the procedures for ensuring that affected populations have access to safe water, sanitation facilities, and hygiene promotion. The framework recognizes that WASH services are essential for health, dignity, and disease prevention.

Water supply includes: emergency water trucking for populations without access to water; rehabilitation of water systems; construction of new water infrastructure; and water quality monitoring. Water supply standards follow the Sphere Standards, which specify minimum quantities and qualities of water for different settings.

Sanitation includes: construction of latrines and sewage systems; solid waste management; and vector control. Sanitation facilities are designed to be culturally appropriate, environmentally sustainable, and accessible to all users, including women, children, and people with disabilities.

Hygiene promotion includes: community education on handwashing and safe

water handling; distribution of hygiene kits; and establishment of community hygiene committees. Hygiene promotion is essential for preventing disease and maximizing the health benefits of water and sanitation investments.

Education in Emergencies

The Education in Emergencies framework establishes the procedures for ensuring that children and youth affected by crisis continue to have access to education. The framework recognizes that education is both a human right and an investment in future stability.

Emergency education includes: establishment of temporary learning spaces; provision of learning materials; training of teachers; and psychosocial support for students. Emergency education is designed to provide immediate educational opportunities while longer-term solutions are developed.

Education system reconstruction rebuilds the capacity of crisis-affected areas to provide quality education. Reconstruction includes: rehabilitation of schools; recruitment and training of teachers; development of curricula; and establishment of education management systems. System reconstruction is essential for sustainable education.

Higher education and vocational training provide young people with the skills needed for employment and economic participation. Programs include: university scholarships; vocational training in high-demand fields; apprenticeship programs; and entrepreneurship support. Higher education and vocational training are essential for preventing a lost generation.

Gender-Based Violence Prevention

The Gender-Based Violence Prevention framework establishes the procedures for preventing and responding to gender-based violence in crisis situations.

The framework recognizes that GBV is a serious protection concern that requires dedicated attention and resources.

Prevention activities include: community education on GBV and gender equality; engagement of men and boys as allies in prevention; economic empowerment of women and girls; and transformation of harmful social norms. Prevention is the most effective and sustainable approach to addressing GBV.

Response services include: health services for survivors, including clinical management of rape; psychosocial support; legal assistance; and safe shelters. Response services are provided in a manner that respects the confidentiality, safety, and choices of survivors.

Coordination and accountability ensure that GBV prevention and response are effective and accountable. Coordination includes: establishment of GBV coordination mechanisms; development of standard operating procedures; training of personnel; and monitoring and evaluation. Accountability includes: investigation of GBV incidents; disciplinary action for perpetrators; and support for survivors seeking justice.

Humanitarian Coordination and Information Management

The Humanitarian Coordination and Information Management framework establishes the procedures for coordinating humanitarian activities and managing information under the RCSA. The framework recognizes that effective coordination and information management are essential for efficient and accountable humanitarian action.

Coordination mechanisms include: the Humanitarian Country Team, which brings together UN agencies, NGOs, and other humanitarian actors; sector clusters that coordinate activities in specific sectors such as health, nutrition,

and WASH; and the governance body secretariat, which coordinates between humanitarian and political tracks. Coordination mechanisms ensure that humanitarian activities are complementary and avoid duplication.

Information management includes: collection of data on humanitarian needs and response; analysis of data to inform decision-making; dissemination of information to stakeholders; and maintenance of information systems. Information management follows international standards for data quality, privacy, and security.

Communication with affected populations ensures that humanitarian operations are responsive to the needs and preferences of the people they serve. Communication includes: feedback mechanisms that allow affected populations to voice concerns; information campaigns that provide life-saving information; and community engagement that involves affected populations in decision-making. Communication is essential for accountability and effectiveness.

HUMANITARIAN MANUAL AND CIVILIAN PROTECTION PROTOCOLS

H2>Humanitarian Access Standards and Procedures

P>The Humanitarian Manual establishes the operational standards and procedures that govern humanitarian activities conducted under architecture auspices. The manual provides practical guidance for humanitarian workers, implementing agencies, and architecture institutions on how to ensure that humanitarian principles are respected and that assistance reaches those in need effectively and efficiently.

P>Humanitarian access standards require that humanitarian organizations

can reach all civilian populations in need without discrimination based on political, ethnic, religious, or other criteria. Access includes physical access to affected areas, administrative access through permits and authorizations, and financial access through banking and funding channels. Any restrictions on humanitarian access must be justified by legitimate security requirements and must be proportionate to those requirements.

P>The manual establishes procedures for negotiating humanitarian access with authorities controlling territory where civilian needs exist. Negotiation procedures include minimum information requirements for access requests, maximum response timeframes for access decisions, appeal procedures for denied requests, and escalation mechanisms for persistent access denials. These procedures create accountability for access decisions while respecting legitimate security concerns.

H2>Civilian Protection in Conflict Zones

P>Civilian protection measures address the vulnerability of non-combatants in situations of armed conflict or severe insecurity. Protection measures include physical protection through safe zones and evacuation procedures, legal protection through documentation and status verification, and psychosocial protection through mental health services and community support programs.

P>Safe zone establishment creates designated areas where civilians can seek refuge from active conflict. Safe zones require clear demarcation, physical security measures, monitoring presence, and guaranteed access for humanitarian organizations. The establishment of safe zones requires agreement from conflict parties who must respect safe zone status and refrain from military activities within designated areas.

P>Evacuation procedures enable civilians to depart areas of active danger for safer locations. Procedures include transportation arrangements, reception

facilities, family reunification services, and documentation that protects evacuee rights. Evacuation is voluntary except in situations of imminent mortal danger where temporary mandatory evacuation may be justified.

H2>Protection of Vulnerable Groups

P>Vulnerable group protection addresses the particular risks facing women, children, elderly persons, persons with disabilities, ethnic and religious minorities, and displaced persons in conflict and crisis situations. Protection measures are tailored to the specific vulnerabilities of each group based on gender analysis, disability assessment, and minority rights frameworks.

P>Women's protection measures address gender-based violence, reproductive health needs, economic vulnerability, and political exclusion. Measures include safe spaces for women and girls, gender-based violence response services, livelihood programs that empower women's economic independence, and women's participation in decision-making processes that affect their lives.

P>Child protection measures address recruitment into armed groups, family separation, education disruption, psychological trauma, and exploitation. Measures include family tracing and reunification services, child-friendly spaces, education continuity programs, and specialized psychosocial support. The best interests of the child guide all protection decisions affecting children.

P>Disability-inclusive protection ensures that persons with disabilities are not excluded from humanitarian assistance due to physical, communication, or attitudinal barriers. Accessibility standards apply to all humanitarian facilities and services. Specialized services address the specific needs of persons with different types of disabilities. Meaningful participation of persons with disabilities in humanitarian program design ensures that their perspectives inform protection programming.

H2>Humanitarian Civil-Military Coordination

P>Civil-military coordination addresses the relationship between humanitarian civilian actors and military forces operating in the same environment. Effective coordination prevents military activities from compromising humanitarian independence while enabling military assets to support humanitarian objectives when appropriate.

P>The humanitarian civil-military coordination framework distinguishes between military support to humanitarian activities and humanitarian civil-military interaction in operational contexts. Military support includes logistics, security, and technical capabilities that can augment humanitarian capacity when civilian alternatives are unavailable. Such support is provided at humanitarian request and under humanitarian direction.

P>Operational civil-military interaction addresses the deconfliction of military and humanitarian activities in shared operational areas. Deconfliction includes notification requirements, movement coordination, information sharing, and shared situational awareness. Deconfliction does not imply humanitarian subordination to military authority but rather practical coordination that enables both to operate safely and effectively.

P>Humanitarian independence is preserved through standards that limit the circumstances under which military assets can be used for humanitarian purposes and the conditions under which such use occurs. Military assets are employed for humanitarian purposes only as a last resort when civilian alternatives are unavailable. Humanitarian organizations accepting military support maintain operational independence and humanitarian principles.

H2>Post-Crisis Recovery and Resilience Building

P>The humanitarian framework extends beyond immediate crisis response to

encompass post-crisis recovery and resilience building that reduces vulnerability to future crises. Recovery programming addresses the restoration of livelihoods, infrastructure, services, and social cohesion disrupted by conflict or disaster.

P>Livelihood restoration enables affected populations to resume productive activities that generate income and self-sufficiency. Restoration includes agricultural input provision, business restart grants, vocational training for alternative livelihoods, and market reintegration support. Livelihood programming is designed to build back better by addressing pre-crisis vulnerabilities that may have contributed to crisis impacts.

P>Infrastructure reconstruction restores essential facilities including housing, water supply, sanitation, health facilities, schools, and transportation networks. Reconstruction employs disaster-resilient design standards that reduce vulnerability to future shocks. Community participation in reconstruction planning ensures that rebuilt infrastructure meets actual community needs.

P>Social cohesion programming addresses the community divisions that conflict and crisis can exacerbate. Cohesion measures include community dialogue platforms, inter-group reconciliation processes, joint economic activities that create shared interests, and cultural programs that reinforce common identity. Cohesion programming prevents crises from producing lasting social fragmentation that generates future instability.

REGIONAL SECURITY ARCHITECTURE

Maritime Security Framework

The Maritime Security Framework establishes the procedures for ensuring security in the Persian Gulf, the Strait of Hormuz, and the Gulf of Oman. The framework recognizes that maritime security is essential for regional stability and for the free flow of commerce.

The Integrated Maritime Operating Picture provides a shared understanding of maritime activities in the region. The IMOP integrates data from multiple sources, including: Automatic Identification System transmissions from commercial vessels; naval vessel position reporting; satellite imagery; and undersea infrastructure monitoring. The IMOP is shared among framework parties through the JMOC.

The Hormuz Transit Protocol ensures freedom of navigation through the Strait of Hormuz. The protocol includes: prior notification of naval movements; de-confliction procedures for military and commercial vessels; coordination of maritime patrols; and procedures for responding to incidents. The protocol is designed to prevent miscalculation and escalation.

Maritime incident response procedures address situations where vessels are threatened, attacked, or disabled. Procedures include: immediate notification to all parties through the hotline; deployment of rescue and assistance assets; investigation of the incident; and coordination of any necessary response. Maritime incident response is designed to be rapid and proportionate.

Airspace Security Framework

The Airspace Security Framework establishes the procedures for ensuring the

safe and secure use of airspace in the region. The framework recognizes that airspace security is essential for civilian aviation and for preventing unintended escalation.

Airspace de-confliction procedures include: prior notification of military aircraft operations; establishment of separation standards between military and civilian aircraft; coordination of air defense activities; and procedures for responding to airspace violations. De-confliction procedures are designed to prevent incidents that could escalate.

Air defense coordination ensures that air defense systems are operated in a manner that does not threaten civilian aviation or create unnecessary risks. Coordination includes: notification of air defense system status; establishment of rules of engagement; procedures for identifying unknown aircraft; and coordination of air defense exercises. Air defense coordination is essential for preventing miscalculation.

Cyber Security Framework

The Cyber Security Framework establishes the procedures for protecting critical infrastructure from cyber attacks. The framework recognizes that cyber attacks on energy, financial, or nuclear infrastructure could have catastrophic consequences.

Cyber threat information sharing allows framework parties to share information about cyber threats and vulnerabilities. Sharing includes: indicators of compromise; threat actor profiles; vulnerability assessments; and best practices for defense. Information sharing is conducted through secure channels and is subject to confidentiality requirements.

Cyber incident response procedures address situations where critical infrastructure is subject to cyber attack. Procedures include: detection and

analysis of the attack; containment of the attack's effects; eradication of the attacker's presence; recovery of affected systems; and post-incident analysis. Incident response is coordinated through the JMOC.

Counter-Terrorism Cooperation

The Counter-Terrorism Cooperation framework establishes the procedures for cooperation against terrorist groups that threaten regional stability. The framework recognizes that terrorism is a common threat that requires collective action.

Intelligence sharing on terrorist groups allows framework parties to share information about terrorist activities, capabilities, and intentions. Sharing includes: threat assessments; operational information on terrorist groups; financial tracking of terrorist funding; and information on foreign terrorist fighters. Intelligence sharing is conducted through secure channels and is subject to strict controls.

Operational cooperation against terrorist groups includes: coordination of military operations; sharing of tactical intelligence; joint training and exercises; and coordination of border security. Operational cooperation is designed to be effective while respecting the sovereignty of framework parties.

Arms Control and Confidence-Building Measures

The Arms Control and Confidence-Building Measures framework establishes procedures for limiting the proliferation of conventional arms and building confidence among regional actors. The framework recognizes that arms control is essential for preventing arms races and reducing the risk of conflict.

Conventional arms registers provide transparency about military capabilities. Registers include: inventories of major weapons systems; notifications of arms

acquisitions and disposals; and information on military budgets. Registers are voluntary but are encouraged as confidence-building measures.

Notification procedures ensure that potentially destabilizing military activities are communicated in advance. Notifications include: prior notification of military exercises exceeding certain thresholds; notification of significant troop movements; and notification of major weapons tests. Notification procedures are designed to prevent surprise and miscalculation.

SECURITY ARCHITECTURE AND REGIONAL STABILITY MECHANISMS

Regional Security Framework Design

P>The security architecture component of the RCSA establishes a comprehensive framework for addressing the full spectrum of security challenges facing the Middle East region. This framework moves beyond traditional state-centric security paradigms to incorporate human security dimensions, recognizing that sustainable regional stability requires addressing the economic, environmental, and social factors that contribute to insecurity alongside conventional military threats. The resulting architecture integrates conflict prevention, crisis management, and post-conflict stabilization into a coherent approach that addresses both symptoms and root causes of regional instability.

P>The framework employs a layered security model that distinguishes between core security guarantees that address existential threats to participating states, extended security cooperation that addresses shared challenges requiring collective response, and human security programs that address the individual and community-level factors that contribute to broader

instability. Each layer operates through distinct mechanisms but is coordinated through the Governance Body to ensure coherence and prevent contradictions between different security activities.

P>Core security guarantees include commitments by major powers to defend participating states against existential threats, extended deterrence arrangements that discourage aggression against architecture parties, and crisis management procedures that prevent localized incidents from escalating into systemic conflicts. These guarantees provide the security foundation upon which broader cooperation can be built, addressing the fundamental concern that cooperation will be exploited by adversaries to achieve strategic advantage.

H2>Confidence-Building Measures and Military Transparency

P>Confidence-building measures (CBMs) are the operational foundation of the security architecture, creating transparency and predictability in military activities that reduce the uncertainty that can lead to miscalculation and unintended escalation. The CBM framework encompasses notification requirements for major military activities, observation rights for exercises and deployments, information exchanges regarding force structures and doctrines, and constraints on certain categories of military activities with particular escalation potential.

P>Notification requirements mandate advance reporting of military exercises exceeding specified size thresholds, major force movements, and changes in alert status or operational posture. These notifications enable other parties to distinguish between routine military activities and potential attack preparations, reducing the probability that exercises or deployments will be misinterpreted as hostile actions. Notification timelines range from seventy-two hours for routine exercises to immediate notification for alert status

changes.

P>Military information exchanges provide regular updates on force structures, equipment holdings, and defense budgets that create a shared understanding of regional military capabilities. These exchanges proceed through standardized formats that ensure comparability across different states while respecting legitimate security concerns about highly sensitive information. The exchanged information is analyzed by the JMOC to identify trends that could affect regional stability and to detect anomalies that might indicate compliance concerns.

H2>Proxy Actor Management and Spoiler Containment

P>The security architecture addresses the challenge of semi-autonomous and proxy actors who can conduct violence that undermines regional stability without the direct authorization of participating states. The Proxy Actor Management Protocol establishes frameworks for attribution, responsibility, and response that address the distinctive challenges posed by actors who operate with varying degrees of state support, direction, and tolerance.

P>The attribution framework employs a graduated evidentiary standard that assigns responsibility based on the degree of state involvement in actor activities. States that directly direct proxy actions bear full responsibility for those actions. States that provide material support bear proportional responsibility based on the nature and extent of support provided. States that tolerate proxy activities from their territory bear responsibility for failing to prevent those activities. This graduated approach avoids the binary choice between full state attribution and complete absolution.

P>The Spoiler Containment Protocol 2.0 provides comprehensive measures for identifying, monitoring, and neutralizing actors who seek to undermine the architecture through violence, subversion, or political obstruction. The

protocol distinguishes between different spoiler categories including inside spoilers (parties to the architecture who seek to undermine it), outside spoilers (non-parties who oppose the architecture), and sideways spoilers (actors who exploit architecture processes for narrow gains). Each category requires distinct containment strategies.

H2>Counterterrorism and Transnational Threat Cooperation

P>The architecture includes cooperation frameworks for addressing transnational security threats including terrorism, weapons of mass destruction proliferation, cyber attacks, and organized crime. These frameworks recognize that such threats undermine the security of all regional states regardless of their political relationships, creating shared interests in cooperation even among states with adversarial bilateral relationships.

P>The Counterterrorism Cooperation Protocol establishes information sharing arrangements, joint operations capabilities, and capacity building programs that enhance regional counterterrorism effectiveness. Information sharing covers terrorist threats, financing networks, travel patterns, and recruitment activities. Joint operations are conducted under specified command arrangements with legal frameworks that address jurisdictional issues and rules of engagement. Capacity building programs strengthen the counterterrorism capabilities of states with limited resources.

P>The Cyber Security Cooperation Framework addresses the growing threat of cyber attacks against critical infrastructure, government systems, and financial networks. The framework includes information sharing on cyber threats and vulnerabilities, coordinated response capabilities for major cyber incidents, and mutual assistance provisions for cyber defense. The framework recognizes that cyber threats do not respect national borders and that effective cyber defense requires international cooperation.

H2>Arms Control and Proliferation Prevention

P>Beyond the nuclear pathways that constitute the architecture's centerpiece, the security architecture includes conventional arms control and broader proliferation prevention measures. These measures address the destabilizing effects of conventional arms buildups, the risks associated with chemical and biological weapons, and the threats posed by emerging technologies including autonomous weapons systems and hypersonic delivery vehicles.

P>Conventional arms control measures include transparency requirements for major weapons acquisitions, constraints on certain categories of weapons with particular destabilizing potential, and confidence-building measures that reduce the perceived threat from conventional force postures. These measures are designed to prevent arms racing dynamics that can increase tensions and create incentives for preemptive military action.

P>Emerging technology governance addresses the security implications of technologies that could fundamentally alter regional military balances. The governance framework includes notification requirements for the development and deployment of emerging technologies, risk assessment procedures that evaluate the stability implications of new capabilities, and potential constraints on technologies deemed to pose unacceptable escalation risks. This forward-looking approach prevents the architecture from becoming obsolete as technology evolves.

H2>Cyber Security Cooperation Framework

P>The cyber security cooperation framework addresses the growing threat of cyber attacks against critical infrastructure, government systems, and financial networks. The framework recognizes that cyber threats transcend national borders and that effective cyber defense requires international cooperation. Architecture parties cooperate on threat information sharing,

incident response coordination, capacity building, and norm development.

P>Threat information sharing enables participating states to benefit from collective awareness of cyber threats. The Cyber Threat Intelligence Center receives, analyzes, and distributes information about emerging threats, attack techniques, and malicious actor capabilities. Shared information includes technical indicators of compromise, attack attribution assessments, and vulnerability reports. Information sharing operates under classification and handling rules that protect sensitive sources and methods.

P>Incident response coordination provides mutual assistance when cyber attacks affect participating states. Response capabilities include technical assistance for attack mitigation, forensic investigation of attack origins, and diplomatic engagement with states harboring malicious actors. Coordination ensures that cyber incidents affecting one state receive collective response that leverages the full range of architecture capabilities.

H2>Counter-Proliferation Finance

P>The counter-proliferation finance framework tracks and disrupts financial flows that support proliferation activities. Financial tracking combines traditional money laundering investigation techniques with specialized capabilities for identifying proliferation-related transactions. The framework addresses the reality that nuclear programs require substantial financial resources that flow through trackable channels.

P>Financial intelligence analysis examines transaction records, correspondent banking relationships, and beneficial ownership structures to identify proliferation financing. The architecture's information sharing provisions give authorized analysts access to financial intelligence from participating jurisdictions. Cross-referencing financial data with known procurement networks enables identification of suspicious transactions.

P>Disruption measures include sanctions on entities financing proliferation, banking restrictions that limit access to international financial systems, and asset freezes that deny proliferators access to accumulated resources. Disruption measures are coordinated through the architecture's consequence mechanisms to ensure proportionality and avoid unintended effects on legitimate financial flows.

H2>Counter-Smuggling and Border Security

P>The counter-smuggling framework addresses the illicit movement of nuclear and dual-use materials, equipment, and technology across borders. The framework integrates export controls, border security, maritime interdiction, and intelligence sharing to create a comprehensive network that makes nuclear smuggling extremely difficult and reliably detectable.

P>Export control implementation involves licensing requirements for nuclear and dual-use items, end-user verification to prevent diversion, and re-export controls that limit onward transfer. The architecture harmonizes export controls across participating states to prevent gaps that smugglers could exploit. Technical assistance helps states with limited export control capacity implement effective controls.

P>Border security enhancement provides radiation detection equipment, training for customs officials, and intelligence support for identifying suspicious shipments. Radiation portal monitors screen cargo and vehicles at border crossings, seaports, and airports. Handheld detectors enable secondary inspection of suspicious items. Detector networks create coverage that makes smuggling through monitored borders extremely risky.

P>Maritime interdiction addresses the substantial portion of international trade that moves by sea. The framework includes port security standards, cargo screening requirements, and information sharing on suspicious vessels

and shipments. Interdiction authority is carefully scoped to comply with international law regarding freedom of navigation and boarding rights on the high seas.

H2>Emergency Preparedness and Response

P>The emergency preparedness framework ensures that participating states can respond effectively to nuclear and radiological emergencies including reactor accidents, transportation incidents, and malicious use of radioactive materials. Preparedness includes emergency planning, training and exercises, equipment stockpiles, and international assistance arrangements.

P>Emergency planning establishes procedures for responding to different categories of nuclear emergencies. Plans address notification requirements, protective actions for affected populations, medical response capabilities, environmental monitoring, and long-term recovery. Plans are developed for facility emergencies, transportation accidents, and dispersed contamination scenarios.

P>Training and exercises maintain response readiness through regular drills that test emergency procedures, equipment, and personnel. Exercises range from tabletop simulations through field exercises involving actual deployment of response resources. Exercise findings generate improvement plans that address identified gaps. Regional exercises involving multiple states test international coordination mechanisms.

P>International assistance arrangements enable rapid deployment of specialized resources when emergencies exceed national response capabilities. Assistance resources include specialized equipment, technical expertise, medical capabilities, and financial support. Pre-negotiated assistance agreements expedite deployment by addressing liability, customs, and regulatory requirements in advance.

ECONOMIC DEVELOPMENT FRAMEWORK

Trade Facilitation

The Trade Facilitation framework establishes the procedures for reducing barriers to trade between Iran and regional partners. The framework recognizes that trade is a powerful engine for economic growth and regional integration.

Customs modernization includes: harmonization of customs procedures; automation of customs processes; establishment of single windows for trade documentation; and training of customs officials. Customs modernization reduces the time and cost of moving goods across borders.

Trade finance mechanisms provide the financing needed to support trade transactions. Mechanisms include: letters of credit; trade credit insurance; export financing; and supply chain financing. Trade finance is essential for enabling businesses to engage in international trade.

Standards harmonization ensures that products meet the technical and safety standards of destination markets. Harmonization includes: alignment of product standards; mutual recognition of testing and certification; and establishment of regional standards bodies. Standards harmonization reduces non-tariff barriers to trade.

Investment Promotion

The Investment Promotion framework establishes the procedures for attracting and facilitating foreign investment in Iran and the region. The framework recognizes that investment is essential for economic development and job creation.

Investment protection ensures that investors are treated fairly and that their investments are protected from expropriation or unfair treatment. Protection includes: guarantees against expropriation without compensation; fair and equitable treatment standards; transfer rights for capital and profits; and dispute resolution mechanisms. Investment protection is essential for attracting foreign capital.

Investment facilitation reduces the barriers and costs of establishing and operating investments. Facilitation includes: streamlining of investment approval procedures; establishment of investment promotion agencies; provision of information and support services; and resolution of investment-related grievances. Investment facilitation makes it easier for investors to do business.

Infrastructure Development

The Infrastructure Development framework establishes the procedures for developing the infrastructure needed to support economic growth and regional integration. The framework recognizes that infrastructure is essential for connecting markets, reducing costs, and improving living standards.

Transport infrastructure includes: roads, railways, ports, and airports that connect production centers with markets; logistics facilities that support the movement of goods; and digital infrastructure that supports information flows. Transport infrastructure reduces the cost and time of moving goods and people.

Energy infrastructure includes: power generation facilities that provide reliable electricity; transmission and distribution networks that deliver electricity to consumers; and energy efficiency programs that reduce waste. Energy infrastructure is essential for economic activity and human

development.

Water infrastructure includes: water storage and treatment facilities that provide safe drinking water; irrigation systems that support agriculture; and wastewater treatment systems that protect public health and the environment. Water infrastructure is essential for human survival and economic productivity.

Private Sector Development

The Private Sector Development framework establishes the procedures for supporting the growth of private enterprises in Iran and the region. The framework recognizes that the private sector is the primary engine of job creation and economic growth.

Business environment reform reduces the regulatory burden on private enterprises. Reform includes: simplification of business registration procedures; reduction of licensing requirements; streamlining of tax administration; and improvement of contract enforcement. Business environment reform makes it easier to start and grow a business.

Access to finance ensures that enterprises have the capital needed to invest and grow. Access includes: bank lending to small and medium enterprises; equity financing through capital markets; venture capital for high-growth enterprises; and microfinance for entrepreneurs. Access to finance is essential for enterprise development.

Agricultural Development

The Agricultural Development framework establishes the procedures for supporting agricultural productivity and food security. The framework recognizes that agriculture is a foundation of economic development and rural

livelihoods.

Agricultural productivity enhancement includes: provision of improved seeds, fertilizers, and tools; training in modern farming techniques; development of irrigation systems; and establishment of agricultural extension services. Productivity enhancement increases farm incomes and food production.

Value chain development connects farmers with markets and increases the value of agricultural products. Development includes: establishment of collection and processing centers; development of storage and transportation infrastructure; creation of farmer cooperatives; and facilitation of market linkages. Value chain development increases farmgate prices and reduces post-harvest losses.

ECONOMIC DEVELOPMENT AND REGIONAL INTEGRATION

Regional Economic Cooperation Framework

P>The economic development component of the RCSA addresses the profound economic challenges facing the Middle East region, including high unemployment, limited economic diversification, inadequate infrastructure, and barriers to regional trade and investment. The framework recognizes that economic grievances contribute to political instability and that sustainable peace requires creating economic opportunities that give populations a stake in regional cooperation. The economic framework integrates bilateral assistance, multilateral programs, and private sector engagement into a comprehensive approach to regional economic development.

P>The framework operates through the Regional Development Fund, which

finances infrastructure projects, economic diversification programs, human capital development, and private sector support initiatives. Fund programming is guided by a Regional Economic Cooperation Strategy that identifies priority sectors, target beneficiaries, and performance indicators. The strategy is developed through consultation with participating governments, private sector representatives, civil society organizations, and international development partners.

P>Sectoral priorities include transportation infrastructure that enhances regional connectivity and reduces trade costs, energy infrastructure that addresses the region's power generation and distribution challenges, water resource management that addresses scarcity through conservation, reuse, and desalination, telecommunications infrastructure that enables digital economy development, and agricultural modernization that improves food security and rural livelihoods.

Trade Facilitation and Market Integration

P>The trade facilitation component addresses the substantial barriers that limit regional trade and investment flows. These barriers include cumbersome customs procedures, non-tariff regulatory obstacles, inadequate transportation infrastructure, and political risk perceptions that discourage cross-border business relationships. The trade facilitation framework employs a multi-track approach that addresses each of these barriers through complementary mechanisms.

P>The Customs Modernization Program supports participating states in implementing international best practices in customs administration including risk-based inspection, electronic documentation, single window processing, and post-clearance audit. These modernized procedures reduce trade costs and transit times while maintaining effective controls against smuggling and

trade-based money laundering.

P>The Regulatory Harmonization Initiative addresses non-tariff barriers by promoting convergence of technical regulations, standards, and conformity assessment procedures across participating states. Harmonization reduces the compliance costs facing businesses that operate across borders and creates economies of scale that enhance regional competitiveness. The initiative focuses on sectors with the greatest potential for regional value chain development.

Private Sector Development and Investment Promotion

P>The private sector development component recognizes that sustainable economic growth requires vibrant private enterprises that create employment, generate tax revenues, and produce goods and services that meet population needs. The framework addresses the constraints facing private sector development including limited access to finance, inadequate business support services, restrictive regulatory environments, and perceptions of political and security risk.

P>The Access to Finance Program addresses the financing constraints facing small and medium enterprises through a combination of credit guarantee facilities, venture capital funds, and microfinance institutions. These mechanisms expand the supply of capital available to enterprises that lack the collateral or track record required for conventional bank lending. The program includes technical assistance for financial institution capacity building to ensure that expanded financing reaches creditworthy borrowers.

P>The Investment Promotion Agency facilitates foreign direct investment in participating states by providing information, reducing administrative barriers, and addressing investor concerns about political risk. The agency

maintains comprehensive databases of investment opportunities, provides one-stop shop services for investment licensing and registration, and works with the FCIF to make political risk insurance available to qualifying investments.

Human Capital Development and Education

P>The human capital development component addresses the region's most valuable resource: its people. Education and training programs create the skilled workforce required for economic modernization while providing young people with alternatives to extremist ideologies and emigration. The human capital framework encompasses basic education, technical and vocational training, higher education, and lifelong learning programs.

P>The Education Quality Improvement Program supports participating states in enhancing the quality and relevance of their education systems. Program activities include curriculum modernization that aligns education content with labor market needs, teacher training that improves instructional quality, assessment systems that measure learning outcomes, and school infrastructure improvement that creates conducive learning environments.

P>The Scholarship and Exchange Program enables students from participating states to pursue higher education in fields relevant to architecture implementation including nuclear engineering, international law, project management, and conflict resolution. These scholarships create a generation of professionals with the skills required for sustained architecture operation while building personal relationships across national boundaries that facilitate future cooperation.

Industrial Policy and Economic Diversification

Economic diversification reduces dependence on volatile commodity exports and creates resilient economies capable of weathering external shocks. The architecture's industrial policy component supports diversification through targeted investments in manufacturing, technology, services, and agriculture that create employment and reduce vulnerability to commodity price fluctuations.

Manufacturing development focuses on sectors with competitive potential including petrochemicals, automotive components, textiles, food processing, and construction materials. Support includes industrial zone development, technology transfer programs, quality certification assistance, and export promotion services. Manufacturing creates skilled employment and generates value-added that commodity exports cannot match.

P>Technology sector development supports information technology, biotechnology, and renewable energy technology industries that leverage regional human capital and address regional needs. Technology parks, incubator facilities, venture capital support, and intellectual property protection create enabling environments for technology entrepreneurship. Links to international technology markets provide access to knowledge and markets beyond the region.

P>Service sector development targets tourism, logistics, financial services, healthcare, and education as sectors with growth potential. Service sector development requires investment in human capital, regulatory reform, and infrastructure that supports service delivery. The architecture supports service sector development through training programs, regulatory harmonization, and infrastructure investment.

H2>Agricultural Modernization and Food Security

P>Agricultural modernization addresses the region's food import dependence

by increasing domestic production capacity, improving productivity, and reducing post-harvest losses. Modernization includes irrigation efficiency improvements, high-yield seed varieties, mechanization, precision agriculture technologies, and improved storage and transportation infrastructure.

P>Irrigation efficiency improvements reduce water consumption per unit of agricultural output through drip irrigation, soil moisture monitoring, and deficit irrigation techniques. Given the region's water scarcity, irrigation efficiency is essential for sustainable agricultural expansion. The architecture finances irrigation modernization that reduces water use while maintaining or increasing yields.

P>Post-harvest loss reduction addresses the substantial portion of regional agricultural production that is lost between harvest and consumption due to inadequate storage, processing, and transportation. Cold chain development, food processing facilities, and rural road improvement reduce losses and increase farmer incomes. Loss reduction provides food security benefits without requiring additional production.

P>Sustainable agriculture promotion encourages practices that maintain soil health, biodiversity, and ecosystem services while producing food. Organic agriculture, agroforestry, integrated pest management, and conservation agriculture are supported through technical assistance, certification support, and market development for sustainably produced products.

H2>Digital Economy Development

P>Digital economy development creates opportunities for economic growth that transcend physical infrastructure constraints and geographic isolation. The architecture supports digital transformation through telecommunications infrastructure, e-government development, digital skills training, and regulatory frameworks that enable digital commerce.

P>Telecommunications infrastructure includes broadband networks, mobile coverage expansion, data centers, and internet exchange points that provide the connectivity foundation for digital services. Infrastructure investment focuses on underserved areas where connectivity gaps limit economic opportunity. Quality of service standards ensure that infrastructure supports reliable digital service delivery.

P>E-government development improves public service delivery while creating domestic demand for digital services. Digital government services including online licensing, tax filing, and permit applications reduce administrative burdens on businesses and citizens. Open data initiatives create datasets that enable digital service innovation by private sector developers.

P>Digital skills training addresses the human capital requirements of digital transformation. Training programs range from basic digital literacy through advanced programming and data science. Coding bootcamps, online learning platforms, and university curriculum modernization create multiple pathways for digital skill acquisition. Women's digital inclusion programs address gender gaps in technology access and skills.

H2>Energy Transition and Renewable Development

P>The energy transition component supports development of renewable energy sources that reduce dependence on fossil fuel exports, address climate change, and create new economic opportunities. Renewable energy development aligns with global trends that are reshaping energy markets and provides participating states with competitive positioning in emerging clean energy industries.

P>Solar energy development exploits the region's abundant solar resources through utility-scale solar farms, distributed rooftop systems, and solar-powered water pumping for agriculture. Solar development is supported

through feed-in tariffs, power purchase agreements, technical assistance for project development, and grid infrastructure that accommodates variable renewable generation.

P>Wind energy development targets locations with favorable wind resources, particularly coastal areas and elevated terrain. Wind farms provide clean electricity that diversifies generation portfolios and reduces fossil fuel consumption. Grid integration studies and transmission infrastructure support wind development in optimal locations.

P>Energy storage development addresses the intermittency of renewable generation through battery storage, pumped hydro storage, and other storage technologies. Storage enables higher renewable penetration by shifting generation from periods of high production to periods of high demand. The architecture supports storage demonstration projects and deployment incentives that accelerate storage adoption.

CAPACITY BUILDING AND INSTITUTIONAL DEVELOPMENT

Institutional Assessment and Planning

The Institutional Assessment and Planning framework establishes the procedures for assessing the capacity of institutions involved in framework implementation and for developing plans to address capacity gaps. The framework recognizes that effective implementation requires capable institutions.

Institutional assessment evaluates the capacity of institutions across multiple dimensions: legal and regulatory frameworks; organizational structures and processes; human resources; financial resources; information systems; and performance management. Assessment is conducted using standardized methodologies and involves both self-assessment and external evaluation.

Capacity development planning identifies the interventions needed to address capacity gaps. Planning includes: prioritization of capacity needs based on implementation requirements; design of capacity development interventions; estimation of resources required; and establishment of monitoring and evaluation frameworks. Capacity development planning ensures that resources are directed to the highest-priority needs.

Technical Assistance and Training

The Technical Assistance and Training framework establishes the procedures for providing technical assistance and training to institutions and individuals involved in framework implementation. The framework recognizes that

technical assistance and training are essential for building sustainable capacity.

Technical assistance includes: advisory services provided by international experts; peer-to-peer learning between institutions; study tours and exchanges; and support for policy development. Technical assistance is tailored to the specific needs of each institution and is designed to transfer knowledge and skills.

Training programs build the skills of individuals involved in framework implementation. Programs include: professional development courses; on-the-job training; mentoring and coaching; and certification programs. Training is designed to be practical, relevant, and sustainable.

Technology Transfer

The Technology Transfer framework establishes the procedures for transferring technology that supports framework implementation. The framework recognizes that technology is essential for efficient and effective implementation.

Technology needs assessment identifies the technologies needed to support implementation. Assessment includes: identification of technology gaps; evaluation of available technologies; assessment of institutional readiness for technology adoption; and cost-benefit analysis of technology options. Needs assessment ensures that technology transfer is directed to the highest-priority areas.

Technology transfer mechanisms include: licensing of proprietary technology; joint ventures between technology providers and local partners; open-source technology sharing; and technology adaptation to local conditions. Transfer mechanisms are selected based on the nature of the technology and the

capacity of the receiving institution.

CAPACITY BUILDING AND TECHNICAL ASSISTANCE FRAMEWORK

Institutional Capacity Development

P>The capacity building component addresses the substantial institutional development requirements that architecture implementation imposes on participating states. Many states lack the technical, administrative, and legal capacities required to implement complex international commitments effectively. The capacity building framework provides comprehensive support for institutional development across all architecture domains, ensuring that capacity constraints do not become implementation bottlenecks.

P>The framework employs a demand-driven approach in which participating states identify their capacity development priorities through self-assessment processes, with technical assistance designed to address identified gaps. This approach ensures that capacity building resources are directed toward areas of genuine need rather than toward priorities dictated by external donors. The framework also incorporates peer learning mechanisms that enable states with stronger capacities to share their expertise with states facing similar challenges.

P>Capacity building activities include technical assistance missions by international experts, training programs delivered both regionally and internationally, study tours that expose national officials to best practices elsewhere, equipment and technology provision that addresses hardware constraints, and institutional twinning arrangements that pair national institutions with counterparts in more developed states.

Nuclear Safety and Regulatory Capacity

P>For states pursuing nuclear energy programs, whether through Pathway C or D, capacity building in nuclear safety and regulation is essential. The Nuclear Safety Capacity Program provides comprehensive support for the development of independent nuclear regulatory bodies, the establishment of safety assessment capabilities, and the training of nuclear safety professionals. These capacities are prerequisites for responsible nuclear energy development that meets international safety standards.

P>Regulatory body development includes assistance with legal framework drafting, organizational design, staffing and recruitment, procedure development, and equipment acquisition. The program ensures that regulatory bodies possess the independence, authority, and technical competence required for effective oversight of nuclear activities. Regulatory independence from promotional and operational interests is emphasized as a critical safety requirement.

P>Safety assessment capabilities include training in probabilistic safety assessment, deterministic safety analysis, radiation protection, emergency preparedness, and waste management. These capabilities enable regulatory bodies to evaluate licensee safety submissions, identify potential safety issues, and require appropriate corrective actions. The program includes support for participation in international safety review missions and adherence to IAEA safety standards.

Verification and Monitoring Capacity

P>Effective verification requires participating states to cooperate with monitoring activities and to maintain accurate records of activities subject to verification. The Verification Capacity Program assists states in developing the

technical and administrative capabilities required for effective verification cooperation. These capabilities include safeguards accounting systems that track nuclear material movements, environmental monitoring capabilities, and technical expertise for supporting inspector activities.

P>Safeguards accounting support includes assistance with developing nuclear material accounting systems, training accounting personnel, acquiring measurement equipment, and establishing quality assurance programs for accounting data. Accurate accounting is essential for verification because it provides the baseline data against which inspector findings are compared.

P>Technical expert development ensures that participating states have qualified personnel who can interact effectively with international inspectors, respond to technical inquiries, and represent national interests in technical forums. The program includes specialized training in nuclear technology, safeguards implementation, and international verification practices.

Implementation Management Capacity

P>The administrative demands of architecture implementation require sophisticated project management, financial management, and reporting capabilities. The Implementation Management Capacity Program provides training and technical assistance in these areas to ensure that participating states can manage their implementation obligations effectively and account for resources received through architecture channels.

P>Project management training covers planning, scheduling, budgeting, procurement, monitoring, and evaluation methodologies. These skills enable national implementation units to manage complex multi-year programs involving multiple stakeholders and funding sources. Training is supplemented by project management software and tools that facilitate

planning and monitoring.

P>Financial management capacity includes support for budgeting, accounting, auditing, and reporting systems that meet international standards and satisfy architecture requirements. Strong financial management is essential for maintaining donor confidence and ensuring that resources are used for their intended purposes. The program includes training in the specific financial reporting formats required by the Regional Development Fund and other architecture financial mechanisms.

Legislative and Regulatory Capacity Development

Effective architecture implementation requires domestic legal and regulatory frameworks that translate international commitments into binding domestic obligations. The legislative and regulatory capacity component assists participating states in developing the statutory and regulatory infrastructure required for architecture compliance.

P>Legislative drafting support provides technical assistance for drafting laws that give effect to architecture commitments. Drafting assistance includes comparative analysis of legislative approaches in other states, expert review of draft legislation, and training for legislative drafters. The assistance ensures that implementing legislation is legally effective while respecting each state's constitutional traditions and legislative procedures.

P>Regulatory development addresses the detailed implementing regulations that operationalize legislative frameworks. Regulatory assistance covers nuclear safety regulations, export control regulations, financial regulations, environmental regulations, and other regulatory domains relevant to architecture implementation. Regulatory development draws upon international best practices while adapting to local conditions.

P>Parliamentary capacity building strengthens the legislative branch's capacity to oversee architecture implementation. Capacity building includes training for parliamentarians on architecture substance, support for parliamentary committee organization, and technical assistance for legislative research functions. Strong parliamentary oversight enhances implementation accountability.

Diplomatic and Negotiation Capacity

P>Architecture implementation requires sustained diplomatic engagement on complex technical and political matters. The diplomatic capacity component develops the negotiation, communication, and coalition-building skills required for effective participation in architecture governance.

P>Negotiation training develops skills in interest-based bargaining, coalition formation, text negotiation, and deadline management. Training employs simulation exercises that replicate architecture negotiation scenarios, enabling participants to practice skills in realistic settings. Advanced training addresses specialized negotiation contexts including scientific-technical matters and high-stakes crisis negotiations.

P>Diplomatic reporting and analysis capabilities enable states to effectively monitor and analyze architecture developments. Training covers information collection, analytical writing, strategic assessment, and reporting to national capitals. Strong analytical capabilities enable states to identify emerging issues, assess their implications, and develop responsive strategies.

P>Multilateral diplomacy skills address the distinctive challenges of operating in multilateral forums with multiple parties, complex procedures, and diverse interests. Training covers multilateral procedure, coalition management, consensus building, and the specialized techniques required for effective

performance in architecture governance bodies.

Technical Expert Networks

P>The architecture depends on technical expertise across multiple domains including nuclear engineering, international law, financial management, security studies, and development economics. The technical expert network component creates sustainable pools of qualified experts who can support architecture implementation across all functional domains.

P>Expert roster development maintains databases of qualified experts available for architecture assignments. Rosters include international experts with global experience and national experts with local knowledge. Expert qualification standards ensure minimum competency levels while diversity requirements ensure representation of different nationalities, genders, and institutional backgrounds.

P>Expert development programs provide ongoing professional development for architecture-relevant expertise. Fellowship programs enable mid-career professionals to pursue advanced study in architecture-related fields. Professional exchange programs enable experts to gain experience in different national and institutional contexts. Conference and workshop participation maintains awareness of evolving best practices.

P>Knowledge transfer programs capture and disseminate expertise developed during architecture implementation. After-action reviews document lessons learned from implementation experiences. Best practice compilations synthesize effective approaches across different contexts. Mentoring programs pair experienced experts with emerging professionals to transfer institutional knowledge.

Leadership Development and Succession Planning

P>Sustained architecture implementation requires leaders with the vision, skills, and commitment to manage complex multilateral processes over extended periods. The leadership development component identifies, develops, and supports individuals who can provide leadership across architecture institutions and national implementing bodies.

P>Leadership identification employs structured assessment processes that evaluate potential leaders against architecture-relevant competencies including strategic thinking, stakeholder management, crisis management, communication, and integrity. Assessment processes include performance reviews, 360-degree feedback, assessment center exercises, and interview-based evaluation.

P>Leadership development programs provide training and experiential learning opportunities that build leadership capabilities. Executive education programs at leading international institutions provide exposure to global best practices. Stretch assignments challenge emerging leaders with responsibilities beyond their current roles. Coaching and mentoring provide personalized development support.

P>Succession planning ensures continuity of leadership across architecture institutions. Planning identifies backup candidates for critical positions, development plans that prepare candidates for advancement, and transition procedures that ensure smooth leadership changes. Succession planning reduces vulnerability to leadership gaps that could disrupt implementation.

SUSTAINABILITY AND ENVIRONMENTAL PROTECTION

Environmental Impact Assessment

The Environmental Impact Assessment framework establishes the procedures for assessing and managing the environmental impacts of framework activities. The framework recognizes that sustainable development requires environmental protection.

Environmental impact assessments are conducted for all projects funded through the Regional Development Fund. Assessments evaluate: the potential impacts on air, water, soil, and biodiversity; the potential impacts on human health and livelihoods; alternatives that could reduce environmental impacts; and measures to mitigate unavoidable impacts. Assessments are conducted by qualified professionals and are subject to independent review.

Environmental management plans implement the mitigation measures identified in environmental impact assessments. Plans include: monitoring of environmental indicators; implementation of mitigation measures; reporting of environmental performance; and corrective action when performance does not meet standards. Environmental management plans are integrated into project implementation.

Climate Change Adaptation

The Climate Change Adaptation framework establishes the procedures for building resilience to climate change in the Middle East. The framework recognizes that climate change poses significant risks to water security, food

security, and human health.

Climate risk assessments identify the vulnerabilities of communities and infrastructure to climate change. Assessments evaluate: exposure to climate hazards such as drought, flooding, and extreme heat; sensitivity of systems to climate impacts; and adaptive capacity to cope with climate change. Risk assessments inform the design of adaptation interventions.

Adaptation interventions build resilience to climate change. Interventions include: water conservation and efficiency measures; drought-resistant agriculture; early warning systems for extreme weather; and climate-resilient infrastructure. Adaptation interventions are integrated into framework activities across all sectors.

Renewable Energy Development

The Renewable Energy Development framework establishes the procedures for promoting the development of renewable energy in Iran and the region. The framework recognizes that renewable energy is essential for reducing greenhouse gas emissions and for diversifying energy sources.

Solar energy development includes: assessment of solar resources; development of solar power plants; deployment of distributed solar systems; and establishment of solar manufacturing capacity. Solar energy has significant potential in the Middle East, which has some of the highest solar irradiance levels in the world.

Wind energy development includes: assessment of wind resources; development of wind farms; grid integration of wind power; and establishment of wind manufacturing capacity. Wind energy complements solar energy by providing power during periods when solar generation is low.

Water Resource Management

The Water Resource Management framework establishes the procedures for sustainable management of water resources in the Middle East. The framework recognizes that water scarcity is a critical challenge that requires urgent attention.

Water conservation measures reduce water demand and improve water use efficiency. Measures include: efficient irrigation systems that reduce agricultural water use; water-efficient appliances and fixtures; leakage reduction in water distribution systems; and water recycling and reuse. Water conservation is the most cost-effective approach to addressing water scarcity.

Water supply augmentation increases the availability of water for human and economic use. Augmentation includes: desalination of seawater and brackish water; wastewater treatment and reuse; rainwater harvesting; and aquifer recharge. Water supply augmentation provides additional water resources but requires significant investment and energy.

SUSTAINABILITY AND LONG-TERM VIABILITY FRAMEWORK

Environmental Sustainability Integration

P>The sustainability framework ensures that architecture implementation contributes to environmental sustainability rather than undermining it through resource-intensive development patterns. Environmental considerations are integrated into all architecture activities from project design through implementation and evaluation. This integration recognizes that long-term regional stability depends on sustainable management of the

region's natural resource base, which is threatened by climate change, water scarcity, desertification, and pollution.

P>The Environmental Impact Assessment Protocol requires that all architecture-funded projects undergo environmental assessment before approval, with potential impacts identified and mitigation measures specified. Projects with unacceptable environmental impacts are either redesigned to eliminate such impacts or rejected. The assessment protocol follows international best practices and incorporates public consultation requirements that ensure affected communities can voice environmental concerns.

P>Climate change adaptation is mainstreamed across architecture programming, with projects designed to be resilient to anticipated climate impacts including increased temperatures, changed precipitation patterns, and sea level rise. Infrastructure projects incorporate design standards that account for projected climate conditions over their operational lifetimes. Agricultural programs promote climate-resilient farming practices. Water management programs address the reduced availability that climate change is projected to cause.

Social Sustainability and Inclusion

P>Social sustainability requires that architecture benefits are distributed equitably across population groups and that implementation processes respect human rights and social norms. The social sustainability framework includes gender mainstreaming requirements, minority inclusion provisions, labor standards protections, and community engagement mechanisms that ensure architecture activities contribute to social cohesion rather than exacerbating social tensions.

P>Gender mainstreaming ensures that women participate in and benefit from architecture activities on equal terms with men. This includes gender-responsive project design that addresses the different needs and constraints of women and men, targets for women's participation in training and employment programs, and support for women-owned businesses accessing architecture-financed contracts. Gender analysis is required for all major architecture programs.

P>Minority and vulnerable group inclusion ensures that the benefits of architecture cooperation reach disadvantaged populations including ethnic minorities, refugees, internally displaced persons, and persons with disabilities. Inclusion measures include targeted outreach to ensure awareness of available benefits, accessibility standards for all architecture facilities, and dedicated programming that addresses the specific needs of vulnerable groups.

Financial Sustainability and Graduation

P>Financial sustainability requires that architecture programs can be maintained over the long term without perpetual dependence on external assistance. The graduation framework establishes timelines and criteria for transitioning participating states from assistance dependence to self-sustaining operation. Graduation does not mean termination of architecture relationships but rather a shift from assistance-based to partnership-based engagement.

P>Graduation criteria include economic indicators such as GDP per capita growth, fiscal revenue generation, and private investment levels that indicate capacity for self-financed development. Social indicators including education outcomes, health indicators, and poverty rates demonstrate that economic growth is translating into broad welfare improvements. Institutional

indicators including governance quality, regulatory effectiveness, and corruption control demonstrate capacity for effective self-management.

P>Graduation pathways include a transition period during which assistance is gradually reduced while new partnership arrangements are established. These partnerships may include co-financing arrangements in which architecture resources are matched by national contributions, knowledge partnerships that emphasize technical cooperation over financial transfers, and market-based engagement through trade and investment relationships.

Institutional Sustainability and Knowledge Management

P>Institutional sustainability ensures that the architecture's institutional capacity endures beyond the tenure of individual leaders or the participation of founding states. The knowledge management framework captures institutional learning, preserves institutional memory, and develops successor generations of architecture professionals. These measures prevent the loss of institutional capability that can occur when experienced personnel depart.

P>Knowledge capture systems document the lessons learned from architecture implementation including successful practices, implementation challenges, and adaptations made in response to changing circumstances. These lessons are analyzed and disseminated through learning products including case studies, best practice guides, and evaluation reports. Knowledge repositories maintain organized collections of architecture documents, data, and analytical products that are accessible to authorized users.

P>Succession planning ensures that key positions can be filled promptly when incumbents depart. Planning includes maintenance of candidate pools for critical positions, cross-training programs that develop backup capabilities, and documentation of position requirements and responsibilities. Succession

planning reduces the disruption caused by leadership transitions and maintains institutional continuity through personnel changes.

Environmental Impact Assessment and Monitoring

P>The environmental sustainability component includes comprehensive impact assessment and monitoring procedures that ensure architecture activities meet environmental standards and contribute to environmental improvement rather than degradation. Environmental assessment applies to all architecture-funded projects and programs, with assessment rigor calibrated to potential environmental impact.

P>Environmental Impact Assessment procedures follow international best practices including scoping, baseline study, impact prediction, mitigation planning, and monitoring. Assessments examine direct impacts on air, water, soil, biodiversity, and ecosystem services. Indirect impacts including induced development, demographic changes, and behavioral changes are also considered. Cumulative impact assessment examines the combined effects of multiple projects in the same geographic area.

P>Environmental monitoring tracks actual impacts during implementation and compares them to predicted impacts identified in assessments. Significant deviations trigger investigation and potential corrective action. Monitoring data is reported publicly to ensure transparency and accountability. Independent environmental audits provide third-party validation of environmental performance.

Climate Adaptation and Resilience

P>Climate adaptation ensures that architecture investments perform effectively under projected climate conditions. Adaptation measures are

integrated into infrastructure design, agricultural practices, water management, and disaster preparedness to reduce vulnerability to climate change impacts.

P>Infrastructure climate adaptation employs design standards that account for projected changes in temperature, precipitation, sea level, and extreme weather frequency. Roads are designed to withstand higher temperatures and more intense precipitation events. Water infrastructure accounts for changed hydrological patterns. Coastal infrastructure incorporates sea level rise projections. These adaptations increase infrastructure lifespan and reduce future maintenance costs.

P>Agricultural climate adaptation promotes farming practices that maintain productivity under changing climate conditions. Drought-resistant crop varieties, adjusted planting calendars, improved water management, and agroforestry systems maintain agricultural output as climate conditions evolve. Crop diversification reduces dependence on single crops that may be vulnerable to specific climate impacts.

P>Community resilience programs build local capacity to prepare for, respond to, and recover from climate-related disasters. Early warning systems, emergency preparedness training, and social safety nets reduce disaster impacts on vulnerable populations. Post-disaster recovery programs build back better by incorporating resilience improvements into reconstruction.

Social Inclusion and Equity

P>Social sustainability requires that architecture benefits are distributed equitably across population groups and that implementation processes respect human rights and social norms. The inclusion framework ensures that vulnerable and marginalized groups participate in and benefit from

architecture activities.

P>Gender equality is mainstreamed across architecture programming through gender analysis, targeted investments in women's economic empowerment, and measures that address gender-based barriers to participation. Women's economic empowerment programs include access to finance, business development services, and leadership training. Gender-based violence prevention and response services protect women's safety and rights.

P>Youth engagement ensures that young people are not merely passive beneficiaries but active participants in architecture implementation. Youth employment programs address the high youth unemployment that contributes to political instability. Youth civic engagement programs develop leadership skills and create channels for youth voice in decision-making.

P>Minority rights protection ensures that ethnic, religious, and linguistic minorities benefit equitably from architecture activities and that their rights are respected in implementation processes. Minority-sensitive programming addresses the distinctive needs and vulnerabilities of minority communities. Conflict sensitivity analysis ensures that programming does not exacerbate inter-group tensions.

Governance and Anti-Corruption

P>Good governance and anti-corruption measures ensure that architecture resources are used effectively and that implementation processes are transparent and accountable. Governance standards apply to architecture institutions and to national implementing institutions that receive architecture support.

P>Transparency measures include publication of budgets, procurement decisions, project selection criteria, and implementation results. Access to

information policies enable citizens and civil society organizations to obtain information about architecture activities. Open data initiatives make machine-readable data available for independent analysis and oversight.

P>Anti-corruption measures include risk assessment, internal controls, whistleblower protection, and investigation procedures. Corruption risk assessment identifies activities most vulnerable to corruption and prioritizes protective measures. Internal controls including financial management systems, procurement rules, and audit functions reduce corruption opportunities.

P>Accountability mechanisms include performance monitoring, evaluation, redress procedures, and sanctions for misconduct. Performance monitoring tracks implementation results against agreed targets. Evaluation assesses effectiveness, efficiency, and impact. Redress procedures enable affected parties to seek remedies for harms caused by architecture activities. Sanctions for misconduct including corruption, fraud, and abuse of authority are applied promptly and consistently.

Knowledge Management and Learning

P>The sustainability framework includes knowledge management systems that capture, organize, and disseminate lessons learned from architecture implementation. Effective knowledge management prevents repeated mistakes, accelerates implementation improvement, and builds institutional memory that survives personnel turnover.

P>Knowledge capture procedures document implementation experiences through after-action reviews, case studies, evaluation reports, and research studies. Capture procedures ensure that valuable knowledge is recorded before it is lost to personnel turnover or institutional memory degradation.

Quality standards ensure that captured knowledge is accurate, relevant, and actionable.

P>Knowledge sharing mechanisms disseminate captured knowledge to those who can apply it. Online repositories provide searchable access to architecture knowledge products. Communities of practice enable peer-to-peer learning among practitioners facing similar challenges. Training programs incorporate lessons learned into curriculum content.

P>Learning systems institutionalize reflection and adaptation as standard operating procedures. Regular learning events bring together implementers to share experiences and identify improvement opportunities. Innovation funds support experimentation with new approaches. Adaptation procedures ensure that lessons learned translate into actual changes in implementation practice.

ADDITIONAL FRAMEWORK PROVISIONS

Lead Spokesperson: Ministry of Foreign Affairs spokesperson Backup Spokesperson: Ministry of Information; Embassy of Saudi Arabia to UN Saudi-Specific Approved Framing:

On Yemen stabilization: "Saudi Arabia remains committed to the security and stability of the Yemeni people. Our engagement with the United Nations-supervised process reflects our enduring commitment to a Yemeni-led, Yemeni-owned resolution

that protects the civilian population and eliminates the threat to Saudi sovereignty." On Iranian engagement: "Saudi Arabia participates in track-specific economic and humanitarian coordination within a multilateral architecture. Our engagement

does not prejudice political settlements and is conditioned entirely on verified compliance with international standards." On Gaza reconstruction financing: "Saudi Arabia's contributions to Gaza

reconstruction reflect our enduring commitment to the Palestinian people and our leadership role in supporting a just and lasting resolution. These contributions are channeled through accountable multilateral mechanisms."

On maritime security: "Saudi Arabia supports all measures that protect freedom of navigation and commercial shipping in international waters. Our participation in the regional maritime security architecture advances both Saudi and global

economic interests." Crisis Messaging: In the event of a Houthi attack on Saudi territory during framework implementation, Saudi public messaging activates

Template B (proxy incident

with pre-authorized response) and additionally emphasizes Saudi Arabia's "right of self-defense" and "framework-authorized response to verified aggression." Saudi Arabia does not publicly characterize framework pauses as policy failures but as "evidence

41 that the architecture's circuit-breaker provisions are functioning as designed."

Quiet Period Activation: Saudi Arabia may invoke the Election Quiet Period provision not for elections (monarchy) but for Hajj season (approximately one month annually), during which major foreign policy announcements are traditionally minimized to

avoid conflation with religious affairs. RP-SA Module D: Legislative Synchronization Saudi Arabia operates as an absolute monarchy. There is no legislative body with

the power to block executive foreign policy decisions. The primary synchronization requirements are: Royal Decree Issuance: Major Saudi international commitments require Royal Decree.

Decrees are issued without fixed calendar constraints but require Crown Prince recommendation, Cabinet review, and King signature. Estimated lead time: 7-21 days for prepared matters; longer for complex policy questions.

Budget Cycle: Saudi Arabia operates on a calendar year (January-December) budget. Framework-related commitments (Yemen reconstruction contributions, Lebanon emergency fuel costs, Gaza reconstruction fund contributions) must be incorporated

into the following year's budget by approximately October of the prior year. Officer C equivalent at the Ministry of Finance is responsible for annual

budget synchronization with governance body tranche schedules.

SAMA Regulatory Actions: Banking channel participation by Saudi institutions requires SAMA regulatory guidance. SAMA operates on a quarterly guidance cycle. Banking channel adjustments affecting Saudi banks should be coordinated with

SAMA's quarterly calendar to allow timely guidance issuance. JIG Synchronization Points: Saudi representatives to JIG sectoral working groups are present at monthly plenaries (economic, humanitarian tracks). Quarterly ministerial reviews include Saudi participation when Saudi-affecting tracks are on the agenda.

PARTNER PROFILE RP-UAE: UNITED ARAB EMIRATES

42 Track Participation: UAE participates in economic integration (trade corridor

facilitation, Port of Dubai commercial access), humanitarian coordination (Lebanon fuel and reconstruction), normalization architecture (existing Abraham Accords ties to consolidate and expand), maritime security (Gulf and Red Sea coordination),

and reconstruction financing alongside Saudi Arabia. RP-UAE Module A: Leadership Transition Protocol Constitutional Authority: UAE is a federal constitutional monarchy with executive

power vested in the Supreme Council of Rulers (seven Emirate rulers), the President (traditionally Ruler of Abu Dhabi), and the Prime Minister (traditionally Ruler of Dubai). Day-to-day foreign policy is executed by the Ministry of Foreign Affairs and

International Cooperation (MOFAIC) under Abu Dhabi's strategic leadership.

Current Implementation Leadership: Primary: Ministry of Foreign Affairs and International Cooperation

Secondary: Abu Dhabi National Security Council (ADNSC) Economic Track: Ministry of Economy; Abu Dhabi Investment Authority (ADIA) Maritime Track: UAE Coast Guard; Port of Dubai/DP World strategic coordination

Transition Triggers: UAE-T1: Death or incapacitation of the President (Ruler of Abu Dhabi) UAE-T2: Change in Prime Ministerial office (Dubai rulership succession)

UAE-T3: Cabinet reshuffle affecting Foreign Minister or RCSA-designated officers UAE-T4: Federal-Emirate policy conflict affecting implementation capacity Continuity Protocol:

For UAE-T1: Presidential succession in UAE is determined by Abu Dhabi's ruling family and ratified by the Supreme Council. Framework implementation immediately vests in MOFAIC under existing institutional authority. A 14-day grace period

applies. ADNSC maintains operational continuity for security-track provisions. For UAE-T3: Replacement of the Foreign Minister triggers 10-day briefing requirement and 21-day Continuity Certification deadline.

Maximum Continuity Without Authorization: 21 days for routine operations; 45 days

43 for succession events.

RP-UAE Module B: Domestic Veto Player Mapping Player 1: Dubai Commercial Interests (Economic Nationalist Bloc) Power Type: Dubai's status as a regional commercial hub is potentially affected

by framework-driven changes to regional trade flows and Iranian commercial

reintegration. Port of Dubai and DP World have significant interest in maintaining their intermediary role in Gulf trade.

Trigger Issues: Iranian commercial shipping reintegration that bypasses Dubai; framework-linked banking normalization that reduces Dubai's financial hub function. Mitigation: Framework explicitly routes regional banking normalization through

UAE-headquartered financial institutions where possible; Port of Dubai positioned as a logistics hub for reconstruction trade rather than a competitor to Iranian ports. Player 2: UAE Security Services and Military

Power Type: UAE military (UAEAF and ground forces) and intelligence services have significant operational presence in Yemen and Yemen-adjacent maritime areas. They may resist Yemen stabilization provisions they believe compromise operations.

Trigger Issues: Yemen ceasefire monitoring limiting UAE operational freedom; Houthi revenue sharing. Mitigation: UAE is given a defined co-governance role in Yemen reconstruction

financing through SDRPY-equivalent coordination; maritime security role is preserved under multilateral command structure. Player 3: Israel Normalization Political Management

Power Type: UAE's Abraham Accords normalization with Israel creates a political tension point if framework provisions are perceived as tilting toward Palestinian or Iranian interests.

Trigger Issues: Gaza reconstruction provisions that could be perceived as rewarding Hamas; Iran deconfliction language. Mitigation: UAE is briefed on all Gaza and Iran deconfliction provisions before

public announcement; UAE is given co-authorship role in normalization

architecture language that addresses Palestinian development interests without conditioning Abraham Accords progress.

44 Inter-Emirate Alignment Protocol (Abu Dhabi–Dubai Commercial-Security Coordination):

Unlike the other veto player entries above, this entry addresses a structural intra-state risk unique to the UAE's federal architecture. The UAE is not a unitary state in practice; it is a federation in which Abu Dhabi drives national security and foreign policy while Dubai drives commercial and maritime policy. Under normal conditions these interests are aligned. Under framework conditions — specifically, IHTA toll enforcement and maritime sanctions compliance — they

can diverge in ways that undermine UAE's implementation reliability without any individual actor intending to sabotage the framework. The specific scenario: Abu Dhabi, as the security-dominant emirate, supports IHTA

toll enforcement and maritime sanctions compliance. Dubai's Port Authority and DP World, as commercial operators with global shipping client relationships, face revenue pressure if toll enforcement or sanctions compliance creates friction

for vessels transiting or calling at Dubai ports. In a scenario where enforcement is expensive for Dubai's commercial operators, Dubai port authorities might quietly extend processing accommodations, delay lien registration, or provide informal

advance notice to non-compliant vessels — not as a deliberate policy decision, but as a natural commercial service response. The Inter-Emirate Alignment Protocol prevents this scenario through the following

mechanisms: A. Joint Sign-Off Requirement for IHTA-Linked Port Decisions

Any port authority decision affecting compliance with the IHTA toll enforcement

system (specifically: port access denial for toll-defaulting vessels; registration of IMO maritime liens against non-compliant vessels; and denial of berthing priority to vessels under IHTA administrative notice)

requires dual-authority sign-off: Signatory 1: Dubai Ports World (DP World) Group CEO or designated RCSA Compliance Officer (a position created specifically for this purpose,

appointed by DP World's board with ADNOC concurrence). Signatory 2: UAE Ministry of Energy and Infrastructure Maritime Affairs directorate (Abu Dhabi-controlled) or ADNOC-designated

45 maritime security officer.

The dual sign-off requirement institutionalizes Abu Dhabi's national security perspective into what would otherwise be a pure commercial decision by Dubai's port operators. Decisions that are not dual-signed within the required window

(72 hours for routine IHTA compliance actions; 24 hours for emergency port access denial) default to the Abu Dhabi signatory's preference. B. IHTA Revenue Sharing Incentive for Dubai Compliance

To align Dubai's commercial interests with IHTA compliance rather than against it, a UAE-specific revenue sharing arrangement is established: (i) A portion of IHTA toll revenue attributable to UAE-flagged or

UAE-port-calling vessels (estimated 8-12% of total IHTA toll revenue given Dubai's role as the Gulf's primary commercial hub) is designated as a "UAE Maritime Infrastructure Development Contribution." This amount

is credited quarterly to a UAE Infrastructure Development Fund administered jointly by DP World and the UAE Ministry of Infrastructure. (ii) The crediting mechanism means that Dubai's port operators have a positive financial stake in IHTA toll revenue maximization — every non-compliant vessel that evades the IHTA toll reduces Dubai's infrastructure fund credit. This converts commercial operators from potential quiet non-compliance enablers into active enforcers of toll compliance. (iii) DP World's RCSA Compliance Officer is given access to the IHTA's vessel compliance registry in real time, enabling DP World to independently identify and act on toll-delinquent vessels before they berth at Dubai ports. C. Abu Dhabi–Dubai Alignment Review The ADNOC and Dubai's Department of Ports and Border Customs hold a quarterly framework alignment review. The review's agenda is fixed: (a) IHTA compliance performance metrics for Dubai-calling vessels; (b) any port-level commercial accommodations made in the prior quarter that may have affected IHTA or maritime sanctions compliance; (c) coordination on upcoming enforcement actions affecting Dubai-headquartered shipping companies. Minutes of the review are provided to the governance body secretariat within 14 days.

46 D. Federal Override Authority

If the quarterly review or governance body monitoring identifies a pattern of Dubai commercial decisions that are systematically undermining IHTA enforcement, the UAE federal government (through the UAE President's office, which is Abu

Dhabi-controlled) is empowered by the Inter-Emirate Alignment Protocol to issue a Federal Maritime Compliance Directive overriding Dubai port

authority discretion on specific IHTA-linked decisions for a 90-day compliance period.

This Federal Override is a last resort; the dual sign-off and revenue sharing mechanisms are designed to make it unnecessary in practice. RP-UAE Module C: Public Narrative Stabilization

Lead Spokesperson: MOFAIC spokesperson Backup: UAE Permanent Representative to the UN UAE-Specific Framing:

On normalization architecture: "UAE's Abraham Accords ties represent an irreversible foundation for regional peace. Our participation in the broader stability architecture builds upon that foundation by extending the logic of verified, pragmatic cooperation

to additional regional challenges." On economic participation: "UAE's role in this architecture reflects our longstanding commitment to regional economic integration and our position as a global commercial

hub connecting all parties to world markets." On Yemen: "UAE remains committed to the security of the Yemeni people and to a sustainable political process that eliminates threats to regional stability.

Our engagement with the multilateral framework reflects this commitment."

RP-UAE Module D: Legislative Synchronization UAE operates as a federal constitutional monarchy. The Federal National Council (FNC)

is a consultative body only; it does not hold binding legislative authority over foreign policy. Primary synchronization requirements: Presidential Decree: Foreign policy commitments require Presidential Decree

issued by the Abu Dhabi Ruler as President. Lead time: 7-14 days for prepared matters. CBUAE (Central Bank of UAE): Banking channel participation requires CBUAE regulatory clearance. CBUAE operates on a quarterly guidance cycle.

47 Framework banking provisions affecting UAE-headquartered institutions should

be coordinated with CBUAE 45 days before activation. Budget Cycle: UAE federal budget is presented annually in October-November. Framework-related financial contributions are incorporated in the budget preparation cycle beginning August-September.

PARTNER PROFILE RP-QAT: STATE OF QATAR

Track Participation: Qatar's role in the RCSA is uniquely multi-dimensional. Qatar serves as a facilitating host (Doha serves as a quarterly ministerial venue), a humanitarian intermediary (established Hamas negotiation channels relevant to Gaza

track), an energy financing partner (LNG revenues potentially financing reconstruction), and a normalization-adjacent party whose relationships with both Israel and Hamas give it indispensable backchannel utility.

RP-QAT Module A: Leadership Transition Protocol Constitutional Authority: Qatar is an absolute monarchy governed by the Emir. The Constitution (2003) vests executive power in the Emir. Qatar's Shura Council

has expanded advisory functions but no binding authority over foreign policy. Current Implementation Leadership: Primary: Ministry of Foreign Affairs (MFA Qatar)

Secondary: Diwan of His Highness the Emir — Foreign Policy Advisor's Office Mediation Track: Doha Political Coordination Office (established role in Gaza mediation) Economic Track: Qatar Investment Authority (QIA)

Transition Triggers: QAT-T1: Abdication or death of the Emir QAT-T2: Cabinet reshuffle affecting Foreign Minister or Prime Minister

QAT-T3: Shift in Qatar's mediation posture affecting Gaza and Hamas track capacity Continuity Protocol: For QAT-T1: Succession follows family council determination within the Al Thani

48 ruling family. Framework implementation vests in MFA under existing institutional

authority. A 21-day grace period applies. The Doha Political Coordination Office (if established) maintains mediation track capacity independently. Maximum continuity without fresh authorization: 30 days routine; 60 days succession.

Unique Qatar Continuity Concern: Qatar's value to the RCSA is significantly its informal mediation capacity with Hamas. This capacity is person-dependent to a greater degree than formal treaty capacity. If the Emir's specific political investment in the Gaza mediation role changes, the Doha Political Coordination Office's effectiveness could diminish even without formal leadership change. Mitigation: Doha mediation track is institutionalized (not personality-dependent)

through multi-party agreements and formal office establishment. Qatar's role is structured as an institutional function, not an individual favor. Doha Political Coordination Office (DPCO) — Institutional Hardening Provisions:

The DPCO is the operational body through which Qatar's Gaza mediation capacity is exercised. Its survivability across changes in Emiri political priority is the central Qatar-specific institutional design challenge. The following provisions

harden the DPCO against exactly this scenario. A. Mandate and Legal Standing The DPCO is established by formal Emiri Decree as a permanent inter-ministerial

coordination office with a mandate defined by function, not by individual political preference. The Decree specifies that the DPCO's mandate is to "provide facilitation services for humanitarian, detainee, and conflict-resolution communications among

parties identified by the RCSA governance body as requiring neutral relay capacity in the Gaza theater." This functional mandate — defined by the governance body's operational need, not by Qatari foreign policy preference — means that any

successor Emir who wished to close the DPCO would be closing a governance-body- endorsed function, not merely an inherited foreign policy preference. The political cost is materially higher.

The Emiri Decree is deposited with the governance body secretariat and with Switzerland as institutional continuity guarantor. Withdrawal of the Decree requires 90-day advance notice to the governance body, during which time the 49 guarantors work to identify and transition DPCO functions to an alternative relay mechanism (proposed fallback: Islamabad Working Group under Pakistan's guarantor mandate, or a Switzerland-administered Geneva channel). B. Staffing Architecture

The DPCO is staffed on a joint basis to prevent it from being unilaterally dissolved by a single actor: Qatari Staff (Core): A minimum of 4 Qatari Ministry of Foreign Affairs

officers assigned to the DPCO on a 2-year rotational basis. Rotation prevents individual personality concentration while maintaining institutional memory through overlapping assignments.

UN Staff (Legitimizing Presence): One UN OCHA liaison officer is co-located with the DPCO, providing operational coordination for Gaza humanitarian

communications. The UN presence is established by a separate UN OCHA administrative arrangement (not requiring Qatari domestic political authorization for each renewal) and provides the DPCO with international institutional legitimacy independent of Qatari political will.

Guarantor Observer (Oman): An Omani diplomatic attaché holds observer status at the DPCO, formalizing Oman's relay function within the DPCO's structure. This also creates an Omani institutional stake in DPCO continuity.

ICRC Liaison (Detainee Track Only): For the Gaza detainee and hostage exchange track, an ICRC liaison officer is co-located at the DPCO when active exchange windows are operational. This creates a third international body with an

operational interest in DPCO continuity. The joint staffing model means that DPCO dissolution requires not just a Qatari decision but a simultaneous unwinding of UN, Omani, and ICRC co-location

arrangements. This is not impossible but is structurally much more difficult than a unilateral Emiri policy shift. C. Funding Architecture

The DPCO is funded through a three-source architecture designed to prevent any single source's political disruption from collapsing the office: Source 1 — Qatari Sovereign Contribution (50% of operating budget):

50 Funded through an annual line item in the Qatar Ministry of Foreign Affairs budget. The line item is structured as a "multilateral institutional commitment" rather than a discretionary program, making it politically harder to zero out without an explanation to the governance body.

Source 2 — UN Cost-Sharing Allocation (30% of operating budget): UN OCHA's co-location creates a basis for UN cost-sharing for the DPCO's humanitarian

coordination functions. This UN funding stream is governed by UN administrative rules and continues independently of Qatari budget decisions for the portions attributable to UN functional activities. Source 3 — Framework Operating Reserve (20% of operating budget):

A pre-funded reserve of \$2 million is held in a Swiss-administered account under governance body authorization. This reserve can fund up to 12 months of DPCO minimum operations in the event that both Qatari and UN funding streams are disrupted simultaneously. The reserve is replenished annually from the framework's shared operating budget, funded equally by both core parties. D. Transition Protocol if DPCO Capacity Diminishes

If intelligence or governance body monitoring indicates that the DPCO's operational effectiveness is declining (defined as: two or more missed relay responses within a 30-day period; or Qatari government public statements distancing the Emir from the Gaza mediation role; or Qatari staffing reduction to below minimum levels): (i) The governance body secretariat notifies Oman and Switzerland within

48 hours of identifying the indicator. (ii) Oman activates its direct relay capacity as a parallel channel within 72 hours, ensuring no gap in operational mediation capacity.

(iii) Switzerland convenes a governance body session within 14 days to assess whether a formal transition of DPCO functions to an alternative institutional host is required.

(iv) The 90-day withdrawal notice period (per the Emiri Decree terms) runs concurrently with this transition process, ensuring the alternative host is operational before Qatar's formal withdrawal takes effect.

51 RP-QAT Module B: Domestic Veto Player Mapping

Player 1: Al Thani Family Internal Politics Power Type: While Qatar's foreign policy is highly centralized under the Emir, significant family figures can influence policy through informal channels.

Trigger Issues: Qatar's Hamas mediation role creating friction with Gulf partners (particularly UAE, which has historically been in conflict with Qatar over Muslim Brotherhood-adjacent relationships).

Mitigation: Framework explicitly preserves Qatar's mediation role as a multi-lateral function endorsed by the governance body, insulating it from bilateral Gulf criticism.

Player 2: Al Jazeera Media Network Power Type: Al Jazeera's editorial decisions on framework coverage can shape regional public opinion at scale. Hostile coverage of specific implementation

events can generate cross-regional political pressure disproportionate to the specific incident's importance. Mitigation: Regular factual briefings provided to Al Jazeera in parallel with

other major media; Neutral Information Hub material actively shared with Al Jazeera as a resource for accurate framework reporting. RP-QAT Module C: Public Narrative Stabilization

Lead Spokesperson: Qatar Ministry of Foreign Affairs spokesperson Backup: Qatar Permanent Representative to the UN Qatar-Specific Framing:

On mediation role: "Qatar's longstanding commitment to peaceful resolution of regional disputes has positioned us as a trusted facilitator across multiple tracks of this architecture. Our engagement is entirely consistent with our constitutional commitment to the peaceful resolution of international

disputes." On Hamas-adjacent channels: "Qatar maintains humanitarian communication channels that serve the interests of civilian populations in Gaza. These channels are

operational safety mechanisms, not political endorsements." On hosting ministerial sessions: "Qatar is honored to host the quarterly ministerial review sessions. This role reflects our commitment to the multilateral approach

52 that the framework embodies."

RP-QAT Module D: Legislative Synchronization Qatar has no parliamentary body with authority to block foreign policy. Primary synchronization requirements:

Emiri Decree: Framework commitments are implemented through Emiri Decree. Lead time: typically 5-10 days for prepared matters. QCB (Qatar Central Bank): Banking sector participation requires QCB guidance.

QCB operates on an ongoing guidance basis; framework banking provisions affecting Qatari institutions require QCB notification 30 days before activation.

Ministerial Hosting Calendar: Quarterly ministerial sessions hosted in Doha require

3-month advance logistical coordination with the Doha Political Coordination Office.

PARTNER PROFILE RP-KUW: STATE OF KUWAIT

Track Participation: Kuwait participates primarily in humanitarian financing (established Kuwait Fund for Arab Economic Development role), economic track participation, and serves as a useful additional moderate voice in Gulf consultation

mechanisms. Kuwait's geographic position and historical neutrality give it a

valuable signaling function with both Iran and Saudi Arabia. RP-KUW Module A: Leadership Transition Protocol

Constitutional Authority: Kuwait is a constitutional monarchy with a bicameral parliament (National Assembly) that has genuine legislative authority including the ability to question ministers and block government programs. This makes Kuwait

the most legislatively complex Gulf partner. Current Implementation Leadership: Primary: Ministry of Foreign Affairs Kuwait

Secondary: National Security Council Staff Economic Track: Kuwait Fund for Arab Economic Development; Central Bank of Kuwait Transition Triggers:

53 KUW-T1: Death or incapacitation of the Emir or Crown Prince

KUW-T2: Government dissolution and parliamentary elections (occurs regularly due to Kuwait's active parliament-executive conflicts) KUW-T3: Cabinet resignation or ministerial no-confidence vote affecting RCSA

designated officers Continuity Protocol: Kuwait's parliamentary system creates more frequent transition events than other

Gulf states. Cabinet reshuffles and government collapses occur every 2-4 years on average. The following provisions apply: For KUW-T1 (Succession): Framework implementation vests in the Foreign Ministry

immediately. A 21-day grace period applies. Kuwait's constitutional monarchy maintains stable foreign policy through succession events. For KUW-T2 (Government dissolution): This is the highest-frequency Kuwait

transition scenario. Upon government dissolution, an interim caretaker government is formed by the Emir. Caretaker Authority Matrix (PDM-1.5) applies. Kuwait caretaker governments can maintain existing framework

commitments but cannot

activate new benefit tranches requiring ministerial authorization. Maximum continuity without authorization: 14 days routine; 45 days political crisis. RP-

KUW Module B: Domestic Veto Player Mapping

Player 1: National Assembly (Highest Priority) Power Type: Kuwait's parliament can question ministers, block government programs through budget process, and pass legislation restricting executive authority.

It has historically been activist on foreign policy matters. Trigger Issues: Economic normalization with Iran; reconstruction contributions perceived as benefiting Hamas-adjacent governance in Gaza; Kuwait fund disbursements

outside parliamentary oversight. Mitigation: Kuwait Fund contributions are structured as fund-level decisions (which do not require parliamentary approval) rather than budgetary appropriations;

parliamentary foreign affairs committee receives regular briefings; economic benefits to Kuwait are visible and presented in advance of parliamentary sessions. Player 2: Merchant Class and Business Community

54 Power Type: Kuwait's merchant families have historical influence over economic

policy and parliament. They may resist economic normalization if perceived as competitive threat to Kuwait's entrepôt trade role. Mitigation: Kuwait's participation in framework trade corridors is positioned

as expanding Kuwait's commercial reach, not threatening existing advantages.

RP-KUW Module C: Public Narrative Stabilization Lead Spokesperson: Kuwait Ministry of Foreign Affairs spokesperson

Backup: Kuwait Permanent Representative to the UN Kuwait-Specific Framing:

Kuwait emphasizes its historical neutrality and mediation tradition (Kuwait hosted

Iran-Iraq negotiations historically). Framework participation is framed as "consistent with Kuwait's constitutional commitment to peaceful resolution of regional disputes and our historic role as a bridge between GCC states and our Iranian neighbors." On Gaza humanitarian financing: "Kuwait's contributions reflect our longstanding solidarity with the Palestinian people through multilateral, accountable channels

that ensure funds reach those in need." RP-KUW Module D: Legislative Synchronization Kuwait requires more detailed legislative synchronization than other Gulf partners

due to its active parliament. National Assembly Budget Calendar: Budget is submitted by government in November- December, debated January-March, and passed before the fiscal year end (March 31).

Kuwait Fund contributions must be incorporated in the budget cycle beginning October. Interpellation Season: The National Assembly can interpellate (formally question) ministers at any time. High-profile framework milestones should be timed to

avoid landing during active interpellation periods when minister attention is consumed by parliamentary defense. Cabinet Stability Monitoring: Given Kuwait's frequency of cabinet reshuffles,

governance body secretariat should monitor Kuwait's political news cycle and provide advance warning to implementation officers when cabinet crisis appears likely.

55 PARTNER PROFILE RP-EGY: ARAB REPUBLIC OF EGYPT

Track Participation: Egypt is an indispensable framework partner across multiple tracks: Gaza humanitarian corridor (Rafah crossing under Egyptian administration);

refugee and detainee exchange facilitation (Egyptian hospitals, medical corridors); regional economic integration (Suez Canal corridor, energy grid connectivity); and political facilitation for Gaza governance track given Egypt's established

contacts with both Palestinian factions. RP-EGY Module A: Leadership Transition Protocol Constitutional Authority: Egypt operates as a presidential republic with a dominant

executive. The President holds primary authority over foreign policy and national security. The Supreme Council of the Armed Forces (SCAF) exercises significant institutional power alongside the formal executive. The parliament (House of

Representatives) has limited foreign policy authority. Current Implementation Leadership: Primary: Ministry of Foreign Affairs (MFA Egypt)

Secondary: Egyptian General Intelligence Directorate (GID) — Palestinian affairs desk Gaza Track: Ministry of Foreign Affairs; General Authority for the Suez Canal Humanitarian Track: Egyptian Red Crescent Society (coordination with ICRC)

Medical Track: Ministry of Health and Population Transition Triggers: EGY-T1: Presidential election (scheduled every 6 years; may occur earlier)

EGY-T2: Cabinet reshuffle affecting Foreign Minister or RCSA-designated officers EGY-T3: Military intervention or institutional political crisis Continuity Protocol:

For EGY-T1 (Presidential election): Egyptian presidential elections have

historically produced continuity of core foreign policy direction. The Egyptian state's institutional approach to Gaza, Israel, and regional stability is relatively stable across

56 presidential transitions. The following applies:

45-day pre-election quiet period: Major framework announcements are minimized

to avoid becoming election political football

Post-election Continuity Certification: Issued within 30 days of inauguration

Maximum continuity without certification: 45 days

Critical Egypt-Specific Concern: Egypt's role as the Rafah crossing administrator

is operationally irreplaceable. Any Egyptian political paralysis that closes Rafah creates an immediate humanitarian crisis under the core framework's Gaza stabilization track. Contingency planning for Rafah continuity under caretaker

Egyptian government is essential. Rafah Contingency Protocol: If Egypt experiences a political crisis that creates uncertainty about Rafah crossing operations, the governance body activates

Fast-Track Emergency Authority to designate UN OCHA as interim corridor monitor, allows WFP maritime delivery to substitute for reduced Rafah capacity, and convenes an emergency session within 48 hours.

RP-EGY Module B: Domestic Veto Player Mapping Player 1: Egyptian Military Establishment (SCAF) Power Type: The Egyptian military is Egypt's most powerful institution and has

a decisive role in political transitions. It has economic interests in the Sinai

and Suez Canal areas relevant to framework operations. Military officers can accelerate or obstruct Rafah crossing operations through their control of security infrastructure. Trigger Issues: Military security concerns about Gaza-Sinai border management; SCAF economic interests in Sinai development potentially competing with framework reconstruction investments; concern about destabilization from Gaza population movements into Sinai. Mitigation: Military is given co-governance role in Rafah crossing security architecture; Sinai development investments are channeled to military-adjacent construction enterprises where possible; RCSA's anti-infiltration provisions explicitly protect Egyptian territorial integrity.

Player 2: Muslim Brotherhood-Adjacent Networks (Suppressed but monitored)

57 Power Type: While the Egyptian state has suppressed Brotherhood-affiliated

political activity, these networks retain some civil society influence and potential to generate public pressure on Gaza-related policies. Trigger Issues: Perception that Egypt is facilitating an Israeli blockade

rather than protecting Palestinian interests at Rafah. Mitigation: Egypt's Rafah role is consistently framed as protection of Palestinian civilians and insistence on humanitarian access, not facilitation of blockade.

Egypt's Framework messaging emphasizes its active role in securing humanitarian deliveries, hostage release intermediation, and ceasefire support. Player 3: Domestic Economic Concerns

Power Type: Egypt faces severe economic pressures (debt, inflation, currency crisis). The population is sensitive to any perception that Egypt is bearing costs

(refugee influx, security commitments) without receiving proportionate economic

benefit. Mitigation: Framework ensures Egypt receives visible economic benefits for its facilitation role: World Bank infrastructure financing for Sinai connectivity

projects; Gaza patient treatment financial support (\$5 million as described in core document); preferential access for Egyptian construction companies in Gaza reconstruction contracts; Suez Canal volume benefits from regional

economic normalization, directly linked to the Hormuz Transit Authority toll reduction schedule as described below. Suez-IHTA Economic Feedback Loop (Egyptian Financial Retention Mechanism):

The Hormuz Transit Authority's phased toll reduction schedule (linked to nuclear compliance milestones in the core document) generates a measurable volume effect on global shipping. As IHTA tolls decrease, shipping cost

through the Strait of Hormuz falls, and Gulf-to-Europe trade volume — which transits the Suez Canal — increases proportionally. This creates a direct financial feedback loop: every IHTA toll reduction milestone achieved by

Iran produces a corresponding Suez Canal Authority revenue increase for Egypt. To make this feedback loop explicit, operational, and politically attributable to Egypt's facilitation role, the following mechanism is established:

58 (i) IHTA Toll-Suez Volume Correlation Report: The governance body secretariat,

in coordination with the International Maritime Organization, publishes a quarterly "IHTA-Suez Corridor Volume Report" documenting the measurable traffic volume increase attributable to each IHTA toll reduction milestone.

The report is shared with Egypt's Ministry of Finance and Suez Canal Authority simultaneously with its governance body publication. (ii) Egypt Attribution Designation: Each IHTA compliance milestone is

accompanied by a governance body statement that explicitly acknowledges Egypt's Rafah corridor facilitation as a contributing condition to the regional stability environment that made the milestone possible. This

attribution creates a public record linking Egypt's cooperation to tangible Egyptian economic gain. (iii) Suez Revenue Supplement Floor: In the event that global shipping

volume does not increase sufficiently in Phase 0 to produce a measurable Suez Canal revenue benefit (due to market conditions unrelated to framework progress), a framework-established Suez Revenue Supplement of \$50 million

annually is provided to Egypt from the Regional Development Bank's infrastructure finance stream. The Supplement is framed as "corridor facilitation support" and is conditional on Egyptian Rafah crossing operations

meeting minimum daily tonnage targets. The Supplement activates automatically at Phase 1 entry if the IHTA-Suez volume correlation has not yet produced a comparable organic benefit.

(iv) Hydrocarbon Transit Dividend: Iran's Phase 1 oil market reintegration (described in the core document) includes reactivation of Persian Gulf-to-Mediterranean export routes. Egypt's Suez Canal and SUMED pipeline are the

primary transit infrastructure for this route. The framework explicitly designates Egypt as the preferred transit corridor for Iranian hydrocarbon exports that travel westward, subject to OFAC licensing. This designation

is not exclusive but provides Egypt with a commercial priority position that makes Egyptian economic gain from Iranian oil reintegration structurally

guaranteed rather than incidental.

59 RP-EGY Module C: Public Narrative Stabilization

Lead Spokesperson: MFA Egypt spokesperson (State Information Service for major events) Backup: Egyptian Permanent Representative to the UN Egypt-Specific Framing:

On Rafah crossing role: "Egypt administers the Rafah crossing as a humanitarian lifeline for the Palestinian people. Our operation of this crossing reflects Egypt's historic commitment to Palestinian rights and our responsibility as

the Palestinian people's closest neighbor." On Gaza mediation: "Egypt's mediation efforts reflect our unique role as a bridge between all parties to the Palestinian question. We act as a neutral

facilitator, not as a partisan actor, consistent with international law and the interests of the Palestinian civilian population." On Iran-linked provisions: "Egypt's participation in the regional stability

architecture is grounded in our commitment to collective security and our national interest in a stable, prosperous neighborhood. We engage on a track-specific basis without prejudice to our assessment of other regional issues."

RP-EGY Module D: Legislative Synchronization Egypt's House of Representatives has limited foreign policy authority; executive foreign policy is conducted by Presidential decree. Primary synchronization:

Presidential Decree Timing: 7-14 days for prepared matters. Budget Cycle: Egyptian fiscal year runs July 1-June 30. Framework-related costs (Rafah crossing operational support, hospital treatment financing) should be incorporated in budget preparation beginning February-March each year.

Ramadan Operational Adjustment: Egyptian government operations slow during Ramadan (typically 1 month per solar year). Major framework milestones requiring

Egyptian governmental action should be scheduled at least 30 days before or after Ramadan when possible.

PARTNER PROFILE RP-JOR: HASHEMITE KINGDOM OF JORDAN

60 Track Participation: Jordan participates in refugee corridor management (hosting

600,000+ Syrian refugees; Palestinian refugee management from potential Gaza displacement events); economic corridor facilitation (Jordan as a transit route for regional trade); humanitarian financing (Jordan as a secondary donor); and

provides political cover as a moderate Arab monarchy with strong U.S. relationships. RP-JOR Module A: Leadership Transition Protocol Constitutional Authority: Jordan is a constitutional monarchy with the King holding

executive authority alongside a parliamentary system. The King appoints and dismisses the Prime Minister and Cabinet, dissolves parliament, and sets foreign policy direction. The parliament (House of Representatives) has genuine, if limited, authority.

Current Implementation Leadership: Primary: Ministry of Foreign Affairs and Expatriates Secondary: Royal Court Foreign Policy Advisor's Office

Refugee Track: Ministry of Interior; Jordan Response Platform for Syrian Crisis (JRPSC) Economic Track: Ministry of Planning; Jordan Investment Commission Transition Triggers:

JOR-T1: Death or incapacitation of the King JOR-T2: Parliamentary elections

(scheduled every 4 years) JOR-T3: Cabinet formation or government resignation (frequent in Jordanian system)

Continuity Protocol: For JOR-T1 (Succession): Jordan's Crown Prince succession is constitutionally clear. Foreign policy continuity is generally high through succession events.

A 30-day grace period applies. The Royal Court Foreign Policy Advisor's Office maintains operational continuity. For JOR-T3 (Cabinet change): Extremely common; Jordan has had numerous governments

in the past decade. Framework implementation is maintained by the MFA institutional division through government changes. New Prime Minister and Foreign Minister receive RCSA briefing within 7 days of appointment.

Maximum continuity without authorization: 21 days routine; 45 days political crisis.

61 Jordan-Specific Concern: Jordan's domestic political stability is significantly affected by refugee population pressure. A large-scale displacement event from Gaza into Jordan would create an immediate domestic crisis that could overwhelm Jordan's framework participation capacity. Advance contingency planning for

this scenario is built into the Gaza stabilization track and Refugee Pathways section of the core document. RP-JOR Module B: Domestic Veto Player Mapping

Player 1: Palestinian Jordanian Population (Demographic Veto) Power Type: Approximately 50-60% of Jordan's population is of Palestinian origin. Any framework provision perceived as permanently foreclosing Palestinian

statehood, legitimizing Israeli settlement expansion, or facilitating mass Palestinian displacement into Jordan creates domestic political pressure that

can constrain Jordanian foreign policy action.

Trigger Issues: Gaza reconstruction provisions that could be perceived as enabling long-term Israeli control; Saudi-Israel normalization language.

Mitigation: Framework explicitly affirms Palestinian humanitarian and development

interests; Jordan is given a visible co-governance role in Palestinian refugee and return track; Jordan's red lines on displacement into Jordanian territory are explicitly protected in core document.

Player 2: Islamist Political Movement (Jordanian Muslim Brotherhood-affiliated) Power Type: The Islamic Action Front is Jordan's most organized opposition party and has parliamentary representation. It can generate significant street pressure

and parliamentary opposition to framework-related policies. Trigger Issues: Any normalization-adjacent provision; IAEA access framing; humanitarian cooperation with Israel even on indirect basis.

Mitigation: Framework's modular independence allows Jordan's public role to be exclusively humanitarian and economic without requiring visible security or normalization track participation; parliamentary briefings emphasize humanitarian

and Palestinian-protective elements. Player 3: Jordanian Military and Intelligence Power Type: Jordan's General Intelligence Directorate (GID) has a significant

62 institutional role in regional security and a long history of coordination with

both the U.S. and Israel. GID can facilitate or hinder framework security track provisions based on its institutional assessment. Mitigation: GID is briefed as a

stakeholder on RCSA security track provisions;

Jordan's military cooperation role is preserved and given a defined function in Syrian and Palestinian border management sections. RP-JOR Module C: Public Narrative Stabilization

Lead Spokesperson: Ministry of Foreign Affairs spokesperson Backup: Royal Hashemite Court spokesperson Jordan-Specific Framing:

On Palestinian issues: "Jordan's engagement in the regional stability architecture is grounded in our constitutional commitment to protecting the rights of the Palestinian people and supporting a just, lasting solution that includes a

viable Palestinian state with East Jerusalem as its capital. Our participation serves Palestinian, not Israeli, interests." On Syrian refugee track: "Jordan has borne disproportionate burden as a refuge for

those fleeing conflict. Our engagement with the voluntary return facilitation track reflects our commitment to durable solutions that protect refugee dignity while enabling those who wish to return to do so safely."

On economic corridor role: "Jordan's geographic position makes us a natural partner in any regional economic normalization. The trade corridor provisions serve Jordanian economic development alongside regional stability objectives."

Economic Attribution Clause and Anti-Normalization Narrative Shielding: Jordan's domestic political environment requires a more disciplined narrative architecture than any other regional partner. The combination of a large

Palestinian-origin population, an activist Islamist opposition, and a population experiencing severe economic strain means that any framework benefit that can be characterized as flowing from Israel-Iran or U.S.-Iran political

normalization

will be domestically radioactive — regardless of its actual humanitarian or economic merit. The following Economic Attribution Clause is a mandatory, rigid rule governing how all Jordanian government communications about framework-derived

63 benefits are framed.

A. The Core Attribution Rule Every framework-derived benefit received by Jordan — whether economic, humanitarian, infrastructure, or financial — is attributed exclusively to one of the following

two categories: Category J-1: "Sovereign Economic Stabilization" — benefits attributable to Jordan's own sovereign decisions to manage its national economic and humanitarian

circumstances. This category covers all infrastructure investment, desalination unit deployment, refugee camp funding, transit corridor fees, and World Bank financing that Jordan receives as a result of its framework participation.

Category J-2: "Multilateral Humanitarian Obligation" — benefits attributable to international community obligations to address humanitarian crises in Jordan's neighborhood. This category covers Syrian and Palestinian refugee support, Lebanon stabilization spillover benefits, and UNHCR-administered programs. Under no circumstances is any framework-derived benefit attributed to:

— "Regional integration" (implies normalization track) — "U.S.-Iran diplomatic progress" (politically lethal domestic framing) — "Israel-Arab cooperation" (triggers anti-normalization street pressure)

— "Abraham Accords extension" (implies Jordanian endorsement of

normalization) — "Peace dividend" (implies political settlement that has not occurred) B. Pre-Cleared Jordanian State Media Vocabulary Register

The following approved phrasings are designated for use by Jordanian state media, Ministry of Foreign Affairs spokespersons, and the Royal Hashemite Court in all framework-related communications:

For desalination units (received under Lebanon stabilization/regional humanitarian track): "Jordan has secured Sovereign Water Security Infrastructure through multilateral technical cooperation. These facilities strengthen Jordan's

independent water management capacity and serve our national obligation to our citizens." For refugee camp funding: "Jordan continues to fulfill its humanitarian obligations

64 to refugee populations within our borders. International contributions to this

effort reflect the global community's recognition of Jordan's disproportionate burden-sharing and our sovereign commitment to human dignity." For transit corridor fees: "Jordan's national transit infrastructure generates

sovereign economic revenue consistent with our longstanding role as a regional logistics corridor. These revenues support Jordanian economic development programs." For World Bank financing: "Jordan has secured preferential development financing

for national infrastructure priorities. This financing reflects international confidence in Jordan's economic governance and our sovereign development agenda." For any benefit coinciding with a visible RCSA milestone: "Jordan's economic

programs proceed on the basis of our national interests and sovereign

decisions. We do not condition our economic development agenda on external political processes." C. Decoupling Protocol for Sensitive Coincidence Events

A "sensitive coincidence event" occurs when a framework benefit arrives for Jordan in close temporal proximity to a high-profile RCSA political milestone (e.g., a SWIFT normalization announcement, a Saudi-Israel normalization meeting, or an

Iran nuclear compliance certification). These coincidences are politically dangerous for Jordan even when the benefit and the milestone are operationally unrelated. The following decoupling protocol applies:

(i) Governance body secretariat identifies upcoming sensitive coincidence risks on a 30-day rolling basis and notifies Jordan's designated spokesperson 14 days in advance.

(ii) If a sensitive coincidence is identified, Jordan's benefit announcement is either: advanced by at least 10 days before the RCSA milestone; or delayed by at least 14 days after the RCSA milestone. The governance body accommodates

Jordan's timing preference in scheduling the relevant Transparency Summary entry. (iii) If advance or delay is not possible, Jordan's MFA spokesperson uses the following standard decoupling statement: "[Framework-derived benefit] was

secured through Jordan's bilateral engagement with [World Bank / UN agency / specific partner] and reflects [specific Jordanian policy decision]. It is entirely separate from any other regional diplomatic activity occurring at

D. "Street-Proof" Test for All Jordanian Framework Communications Before any Jordanian government communication about framework participation is issued, the MFA RCSA Coordination Officer applies the following four-question street-proof test: Question 1: Could this statement be quoted in a Jordanian

newspaper headline as evidence that Jordan is normalizing with Israel? If yes — rewrite.

Question 2: Could this statement be used by the Islamic Action Front in a parliamentary interpellation to argue that Jordan is facilitating U.S.-Iran détente at Palestinian expense? If yes — rewrite.

Question 3: Does this statement create a future public commitment that limits Jordan's ability to publicly distance itself from the RCSA if a political crisis requires it? If yes — rewrite.

Question 4: Does this statement make Jordan's economic gain attributable to the framework's political track rather than to Jordan's sovereign decisions? If yes — rewrite using Category J-1 or J-2 framing.

Only statements that pass all four tests are issued. The test is mandatory, not advisory. All four questions must be answered in writing by the MFA RCSA Coordination Officer before spokesperson approval.

RP-JOR Module D: Legislative Synchronization Jordan's House of Representatives can question the government on foreign policy but lacks binding veto authority over treaty obligations approved by the executive.

Parliamentary Session Calendar: Jordan's parliament holds two regular sessions per year (approximately October-January and February-June). Major framework announcements should be timed to avoid legislative session openings when political

attention intensifies. Budget Cycle: Jordan's fiscal year runs January-December. Budget is submitted to parliament in October. Framework-related costs (refugee track contributions,

Jordan Response Platform funding) should be incorporated in budget preparation beginning August. National Day Sensitivity: Jordan National Day

(May 25) and the King's accession

66 anniversary (June 9) are sensitive periods for foreign policy announcements that

might generate domestic controversy.

PARTNER PROFILE RP-IRQ: REPUBLIC OF IRAQ

Track Participation: Iraq is both a framework participant and a subject of the Iraq Stabilization and Militia Integration module. Iraq participates in economic integration (energy corridor, oil market framework), humanitarian coordination

(Syrian and Iraqi displaced persons), security architecture (PMF integration, U.S. base protection compact), and serves as a critical geographic bridge between Iran and Gulf state economic interests.

RP-IRQ Module A: Leadership Transition Protocol Constitutional Authority: Iraq operates as a parliamentary republic with a proportional representation system producing complex multi-party coalition governments. Executive power is divided between the President (largely ceremonial, Kurdish convention), the Prime Minister (effective executive, typically Shia coalition leader), and the Council of Representatives. Government formation after elections typically takes

3-9 months. Current Implementation Leadership: Primary: Ministry of Foreign Affairs Iraq

Secondary: National Security Advisor's Office PMF/Militia Track: Ministry of Defense; PMF Commission Economic Track: Ministry of Finance; Central Bank of Iraq

U.S. Forces Track: Iraqi Joint Operations Command Transition Triggers: IRQ-T1:

Parliamentary elections (every 4 years)

IRQ-T2: Government formation crisis (historically common, 3-9 month processes) IRQ-T3: Prime Ministerial resignation or parliamentary no-confidence IRQ-T4: Presidential election by parliament (produces extended coalition negotiation)

67 Continuity Protocol:

Iraq's most significant transition risk is the extended government formation period following elections. The following provisions apply: For IRQ-T1/T2 (Election/Government Formation): Framework implementation is

maintained at caretaker level by the outgoing government for up to 180 days pending new government formation. This extended caretaker period is Iraq-specific and reflects historical reality. The PMF Commission maintains its implementation

responsibilities independently of the political government change. Caretaker Authority in Iraq: The Iraqi caretaker government is authorized to:

Maintain all existing framework operational commitments (PMF audit, base perimeter protocol, monitoring cooperation)

Continue JIG participation at Deputy Minister level Process scheduled benefit disbursements already authorized

The caretaker government may NOT activate new PMF integration stages, new economic tranches, or new annex provisions without a formed government.

Maximum continuity without authorization: 45 days routine; 180 days under formal caretaker designation with governance body notification. Iraq-Specific Concern: Iran has significant influence over major Shia coalition

political parties that form Iraqi governments. IRGC-affiliated networks can

shape government formation outcomes. If a government hostile to the RCSA PMF integration provisions is formed, the framework relies on: (a) PMF Commission

institutional independence from political government; (b) Ministry of Defense institutional commitment independent of government coalition preferences; (c) economic benefits to PMF-controlled constituencies as a retention mechanism.

RP-IRQ Module B: Domestic Veto Player Mapping Player 1: Iran-Aligned PMF Factions (Critical Priority) Power Type: The most significant Iraqi veto player. PMF factions with direct

IRGC command links can: refuse PMF integration registration; conduct attacks within base perimeter zones; undermine PMF salary normalization; and influence government formation to produce a Prime Minister resistant to integration.

Trigger Issues: PMF integration deadline (18 months); dual-loyalty relocation 68 requirement; payroll deduction enforcement mechanism; base protection compact.

Mitigation: Defense sector pivot economic alternatives; graduated integration incentives (salary guarantees, provincial infrastructure, vocational training); payroll deduction enforcement creates direct financial cost for non-compliance;

IRGC-Iran-Iraq backchannel pressure where RCSA provides IRGC with a reason to nudge affiliated PMF groups toward compliance. Player 2: Shia Coalition Political Parties

Power Type: Control government formation and Prime Ministerial selection. Can produce a government that administratively obstructs PMF integration or

U.S. force presence provisions.

Trigger Issues: U.S. base protection compact seen as legitimizing permanent U.S. presence; PMF integration seen as threatening Shia political power base.

Mitigation: Force posture transition language explicitly provides for phased

U.S. drawdown; PMF integration is framed as Iraqi state-building (national security capacity) not U.S. pressure; economic benefits to Shia-majority provinces are front-loaded to build political stakeholder base.

Player 3: Kurdish Regional Government (KRG) (Moderate Priority) Power Type: KRG holds significant de facto autonomy and controls border regions relevant to Syria stabilization and ISIS counterterrorism coordination. KRG

can support or obstruct cross-border humanitarian and security operations.

Trigger Issues: KRG oil revenue sharing with federal government; Turkey-KRG border security tensions relevant to Syria Zone 3-4 provisions.

Mitigation: KRG receives explicit mention in Kurdistan Regional Governance Compact (Annex KK); framework's anti-ISIS coordination is a shared interest that creates natural alignment; KRG economic integration in regional trade

corridor provides positive-sum incentive. Player 4: Sunni Community Leaders (Moderate Priority) Power Type: Sunni political representation in parliament; tribal and social

leaders in Anbar, Nineweh, and Tikrit governorates. Can obstruct local governance implementation in framework-relevant areas. Trigger Issues: Perception that PMF integration perpetuates Shia militia

control in formerly contested (Sunni-majority) areas.

Mitigation: PMF relocation requirement (100km from traditional strongholds) directly addresses this concern; Sunni provincial authorities receive equal

access to reconstruction fund disbursements.

RP-IRQ Module C: Public Narrative Stabilization Lead Spokesperson: Iraqi Ministry of Foreign Affairs spokesperson Backup: Iraqi Permanent Representative to the UN; Prime Minister's Media Office

Iraq-Specific Framing: On PMF integration: "Iraq's security sector transformation reflects our commitment to a unified national defense architecture that serves all Iraqis. Integration

of security forces into unified national command is a constitutional requirement and an exercise of Iraqi sovereignty, not compliance with foreign pressure." On U.S. forces: "Iraq's security partnership with international forces reflects

our national security requirements as determined by the Iraqi government. The phased transition to Iraqi-led security reflects the growing capacity of Iraqi forces, not any external timeline."

On Iran-adjacent provisions: "Iraq maintains friendly relations with all its neighbors on the basis of mutual respect and non-interference. Our participation in the regional stability architecture serves Iraqi national interests and the

interests of all Iraqis regardless of sect or ethnicity." RP-IRQ Module D: Legislative Synchronization Iraq's Council of Representatives holds genuine authority but its operations are

frequently disrupted by political dysfunction. Primary synchronization: Government Formation Calendar: Framework planning must account for the possibility of 3-9 month government formation periods after elections. Key implementation

decisions that require Prime Ministerial authorization should be clustered in

the mid-term of government cycles when political authority is most consolidated. Budget Cycle: Iraqi fiscal year runs January-December. Iraq's budget has historically

been subject to severe delays (sometimes 2+ years without a budget). Framework-related financial commitments should be structured to use PMF Commission and Ministry of Defense operational authorities where possible to avoid dependency on annual

70 parliamentary budget approval.

Council of Representatives Session: Parliament typically holds sessions March-June and September-December. Major legislative actions supporting framework implementation (PMF legal framework amendments, base protection

compact enabling legislation) should be targeted for these windows. Federal Budget Synchronization Clause for PMF Militia Integration: The RCSA PMF Integration Pathway (Stages 1-4, described in the core document's

Iraq Stabilization and Militia Integration section) creates structured milestones for converting PMF units into Iraqi National Guard or reserve status. The foundational economic driver of PMF compliance with these stages is the shift from informal and foreign funding to formal Iraqi state payroll. This shift is contingent on Iraqi federal budget appropriations — which are the single most structurally vulnerable link in the entire PMF integration chain.

The following Federal Budget Synchronization Clause addresses this vulnerability with specificity: A. PMF Payroll Line Item as Non-Negotiable Budget Component

The framework's PMF integration pathway requires that, from the moment a PMF unit achieves Stage 1 (Registration) status, its personnel appear on the

Iraqi Ministry of Defense payroll. To ensure that parliamentary budget gridlock cannot

break this linkage, the following architecture applies: (i) At framework entry into force, Iraq commits to incorporating all registered PMF units' salary requirements into a dedicated "National Security Integration

Reserve" (NSIR) line item in the Ministry of Defense budget submission. (ii) The NSIR line item is classified under Iraqi budget law as an "ongoing obligatory expenditure" rather than a discretionary program. This classification

gives it the same protected status as civil service salaries and debt service — it is funded automatically even under a Continuing Resolution or a caretaker budget in the absence of a full parliamentary appropriation.

(iii) The Council of Representatives is notified of the NSIR's obligatory classification at the beginning of each annual budget cycle. The Ministry of Finance certifies to the governance body secretariat within 30 days of each

71 fiscal year start that the NSIR has been funded at levels sufficient to cover all registered PMF unit payrolls for the coming year. B. Transitional Funding Bridge — Architecture and Trigger The Transitional Funding Bridge (TFB) activates automatically if the Iraqi

federal budget is not passed by the constitutional deadline (December 31 of the preceding year) or if a budget that has passed does not include the NSIR line item at full required levels.

TFB Activation Trigger: Any of the following events triggers automatic TFB activation: — Iraqi parliament fails to pass a budget by January 31 of the applicable

fiscal year (allowing 31 days beyond the constitutional deadline before automatic activation); — A passed budget zeroes out or reduces the NSIR line item below 80% of

the prior year's registered PMF payroll total; — The Ministry of Finance fails to issue the NSIR funding certification to the governance body secretariat within 30 days of fiscal year start.

TFB Mechanics: (i) Upon TFB activation, the Central Bank of Iraq (CBI) is authorized by a standing Ministerial Directive (pre-signed at framework entry into

force by the Iraqi Prime Minister and deposited with the governance body secretariat) to advance operational funds from the CBI's Settlement Reserve Fund directly to the Ministry of Defense's PMF Integration Account.

(ii) The advance covers: (a) 90 days of payroll for all registered PMF units at current salary rates; (b) 30 days of operational costs for the PMF Commission audit and compliance monitoring function; and (c) any

pending base perimeter incident investigation costs. (iii) The advance is an interest-free bridge loan from the CBI to the Ministry of Defense, repayable within 180 days of a full budget passing.

If the budget passes before the 90-day bridge expires, the bridge amount is reduced to cover only the gap period. (iv) The CBI advance is NOT contingent on a new Prime Ministerial decision.

72 The standing Ministerial Directive provides the CBI with self-executing authority. This is the critical design feature: an unpaid militia cannot be told to wait for a political decision that may take months. TFB Limits and Safeguards: The TFB is not a permanent alternative to proper budget appropriation. The

following limits apply: — Maximum TFB duration: 90 days per activation event.

— Maximum TFB advances in a single fiscal year: 2 (i.e., up to 180 days total bridge coverage in a year of severe budget dysfunction). — TFB activation triggers an automatic Tier 2 compliance review of Iraq's

legislative synchronization obligations. If TFB activates in two consecutive years, the governance body convenes a special session to assess whether Iraq's budget dysfunction constitutes a structural implementation risk

requiring framework-level contingency redesign. — Each TFB advance is reported to the governance body secretariat within 48 hours and is published in the next quarterly Transparency Summary.

C. PMF Integration Milestone-Budget Alignment Calendar Phase 1 Integration Milestones (Stages 1-2, months 1-18) must be mapped to the Iraqi budget cycle as follows:

Stage 1 Registration deadline (Month 18): Timed to fall no later than October 31 of the applicable year, ensuring that registration data (unit counts and salary requirements) can be incorporated into the

Ministry of Defense budget submission for the following fiscal year by the November-December submission deadline. Stage 2 Audit completion (Month 24): Timed to coincide with Q1 of the

fiscal year, ensuring audit results are available to inform the Council of Representatives' spring session budget review. If an election or government formation crisis causes either milestone to slip

past its mapped budget window, the TFB pre-funds the affected payroll obligations for the slip period while the political calendar resolves.

73 PARTNER PROFILE RP-ISR: STATE OF ISRAEL

Track-Specific Provisions Note: Israel is not a formal RCSA party. These provisions apply exclusively to the tracks where Israeli cooperation or non-opposition is

structurally required: Gaza humanitarian access and reconstruction, maritime security (Kerem Shalom crossing, Red Sea corridor), normalization architecture, and the Israel-Iran Direct Deconfliction Layer (Section 58-60 of core document).

RP-ISR Module A: Leadership Transition Protocol Constitutional Authority: Israel operates as a parliamentary democracy with a Prime Minister holding executive authority dependent on coalition confidence. Israel's

proportional representation system produces fragile, multi-party coalitions. Israel has experienced multiple elections and government collapses within single parliamentary terms. The Knesset holds legislative authority. The Cabinet makes foreign and security

policy decisions collectively. Current Implementation Engagement Points: Primary: Office of the Prime Minister (PMO) — Foreign Policy Advisor

Secondary: Ministry of Foreign Affairs Gaza/Security Track: Israel Defense Forces (IDF) Military Coordination and Liaison Administration (COGAT) for Gaza crossing operations

Maritime Track: Israel Navy / COGAT maritime division Deconfliction Track: IDF Military Intelligence (AMAN); Mossad (strategic level) Normalization Track: Ministry of Foreign Affairs; National Security Council

Transition Triggers: ISR-T1: Knesset no-confidence vote producing government collapse ISR-T2: Scheduled or snap elections

ISR-T3: Coalition breakdown causing PM resignation or caretaker government
ISR-T4: PM legal incapacitation (criminal conviction, health crisis) Continuity Protocol:

74 Israel's highest-frequency risk is coalition collapse and government change.

Israeli governments have changed multiple times in recent years. The following applies: For ISR-T2/T3 (Election/Coalition collapse): Framework-linked Israeli operational

commitments (Kerem Shalom crossing operations, deconfliction hotline maintenance) continue under caretaker government authority. Israel's caretaker governments retain full operational authority for ongoing security and humanitarian operations.

A 45-day grace period applies for any new political-level commitment. COGAT Continuity: COGAT is a military body, not a political one. Its operational continuity across government changes is high. COGAT's Kerem Shalom crossing

operations and maritime coordination functions are institutionally stable regardless of government composition. Deconfliction Hotline Continuity: The Israel-Iran deconfliction channels

(airspace, maritime, cyber) operate through military-to-military and intelligence-to-intelligence links that are institutionally continuous across political changes.

Maximum continuity of operational commitments without political authorization: 90 days under caretaker authority for existing operational commitments. New political-level engagements (normalization steps, new deconfliction domains)

require a formed government. RP-ISR Module B: Domestic Veto Player

Mapping Player 1: Coalition Far-Right Partners (Critical Priority)

Power Type: Israeli governing coalitions have increasingly included far-right parties that hold ministerial authority (Finance, National Security, Housing). These ministers can: block or restrict humanitarian goods at Kerem Shalom; issue statements undermining normalization framing; authorize settlement activity creating diplomatic crises during sensitive phases; challenge deconfliction framing in public.

Trigger Issues: Any humanitarian provision benefiting Gaza civilian population without explicit conditioning on Hamas; normalization language implying Palestinian political horizon; Iran deconfliction framing appearing to limit

75 Israeli freedom of action.

Mitigation: Framework provisions that require Israeli cooperation are framed exclusively as Israeli-interest measures (security, maritime, intelligence); humanitarian provisions are framed as verification measures, not concessions;

far-right ministers are not engaged through framework channels (only PMO and IDF/MFA are framework contact points); COGAT operational independence from political ministerial authority is preserved where possible.

Player 2: Military and Intelligence Establishment Power Type: The IDF and Mossad have significant independent policy influence. They can resist operational commitments perceived as compromising military

freedom of action (particularly strike freedom in Syria, Iran shadow conflict provisions). Their assessments shape PM decision-making. Trigger Issues: Shadow Conflict Ceiling provisions (Section 62 of core document);

Iran nuclear monitoring provisions that could be characterized as constraining pre-emptive strike options; third-party strike buffer rule. Mitigation: Third-Party Strike Buffer Reduction (Edit 13 of core document)

explicitly preserves active counter-battery rights; Article 51 override preserves inherent self-defense; shadow conflict ceiling is framed as a notification requirement, not a prohibition; Israel is not a framework party

and cannot be penalized for military actions outside its framework-adjacent operational commitments. Player 3: Knesset Opposition and Public Opinion

Power Type: Israeli public opinion is highly sensitive to security perceptions. Any narrative that framework provisions are constraining Israeli security options against Iran creates opposition pressure on the governing coalition.

Trigger Issues: IAEA monitoring provisions that appear to slow Israeli pre-emptive option; normalization with Saudi Arabia requiring visible Palestinian development commitment.

Mitigation: Framework does not constrain Israeli security options (Israel is not a party); deconfliction provisions are framed as Israeli-interest intelligence access, not limitation; normalization architecture explicitly

76 preserves Israeli-Jordanian-Egyptian peace structures as the model.

Player 4: Palestinian Political Actors (Track-Specific) Power Type: Palestinian Authority and Gaza de facto administration can obstruct humanitarian corridor operations from the Palestinian side, creating Israeli

political pressure when crossing closures are attributed to Palestinian rather than Israeli action. Mitigation: Humanitarian corridor provisions specifically address Palestinian-

side corridor management through UN OCHA intermediation; joint crossing

management protocols are designed to distribute operational control to reduce any single actor's blocking capacity.

RP-ISR Module C: Public Narrative Stabilization Note: Israel is not a formal framework party and is not bound by the RCSA's Public Narrative Stabilization module. The following guidance applies only to how framework

parties and guarantors should frame Israel-adjacent provisions when communicating publicly. Framing for Framework Parties:

On Israeli Gaza crossing cooperation: "[Framework parties/guarantors] acknowledge the operational role of Israeli border authorities in facilitating humanitarian access and express appreciation for the cooperation extended. All crossing operations

are subject to international monitoring." On Israel-Iran deconfliction: Framework parties avoid characterizing the deconfliction architecture as a "deal with Israel" or as limiting Iranian

freedom of action. The architecture is framed as "mutual risk reduction through established operational protocols." On normalization architecture: Framework parties acknowledge "existing normalized

relationships (Abraham Accords) as a foundation" without implying Israeli concessions on Palestinian issues. Israeli Domestic Framing Guidance (for Israeli government reference only,

not framework obligation): On Gaza crossings: "Israel operates all crossing facilities based on security assessment and in coordination with international humanitarian bodies.

77 Our policy is to enable civilian humanitarian access while preventing

dual-use material from reaching terrorist organizations." On Iran

deconfliction: "Israel maintains independent freedom of action to defend its citizens and interests. Communication channels through third parties

are operational safety mechanisms, not political agreements." On normalization architecture: "Israel's path to peace with its neighbors is through direct negotiation and demonstrated security. Abraham Accords

partners are engaged based on mutual interest and sovereign decision-making." RP-ISR Module C-Supplement: PMO Engagement Protocol During Israeli Election Quiet Period

Because Israel is not a formal framework party, the standard Election Quiet Period provision (PDM-4, core document) does not apply automatically. Nevertheless, the 30-day window before and after an Israeli election is the period of maximum domestic

political vulnerability for framework-adjacent Israeli cooperation. The following PMO Engagement Protocol governs how the United States and neutral guarantors maintain continuity through that window without generating Israeli domestic political

cost. A. 30-Day Pre-Election Quiet Window: Definition and Activation The 30-day pre-election quiet window activates automatically upon official Israeli election announcement (Knesset dissolution vote or scheduled election date confirmation). Activation requires no governance body vote; it is a standing protocol that takes effect by operation of this provision.

During the pre-election quiet window: (i) No new framework-adjacent milestones involving Israeli cooperation are publicly announced. Operational work continues, but governance body Transparency

Summaries are written to describe Israeli-adjacent operational activity in institutional rather than political terms (e.g., "COGAT crossing operations

continue at standard throughput" rather than "Israeli government cooperation with the humanitarian track"). (ii) U.S. engagement with the PMO is conducted exclusively through the PMO Foreign Policy Advisor's Office, not through politically exposed ministers.

78 The PMO Foreign Policy Advisor is a career-level appointment with continuity

across governments; engagement through this channel avoids the optics of the U.S. government being perceived as influencing the election by engaging campaign-vulnerable political figures.

(iii) Oman, as operational guarantor, serves as the primary active relay for any framework-adjacent communication that would otherwise require PMO political-level authorization. The Omani channel provides deniability for

both parties: the Israeli government need not publicly acknowledge coordination, and the U.S. need not be seen pressing a caretaker or campaign-mode government. (iv) Switzerland, as institutional continuity guarantor, maintains any

documentation or legal instrument review that requires a third-party institutional signature during the quiet window, ensuring that legal processes do not stall waiting for Israeli political authorization.

B. Election Day Through Day 14 Post-Election: Caretaker Engagement Rules
Israeli elections produce an outgoing caretaker government (typically the same government that called the election, continuing in a caretaker capacity).
The

caretaker government retains full operational authority for existing commitments. The following rules apply to U.S. and guarantor engagement during this period: (i) The U.S. does not seek new political-level commitments

from the caretaker

government. Existing operational cooperation (COGAT crossings, deconfliction hotlines, maritime channels) continues without any new authorization requirement. (ii) If a significant framework-adjacent event occurs during this period

(a mass casualty event, a major humanitarian corridor disruption, or a deconfliction threshold breach), the Oman relay channel is the primary communication pathway. Oman notifies the PMO Foreign Policy Advisor within

4 hours; the Advisor notifies the relevant caretaker minister within 24 hours. The governance body is notified simultaneously. (iii) Pakistan, as regional security guarantor, provides any required

Islamic-world credibility framing if a regional partner is pressing Israel on framework-adjacent matters during the election period. This prevents regional partners from perceiving the election window as an opportunity to

79 extract concessions from a politically weakened Israeli caretaker government.

C. Day 15-30 Post-Election: Coalition Formation Engagement Rules Israeli coalition formation typically takes 28-45 days from election results. During this period, the governance body and guarantors must ensure that no

framework-adjacent Israeli cooperation is held hostage to coalition negotiations: (i) The U.S. State Department Policy Planning Staff prepares a one-page "Framework Adjacency Brief" for each prospective coalition partner that is

likely to hold relevant ministerial authority (Finance, Defense, National Security). The Brief is provided to the PMO Foreign Policy Advisor for internal

coalition briefing use, not for public release.

(ii) The Brief frames framework-adjacent Israeli cooperation exclusively in Israeli-interest terms: maritime security, Gaza stability reducing refugee pressure, Iran deconfliction reducing surprise-attack risk, and

normalization architecture expanding regional trading partners. The Brief contains no language that could be characterized as requesting Israeli political concessions.

(iii) COGAT and IDF military-to-military channels are explicitly shielded from coalition negotiation pressure. Their operational continuity commitments do not require incoming ministerial re-authorization. The PMO Foreign Policy

Advisor certifies this shield in writing to the governance body secretariat within 72 hours of election results. D. New Government Onboarding (Day 30 Post-Election Through Day 60):

Once a new Israeli government is formed: (i) The U.S. Secretary of State (or designated Deputy) contacts the incoming Israeli Foreign Minister within 5 business days of government formation,

not to request new commitments, but to confirm existing operational continuity and schedule a framework adjacency review within 30 days. (ii) The framework adjacency review is a private briefing (not a public

event) covering: the status of framework-adjacent Israeli operational cooperation; upcoming milestones where Israeli decisions could affect framework progress; and Israeli interests being served by current cooperation.

80 (iii) If the new Israeli government signals reluctance to continue any

specific cooperation track, the neutral guarantors are notified immediately. Oman convenes a 14-day mediation window before any public

characterization of Israeli non-cooperation. The 14-day window allows private accommodation

of new government sensitivities without public confrontation. (iv) The governance body does not publicly characterize Israeli cooperation status during the onboarding period. The Transparency Summary for the

relevant cycle notes "transition period review underway" rather than any compliance characterization. RP-ISR Module D: Legislative Synchronization

Knesset Role: The Knesset ratifies major international treaties and can pass legislation affecting government operational capacity. For framework-adjacent provisions, the following applies:

Gaza Crossing Operations: These are administered through COGAT under military- administrative authority. No Knesset legislation is required for operational cooperation with framework corridor provisions.

Normalization Actions: New normalization steps require either Cabinet decision or, for peace treaties, Knesset ratification (simple majority). Cabinet decisions are achievable without Knesset majority but are vulnerable to coalition collapse.

Knesset Calendar: The Knesset holds winter session (October-March) and summer session (May-July) with spring and summer recesses. Major normalization advances should be timed to avoid pre-election periods when the political cost of any

perceived concession is magnified. Election Timing: Israeli elections can occur at any time due to the no-confidence mechanism. The governance body's Election Quiet Period provision applies to

all parties with formal framework standing; for Israel-adjacent provisions, an informal 30-day quiet period is recommended before and after Israeli

elections to avoid framework developments becoming campaign issues.

PART III: CROSS-PARTNER SYNCHRONIZATION ARCHITECTURE

81 CS-1: JIG Timing Conflict Early Warning System

The governance body secretariat maintains a rolling 12-month forward calendar of all known election, transition, and legislative deadline events across all core and regional partner states. The calendar is updated monthly and shared with all framework parties

and guarantors. Color coding: Red: Event within 30 days with potential to disrupt implementation cycle Amber: Event within 60 days requiring preparation

Yellow: Event within 90 days for advance awareness Green: Event beyond 90 days for planning purposes When two or more partner states have simultaneous Red events, the secretariat convenes

a special coordination session to assess cumulative risk and adjust implementation timing where possible. CS-2: Simultaneous Election Collision Protocol

If two or more framework partners simultaneously experience elections or government transitions within the same 60-day window: A. The governance body convenes a special session within 14 days of the first

election to assess combined transition risk. B. The neutral chair is authorized to activate a system-wide 30-day Stabilization Hold on new obligation activations (not existing obligations) with governance

body notification. C. All three guarantors issue a joint statement confirming framework operational continuity to reduce market and political uncertainty.

D. Benefit tranche timing is adjusted to avoid the election collision window

where possible without creating payment defaults. CS-3: Regional Veto Cascade Prevention

A veto cascade occurs when one partner state's domestic political blockage creates pressure on other partner states to also block implementation (through GCC consensus dynamics, Arab League political spillover, or bilateral political linkage). The

following provisions prevent cascade:

82 A. Modular Independence Principle: The framework explicitly states that any

partner state's domestic political constraint affects only that state's specific track participation. It does not trigger automatic adjustment by other partners.

B. Cascade Early Warning: The secretariat monitors cross-partner political linkage and notifies the governance body within 48 hours if cascade risk is assessed.

C. Guarantor Stability Statement: If cascade risk is identified, the guarantors issue a targeted factual statement clarifying that framework operations in unaffected tracks continue normally.

CS-4: Synchronized Narrative Management Framework When multiple partner states are simultaneously managing domestic political sensitivity around framework provisions, coordinated narrative management is required:

A. Weekly Narrative Coordination Brief: The secretariat circulates a confidential brief identifying active domestic political challenges in each partner state and the approved narrative framing each partner is using.

B. Consistency Check: The secretariat flags any narrative inconsistency

between partners (e.g., one partner describing a provision as "temporary" while another describes it as "permanent") and works with designated spokespersons to align

framing. C. Joint Statement Coordination: When a major regional event (proxy incident, mass casualty event, major humanitarian milestone) requires simultaneous

partner statements, the secretariat circulates a template that partners can adapt while maintaining core consistency on key facts.

PART IV: ANNEXES TO THIS MODULE PACKAGE

ANNEX PDM-A: IMPLEMENTATION OFFICER REGISTRY TEMPLATE [To be maintained by Governance Body Secretariat — Live Document]

83 The following template is completed for each core party and updated within 72 hours

of any designation change: Party: _____ Date of Last Update: _____

Officer A (Senior Negotiator): Name: _____ Institution: _____

Title: _____ Authorization Level: _____ Emergency Contact: _____
[SECURE CHANNEL ONLY]

Maximum Continuity Authority (days): _____ Expiration of Current Designation: _____ Alternate A: _____

[same fields as above] [Repeat for Officers B, C, D, E and their Alternates]

Institutional Authorization Chain:

Step 1: _____ Step 2: _____ Step 3: _____

Last Verified: _____ Verified by: _____ (Governance Body

Secretariat) Shared with Guarantors: Yes / No / Pending

ANNEX PDM-B: APPROVED VOCABULARY MASTER LIST [Cross-Reference with PDM-3.2] The complete vocabulary register is maintained as a living document by the governance

body secretariat. Current version includes the categories listed in PDM-3.2 and the following additional entries: CATEGORY: REGIONAL PARTNER ENGAGEMENT

Approved: "track-specific participation," "multi-party stability architecture engagement," "voluntary cooperation within defined scope," "contribution to regional public goods"

84 Avoid: "proxy," "client state," "satellite," "dependent partner," "compelled participant"

CATEGORY: RECONSTRUCTION FINANCING Approved: "compliance-linked reconstruction disbursement," "verified stabilization investment," "performance-based development financing," "international standard

project finance" Avoid: "reparations," "payment for cooperation," "bought stability," "reconstruction as conditionality"

CATEGORY: DETAINEE AND HOSTAGE EXCHANGES Approved: "humanitarian case resolution," "ICRC-facilitated transfer," "welfare-driven priority case processing," "rolling exchange window completion"

Avoid: "prisoner swap," "hostage deal," "ransom payment," "bought release"

CATEGORY: MONITORING AND VERIFICATION Approved: "standard safeguards," "routine compliance parity," "technical

verification," "normal NPT-standard review," "mutual transparency protocol"

Avoid: "inspection," "surveillance," "intrusive monitoring," "extraordinary

access," "exceptional measures"

[Additional categories to be added as implementation proceeds] ANNEX PDM-C: LEGISLATIVE CALENDAR SYNCHRONIZATION MATRIX [Cross-Reference with PDM-4 and Regional Partner Module D sections]

The following matrix is updated quarterly and maintained by the governance body secretariat. It maps all known legislative, budget, and election calendars against the framework's 30-day review cycles and phased implementation windows.

Country/Institution Event Type (election / budget / legislative session / sunset / other) Approximate Date Implementation Impact (None / Low / Medium / High) Required Preparation Lead Time Responsible Officer (designation) Status (upcoming / active / resolved)

[Matrix contents maintained as live document — not reproduced here as static text]

ANNEX PDM-D: PARTNER VETO PLAYER QUICK REFERENCE

85 [Cross-Reference with PDM-2 and Regional Partner Module B sections]

Quick Reference Table — Top-Priority Veto Players by Country: Country ; Actor ; Power Type ; Trigger Issue ; Primary Mitigation

; -----; -----; -----;

USA ; Congress (NDAA/IFCA) ; Legislative/Block ; Sanctions relief scope ; Pre-clearance; bipartisan quorum engineering USA ; IC Establishment ; Assessment/Narrative ; Attribution findings ; IC alignment framework; concurrent data access Iran ; IRGC ; Operational/Proxy ; Proxy freeze; economic threat ; Defense sector pivot mandates; Hormuz revenue share Iran ; Guardian Council ; Constitutional/Block ; Banking/normalization

provisions ; Islamic finance structuring; sovereignty framing Saudi Arabia ; Religious Establishment ; Legitimation ; Iran cooperation perception ; Islamic scholars consultation; sulh framing

UAE ; Dubai Commercial ; Economic/Lobby ; Trade disruption ; Positioning UAE as reconstruction hub Qatar ; Al Jazeera ; Media/Narrative ; Coverage framing ; Regular factual briefings; Neutral Info Hub access Kuwait ; National Assembly ; Legislative/Budget ; Economic cost; normalization optics ; Front-loaded economic benefits; committee briefings Egypt ; Military (SCAF) ; Operational/Institutional ; Sinai security; Rafah control ; Co-governance role; Sinai development investment Jordan ; Palestinian-Jordanian Pop. ; Demographic/Political ; Displacement fears ; Explicit displacement protection in core framework

Iraq ; Iran-PMF Factions ; Operational/Proxy ; PMF integration; base attacks ; Financial enforcement; defense sector pivot

Israel ; Far-Right Coalition ; Ministerial/Block ; Gaza crossing restrictions ; COGAT institutional independence; PMO-only channel ANNEX PDM-E: CRISIS MESSAGING DECISION TREE

[Cross-Reference with PDM-3.5] Decision Point 1: Has a trigger event occurred?
No → Standard operations. No special messaging required.

Yes → Proceed to Decision Point 2. Decision Point 2: Is the event ongoing or concluded?

86 Ongoing → Activate Hour 0-2 protocol (no statement until Hour 4 minimum).

Concluded → Proceed to Decision Point 3. Decision Point 3: What type of event?
Mass casualty / proxy attack → Template B (proxy incident with pre-authorized response)

Nuclear monitoring gap → Template E (verification gap or monitoring disruption) Leadership transition → Template C (leadership transition continuity statement) Crisis Lock trigger → Template D (Crisis Lock activation)

Other major disruption → Template A with event-specific adaptation Decision Point 4: Is attribution established? Established → Include attribution facts in statement with Template framing.

Pending → Statement confirms process underway; no attribution claims. Disputed → Statement notes "attribution assessment ongoing through established channels." Decision Point 5: Has Quiet Implementation Mode been activated?

Yes → Spokesperson responds to media queries with Quiet Mode framing; no proactive release. No → Proceed with appropriate Template at Hour 6-12. Decision Point 6: Is a regional partner narrative consistency issue present?

Yes → Secretariat coordinates cross-partner alignment before any Template release. No → Proceed with unilateral release using approved vocabulary.

DOCUMENT COMPLETION CONFIRMATION — VERSION 1.1

This document contains:

4 Core Party Political and Domestic Stability Modules (PDM-1 through PDM-4) 8 Regional Partner Domestic Stability Profiles (RP-SA, RP-UAE, RP-QAT, RP-KUW, RP-EGY, RP-JOR, RP-IRQ, RP-ISR)

4 Cross-Partner Synchronization Architecture sections (CS-1 through CS-4) 5 Annexes (PDM-A through PDM-E)

v1.1 Refinements incorporated:

RP-ISR: New Module C-Supplement — PMO Quiet Period Engagement Protocol

87 (pre-election window, caretaker rules, coalition formation engagement, Oman/Switzerland relay architecture)

RP-QAT: Doha Political Coordination Office fully fleshed out with mandate, joint staffing architecture (UN/ICRC/Oman co-location), three-source funding model, and transition protocol if DPCO capacity diminishes

RP-EGY: Suez–IHTA Economic Feedback Loop added to Player 3 mitigation, including IHTA-Suez Volume Report mechanism, attribution designation, Suez Revenue Supplement Floor, and Hydrocarbon Transit Dividend

RP-IRQ: Federal Budget Synchronization Clause and Transitional Funding Bridge

added to Module D, including NSIR obligatory line item, CBI standing advance authority, TFB activation triggers, 90-day bridge mechanics, and PMF milestone-budget alignment calendar

RP-SA: PIF Institutional Binding and RCSA Escrow Directive added to Module A,

covering Directive establishment, PIF governance integration, MoF parallel anchoring, and succession event disbursement continuity

RP-UAE: Inter-Emirate Alignment Protocol added to Module B, covering dual sign-off requirement, IHTA revenue sharing incentive for Dubai compliance, Abu Dhabi–Dubai alignment review, and Federal Override Authority

RP-JOR: Economic Attribution Clause and Anti-Normalization Narrative Shielding

added to Module C, covering the core attribution rule, pre-cleared state media vocabulary register, sensitive coincidence decoupling protocol, and the mandatory four-question street-proof test

Approximately 26,500 words of operative content across all sections All sections are fully developed with operative language No truncation detected

Prepared for integration into RCSA v1.5 and successor versions.

All provisions are subordinate to the conflict resolution hierarchy, enforcement ladder, and institutional binding architecture in RCSA v1.5 core document. Document Control: This supplement should be registered in the governance body secretariat's document registry as "RCSA Supplementary Module Package — Political

and Domestic Stability Modules v1.1" and cross-referenced in the Annex Activation

88 Matrix (Table 9 of core document). Module package status: Mandatory (PDM-1 through

PDM-4 for core parties); Highly Recommended (Regional Partner Profiles RP-SA through RP-ISR for regional track participation). Revision cycle: Annual or upon major structural change to core RCSA document. v1.1 supersedes v1.0 in full.

END OF DOCUMENT RCSA Supplementary Module Package — Political and Domestic Stability Modules v1.1

Annex DV: Domestic Veto Map

This annex provides a country-by-country mapping of parliaments, ministries, militaries, monarchic bodies, courts, and sub-state actors that possess hard veto, soft veto, or influence capacity over RCSA implementation, enabling

framework planners to anticipate resistance, sequence actions, and design redundancy.

This annex provides a country-by-country domestic veto map identifying the parliaments, ministries, militaries, monarchic bodies, courts, and sub-state actors that can block or significantly delay RCSA implementation in each participant state. The map does not predict vetoes; it identifies institutional veto points so that framework planners can anticipate domestic resistance, design appropriate sequencing, and pre-clear communications with actors who have blocking capacity.

The map uses a three-tier classification for each actor: Hard Veto (constitutional or legal authority to block ratification, appropriation, or implementation without override); Soft Veto (political capacity to delay, complicate, or erode implementation through parliamentary maneuver, media campaigns, or institutional non-cooperation); and Influence (no formal blocking power but significant capacity to shape public opinion, mobilize opposition, or condition political survival of decision-makers).

89 Annex DV: Domestic Veto Map

Table DP-1: Table DP-1: Domestic Veto Map — Core and Regional Participants

State	Hard Veto	Soft Veto	Actors	Influence	Actors	Key Vulnerability	Actors
United States	Senate (treaty ratification), House of Representatives (appropriations, oversight groups, media, state (November), sanctions relief hearings)	governors (appropriation cycles legislation) (September), presidential transitions (January)	Think tanks, lobbying				
Iran	Supreme Leader, Clerical establishment	Majlis (budget, strategic legislation), Guardian bazaar merchants					

election direction) Council (legality review), provincial authorities transitions (June-July) IRGC (security policy input)

Veto-Point Sequencing

Framework implementation planners use the veto map to sequence actions through the path of least resistance. Example: In the United States, sanctions relief tranches that do not require new legislation

91 Annex LC: Leadership-Transition Continuity Protocols

(Treasury licensing, OFAC guidance) are sequenced before tranches requiring congressional appropriation. In Iran, commitments that can be executed by the Supreme National Security Council are sequenced before commitments requiring Majlis legislation.

The SESS Rapid Mediation Unit provides pre-implementation briefings to domestic actors with soft-veto or influence capacity in each participant state. These briefings are not lobbying; they are transparency presentations explaining the framework's provisions, benefits, and safeguards. Briefings are offered to: parliamentary committee staff; ministry planning departments; military strategic planning offices; and civil society organizations with demonstrated technical expertise. The governance body secretariat maintains a live Domestic Vulnerability Calendar that tracks: election dates; appropriation deadlines; constitutional review periods; religious holidays that may affect decision-making; and known leadership health or transition risks. The calendar informs governance body meeting scheduling and decision

timing.

Mitigation and Redundancy

For each hard-veto actor, the framework designs a mitigation pathway: US Senate ratification requirement is bypassed where possible through executive agreements and Treasury licensing (political commitments, not treaties, requiring no Senate approval). Iranian Supreme Leader strategic direction is addressed through institutional binding that distributes authority across multiple institutions. Saudi royal authority is leveraged rather than bypassed—the King issues framework-linked decrees that embed commitments in domestic law. For soft-veto and influence actors, the framework employs redundancy: multiple communications channels (official, media, civil society) to ensure that blocking actors cannot control the narrative; multiple implementation pathways so that if one ministry delays, another can advance; and multiple benefit delivery points so that public constituencies experience tangible gains regardless of political obstruction in one sector.

Annex LC: Leadership-Transition Continuity Protocols

This annex extends hardened continuity protocols to every core and regional participant, establishing standardized succession, incapacity, and election survival procedures with primary and secondary continuity institutions, minimum implementation teams, and crisis continuity modes.

Universal Continuity Architecture

The hardened institutional binding provisions in the Framework Philosophy section are extended by this annex to every core and regional participant, ensuring that each state has a standardized succession, incapacity, or election survival procedure for framework commitments. The objective is to eliminate the

92 Annex LC: Leadership-Transition Continuity Protocols

single-point-of-failure risk that occurs when framework implementation depends on one individual or one institution. Each participant state files a Continuity Designation Statement with the governance body secretariat within 60 days of framework entry into force. The statement identifies: Primary Continuity Institution (the institution that assumes framework authority if the head of state/government is incapacitated); Secondary Continuity Institution (backup if the primary is also incapacitated); Minimum Implementation Team (3-5 named officials who maintain framework knowledge regardless of political transition); and Emergency Communication Protocol (how the framework secretariat reaches continuity institutions during a domestic crisis).

Table DP-2: Table DP-2: Continuity Institution Requirements by Participant Category

Category	Primary	Secondary	Minimum Team	Communication	Continuity Protocol
Core parties	(US, Vice President Secretary of 5 officers across Secure diplomatic Iran) / First Vice State / Foreign State/Treasury/Defense + 3 channel + guarantor President Minister across Foreign relay + SESS direct Ministry/Central Bank/SNSC line				
Monarchies	Crown Prince Council of 3 royal court officials + 2 Royal court direct line (Saudi, UAE, / Deputy Ruler Ministers / ministry officials + guarantor relay + Qatar, Oman, Royal Court SESS Jordan)				
Parliamentary republics	Prime Deputy PM / 3 cabinet officials + 2 Parliamentary liaison (Iraq, Minister / Deputy Speaker parliamentary staff + guarantor relay + Lebanon, Yemen- Speaker of SESS IRG) Parliament				

Transitional De facto Council / 3 operational officials + 2 UN channel + authorities (Syria, deputy / revolutionary political officers guarantor relay + Yemen-Houthi) designated committee SESS successor deputy

Regional partners Vice President Foreign Minister 3 ministry officials + 2 military Diplomatic channel + (Egypt, Turkey, / Deputy / Defense liaison guarantor relay + Pakistan) Prime Minister SESS Minister

Guarantors Federal Foreign 2 federal officials + 2 cantonal Federal direct line + (Switzerland) Council Vice Ministry State liaisons SESS President Secretary

93 Annex LC: Leadership-Transition Continuity Protocols

Three scenarios are addressed: Death or Incapacity of Head of State/Government; Electoral Transition with Change of Party Control; and Domestic Crisis (coup, revolution, civil war, foreign intervention). Each scenario triggers a different continuity pathway. Death or Incapacity: The Primary Continuity Institution assumes framework authority within 24 hours. The governance body secretariat verifies the assumption of authority through the pre-registered communication protocol. If the Primary Institution cannot assume authority, the Secondary Institution is activated. Framework obligations continue without interruption. Benefits continue at current levels. No renegotiation is required. Electoral Transition: The Minimum Implementation Team maintains operational continuity during the transition period (defined as election day through inauguration, or dissolution of parliament through formation of new government). The outgoing administration is required to brief the incoming administration on framework commitments within 14 days of election certification. The SESS Rapid Mediation Unit offers technical assistance to incoming administrations for framework familiarization. Domestic Crisis: If a participant state enters domestic crisis (UN-recognized armed conflict, coup, or foreign military

intervention), the framework enters 'Crisis Continuity Mode' for that state. In this mode: framework obligations are suspended for the duration of the crisis (not voided); benefits to the state are frozen (not confiscated); the guarantors assume temporary administrative oversight of the state's framework interests; and the SESS maintains liaison with whichever authority controls the state's territory. Crisis Continuity Mode does not apply to humanitarian obligations, which continue under UN management regardless of political conditions.

Incapacity and Absence Definitions

'Incapacity' is defined as: medical certification by attending physicians that the head of state/government cannot perform duties for more than 14 days; constitutional declaration of incapacity by competent domestic authority; or disappearance or unverified absence exceeding 21 days. 'Electoral transition' is defined as: from 30 days before a scheduled national election through 30 days after inauguration or government formation. 'Domestic crisis' is defined as: UN Security Council recognition of armed conflict; domestic military seizure of government facilities; or foreign military occupation of more than 25% of national territory.

94 Annex PO: Public-Opinion Stabilization Dashboard

Table DP-3: Table DP-3: Scenario Triggers and Framework Response

Scenario Trigger Framework Response Benefit Status Duration

Death/incapacity Medical certification or Primary continuity Continue at Until new permanent constitutional institution assumes current levels authority confirmed declaration authority

Electoral 30 days before election Minimum Continue at Transition period + 30 transition through 30 days after implementation team current levels days inauguration maintains continuity

Domestic crisis UN recognition or Crisis Continuity Mode Frozen (not Until UN recognizes territorial occupation activated confiscated) restoration of stable threshold government

Annex PO: Public-Opinion Stabilization Dashboard

This annex establishes a structured monitoring and response system tracking polling, protest, media sentiment, and clerical/party signaling streams with defined green/yellow/red thresholds and pre-cleared communications responses designed to detect legitimacy erosion before it forces unilateral framework exit.

Dashboard Architecture

The Public-Opinion Stabilization Dashboard is a structured monitoring and response system tied to the RCSA narrative module. It tracks four indicator streams—polling, protest activity, media sentiment, and clerical or party signaling—and triggers pre-cleared communications responses when thresholds are crossed. The objective is to detect legitimacy erosion early and respond with pre-approved messaging before public backlash forces unilateral framework exit.

95 Annex PO: Public-Opinion Stabilization Dashboard

Table DP-4: Table DP-4: Dashboard Indicator Streams and Thresholds

Stream	Measurement	Green	Yellow	Red	Threshold	Pre-Cleared	Source
Threshold	Threshold	Response					

Polling	Independent	>45% support	or 30-45% support	40% messaging			
	(approved opposition	opposition campaign	+ roster)	ambassador media tour			

Protest	UN human	No significant	1,000 Pre-cleared rights	protests participants			
	in participants or government	monitoring + single event	or >5 days statement				

+ domestic NGOs sustained social sustained independent expert media campaign briefing + SESS facilitator outreach

Media Media >50% 30-50% negative >50% negative Pre-cleared fact- sentiment monitoring neutral/positive coverage or coverage or check deployment consortium coverage significant coordinated + independent (neutral misinformation disinformation media briefing + academic spike social media institution) response team

Clerical/party Framework No negative Criticism from Condemnation Pre-cleared signaling party signaling from secondary from primary religious/party monitoring + major clerical/party clerical/party leader engagement guarantor clerical/party figures authorities + independent observation authorities faith/community expert panel

Dashboard thresholds are assessed weekly by the SESS Rapid Mediation Unit in consultation with the governance body secretariat. When a Yellow threshold is crossed in any stream, the pre-cleared response for that stream activates automatically within 48 hours. The response is implemented by the affected party's designated communications team, not by the framework secretariat. The framework provides messaging templates, expert briefings, and independent validator contacts; it does not dictate domestic communications. When a Red threshold is crossed in two or more streams simultaneously, a 'Legitimacy Crisis Response' activates. This includes: emergency governance body session within 72 hours; SESS deployment of senior facilitator to affected party capital; accelerated benefit delivery in visible, attributable form (e.g., humanitarian corridor surge, banking channel expansion, infrastructure project groundbreaking); and

96 Annex CS: Civil-Society Consultative Lane

independent third-party validation of framework benefits (e.g., World Bank

report on economic impact, WHO report on medical delivery).

Table DP-5: Table DP-5: Legitimacy Crisis Response Timeline

Hour Action Responsible Actor Output

0-24 Dashboard Red alert confirmed + SESS Rapid Mediation Unit Alert memorandum to all governance body emergency parties and guarantors notification

24-48 Pre-cleared messaging campaign Affected party Media coverage + social media launch + ambassador media tour communications team metrics

48-72 Emergency governance body session Neutral chair + governance Session minutes + compromise (virtual if necessary) body secretariat proposals if needed

72-96 Accelerated visible benefit delivery Economic Cooperation Sub-Photographic/video (corridor surge, channel expansion, Committee + affected party documentation + press event project launch)

96- Independent third-party validation World Bank / WHO / UN Published report + media 168 report deployment OCHA (rotating) briefing

Polling and Survey Standards

All polling used for the dashboard must be conducted by firms from an approved roster. Roster firms are selected by the governance body secretariat based on: demonstrated methodological rigor; political neutrality (no party affiliation of principal researchers); and regional experience. The roster is reviewed annually. Current minimum roster: 6 firms (2 US-based, 1 UK-based, 1 Gulf-based, 1 Turkey-based, 1 independent regional consortium). Poll questions are standardized across all participant states to enable cross-national comparison. Core question set: 'Do you support your government's

participation in the regional cooperation framework?' (support/oppose/don't know); 'Has the framework improved conditions in your country?' (yes/no/unsure); 'Should your government continue participation if other parties comply?' (continue/withdraw/unsure). Supplemental questions are tailored to national contexts. Polls are conducted quarterly with sample sizes of minimum 1,000 per country.

Annex CS: Civil-Society Consultative Lane

This annex creates a protected, structured consultative lane for NGOs, municipalities, business chambers, and academic institutions through four sectoral forums, ensuring legitimacy feedback is channeled

97 Annex CS: Civil-Society Consultative Lane

constructively rather than left to public backlash after rollout.

The framework establishes a protected civil-society consultative lane that provides structured, regularized access for non-governmental actors—NGOs, municipalities, business chambers, and academic institutions—to contribute expertise, raise concerns, and validate benefits without requiring formal framework membership or decision-making authority. The lane is designed to prevent the backlash that occurs when civil society is excluded until public anger forces confrontation. The consultative lane operates through four sectoral forums: NGO Forum (humanitarian, human rights, environmental, and development organizations); Municipal Forum (mayors and local council representatives from framework-affected cities and provinces); Business Forum (chambers of commerce, industry associations, and SME representatives); and Academic Forum (universities, research institutes, and independent think tanks). Each forum meets quarterly, hosted by rotating guarantor states, with virtual participation available.

Table DP-6: Table DP-6: Civil-Society Consultative Lane Forums

Forum Participants Meeting Host Rotation Output Frequency

Municipal Mayors + local council Quarterly Guarantor states (Oman, Municipal impact reports, Forum chairs from Gaza, Beirut, Switzerland, Pakistan, service delivery Damascus, Baghdad, then EU, Turkey, Gulf) assessments, local Sana'a, Aden, Aleppo, governance Basra, Tehran, Isfahan recommendations

NGO Country directors of Quarterly UN OCHA Field reports, beneficiary Forum registered international (humanitarian), ICRC feedback, operational NGOs + selected national (protection), UNEP constraint briefings NGOs (environment), UNDP (development)

Business Chamber presidents + Quarterly WTO (trade), World Bank Market access reports, Forum sectoral association heads (investment), IFC (private investment climate from all framework sector), ILO (labor) assessments, SME credit participants feedback

Academic University presidents + Bi-annually UNESCO (education), Policy papers, scenario Forum research institute directors IIASA (systems analysis), analyses, youth surveys, Brookings/Doha (regional technical recommendations policy)

98 Access and Protection

Civil-society participants in the consultative lane are protected by the following provisions: Forum proceedings are confidential (Chatham House Rule) unless all participants agree to public release. Participant lists are shared only with the governance body secretariat and guarantors, not with domestic intelligence services. Participants may submit written concerns to the governance body without attribution. No participant may be sanctioned,

detained, or harassed by any framework participant state solely for participation in the consultative lane. If a participant experiences retaliation (arrest, travel ban, asset freeze, or organizational closure) within 90 days of forum participation, the SESS Rapid Mediation Unit investigates within 14 days. Findings are reported to the governance body. If retaliation is confirmed, the responsible state is subject to automatic compliance indicator adjustment (+1.5 points) and must provide a remediation plan within 30 days. Repeated retaliation triggers escalation to the graduated response framework.

The consultative lane is funded through the framework's general operating budget (\$400,000 annually) plus in-kind contributions from hosting institutions. Travel costs for participants from conflict-affected or economically distressed areas are covered by the framework. Virtual participation infrastructure is maintained by the SESS Administrative Core.

Integration with Governance

The consultative lane is not a parallel decision-making body; it is an advisory input mechanism. Forum outputs are compiled into quarterly Civil Society Briefs that are distributed to all governance body members before monthly plenaries. The neutral chair is required to acknowledge receipt of each brief and may table specific recommendations for governance body discussion. There is no obligation to adopt recommendations, but rejections require written justification published in the quarterly Transparency Summary. At each annual ministerial review, one agenda item is reserved for civil-society presentations. Two representatives from each forum (rotating selection) present a 15-minute summary of the year's concerns and recommendations. Ministers are not required to respond in session but must provide written responses within 30 days, compiled by the governance body secretariat into an Annual Civil Society Response Report.

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA)

Institutional Integration Modules Version 1.5 — Hardened Operational Update

Module I: UN Coordination Annex Module II: Regional Organization Interface

Module Module III: Multilateral Observer Mechanism

Module IV: Treaty Compatibility Module Module V: UNSC Resolution [2231-
Replacement] Blueprint CRITICAL BLIND SPOT CLOSURES (Post-Review
Additions)

Blind Spot 1: Bretton Woods Mandate (World Bank & IMF Integration) Blind

Spot 2: BRICS & SCO Interface Blind Spot 3: Interpol & FATF Synchronization

Blind Spot 4: Peace vs. Justice Jurisdictional Firewall (ICC/ICJ)

PREAMBLE: INSTITUTIONAL ARCHITECTURE AS FRAMEWORK DURABILITY

Operative Clause: These modules establish the complete institutional interface between the RCSA and the existing multilateral system. The framework does not operate in a vacuum — it must be embedded within the

United Nations system, regional organizations, international financial institutions, major power groupings, and international legal regimes. This embedding serves three purposes: (1) legitimacy — anchoring the

framework in institutions recognized by all parties; (2) durability — preventing any single state's withdrawal from collapsing the entire architecture; and (3) legal enforceability — creating binding

obligations under international law that survive political transitions. These modules are classified Tier 1 (must survive in any framework version) and require UNSC Chapter VII endorsement for full legal force.

Provisions that modify existing UN mandates or international treaties

100 cannot enter into force without corresponding UN institutional

MODULE I: UN COORDINATION ANNEX

Operative Clause: This module synchronizes the RCSA with existing UN bodies, missions, and mechanisms. It upgrades current UN missions to operate under hardened framework rules, absorbs existing UN

verification mechanisms into the RCSA architecture, and establishes the legal supremacy of humanitarian coordination over individual state military operations. All provisions require UNSC Chapter VII

authorization for implementation.

1. PEACEKEEPING UPGRADES

1.1 UNIFIL (United Nations Interim Force in Lebanon) — Mandate

Enhancement Current Status: UNIFIL operates under UNSCR 1701 (2006), with approximately 10,000 peacekeepers monitoring the cessation of hostilities between Lebanon and Israel. UNIFIL's current mandate

is limited to observation, liaison, and reporting. It possesses no enforcement authority, no real-time targeting capability, and no direct intelligence fusion with UN Member States.

RCSA Upgrade — UNIFIL-JMOC Fusion Protocol:

Real-time intelligence sharing: UNIFIL military observers

transmit all incident reports (rocket fire, border

crossings, unauthorized weapons movements, UAV activity) to JMOC within 2 hours of observation.

PERT integration: UNIFIL reports feed directly into the

PERT incident registry. UNIFIL-detected cross-border rocket launches from Lebanese territory automatically

101 activate Theater 2 (Lebanon/Northern Israel) Proxy

Activity Cap scoring (Crisis-Management Modules, Module III, Section 2.1).

PFZ enforcement support: UNIFIL patrols within PFZ-1

(South of the Litani River) authorized to: (a) establish temporary checkpoints to interdict weapons transport; (b) inspect suspected weapons storage

facilities with 24-hour advance notice to Lebanese authorities; (c) detain individuals transporting prohibited weapons (Category W1-W5) for transfer to Lebanese judicial authorities.

ROE enhancement: UNIFIL Rules of Engagement upgraded

from "observe and report" to "interdict, detain, and refer" for weapons violations within PFZ-1. Use of

force authorized for self-defense and defense of mandate; NOT authorized for offensive operations against identified groups.

Equipment upgrade: UNIFIL receives framework-funded

counter-UAV systems; night-vision equipped patrol vehicles; real-time communication links to JMOC

Mandate renewal: UNSCR extends UNIFIL mandate for 24

months (from current 12-month cycles) to provide

operational stability; mandate review coordinated with framework Phase transitions. 1.2 UNAMI (United Nations Assistance Mission for Iraq) — Post-2025

Transition Current Status: UNAMI's mandate was established by UNSCR 1546 (2004) and extended through Resolution 2732 (2024), with mandate

expiration on December 31, 2025. UNAMI currently supports political dialogue, electoral assistance, and human rights monitoring in Iraq.

102 It does not have a security or proxy-monitoring mandate.

RCSA Upgrade — UNAMI Security and Stabilization Extension:

Mandate extension beyond December 31, 2025: UNSCR

extends UNAMI for minimum 36 months, expanding scope

to include: (a) PMF integration monitoring; (b) base perimeter security coordination; (c) proxy spoiler identification and reporting.

PMF Integration Monitoring: UNAMI political officers

embedded at Iraqi Ministry of Defence PMF Integration Office; monitor registration process, salary

normalization, and base protection compact compliance; report to JMOC via encrypted channel weekly.

Base Perimeter Coordination: UNAMI security liaison

officers at 5 major U.S./coalition bases in Iraq;

coordinate with Iraqi security forces and PMF integrated units on perimeter defense; relay indirect fire incident reports to JMOC within 15 minutes.

Spoiler Reporting: UNAMI authorized to identify and

report PMF units operating outside integration pathway; reports transmitted to JMOC Spoiler

Containment Cell; triggers Spoiler Containment Protocol 2.0 if 3+ reports on same unit within 90 days.

Humanitarian access protection: UNAMI military

liaison teams provide escort coordination for humanitarian convoys on Iraq-Jordan and Iraq-Turkey

corridors; deconfliction with JMOC PHAR database.

Election monitoring: UNAMI retains electoral

assistance mandate; electoral observation teams report proxy intimidation or militia interference

103 1.3 MINUSMA Successor / Mali Lessons Applied

While Mali is not a framework-affected theater, the collapse of MINUSMA (UN Multidimensional Integrated Stabilization Mission in Mali) provides critical lessons for RCSA UN mission design:

No UN mission under RCSA may be terminated by a host

government demand alone (as Mali demanded MINUSMA withdrawal). Mission termination requires UNSCR

authorization OR governance body supermajority (75% + neutral chair).

UN mission personnel operating under RCSA framework

enjoy diplomatic immunity and inviolability of premises regardless of host government consent (see Section 5.2 below for UN Chartering Protocol).

UN mission withdrawal must follow 12-month phased

transition; immediate withdrawal (as occurred in Mali) creates power vacuums exploited by spoilers.

1. UNVIM (UN VERIFICATION AND INSPECTION MECHANISM FOR YEMEN)

INTEGRATION 2.1 Current Status UNVIM was established by the UN in 2016 to inspect commercial

cargo entering Yemeni ports (Hudaydah, Saleef, Ras Isa) to verify compliance with the arms embargo under UNSCR 2216. UNVIM inspectors examine vessels for prohibited weapons, dual-use

goods, and military equipment. Inspections are conducted by UNVIM teams aboard vessels at sea or in port. 2.2 RCSA Absorption into Humanitarian Logistics Hubs

UNVIM operational staff (approximately 50 inspectors

and analysts) integrated into the RCSA Yemen Humanitarian Logistics Network, physically co-

located at the Aden Pre-Clearance Facility and Hudaydah Port Control Center.

104 UNVIM inspection data feeds directly into JMOC

maritime tracking cell: vessel identity; cargo manifest; inspection results; any prohibited items detected.

Dual-use cargo categorization: UNVIM inspectors

apply the RCSA Category H1-H4 classification (Humanitarian Modules, Module I, Section 2.3) to

all Yemen-bound cargo. Humanitarian cargo receives expedited clearance; prohibited cargo triggers IHTA interdiction authority.

Arms embargo verification: UNVIM continues its

original UNSCR 2216 mandate for weapons interdiction; RCSA adds framework-specific verification (Category W1-W5 weapons transfer

prohibitions; proxy financial tracking).

Revenue-sharing verification: UNVIM inspectors

verify that Hudaydah port revenue flows to the

monitored escrow account (40/40/20 split per Yemen Stabilization Framework). Revenue diversion detected by UNVIM triggers automatic governance body notification and CIS scoring.

UNVIM mandate extension: UNSCR extends UNVIM for minimum 36 months; expands scope to include verification of framework compliance (not just arms embargo); integrates UNVIM leadership into JMOC Yemen Coordination Cell.

1. UN OCHA SUPREMACY — HUMANITARIAN DECONFLICTION MANDATE

3.1 Legal Supremacy Clause The following clause is incorporated into the framework's depositary instrument and requires UNSC Chapter VII

105 "In all framework-affected theaters, the United

Nations Office for the Coordination of Humanitarian Affairs (UN OCHA) is the sole authorized coordinator of humanitarian operations. No

framework party may conduct military operations that obstruct, delay, or endanger humanitarian operations without explicit UN OCHA authorization.

In the event of conflict between a state's military objectives and UN OCHA humanitarian coordination, UN OCHA directives prevail. Violations of UN OCHA

coordination authority are subject to the framework's strict liability regime (Humanitarian Modules, Module I, Section 4.3) and may constitute

war crimes under international humanitarian law." 3.2 Operational Supremacy

UN OCHA Regional Office for the Middle East (Amman)

designated as "Humanitarian Operations Command" for all framework-

affected theaters.

UN OCHA has authority to: designate humanitarian

corridors; approve or deny military operations

within 500m of designated corridors; suspend military operations affecting humanitarian access for up to 48 hours (suspension beyond 48 hours

requires JMOC Director concurrence).

Military operations that violate UN OCHA

coordination: automatic +2.0 CIS Humanitarian

penalty; CPMC emergency investigation; potential ICC referral if evidence of deliberate targeting of humanitarian operations.

UN OCHA Director (Regional) has standing authority

to activate Rapid Aid Deployment Protocol

106 triggers without governance body approval

(Humanitarian Modules, Module III, Section 1.1).

UN OCHA funding: Framework guarantees minimum

\$150M annual operational budget for UN OCHA

Middle East operations through RDF Window A (Humanitarian Emergency Escrow); budget protected by Humanitarian Firewall.

3.3 ICRC Coordination

International Committee of the Red Cross (ICRC)

maintains independent mandate under Geneva

Conventions; NOT subordinate to UN OCHA.

ICRC and UN OCHA establish joint coordination

cell in Geneva for detainee access, medical evacuation, and protection monitoring.

ICRC delegates have unfettered access to all

detention facilities in framework-affected theaters; denial of ICRC access = automatic

+2.0 CIS Humanitarian + governance body emergency session.

ICRC protection findings admissible in BAP

proceedings and CPMC reporting but NOT automatically forwarded to ICC (see Blind Spot 4 for jurisdictional firewall).

MODULE II: REGIONAL ORGANIZATION INTERFACE MODULE

Operative Clause: This module connects the RCSA to regional blocs,

distributing the political and financial weight so that the U.S. and Iran

107 are not the only load-bearing pillars. It formalizes the institutional

relationships between the framework and the Gulf Cooperation Council (GCC), the Arab League, the European Union (EU), and the African Union (AU) / Horn of Africa states. Each interface is designed to leverage the

regional organization's existing legitimacy and infrastructure while embedding framework compliance mechanisms within regional political culture.

1. GCC (GULF COOPERATION COUNCIL) INTERFACE

1.1 GCC Institutional Engagement The GCC is a political and economic union of six Arab states bordering

the Gulf (Saudi Arabia, UAE, Qatar, Kuwait, Bahrain, Oman). Its decision-making is consensus-based; it lacks supranational authority but carries significant regional legitimacy.

GCC Framework Liaison Office:

Established at JMOC Geneva as "GCC Regional

Coordination Desk" staffed by one senior official from each GCC member state (6

officials; rotating 6-month chairmanship).

Functions: Coordinate GCC contributions to

RDF; facilitate IHTA revenue-sharing

distribution to GCC port authorities; manage GCC-Iraq electrical interconnection operations; liaise with GCCIA (GCC

Interconnection Authority) on grid maintenance. IHTA-GCC Coordination:

GCC states collectively hold 25% voting

weight in IHTA Council (Saudi Arabia 8%, UAE 6%, Qatar 4%, Kuwait 4%, Bahrain 2%,

Oman 1% — Oman receives reduced share because it is also Neutral Chair and

108 cannot hold disproportionate commercial

GCC states commit to joint maritime patrol

operations in Hormuz and Red Sea under IHTA

Maritime Security Division coordination.

GCC defense ministers' annual meeting

includes framework security review;

framework JMOC Director invited as observer (non-voting).

GCC emergency summit may be convened by any

member if framework security situation

deteriorates (CIS Security domain ≥ 8.0 for any GCC member); summit is advisory only but produces public communiques that

influence domestic politics in member states. RDF Contribution Structure:

Saudi Arabia: \$800M Phase 1 (via PIF

standing directive); locked through RP-SA Hardened Protocol.

UAE: \$400M Phase 1 (split: \$200M

maritime infrastructure; \$100M trade corridor; \$100M humanitarian via Dubai

International Humanitarian City).

Qatar: \$200M Phase 1 (energy sector

joint ventures; LNG infrastructure).

Kuwait: \$150M Phase 1 (GCC-Iraq grid

interconnection; humanitarian corridor support).

Bahrain: \$50M Phase 1 (IHTA operations

center support; maritime security).

109 Oman: \$400M Phase 1 (guarantor state

contribution; NOT counted in GCC subtotal — Omani contribution flows through guarantor channel).

Total GCC RDF contribution (excluding

Oman guarantor): \$1.6 billion. 1.2 GCC Internal Framework Coordination

"Framework Compliance Working Group"

established within GCC Secretariat (Riyadh): meets monthly; coordinates GCC member state positions on governance body votes; ensures

GCC presents unified (or at least non- contradictory) positions.

Working Group does NOT have authority to

override individual GCC member state positions in governance body (each GCC state retains independent vote), but consensus positions

carry political weight.

Working Group coordinates with RP-SA and

RP-UAE Hardened Protocols to ensure Saudi

and Emirati domestic veto players are managed through GCC institutional framework.

1. ARAB LEAGUE INTERFACE

2.1 Arab League Political Umbrella The Arab League (League of Arab States) is a regional organization of 22 Arab states with headquarters in Cairo.

Its primary value to the RCSA is political legitimacy: Arab League endorsement provides cover for member states engaging with Iran and Israel without appearing to "normalize" outside Arab consensus.

Syrian De-Escalation Zones:

110 Arab League serves as the political umbrella

for the five Syrian De-Escalation Zones (Daraa/South; Coastal/Rural Damascus; Aleppo/North; Northeast/Kurdish; Idlib).

Arab League convenes "Syria Contact Group"

(Jordan, Lebanon, Iraq, Egypt, Saudi Arabia, UAE, Qatar, Algeria) quarterly to review zone security and humanitarian access.

Contact Group recommendations are advisory but transmitted to framework governance body as "regional consensus views."

Arab League provides political cover for

Jordanian and Lebanese engagement with

Syrian transitional authorities (through RP-JOR Narrative Shielding: "Arab League- coordinated humanitarian access," not

"Jordanian-Syrian normalization"). Saudi-Israel Normalization Protocol:

Arab League endorsement required for any

Saudi-Israel framework-linked normalization measures (diplomatic exchange, overflight rights, trade liaison offices).

Arab League Summit (annual) votes on

"regional stability framework endorsement" as procedural motion (not substantive

treaty ratification).

If Arab League endorses: Saudi Arabia can

proceed with normalization measures under Arab political umbrella. If Arab League

rejects: Saudi Arabia may still proceed

111 bilaterally but loses institutional cover

(RP-SA Hardened Protocol anticipated this scenario — PIF funding continues regardless of Arab League position).

Palestinian statehood linkage: Arab League

endorsement of framework is explicitly conditioned on continued Arab commitment

to Palestinian statehood (per RP-JOR Hashemite Custodianship reinforcement).

Framework does NOT require Arab states to

recognize Israel; it allows bilateral normalization if desired. Iraq Stabilization:

Arab League provides institutional platform

for regional support of Iraqi PMF integration. "Arab Security Partnership Initiative" launched under Arab League

auspices to provide training, equipment, and funding for Iraqi security forces (NOT for PMF units outside integration

Arab League Secretary-General issues annual

assessment of Iraqi stability; assessment

feeds into framework governance body deliberations. 2.2 Arab League-Framework Liaison

Arab League Secretary-General appoints "Special

Envoy for Regional Stability" (SES) to serve as permanent observer at framework governance

SES has advisory voice (may speak; may submit

112 written opinions) but NO vote on governance

SES represents Arab League consensus position

(if one exists) or notes internal disagreement

(if positions diverge).

SES office established in Geneva (co-located

with JMOC) with 5-person staff.

1. EUROPEAN UNION (EU) INTERFACE

3.1 EU Sanctions Mirroring and CCP Coordination The European Union is a critical framework partner because: (a) EU sanctions on Iran parallel U.S. sanctions and must be

lifted in coordination; (b) EU Blocking Statute (Regulation 2271/96) protects EU entities from U.S. secondary sanctions; (c) EU hosts the Swiss SPV banking channel; (d) EU member

states contribute to RDF and humanitarian operations. EU Sanctions Architecture Integration:

EU Council Regulation establishing RCSA

humanitarian and commercial exemptions: activated by Council Implementing Regulation upon UN OCHA trigger

verification (Economic Modules, Module II, Section 2.2).

EU Blocking Statute enforcement: EU

member states required to penalize EU entities that comply with U.S. secondary sanctions in violation of framework

White Channel authorization. Penalties established under national implementing legislation (Germany, France, Italy

EU "One-Stop Shop" for framework banking:

113 European Central Bank (ECB) designates

framework liaison officer at TARGET2 operations center; provides euro clearing for designated Iranian banks (Economic

Modules, Module II, Section 2.4).

EU-Iran trade: EU-Iran Joint Commission

(established under JCPOA, currently

moribund) reactivated under RCSA umbrella as "EU-Iran Commercial Facilitation Committee"; meets quarterly in Brussels

or Vienna. Swiss SPV Banking Channel:

Switzerland is not an EU member but

coordinates closely with EU on framework

banking architecture.

Swiss Special Purpose Vehicle (SPV) for

Iranian trade: Swiss National Bank

administers escrow accounts; Swiss commercial banks (UBS, Credit Suisse, Zurcher Kantonalbank) provide

correspondent services for designated Iranian banks.

Swiss Federal Council issues framework

exemption ordinances under autonomous sanctions regime (NOT requiring EU coordination, but harmonized with EU

Swiss financial regulator FINMA provides

enhanced supervision of framework-related

banking transactions; quarterly reporting to JMOC Financial Tracking Cell.

114 EU RDF Contribution:

European Investment Bank (EIB): \$250M

Phase 1 (trade corridor and customs modernization).

EU member states bilateral contributions:

France (\$100M — Lebanon stabilization); Germany (\$100M — Yemen reconstruction +

refugee support); Italy (\$50M — Libya spillover prevention); Nordic countries (\$50M — humanitarian innovation).

Total EU institutional + bilateral: \$550M

Phase 1. 3.2 EU Political Coordination

EU High Representative for Foreign Affairs

participates in framework governance body ministerial sessions as "regional partner representative" (same status as Turkey,

India, Japan — advisory voice, no vote).

EU Political and Security Committee (PSC)

receives monthly JMOC security briefings

(sanitized; no raw intelligence).

EU crisis response mechanism: If framework

Crisis Lock activates, EU Rapid Deployment

Capacity may be mobilized for humanitarian and civilian protection

operations (under UN OCHA coordination).

1. AFRICAN UNION (AU) / HORN OF AFRICA INTERFACE

4.1 Red Sea Maritime Security Coordination The western flank of Houthi containment and Red Sea shipping protection depends on Horn of Africa states:

Djibouti (host to military bases of U.S., China, France,

115 Japan); Eritrea; Somalia; and Sudan. The AU has

mandate for continental peace and security through the AU Peace and Security Council. AU-RCSA Maritime Security Partnership:

AU Peace and Security Council receives

quarterly briefings from JMOC Maritime Coordination Cell on Red Sea security

AU authorized to deploy "AU Maritime

Observer Mission" (AUMOM) to monitor

IHTA compliance in Bab-el-Mandeb and Gulf of Aden; AUMOM staffed by naval officers from Kenya, South Africa, Egypt, and Nigeria.

AUMOM has advisory authority only: may

inspect vessels for IHTA certification; may report violations to IHTA Maritime

Security Division; may NOT conduct enforcement actions (interdiction, boarding, seizure) without host state

authorization. Djibouti Strategic Coordination:

Djibouti hosts the primary IHTA

maritime operations center for southern Red Sea (complementing Muscat center for Hormuz).

Djibouti Code of Conduct (DCoC) —

regional maritime security agreement signed by 20+ Red Sea and Indian Ocean states — integrated into IHTA enforcement architecture.

116 DCoC information-sharing center in

Djibouti feeds real-time maritime intelligence to JMOC maritime cell.

Djibouti receives 5% of IHTA Maritime

Security allocation (from 40% security share) for hosting and operations support. Horn of Africa Counter-Spoiler:

Somalia-based spoiler entities (Al-

Shabaab affiliates; piracy networks; arms smuggling groups) monitored by AU mission in Somalia (ATMIS) and reported

to JMOC if linked to framework-affected proxy networks.

Eritrea: Framework requires Eritrean

non-interference in Red Sea shipping; any Eritrean military action against commercial vessels = automatic IHTA

violation + AU Peace and Security Council review.

Sudan: Post-conflict Sudan receives

framework humanitarian corridor access (Port Sudan maritime route) under UN OCHA coordination; Sudanese military

operations near Red Sea corridor subject to JMOC deconfliction. 4.2 AU RDF Contribution

African Development Bank (AfDB): \$100M

Phase 1 (Horn of Africa port modernization; Djibouti logistics hub expansion;

Red Sea maritime security

117 Egypt (AU member and Arab League member):

\$200M Phase 1 (Arish humanitarian hub; Rafah crossing operations; Suez Canal coordination with IHTA).

South Africa: \$50M Phase 1 (AU liaison

support; technical assistance for RDF governance capacity building).

Total AU institutional + bilateral: \$350M

MODULE III: MULTILATERAL OBSERVER MECHANISM (MOM)

Operative Clause: This module creates a formalized "read-only" tier for global stakeholders who rely on Middle East stability but are not core combatants or framework parties. It provides sanitized early-warning

access and institutional participation without voting authority, ensuring that major energy consumers, trading nations, and stability-dependent powers have visibility into framework operations without being able to

block or delay framework decisions.

1. ENERGY STAKEHOLDER TIER

1.1 Eligibility and Admission

States may apply for Energy Stakeholder Observer status if they meet the following criteria:

Import >500,000 barrels per day of oil or

equivalent from the Middle East (Gulf, Red Sea, or Mediterranean sources), OR

Import >5 billion cubic meters per year

of natural gas from Middle East sources, OR

118 Conduct >\$10 billion annually in two-way

trade with framework-affected states, OR

Maintain >\$5 billion in foreign direct

investment in framework-affected states.

Current Qualifying States (Phase 0):

China (crude imports: ~3.5M bpd from

Iran, Saudi Arabia, Iraq, UAE, Oman)

Japan (crude imports: ~3.3M bpd from

South Korea (crude imports: ~2.5M bpd;

LNG: significant from Qatar)

India (crude imports: ~2.3M bpd from

Iraq, Saudi Arabia, UAE, Iran)

Turkey (trade + energy transit; regional

security stakeholder)

EU collectively (through EIB and member

state bilateral contributions) 1.2 Observer Rights and Access

Energy Stakeholder Observers receive the following institutional benefits:

Sanitized JMOC Maritime Threat Feeds:

Real-time access to JMOC Maritime

Coordination Cell data on: IHTA vessel tracking; sanctions-evasion alerts;

Red Sea/Hormuz security incidents; port status (open/closed/restricted).

Data sanitized to remove: military

operational details; intelligence source identifiers; party-specific operational patterns.

119 Feed delivered via encrypted web

portal updated every 15 minutes; mobile-optimized for shipping company operations centers.

72-Hour Strike Buffer Early Warning:

Observers receive automatic alert when

a framework incident triggers the 72-

Hour De-Escalation Window (Crisis- Management Modules, Module II). Alert includes: incident type; theater;

preliminary threat assessment to commercial shipping; recommended rerouting options.

Purpose: Allows observer states'

shipping companies and energy traders to reroute vessels, adjust supply chains, and hedge price exposure

before kinetic escalation affects markets.

Alert timing: Within 30 minutes of

JMOC incident confirmation. IHTA Council Observer Seat:

One non-voting observer seat per

Energy Stakeholder state at IHTA Council meetings.

Observer may: submit written

opinions; request technical clarifications; participate in working group discussions.

Observer may NOT: vote on toll

rates or revenue allocation; veto

120 council decisions; block membership

applications. RDF Contributor Status (Optional):

Observers may make voluntary

contributions to RDF sub-funds relevant to their interests (e.g., China contributing to

Energy Interdependence Window D; Japan contributing to Humanitarian Emergency Window A).

Observer contributions do NOT

confer governance board voting rights but are recognized in Transparency Summary and framework public

communications. 1.3 Observer Obligations In exchange for access, Energy Stakeholder Observers

Contributing to IHTA operational costs

proportional to their Gulf/Red Sea

shipping volume (minimum \$5M annually for Tier 1 observers; \$2M for Tier 2).

Directing national-flag vessels to

comply with IHTA certification and tolling requirements.

Instructing national energy companies

to purchase framework-compliant Iranian petrochemical exports (when permitted under active tranche) rather

than sanctions-evading "ghost" shipments.

Refraining from actions that undermine

121 framework implementation (e.g., providing

financial or logistical support to sanctioned spoiler entities; purchasing weapons-evasion services from non-

Participating in framework crisis

response when invited by governance

body (e.g., providing emergency energy supply during Gulf disruption). 1.4

Observer Limitations — Explicit Exclusions

The following authorities are EXPLICITLY DENIED to Observer States:

VETO POWER: Observer states may not

block, delay, or veto any governance

body decision, IHTA Council decision, BAP ruling, or CIS scoring action.

BINDING ARBITRATION PANEL MEMBERSHIP:

Observer states may not nominate or serve on the BAP (Enforcement Modules, Module I, Section 2). BAP composition

remains exclusive to guarantor states (Switzerland, Oman, Pakistan) and mutually agreed international legal

PERT PARTICIPATION: Observer states

may not designate analysts to the PERT.

PERT remains exclusive to core party analysts (U.S., Iran) plus neutral guarantor and pool members.

ESCROW RELEASE AUTHORITY: Observer

states may not participate in RDF

122 escrow release decisions. Dual-key

authority (World Bank + NACA) and sub-fund administrator authority (UN OCHA, UNDP, etc.) remain

exclusive to framework parties and designated administrators.

SANCTIONS SNAPBACK TRIGGER: Observer

states may not invoke sanctions snapback or framework suspension. Snapback authority rests exclusively

with core parties through CIS scoring and governance body procedures.

MILITARY OPERATIONS COORDINATION:

Observer states may not participate

in framework military deconfliction (Tier 2 hotline) or proxy freeze zone enforcement.

1.5 Observer Status Review

Observer status reviewed annually by

governance body secretariat.

Grounds for revocation: (a) systematic

violation of observer obligations; (b) actions materially undermining framework

implementation; (c) failure to contribute IHTA operational costs for 2 consecutive years.

Revocation requires governance body

weighted majority (60% + neutral chair); revoked observer receives 90-day

transition period before access terminated.

123 Observer may voluntarily withdraw with

90-day notice; no penalty for withdrawal.

1. COMMERCIAL STAKEHOLDER TIER (PRIVATE SECTOR)

2.1 Shipping and Energy Company Observer Status Major commercial entities may apply for Commercial Observer status (non-state actors):

Eligibility: Shipping companies with

>50 vessels transiting Hormuz/Red Sea annually; energy traders with >\$1B annual Middle East energy trade;

port operators managing >\$500M annual throughput in framework ports.

Benefits: IHTA Green Pass priority

processing; real-time maritime threat feed (same sanitized data as state observers); quarterly JMOC maritime

security briefing (commercial version).

Obligations: IHTA toll compliance;

sanctions-evasion prevention

certification; annual audit of supply chain for prohibited goods.

Exclusions: No governance participation;

no BAP access; no escrow influence. 2.2 Insurance and Reinsurance Observer Tier

Lloyd's of London, Swiss Re, Munich Re,

and other major underwriters receive

framework risk assessment briefings to support CCP insurance pricing and maritime underwriting.

JMOC provides annual "Framework Risk

124 Assessment" (classified; commercial

version published 6 months later) covering: proxy activity trends; maritime incident rates; banking

channel stability; political risk factors.

Insurance observers may participate

in IHTA Maritime Safety Committee as technical advisors (non-voting).

MODULE IV: TREATY COMPATIBILITY MODULE

Operative Clause: This module ensures the RCSA aligns with existing foundational international law. It provides explicit legal language

confirming that framework provisions do not violate the Non- Proliferation Treaty (NPT), the UN Convention on the Law of the Sea (UNCLOS), or the Geneva Conventions. It also addresses potential conflicts with existing bilateral and multilateral

agreements, creating a hierarchy of norms that prevents litigation from dismantling the framework.

1. NPT (NON-PROLIFERATION TREATY) ALIGNMENT

1.1 NPT Article II Confirmation The framework explicitly addresses Iran's obligations as a non-nuclear-weapon state under NPT Article II:

"Article II of the NPT requires each non-nuclear- weapon state Party to undertake not to receive the transfer from any transferor whatsoever of nuclear weapons or other nuclear explosive devices or of control over such

weapons or

125 explosive devices directly, or indirectly; not

to manufacture or otherwise acquire nuclear weapons or other nuclear explosive devices; and not to seek or receive any assistance in the

manufacture of nuclear weapons or other nuclear explosive devices." RCSA Alignment Statement:

The RCSA's Phase 3 provision permitting enrichment up to 20% U-235 for civilian reactor fuel does NOT violate NPT Article

II. Article II prohibits nuclear weapons acquisition — it does NOT prohibit uranium enrichment for peaceful purposes under IAEA

safeguards. The 20% cap is well below the weapons-grade threshold (typically defined as 90% U-235) and is standard for research

reactor fuel (e.g., Tehran Research Reactor uses 19.75% LEU targets). The framework's enrichment provisions are fully consistent

with the NPT's affirmation of the "inalienable right of all the Parties to the Treaty to develop research, production and use of

nuclear energy for peaceful purposes without discrimination" (Article IV). IAEA Safeguards Confirmation:

The framework's IAEA Integration Annex (Verification Modules, Module I) establishes safeguards that EXCEED standard comprehensive

safeguards agreements: continuous monitoring; challenge inspections within 72 hours; environmental sampling; real-time data

126 transmission. These enhanced measures

provide the international community with greater assurance of peaceful use

than standard NPT safeguards, thereby STRENGTHENING

(not undermining) the non-proliferation regime. 1.2 NPT Article X
(Withdrawal) and Framework Continuity

Iran, as an NPT party, retains the right

under Article X to withdraw from the NPT with 3 months' notice if it decides
that

extraordinary events have jeopardized its supreme interests.

Framework does NOT restrict this sovereign

right. However, NPT withdrawal automatically

triggers framework Crisis Lock (30 days) and Step 4 Penalty Ladder activation,
as NPT withdrawal would eliminate the IAEA

safeguards foundation upon which the framework's nuclear provisions
depend.

Framework explicitly encourages Iran to

remain in NPT by providing a superior alternative: under the framework, Iran
achieves economic normalization and

energy export revenue while maintaining NPT membership — a combination
not available if Iran withdraws from NPT

and faces complete international isolation. 1.3 Additional Protocol Integration

Iran's IAEA Additional Protocol (provisionally

applied under the JCPOA, later suspended) is

127 formally reinstated and strengthened under

Framework IAEA Integration Annex provisions

on managed access, challenge inspections,
and environmental sampling are formally incorporated into Iran's Additional Protocol implementation arrangement.

IAEA Board of Governors reviews and approves
the strengthened safeguards approach within 90 days of framework entry into force.

1. UNCLOS (UNITED NATIONS CONVENTION ON THE LAW OF THE SEA)

COMPATIBILITY 2.1 Transit Passage Rights and IHTA Tolling UNCLOS Part III (Articles 37-44) establishes

the right of transit passage through straits used for international navigation. The Strait of Hormuz is explicitly covered by these provisions. The

framework addresses potential UNCLOS conflict as follows: IHTA Toll Structure as "Fee for Services

Rendered": IHTA tolls are NOT framed as transit taxes or passage fees (which would violate UNCLOS

Article 38 transit passage rights). Instead, IHTA tolls are explicitly structured as "maritime safety and environmental compliance

service fees" for the following services:

Real-time maritime traffic management

and collision prevention in the

congested Hormuz transit corridor.

24/7 search and rescue standby

128 coverage for vessels in distress.

Environmental monitoring and oil spill

response capability in the Strait.

Counter-piracy and maritime security

Vessel certification and inspection

services (sanctions compliance verification; safety inspection).

Legal Basis: UNCLOS Article 26 permits coastal states to charge "payment for specific services" in connection with

passage through the territorial sea. While Hormuz transit passage is not the territorial sea per se, IHTA tolls are

analogized to legitimate service fees under UNCLOS Article 26 precedent. Fee

Amount Reasonableness: IHTA base rate

(\$0.15/GT) is benchmarked against the Suez Canal Authority (\$0.50-\$2.00/GT depending on vessel type) and the Panama Canal

(\$5-\$20/GT depending on vessel type). The IHTA rate is approximately 7.5-30% of Suez rates and 0.75-3% of Panama rates — well

within internationally accepted parameters for maritime service fees.

Exemptions: UNCLOS Article 38 guarantees

transit passage shall not be impeded. IHTA explicitly provides: (a) zero toll for humanitarian vessels; (b) zero toll for

government vessels on non-commercial service; (c) no denial of transit for

129 non-payment (non-paying vessels receive

transit certificate but are flagged for compliance review; physical passage is never blocked). These exemptions ensure

UNCLOS transit passage rights are fully respected. 2.2 UNCLOS Dispute Resolution Backstop

Any state party to UNCLOS may challenge

IHTA toll structure before the International Tribunal for the Law of the Sea (ITLOS) under

UNCLOS Part XV dispute resolution.

Framework anticipates this possibility by:

(a) establishing IHTA legal advisory panel including UNCLOS scholars and former ITLOS

judges; (b) pre-positioning legal briefs defending the "services rendered" characterization; (c) committing to

comply with any ITLOS advisory opinion or binding decision, including toll rate adjustments if ordered.

Framework depositary (UN Secretary-General)

serves as conduit for any UNCLOS-related inquiries to IHTA.

2.3 Maritime Boundary Disputes

Framework does NOT resolve existing maritime

boundary disputes (e.g., Iran-UAE islands

dispute; Saudi Arabia-Iran median line dispute; Qatar-Bahrain boundary).

IHTA operates on the explicit understanding

that toll collection and maritime traffic management are functionally separate from

130 territorial claims. IHTA does not adjudicate

sovereignty; it manages traffic.

If maritime boundary dispute escalates to

armed incident: automatic PFZ-4 (Strait of

Hormuz) violation; Crisis Lock activation; UN Security Council referral.

1. GENEVA CONVENTIONS REAFFIRMATION

3.1 Supremacy of IHL over Domestic ROE The framework includes the following binding clause in the depositary instrument:

"The Geneva Conventions of 1949 and their Additional Protocols constitute the supreme legal standard for the protection of persons and objects in armed conflict within all

framework-affected theaters. The framework's 'Strict Liability' penalties for striking protected hospitals, medical facilities,

humanitarian convoys, and civilian objects (Humanitarian Modules, Module I, Section 4.3) do not create a separate standard — they

operationalize and enforce Geneva Convention obligations that already exist under international humanitarian law. No framework

party may invoke domestic military rules of engagement, operational necessity, or national security exceptions to justify attacks on

protected objects registered in the PHAR (Protected Humanitarian Asset Registry). Such attacks constitute grave breaches of

the Geneva Conventions and may be referred to the International Criminal Court consistent

131 with Rome Statute procedures."

3.2 Specific Geneva Convention Provisions Integrated

Geneva Convention I (Wounded and Sick in

Field): CPMC medical infrastructure monitoring

enforces Article 19 protection of fixed medical establishments. Strikes on CPMC- verified hospitals = grave breach.

Geneva Convention II (Wounded, Sick and

Shipwrecked at Sea): IHTA Maritime Safety Division coordinates search and rescue;

attacks on medical evacuation vessels = grave breach.

Geneva Convention III (Prisoners of War):

ICRC access to all detention facilities

(framework or non-framework) is mandatory; detainee proof-of-life registry maintained by ICRC; denial of ICRC access = framework

violation + potential grave breach.

Geneva Convention IV (Civilians): PHAR

registration system operationalizes Article

18 protection of civilian hospitals; Article 24 protection of children; Article 27 protection of civilian persons. CPMC

mortality verification methodology based on GC IV reporting standards.

Additional Protocol I (International Armed

Conflicts): Article 48 (distinction); Article 51 (protection of civilian population); Article 52 (general protection of civilian

objects); Article 57 (precautions in attack). PHAR strict liability operationalizes these

Additional Protocol II (Non-International

Armed Conflicts): Articles 4-14 protections apply to all framework-affected theaters

with active internal armed conflict (Yemen, Syria, Iraq, Libya spillover). 3.3 Domestic ROE Firewall

No framework party may adopt military rules

of engagement that authorize or permit strikes on PHAR-registered assets, humanitarian convoys, or medical facilities.

If a party's domestic ROE conflict with framework strict liability provisions:

framework provisions prevail. Military personnel following domestic ROE that direct strikes on protected objects are

subject to: (a) framework CIS penalties to their state; (b) individual command responsibility under Rome Statute; (c)

domestic military justice proceedings if their state's military law incorporates Geneva Convention obligations.

Framework requires all parties to issue

"Framework Compliance Directive" to their armed forces within 30 days of entry into

force, incorporating PHAR protection and 72-hour strike buffer into standing operational orders.

1. OTHER TREATY COMPATIBILITY PROVISIONS

4.1 JCPOA Supersession

133 The RCSA explicitly supersedes the Joint

Comprehensive Plan of Action (JCPOA) of 2015 as the operative nuclear agreement between the framework parties:

JCPOA commitments are subsumed into RCSA

Phase 0-3 provisions where functionally equivalent (3.67% cap; IAEA access; asset

unfreezing sequence).

JCPOA provisions that conflict with RCSA

are explicitly superseded (e.g., JCPOA's

8-year enrichment restriction sunset vs. RCSA's permanent Tier 1 classification of core provisions; JCPOA's unilateral U.S. snapback vs. RCSA's friction ladder with

UN Security Council Resolution 2231 (2015)

— which endorsed the JCPOA — is explicitly

repealed and replaced by the new RCSA endorsement resolution (see Module V). 4.2 Bilateral Treaty Harmonization

U.S.-GCC Defense Cooperation Agreements:

Framework does not modify existing U.S. defense commitments to GCC states. Base

access, pre-positioning, and joint exercises continue. Framework adds Base Protection Compact rules (100-mile

perimeter; indirect fire = automatic penalty) as supplementary obligations.

Iran-Russia Defense Cooperation: Framework

does not prohibit existing Iran-Russia defense agreements (S-300 delivery; joint

134 exercises; Caspian security coordination).

Framework prohibits NEW transfers of Category W1-W5 weapons to proxies (Module III, Section 4) and prohibits weapons

transfers that violate UNSCR 2231 arms embargo (until repealed by Module V).

Iran-China 25-Year Cooperation Agreement:

Framework does not modify existing Iran- China economic agreements.

Framework provides China with MOM Energy Stakeholder

status and IHTA observer access, creating institutional channel for China to monitor and benefit from framework

Camp David Accords / Abraham Accords:

Framework does not modify existing Arab- Israeli normalization agreements.

Framework

provides Arab League political umbrella for any ADDITIONAL normalization measures, but existing agreements remain bilateral.

Iran-Iraq Algiers Agreement (1975) /

subsequent treaties: Framework does not modify Iran-Iraq border or water-sharing

arrangements. Framework's Iraq-Jordan trade corridor and Iran-Iraq gas supply agreement (Energy Modules, Module IV,

Section 1.4) operate within existing bilateral frameworks. 4.3 Treaty Conflict Resolution Hierarchy

If the RCSA conflicts with any existing treaty to which a framework party is a

party, the

135 following hierarchy applies:

1. UN Charter (Article 103): UN Charter

obligations prevail over all other treaty obligations.

1. UNSC Chapter VII Resolutions: Binding

UNSC resolutions (including the RCSA endorsement resolution, Module V)

prevail over conflicting treaty obligations.

1. Geneva Conventions: IHL obligations

prevail over conflicting domestic

military orders or operational agreements.

1. NPT and IAEA Statute: Nuclear

non-proliferation obligations prevail over conflicting bilateral nuclear cooperation agreements.

1. RCSA Framework Provisions: Framework

provisions prevail over conflicting pre-framework bilateral or multilateral agreements (JCPOA supersession clause).

1. Pre-Framework Bilateral Agreements:

Continue to operate where not

explicitly superseded by framework.

MODULE V: UNSC RESOLUTION [2231-REPLACEMENT] BLUEPRINT

Operative Clause: This module is the crown jewel of the RCSA's

136 institutional architecture. It provides the complete draft text

of a new United Nations Security Council Resolution that repeals UNSCR 2231 (2015) — which endorsed the JCPOA — and installs the RCSA as the binding international legal framework under Chapter

VII of the UN Charter. This resolution transforms the RCSA from a political agreement into enforceable international law, grants UN mandates to JMOC and PERT, provides diplomatic immunity to

framework personnel, and abolishes the flawed 2015 unilateral snapback mechanism.

1. THE MANDATE: CHAPTER VII ENDORSEMENT

1.1 Resolution Structure The following is the operative structure of the proposed UNSC Resolution (designated as UNSCR [XXXX], hereinafter "the RCSA

Endorsement Resolution"): PREAMBLE:

Recalling the purposes and principles of

the UN Charter, especially Article 1

(maintenance of international peace and security).

Recalling UNSCR 2231 (2015) and noting

the expiration of its snapback mechanism provisions in October 2025.

Expressing grave concern over the

deteriorating security situation in the Middle East, including nuclear proliferation risks, proxy conflict

escalation, humanitarian catastrophe, and threats to international shipping.

Recognizing that the 2015 JCPOA framework

has proven insufficient to prevent escalation and that a comprehensive,
137 institutionally anchored, and multilaterally
guaranteed framework is required.

Affirming the inalienable right of all
states to develop nuclear energy for
peaceful purposes under NPT Article IV, subject to comprehensive IAEA
safeguards.

Welcoming the initiative of the United
States, Iran, Switzerland, Oman, and Pakistan to negotiate the Regional
Cooperation and Stability Architecture

Noting the endorsement of the RCSA by the
Gulf Cooperation Council, the Arab League, the European Union, and the
African Union.

OPERATIVE PROVISIONS: Article 1: RCSA as Binding International Law The
Security Council, acting under

Chapter VII of the UN Charter: (a) Endorses the Regional Cooperation and
Stability Architecture (RCSA) as

the comprehensive framework for managing nuclear non-proliferation,
regional security, humanitarian

access, and economic stabilization in the Middle East. (b) Declares that all
RCSA provisions

classified as Tier 1 constitute binding obligations on all framework parties
under Chapter VII.

(c) Determines that the situation in the Middle East constitutes a threat

138 to international peace and security

justifying Chapter VII measures. (d) Calls upon all UN Member States to support and facilitate RCSA

implementation, including through financial contributions, diplomatic support, and refraining from actions

that undermine framework compliance. Article 2: Repeal of UNSCR 2231 Snapback Mechanism

(a) Explicitly revokes the snapback mechanism established under UNSCR 2231, paragraph 11, which permitted

any single JCPOA participant state to trigger automatic reimposition of UN sanctions.

(b) Declares that the UNSCR 2231 snapback mechanism is structurally flawed (unilateral trigger; no

dispute resolution; no proportionality requirement; no cooling-off period) and has contributed to framework

instability. (c) Replaces the 2231 snapback with the RCSA Snapback Friction Ladder

(Economic Modules, Module II, Section 2), which provides: 30-day warning window; 30-day partial

suspension; 30-day full suspension; 90-day total timeline; dispute resolution through BAP; reversibility

139 upon remediation.

(d) Confirms that sanctions reimposition under the RCSA may occur ONLY

through: (i) CIS scoring

reaching Step 3 or Step 4 thresholds with governance body supermajority; (ii) BAP binding ruling on material

breach; (iii) UNSC Resolution adopted under standard Chapter VII procedures (not unilateral trigger).

Article 3: IAEA Enhanced Mandate (a) Calls upon the IAEA to implement the RCSA IAEA Integration Annex

(Verification Modules, Module I) as an enhanced safeguards approach for Iran.

(b) Requests the IAEA Director General to report quarterly to the Security Council on Iran's compliance with

RCSA nuclear provisions. (c) Authorizes the IAEA to conduct challenge inspections under the

Additional Protocol within 72 hours of request, with framework party cooperation mandated under Chapter

VII. (d) Directs the IAEA to establish permanent liaison office at JMOC

Geneva for real-time data fusion with framework verification systems. Article 4: UN Mission Mandate Upgrades

140 (a) Extends UNIFIL mandate for 24 months

under upgraded Rules of Engagement (Module I, Section 1.1). (b) Extends UNAMI mandate beyond

December 31, 2025 for 36 months, expanding scope to PMF integration monitoring and base perimeter

security coordination (Module I, Section 1.2). (c) Extends UNVIM mandate for 36 months,

expanding scope to framework compliance verification beyond arms embargo (Module I, Section 2).

(d) Authorizes UN OCHA as supreme humanitarian coordinator in all framework-affected theaters with

authority to direct military deconfliction (Module I, Section 3). Article 5: JMOC and PERT UN Chartering

(a) Establishes the Joint Monitoring Operations Center (JMOC) as a subsidiary body of the Security

Council under Article 29 of the UN Charter. (b) Grants JMOC personnel diplomatic

immunity under the Convention on the Privileges and Immunities of the United Nations (1946).

(c) Declares JMOC facilities in Geneva and Muscat inviolable under the same Convention.

141 (d) Establishes the Proxy Event Response

Team (PERT) as a JMOC investigative cell with UN-mandated authority to conduct incident attribution. PERT

personnel enjoy functional immunity for acts performed in official capacity. (e) Mandates that all framework parties

provide PERT with access to incident sites, evidence, and witnesses within 48 hours of formal request. Refusal

= Chapter VII compliance obligation violation. Article 6: Humanitarian Protection Mandate

(a) Reaffirms Geneva Conventions as applicable law in all framework- affected

theaters.

(b) Authorizes UN OCHA to establish "Protected Humanitarian Zones" under Chapter VII protection (analogous to

Safe Areas under UNSCR 819 for Srebrenica, but with explicit military enforcement authorization).

(c) Directs all parties to allow unimpeded humanitarian access; blocking humanitarian access =

potential war crime referral to ICC. Article 7: Economic Architecture Legitimization (a) Notes the establishment of the

Regional Development Fund (RDF) and the International Hormuz Transit Authority (IHTA).

142 (b) Encourages UN Member States to

contribute to RDF through bilateral or multilateral channels. (c) Affirms that IHTA tolls constitute

legitimate service fees consistent with UNCLOS (not transit taxes). (d) Calls upon all states to facilitate

framework-compliant banking transactions and to refrain from secondary sanctions actions that

undermine the RCSA Commercial Continuity Protection (CCP) mechanism.

Article 8: Non-Proliferation Reaffirmation (a) Reaffirms NPT as the cornerstone of the international non-proliferation

regime. (b) Confirms that RCSA enrichment provisions (up to 20% for civilian

fuel under Phase 3) do not violate NPT Article II. (c) Demands that Iran ratify and

permanently implement the IAEA Additional Protocol. (d) Calls upon all NPT parties to

support IAEA safeguards funding and technical assistance for RCSA implementation.

Article 9: Dispute Resolution (a) Endorses the RCSA Binding Arbitration Panel (BAP) as the

143 primary dispute resolution

mechanism for framework parties. (b) Confirms BAP awards are enforceable under the New York Convention (1958)

and receive UNSC recognition for international enforcement. (c) Directs framework parties to

exhaust BAP procedures before bringing disputes to UNSC or other international forums (except for

matters involving use of force, which remain subject to UN Charter Chapter VII procedures).

Article 10: Review and Renewal (a) The Security Council shall review RCSA implementation annually through

a dedicated agenda item. (b) The framework shall undergo comprehensive review every 5 years,

with UNSC authorization required for continuation beyond each 5-year period.

(c) Any framework party may request an

extraordinary UNSC session if it believes framework survival is threatened.

(d) UNSC may adopt supplementary resolutions to address emerging threats or implementation gaps,

provided such resolutions are consistent with the RCSA's core architecture.

144 1.2 Adoption Requirements

UNSC adoption requires minimum 9 affirmative

votes (standard) with no veto by permanent members (China, France, Russia, UK, US).

Critical challenge: Russia and China may

veto if they perceive the framework as Western-dominated or threatening to their

regional interests. Addressed through BRICS & SCO Interface (Blind Spot 2 below).

U.S. must abstain from or support the

resolution (U.S. cannot veto its own

framework but may face domestic political pressure to do so if hardliners control the administration).

Iran must support the resolution (Iran is

not a UNSC member but may lobby non- permanent members; Iranian support signals

commitment to framework). 1.3 Resolution as Living Document

UNSCR [XXXX] is not static. Annual review

allows the Security Council to: update UN mission mandates; adjust IAEA reporting requirements; authorize new RDF sub-

funds; address emerging threats (e.g., AI-driven cyber threats; hypersonic weapons proliferation).

Supplementary resolutions may be adopted

for specific crises (e.g., if a new proxy actor emerges in a previously stable theater; if a natural disaster requires

emergency humanitarian authorization).

145 However: the core architecture (Tier 1

provisions) may NOT be modified by supplementary resolution alone; requires framework governance body consensus PLUS

UNSC Chapter VII reauthorization.

BLIND SPOT 1: BRETTON WOODS MANDATE (WORLD BANK & IMF INTEGRATION)

Placement: New standalone annex preceding Module I. 1.1 Problem Statement

The RCSA relies heavily on the World Bank to administer the \$5B+

Regional Development Fund and the IMF to monitor Iranian macroeconomic compliance. However, the World Bank and IMF are independent international financial institutions with their own

Boards of Governors (member country finance ministers), Boards of Executive Directors, and institutional charters. They cannot be "assigned" tasks by a political framework without their own governance approval. The Bretton Woods Mandate closes this gap

by creating a specific UN/Framework authorization that legally enables World Bank and IMF participation without violating their institutional neutrality.

1.2 World Bank Integration — Trust Fund Mandate Legal Mechanism: The World Bank administers external donor

funds through "Financial Intermediary Funds" (FIFs) and "Multi-Donor Trust

Funds" (MDTFs). These are established under World Bank operational policies (OP/BP 14.40) and do NOT require Board of Governors approval for each

146 individual fund — the Bank's management has delegated authority to establish trust funds below certain thresholds. RCSA RDF as World Bank FIF:

The RDF is established as a World Bank

Financial Intermediary Fund titled "Regional Cooperation and Stability Fund"

Governing Instrument: Signed by World Bank

President, UN Secretary-General, and

framework depositary (UN Secretary-General acts as convening authority under UNSCR [XXXX] Chapter VII authority).

The Governing Instrument specifies:

fund objectives; contributor commitments; governance structure; disbursement procedures; audit requirements; and termination conditions.

The World Bank's role is fiduciary ONLY:

it holds, invests, and disburses funds; it

does NOT set framework policy, determine compliance, or adjudicate disputes.

Policy authority rests with RDF Governing Board.

The Governing Instrument explicitly states:

"The World Bank's participation in this Fund is strictly limited to fiduciary administration. The Bank does not endorse, guarantee, or assume

responsibility for the political or security provisions of the Regional Cooperation and Stability Architecture. The Bank's involvement is consistent with its mandate to support development and reconstruction in conflict-affected areas." Board of Executive Directors Notification:

World Bank Management notifies the Board of Executive Directors of the RCSF establishment within 30 days of Governing Instrument signature.

Board may review and raise objections within 60 days; if no objection raised, fund proceeds. (This is standard World Bank procedure for trust funds; objections are rare for well-structured funds with diverse donor base.)

U.S. Executive Director (representing the largest shareholder) may raise concerns but cannot unilaterally block a trust fund that has non-U.S. donors and serves humanitarian purposes. Fiduciary Neutrality Safeguards:

World Bank staff assigned to RCSF are governed by Bank Staff Rules, NOT framework party directives. They may not receive instructions from any framework party's government.

World Bank Internal Audit Department (IAD) conducts annual audit of RCSF independently; findings reported to

World Bank Board AND to framework governance body

World Bank's Independent Evaluation Group

148 (IEG) may conduct program evaluation after

3 years of operations. 1.3 IMF Integration — Article IV and Staff-Monitored Program Legal Mechanism:

The IMF engages with member countries through: Article IV consultations (annual economic reviews); Stand-By Arrangements

(SBA); Extended Fund Facilities (EFF); and Staff-Monitored Programs (SMPs).

The IMF does NOT require UNSC authorization to

engage with a member country — its mandate derives from the Articles of Agreement and the country's own request for engagement.

RCSA-IMF Engagement Structure:

Iran requests an IMF Staff-Monitored

Program (SMP) as a framework condition for

Banking Tier 3 and Tier 4 access (Economic Modules, Module II, Section 4.2).

The SMP is voluntary (Iran requests it)

but practically mandatory for framework advancement.

SMP scope: macroeconomic monitoring;

inflation control; foreign exchange

reserve management; banking sector consolidation; anti-money laundering compliance. The SMP does NOT impose

structural adjustment, privatization, or austerity — these are explicitly excluded by framework FX Stabilization Facility

provisions (Addendum B, Section 6).

IMF Article IV consultations with Iran

149 provide quarterly macroeconomic data

(inflation, GDP growth, reserve levels, exchange rates) that feeds into CIS symmetry metrics (Addendum B, Section 9)

and FX Stabilization Facility activation decisions.

IMF Technical Assistance: IMF provides

capacity-building support to Central Bank of Iran on: monetary policy frameworks; banking supervision; AML/CFT systems;

statistics compilation. Technical assistance is non-conditional and non-political.

IMF Neutrality Safeguards:

IMF staff reports to IMF Management, NOT

to framework governance body or any framework party.

IMF Article IV consultation reports are

published (with member country consent) on the IMF website — transparency prevents

hidden political manipulation.

IMF may suspend engagement with Iran if

Iran fails to meet SMP commitments, but

such suspension is an IMF institutional decision, NOT a framework party directive.

Framework explicitly protects IMF

independence: no framework party may pressure IMF Management or staff to alter economic assessments for political purposes. Violation = +1.5 CIS symmetry penalty.

150 1.4 Other Bretton Woods Institutions

Asian Infrastructure Investment Bank (AIIB):

Contributes \$250M to RDF Window D (energy interconnection). AIIB operates under its

own charter; RDF contribution is a bilateral financial agreement between AIIB and RDF Governing Board, NOT a political

European Investment Bank (EIB): Contributes

\$250M to RDF Window E (trade facilitation).

EIB Board of Directors approves contribution through standard EIB external mandate procedures.

African Development Bank (AfDB): Contributes

\$100M to Horn of Africa operations. AfDB Board approval required but follows standard procedure for regional integration projects.

Islamic Development Bank (IsDB):

Contributes to CCP insurance backstop

(FCIF, 20% share). IsDB Board approves through standard Islamic finance compliance review.

BLIND SPOT 2: BRICS & SCO INTERFACE

Placement: New standalone annex between Module II and Module III.

2.1 Problem Statement Iran is a full member of both BRICS (since January 2024) and the

151 Shanghai Cooperation Organisation (SCO, since July 2023). Russia

and China hold vetoes on the UN Security Council. If the RCSA framework is perceived as Western-dominated or threatening to BRICS/SCO interests, Moscow and Beijing may veto the UNSCR

[XXXX] endorsement resolution or undermine framework implementation through parallel institutions. The BRICS/SCO Interface ensures that Russia and China see the framework as

protecting their regional investments and energy security, not circumventing their influence. 2.2 BRICS Interface

BRICS New Development Bank (NDB) Coordination:

The NDB (headquartered in Shanghai) is

invited to contribute to RDF Window B

(regional infrastructure) as a "BRICS Infrastructure Partner."

NDB contribution: \$300M Phase 1; focused

on infrastructure projects in Iran, Iraq,

and Syria where NDB already has lending operations.

NDB projects under RCSA: financed through

standard NDB procedures (sovereign or non- sovereign lending; country systems approach); NOT subject to framework

governance body veto but subject to RDF fiduciary oversight if RDF co-financing is involved.

NDB liaison office established at JMOC

Geneva (1 representative; advisory capacity only).

BRICS Contingent Reserve Arrangement (CRA) Coordination:

152 The CRA (\$100B pool for BRICS member

liquidity support) may be activated for Iran if Iran experiences balance of payments crisis during framework

CRA activation is a BRICS internal

decision (not framework-controlled), but

framework welcomes CRA as complementary to RDF FX Stabilization Facility.

If CRA and RDF FX Facility are both

activated simultaneously: coordination

between IMF (RDF-linked) and BRICS CRA (BRICS-linked) required to avoid conflicting conditionality. Coordination

managed through "Bretton Woods-BRICS Macro Coordination Working Group" (quarterly teleconference; IMF + NDB +

RDF + Iranian Central Bank). BRICS Pay / Alternative Payment Systems:

The framework does NOT require Iran to

abandon BRICS Pay, bilateral currency swaps (yuan-rial, ruble-rial), or other non-dollar trade mechanisms.

Framework provides parallel channels:

U.S. dollar/euro/Swiss franc clearing through IHTA banking channel AND BRICS

alternative channels may coexist.

JMOC Financial Tracking Cell monitors

BOTH channels for sanctions evasion and spoiler financing. Monitoring is

channel-neutral — it targets illicit

153 activity, not payment system choice.

BRICS Observer Status at Framework Events:

BRICS Sherpa (representative of BRICS

rotating chair) invited as observer to

framework governance body ministerial sessions (non-voting; same status as

EU High Representative and Arab League SES).

BRICS Sherpa may submit written

opinions on economic and development aspects of framework implementation.

2.3 SCO (Shanghai Cooperation Organisation) Interface SCO Regional Anti-Terrorism Structure (RATS) Coordination:

SCO RATS (based in Tashkent) coordinates

counterterrorism intelligence sharing among SCO members (China, Russia, India, Pakistan, Iran, Central Asian states).

Framework establishes "SCO-RCSA

Counterterrorism Information Sharing Protocol": SCO RATS may share sanitized

intelligence on transnational terrorist networks (Category Delta spoilers) with JMOC PERT, subject to SCO internal

classification review.

Shared intelligence includes: ISIS/Al-

Qaeda network movements; foreign fighter

flows; weapons trafficking routes; financing networks. Source identities and collection methods are NOT shared.

JMOC PERT may request SCO RATS

intelligence support for specific

154 incidents involving transnational

spoilers; SCO RATS has 7-day response window (may decline if request conflicts with SCO member state interests).

SCO-Afghanistan Contact Group:

Afghanistan is not a framework party but

is a major source of regional instability

and spoiler activity.

SCO-Afghanistan Contact Group

(coordinated by SCO Secretariat) shares

quarterly assessments with JMOC on: Afghan refugee flows; Taliban cross-border activity; narcotics trafficking; terrorist safe havens.

Framework RDF may fund border

infrastructure projects (Iran-Afghanistan, Pakistan-Afghanistan, Central Asia-

Afghanistan) that SCO identifies as stability priorities. SCO Economic Cooperation:

SCO's Programme of Multilateral Trade and

Economic Cooperation includes energy, transport, and agriculture projects that overlap with RCSA economic corridors.

Framework recognizes SCO projects as "complementary" rather than competitive:

SCO's China-Pakistan Economic Corridor (CPEC) and SCO's International North-South Transport Corridor (INSTC) may interface with RCSA's Iraq-Jordan-Saudi and Syria-Jordan-Lebanon corridors.

155 Coordination managed through "SCO-RCSA

Economic Corridor Coordination Committee" (biannual meeting; SCO Secretariat + framework governance body secretariat).

2.4 Russia and China — Specific Veto Management Russia:

Russia's primary interests in the region:

Syria (military bases in Tartus and Khmeimim); Iran (weapons sales; nuclear cooperation; energy partnerships); regional arms market.

Framework accommodations for Russia:

* Syrian Zone 2 (Coastal/Rural Damascus) protection: framework does NOT require

Russian base withdrawal; Russian forces in Syria may remain under existing bilateral agreements.

* Russian weapons sales to Iran: framework does NOT prohibit existing contracts; prohibits only NEW proxy-directed

transfers of Category W1-W5 systems. * Russia designated as "Special Partner"

with MOM Commercial Stakeholder status

(if energy import criteria met) — provides early warning access for Russian energy companies and shipping.

If Russia threatens UNSC veto: guarantor

states (Oman, Pakistan) engage in direct bilateral diplomacy; BRICS Sherpa

negotiates within BRICS framework; potential for "abstention deal" (Russia

156 abstains rather than vetoes in exchange

for specific accommodations on Syrian zone or weapons sales timeline). China:

China's primary interests: energy security

(40%+ of Chinese oil imports from Middle East); Belt and Road Initiative (BRI)

projects in Iran, Iraq, Syria; Taiwan issue (wants to avoid precedents for international intervention in sovereignty).

Framework accommodations for China:

* China receives Energy Stakeholder Observer status with full MOM benefits (sanitized maritime feeds; 72-hour

strike buffer alerts; IHTA observer seat). * China's BRI projects in framework-

affected states are recognized as "complementary infrastructure"; RDF may co-finance BRI projects that align with

framework corridor priorities. * China's 25-year Iran cooperation agreement is explicitly protected;

framework does not modify existing bilateral economic agreements. * Taiwan sovereignty firewall: framework

explicitly states it does NOT create precedent for international intervention in

internal sovereignty matters;

framework is a "consensual regional security arrangement among sovereign

If China threatens UNSC veto: SCO

diplomacy channel activated; Chinese energy companies lobby for framework

stability (energy price volatility hurts Chinese economy); potential for "constructive abstention" (China

abstains while publicly noting sovereignty concerns).

BLIND SPOT 3: INTERPOL & FATF SYNCHRONIZATION

Placement: New standalone annex between Module III and Module IV. 3.1

Problem Statement

The Spoiler Containment Protocol 2.0 (Enforcement Modules, Module III) and the Proxy Activity Containment Module (Crisis-Management Modules, Module III) both require global police and financial intelligence cooperation to function. A proxy commander in Iraq

or Lebanon can only be "quarantined" if his name is on watchlists that banks, border agencies, and law enforcement worldwide recognize. Interpol Red Notices and FATF watchlists are the

primary global tools for this. The Interpol/FATF Synchronization creates a formal pipeline from JMOC/PERT to these institutions. 3.2 Interpol Red Notice Pipeline

JMOC-to-Interpol Process:

When PERT or Spoiler Containment Cell

identifies a spoiler commander or

operative as responsible for framework- violating activity (Tier 2+ spoiler

158 trigger; confirmed operational

leadership), JMOC forwards the following to Interpol General Secretariat (Lyon) via the National Central Bureau (NCB)

of the affected state: * Identifying information (name, aliases, date of birth, nationality,

photographs if available). * Framework violation summary (incident description; CIS scoring

impact; Spoiler Containment Protocol activation). * Request for Diffusion or Red Notice

issuance. * Assurance that the request is politically motivated ONLY by

framework compliance objectives, NOT by domestic political persecution (per Interpol Constitution Article 3:

"It is strictly forbidden for the Organization to undertake any intervention or activities of a

political, military, religious or racial character"). Interpol Review and Issuance:

Interpol General Secretariat reviews

JMOC request for compliance with Interpol Constitution Article 3 (no political motivation).

Review criteria: Is the individual

accused of violent crime, terrorism, or

159 organized crime? Is there sufficient

evidentiary basis? Is the request from a recognized law enforcement authority (JMOC is NOT a law enforcement authority;

request must be channeled through a member state's NCB — typically Switzerland or Oman as neutral

If approved: Interpol issues Diffusion

(immediate, bilateral sharing with

selected NCBs) or Red Notice (global circulation to all 196 member states).

Red Notice content: "Wanted for

[terrorism/violent crime/organized

crime] in connection with framework violation incident [reference number].

Subject to Spoiler Containment Protocol

of RCSA." Red Notice Limitations:

Interpol Red Notice is NOT an

international arrest warrant. It is a request for law enforcement cooperation.

Arrest depends on national legislation

and extradition treaties.

Framework parties may NOT use Red Notice

mechanism to target political opponents,

dissidents, or individuals unrelated to spoiler activity. Misuse detected by

Interpol Commission for the Control of

Interpol's Files (CCF) triggers: Red Notice deletion; framework party

160 suspension from JMOC-to-Interpol pipeline

for 180 days; +1.5 CIS procedural penalty.

Individuals on Red Notice may appeal

to CCF; framework does NOT interfere with CCF procedures. 3.3 FATF Synchronization

FATF-Iran Engagement:

Iran is currently designated as a

"High-Risk Jurisdiction subject to a

Call for Action" (FATF "blacklist") due to strategic deficiencies in AML/CFT.

The framework does NOT automatically

remove Iran from FATF blacklist. Instead,

it creates a "parallel compliance track": * Iran continues implementing FATF Action Plan (addressing 2015

deficiencies) as a framework condition for Banking Tier 3 and Tier 4 access.

* IMF and World Bank provide technical assistance for Iran's FATF compliance (same as Blind Spot 1 Bretton Woods

Mandate). * FATF International Cooperation Review Group (ICRG) conducts annual review of

Iran's progress; review results shared with framework governance body (sanitized; no confidential FATF

deliberations disclosed). * If Iran achieves "substantial

161 progress" on FATF Action Plan: FATF

may downgrade Iran to "jurisdiction under increased monitoring" (grey list); this downgrade unlocks Banking

Tier 3 (5 designated Iranian banks).

If Iran achieves full compliance:

FATF removes Iran from blacklist;

this unlocks Banking Tier 4 (all compliant Iranian banks). JMOC-to-FATF Financial Intelligence Pipeline:

JMOC Financial Tracking Cell shares

sanitized proxy financing intelligence with FATF through the following channel: * JMOC → Swiss Federal Department of

Finance (FDF) → FATF Secretariat (Paris). * Shared data: Transaction patterns

linked to known spoiler entities; VASP wallet addresses; correspondent banking anomalies; trade-based money

laundering schemes. * NOT shared: Individual bank customer data; source of intelligence;

domestic Iranian banking information unrelated to spoiler financing.

FATF may incorporate JMOC intelligence

into its Mutual Evaluation Reports for relevant jurisdictions (e.g., if UAE banks are facilitating spoiler

financing, FATF UAE evaluation reflects this).

162 FATF may issue "Public Statement"

urging jurisdictions to address framework-related AML/CFT gaps. FATF Regional Bodies:

Middle East and North Africa Financial

Action Task Force (MENAFATF): Framework cooperates with MENAFATF on regional

AML/CFT capacity building; MENAFATF evaluators may access JMOC financial

intelligence for mutual evaluation

purposes (with governance body authorization).

Eurasian Group (EAG): Cooperates on

Central Asian transit routes for spoiler

financing; EAG shares intelligence with JMOC on Afghanistan-Pakistan-Iran financial corridors.

Asia/Pacific Group (APG): Cooperates on

East Asian banking channels used for Iranian sanctions evasion; APG shares

intelligence on Chinese, Japanese, South Korean bank compliance with framework White Channel.

3.4 Banking Watchlist Integration

When a spoiler entity is designated under

Spoiler Containment Protocol 2.0 Financial

Quarantine, JMOC transmits the entity's identifying information (names, aliases, corporate registrations, beneficial owners,

known financial accounts, cryptocurrency wallets) to:

163 * U.S. OFAC (for SDN List update).

EU Council (for EU sanctions list update). UK HM Treasury (for UK sanctions list

update). * UN Security Council (for UN sanctions list update — if applicable).

* FATF (for typologies and red flag guidance).

Banks in all framework-compliant

jurisdictions required to update sanctions screening software within 30 days of watchlist update.

Automated screening: When a framework-

designated spoiler entity attempts a transaction through the banking channel, automatic block triggers; transaction

reported to JMOC Financial Tracking Cell within 4 hours.

BLIND SPOT 4: PEACE VS. JUSTICE JURISDICTIONAL FIREWALL (ICC/ICJ)

Placement: New standalone annex between Module IV and Module V. 4.1 Problem Statement

In Block 4, the Civilian Protection Monitoring Cell (CPMC) generates forensic-quality evidence of civilian casualties, hospital strikes, and humanitarian blockages. This data could

constitute evidence of war crimes under the Rome Statute of the International Criminal Court (ICC). If the CPMC automatically

164 forwards this data to the ICC Prosecutor, sitting leaders and

commanders will abandon the framework immediately to avoid arrest warrants. At the same time, the framework cannot become a "safe harbor for war criminals." The Peace vs. Justice

Jurisdictional Firewall creates a highly specific legal architecture that allows accountability through the framework's Graduated Penalty Ladder while protecting the diplomatic table

from ICC collapse dynamics. 4.2 Core Principle: Internal Accountability First, External Justice Second

The framework operates on the principle of "complementarity on steroids" —

an expanded version of Rome Statute Article 17, which provides that the ICC is complementary to national

criminal jurisdictions and may only act when national jurisdictions are "unwilling or unable" to prosecute. Framework Complementarity Doctrine:

The RCSA Graduated Penalty Ladder

(Enforcement Modules, Module II) and CIS scoring system constitute a

"functioning accountability mechanism" for framework violations that cause civilian harm.

As long as the framework's internal

accountability mechanisms are operational and producing measurable consequences (CIS penalties; benefit

suspensions; reparations; spoiler quarantine; governance body condemnation), the framework qualifies

as "able and willing" to address violations through its own institutional

The ICC Prosecutor may initiate

preliminary examination of framework- related incidents ONLY if: (a) the

framework has collapsed (Level 4 degradation); OR (b) a specific incident involves systematic and

widespread attack against civilian population that the framework's internal mechanisms demonstrably

failed to address; OR (c) the responsible state has formally withdrawn from the framework and

thereby removed itself from internal accountability.

While the framework is operational

(Levels 1-3 degradation or full

compliance): ICC Prosecutor DEFERS to framework internal accountability.

This deferral is NOT amnesty; it is

"complementarity-based sequencing" that prioritizes framework survival over immediate prosecution.

4.3 CPMC Data Firewall The CPMC operates under strict data handling protocols that prevent automatic transmission to external judicial

bodies: Tier 1 — CPMC Internal Use (All Data):

All CPMC findings (mortality counts;

blockage verification; medical supply shortage indices) are used EXCLUSIVELY

CIS scoring (internal framework compliance assessment). BAP proceedings (binding arbitration

between framework parties). * CPMC quarterly public reports (aggregated, anonymized data only).

* UN OCHA humanitarian coordination (operational, not judicial use).

CPMC Director has sole authority to

determine whether specific data may be released outside CPMC for non-framework purposes.

Tier 2 — ICRC Access (Protected Only):

ICRC receives CPMC data on detainee

treatment, medical facility access, and civilian protection for ICRC's

independent mandate under Geneva Conventions.

ICRC data is subject to ICRC's

"principle of confidentiality" — ICRC may NOT share CPMC-sourced data with ICC, domestic courts, or other third

parties without CPMC Director authorization AND ICRC's own institutional approval.

Tier 3 — BAP Admissibility (Limited):

CPMC findings are admissible as evidence

in BAP proceedings for framework

BAP proceedings are binding on framework

167 parties but do NOT create criminal

liability. BAP awards are civil/ administrative in nature (compensation; compliance orders; penalty

BAP awards may NOT be transmitted to

ICC or domestic prosecutors as

evidence of criminal conduct without unanimous BAP panel approval AND governance body authorization.

Tier 4 — External Judicial Release (Highly Restricted):

CPMC data may be released to ICC

Prosecutor ONLY upon:

(a) Framework collapse (Level 4 degradation); OR (b) Governance body supermajority

vote (75% + neutral chair) authorizing release for specific incident; OR

(c) UN Security Council referral under Rome Statute Article 13(b); OR

(d) State Party referral under Rome Statute Article 14 (the referring state must be the state on whose

territory the crime occurred OR the state of nationality of the accused).

Release requires: CPMC Director

certification that data is

168 forensically reliable; Swiss Federal

Department of Justice review for compliance with data protection law; UN OCHA humanitarian impact assessment

(will release destabilize ongoing humanitarian operations?). 4.4 Individual Accountability Pathway

While shielding the framework from immediate ICC collapse, the architecture creates a genuine accountability pathway for individuals responsible

for grave violations: Framework Internal Accountability:

Military commanders responsible for

PHAR-registered facility strikes: automatic CIS state-level penalty; potential individual command

responsibility under domestic military justice (if their state's military law incorporates Geneva Conventions).

Proxy commanders responsible for mass-

casualty events: Spoiler Containment Protocol quarantine; Interpol Red Notice; financial asset freeze;

exclusion from all framework benefits.

Political leaders who order systematic

humanitarian blockage: Step 3 or Step

4 Penalty Ladder (state-level); governance body public condemnation;
potential domestic political

consequences (elections; parliamentary censure; international reputation

Deferred ICC Pathway:

If an individual leaves office (loses

head-of-state immunity) AND the

framework has collapsed or the individual's state has withdrawn: ICC
jurisdiction activates (subject to Rome Statute

temporal and territorial requirements).

If an individual's state is a Rome

Statute party: domestic prosecution

under universal jurisdiction or national implementing legislation may proceed
independently of framework status (this is domestic sovereignty,

not framework-controlled).

ICC may issue sealed arrest warrants

during framework active status if

Prosecutor determines that unsealing would not destabilize framework (highly
unusual; requires Prosecutor's

discretionary assessment). ICJ Advisory Jurisdiction:

The International Court of Justice

(ICJ) may issue advisory opinions on framework-related legal questions if
requested by UN General Assembly or

Advisory opinions are non-binding but carry significant legal weight.

Framework parties may request ICJ advisory opinion on: NPT Article II

170 interpretation (enrichment rights);

UNCLOS transit passage compatibility (IHTA tolls); Geneva Conventions applicability (PHAR strict liability).

ICJ advisory opinions are NOT

criminal proceedings and do NOT target individuals — they clarify legal standards. Therefore, ICJ advisory proceedings do NOT trigger the same "existential threat" dynamics as ICC

arrest warrants. 4.5 Amnesty and Pardon Prohibitions

The framework does NOT provide amnesty for

genocide, crimes against humanity, or war

crimes. Internal accountability (CIS scoring; reparations; spoiler quarantine) is NOT equivalent to amnesty.

Framework parties may NOT issue domestic

pardons for military commanders responsible for PHAR-registered facility

strikes until 5 years after framework termination or individual retirement from active service (whichever comes later).

If a domestic pardon is issued in

violation: +2.0 CIS procedural penalty; governance body condemnation; ICC

Prosecutor receives automatic notification (this is the ONE exception to the data firewall — domestic pardons

for grave breaches trigger automatic ICC notification because they demonstrate

171 "unwillingness" to prosecute under Rome

Statute Article 17). 4.6 Transitional Justice Sequencing When framework reaches Phase 3 or steady state,

a "Transitional Justice Window" opens:

Framework parties may establish "Truth and

Reconciliation Commissions" for framework-

period violations (modeled on South Africa, Peru, Sierra Leone).

Commissions are domestic (not international)

but may receive international technical assistance (UN OHCHR; ICTJ).

Commissions produce public reports;

recommend reparations; may recommend

prosecutions for non-amnestied crimes.

ICC retains jurisdiction for crimes

falling outside commission mandate or

where commission recommendations are not implemented.

Transitional Justice Window does NOT

open until framework has achieved 24 months of verified Phase 3 compliance — ensuring framework stability before

accountability processes begin.

APPENDIX TO INSTITUTIONAL INTEGRATION MODULES

A. INSTITUTIONAL CROSS-REFERENCE MAP

172 Module I (UN Coordination):

UNIFIL: UNSCR 1701 upgrade; JMOC fusion;

PERT integration; PFZ-1 enforcement; ROE enhancement.

UNAMI: UNSCR 2732 extension; PMF

integration monitoring; base perimeter coordination; spoiler reporting.

UNVIM: Arms embargo + framework

compliance; revenue-sharing verification; Humanitarian Logistics Hub integration.

UN OCHA: Supreme humanitarian

coordinator; military deconfliction authority; protected zones; ICRC coordination.

Module II (Regional Organizations):

GCC: IHTA Council 25% voting; RDF

\$1.6B contribution; maritime patrol

coordination; grid interconnection.

Arab League: Syrian De-Escalation

Zones umbrella; Saudi-Israel

normalization cover; Iraq stabilization platform; SES observer at governance body.

EU: Sanctions mirroring; Blocking

Statute enforcement; Swiss SPV

coordination; ECB clearing; EIB contribution; CCP parallel protection.

AU: AUMOM maritime observers; Djibouti

Code of Conduct integration; Horn of Africa counter-spoiler; AfDB contribution.

Module III (Multilateral Observer):

173 Energy Stakeholders: China, Japan, South

Korea, India — sanitized maritime feeds; 72-hour strike buffer alerts; IHTA observer seats; RDF contributor status.

Commercial Stakeholders: Shipping

companies; energy traders; port operators — IHTA Green Pass; threat feeds; insurance coordination.

Explicit exclusions: No veto; no BAP

membership; no PERT participation; no escrow authority; no snapback trigger; no military coordination. Module IV (Treaty Compatibility):

NPT: Article II confirmation; Article IV

affirmation; Article X withdrawal triggers; Additional Protocol integration.

UNCLOS: Transit passage rights; Article

26 service fees; ITLOS backstop; maritime boundary neutrality.

Geneva Conventions: IHL supremacy; PHAR

strict liability as GC operationalization; domestic ROE firewall; individual

command

JCPOA Supersession: UNSCR 2231 repeal;

sunset provision elimination; unilateral snapback abolition.

Bilateral treaties: U.S.-GCC defense;

Iran-Russia; Iran-China; Abraham Accords; Iran-Iraq — all preserved where not

superseded; conflict hierarchy established.

174 Module V (UNSC Resolution):

10 Articles: Binding endorsement; 2231

repeal; IAEA mandate; UN mission upgrades; JMOC/PERT chartering; humanitarian

protection; economic legitimization; NPT reaffirmation; dispute resolution; review and renewal.

Chapter VII basis: Determination of threat

to international peace and security.

Veto management: Russia and China

accommodations through BRICS/SCO interface.

Blind Spot 1 (Bretton Woods):

World Bank: RCSF as FIF under OP/BP

14.40; Board of Executive Directors

notification; fiduciary neutrality safeguards; IAD and IEG oversight.

IMF: SMP as voluntary but practically

mandatory; Article IV quarterly data; technical assistance; institutional independence protection.

Other MDBs: AIIB; EIB; AfDB; IsDB —

standard contribution procedures. Blind Spot 2 (BRICS/SCO):

BRICS: NDB coordination; CRA

complementarity; BRICS Pay coexistence; Sherpa observer status.

SCO: RATS counterterrorism intelligence

sharing; Afghanistan Contact Group; economic corridor coordination.

Russia: Syria base protection; weapons

175 sales grandfathering; Special Partner

status; veto management through abstention deal.

China: Energy Stakeholder observer; BRI

complementarity; 25-year agreement protection; Taiwan sovereignty firewall; constructive abstention strategy.

Blind Spot 3 (Interpol/FATF):

Interpol: JMOC-to-NCB pipeline; Red

Notice issuance; CCF oversight; misuse

FATF: Iran parallel compliance track;

JMOC-to-FATF financial intelligence; MENAFATF/EAG/APG regional coordination;

banking watchlist integration. Blind Spot 4 (ICC/ICJ Firewall):

ICC: Complementarity on steroids;

framework internal accountability as functioning jurisdiction; CPMC data firewall (4 tiers); deferred ICC

pathway; individual accountability sequencing; amnesty prohibitions; pardon restrictions; transitional

ICJ: Advisory jurisdiction for legal

standard clarification (non-criminal;

non-threatening to individuals). B. RESOLUTION ADOPTION STRATEGY The following is the recommended diplomatic sequence for

UNSCR [XXXX] adoption: Phase A — Pre-Negotiation (Months 1-3 before

P5 consultations (U.S., UK, France,

Russia, China): informal briefings on framework architecture; bilateral

accommodation negotiations (Russia: Syrian bases; China: BRI/Taiwan firewall).

E10 consultations (10 elected UNSC

members): briefings on framework humanitarian and economic benefits;

solicitation of co-sponsorship.

Guarantor state diplomacy (Oman,

Pakistan, Switzerland): bilateral outreach to all UNSC members

emphasizing neutral mediation role and regional stability benefits.

BRICS/SCO coordination: BRICS Sherpa

and SCO Secretariat briefed on framework; Russia and China coordinate within BRICS/SCO before taking UNSC

positions. Phase B — Draft Circulation (Month 4):

Draft resolution circulated to all

UNSC members by depositary (UN Secretary-General, acting on framework party request).

30-day consultation period; written

comments incorporated where they do not undermine core architecture.

Draft amended to reflect P5 concerns

(within limits — Tier 1 provisions not

Phase C — Voting (Month 5):

Resolution tabled by co-sponsors (minimum

3: U.S., Oman, Pakistan recommended).

Vote scheduled with 48-hour notice. If Russia or China signals veto: 24-hour

emergency diplomacy window; guarantors propose last-minute accommodation (e.g., additional language on Syrian

base protection; explicit Taiwan firewall; expanded BRICS observer status).

If veto deployed: framework proceeds

without UNSC endorsement as "political commitment" rather than Chapter VII

binding law — durability reduced but not eliminated (still binding on signatories under Vienna Convention on the Law of

Treaties). C. DOCUMENT CONTROL These modules are classified Tier 1 (must survive in any framework

version). The UNSC Resolution Blueprint (Module V) requires UNSC Chapter VII adoption for legal force; provisions contingent on UNSC resolution may not take effect until resolution is adopted.

Bretton Woods Mandate (Blind Spot 1) provisions require World Bank Management authorization and IMF Management concurrence for implementation. BRICS/SCO Interface (Blind Spot 2) provisions

require diplomatic engagement with BRICS Sherpa and SCO Secretariat. Interpol/FATF Synchronization (Blind Spot 3) requires Interpol General Secretariat and FATF Plenary

acknowledgment (non-binding but operationally necessary).

178 Peace vs. Justice Firewall (Blind Spot 4) does NOT require

external authorization; it is a unilateral framework commitment to ICC complementarity. Structural amendments to any module or blind spot require

governance body consensus. Technical clarifications may be issued by the Institutional Integration Sub-Committee (UN Under-Secretary-General for Political Affairs chair) via

Silence Procedure (72-hour auto-adoption). All modifications recorded in the Precedent Registry. Document Identifier: RCSA-Inst-v1.5

Classification: Framework Institutional Integration Reference Depository: UN Secretary-General (upon framework entry into force) Preparation Date: 2026

Integration Note: This module set is the final block of RCSA Version 1.5. All previous modules (Verification & Technical Architecture; Enforcement & Dispute Resolution; Humanitarian &

Civilian Protection; Economic & Financial Architecture; Hardened Regional Partner Protocols; Stress-Tested Hardening Protocols; Crisis-Management & De-Escalation) are cross-referenced herein.

The institutional integration layer provides the multilateral legitimacy and legal enforceability that transforms the RCSA from a political agreement into

binding international law.

179 Key Annexes Summary

The framework contains multiple annexes addressing specific functional domains. The following summary provides reference for the scope and activation conditions of each annex. Table 9 Annex Activation Matrix

Annex Subject Activation Status

A Core Layer Obligations Summary Phase 0 Mandatory B Humanitarian Baseline Metrics Phase 0 Mandatory C Joint Implementation Group Charter Phase 0 Mandatory D Contingency Triggers and Fallback Pathways Phase 0 Mandatory M Hezbollah Disarmament and Integration Phase 2 or 3 Optional N Houthi De-escalation and Integration Phase 2 or 3 Optional O-P Iraqi Political and Militia Integration Phase 2 or 3 Optional Q Israel-Iran Deconfliction Phase 2 essential; Phase 0/1 Optional optional R Syria Stabilization Phase 3 essential; Phase 2 Optional optional

Notable Annex Descriptions

Annex Z: Nuclear Stabilization Integration A mandatory companion to Phase 0, establishing a three-site architecture (Fordow, Natanz, Isfahan), a 15- day review cycle system, and a four-phase nuclear pathway. Full integration of facility conversion protocols and monitoring continuity provisions. Annex HH: Treaty Resilience and Institutional Continuity Mandatory protocol addressing technical lapse procedures, treaty survival in institutional collapse, preliminary stabilization instruments, liaison offices, Pakistan as joint guarantor, precedent registry, dual- speed interpretation, and weighted majority standards. Also establishes a 15-year oil moratorium architecture and compliance cost symmetry mechanisms. Annex GG: International Hormuz Transit Authority Three-tier tolling system with Iranian civilian reconstruction fund allocation, maritime de-escalation protocols, vessel seizure procedures, and toll phase-down linked to nuclear compliance milestones. Annex JJ: Regional Economic Incentive Architecture Twenty compliance-linked

economic incentives with \$300+ billion decade impact. Phase 0 quick-wins of \$15+ billion; Phase 1 boom of \$58+ billion. Designed to make defection cost-prohibitive through constituency pressure. Annex LL: Trilateral Stability Architecture Addresses Israel-Lebanon-Hezbollah dynamics through a calibrated 15-point framework with review cycle integration. Includes parallel unilateral steps for asymmetric actor handling and a tripartite monitoring mechanism anchored to national forces. Activates in Phase 2 or Phase 3 by governance body consensus. Annex NN: Domestic Opposition Management Provides mechanisms for managing internal political opposition to framework participation. Includes legislative safeguard provisions, bipartisan quorum engineering, lobbying transparency registry, neutral information hub, disinformation countermeasures, crisis lock for proxy incidents, defense sector pivot mandates, and compliance simulation tools. These provisions are designed to protect the framework from internal sabotage without restricting legitimate democratic deliberation.

Appendix A: Canonical Core Definitions Breach. A confirmed failure to perform a specific obligation on its due date, verified by the governance body. A breach is distinct from a Technical Lapse and from a pattern-of-concern designation. Not every violation constitutes a breach; not every breach is material. Material Breach. A breach that fundamentally undermines the purpose of the specific provision. Requires governance body determination, not unilateral characterization. Technical Lapse. A delay of up to 45 days in meeting a scheduled milestone where core obligations are still being performed and the delay is logistical or administrative. Does not constitute breach and does not activate enforcement unless uncured after 45 days.

Stabilization Hold. A time-limited pause in new obligation activation (not existing obligation performance), triggered by either party for up to 30 days (renewable to maximum 120 consecutive days). Not a breach and does not

constitute bad faith. Quiet Implementation Mode. A mode in which public announcements about implementation are reduced or batched, without altering substance of obligations, verification, or oversight. Active for maximum 45 consecutive days. Proportionate Response. A consequence limited in scope to the domain and severity of the triggering event. Disproportionate responses require governance body authorization and neutral chair concurrence. Appendix B: Rapid Results Layer (Days 0-30) The Rapid Results Layer produces publicly visible, headline-ready deliverables within 30 days of entry into force. Its purpose is to create immediate domestic political cover, demonstrate framework viability, and generate momentum for longer processes. Table 10 Rapid Results Milestones

Day Milestone Verification

U.S. Treasury, Iranian Dual bank confirmation CBI Day 14 Nuclear facility declaration complete Iranian AEOI, IAEA IAEA confirms receipt Day 21 Humanitarian banking channel operational U.S. Treasury, Iranian First transactions CBI Day 30 First governance plenary; Tranche 1 relief formally Governance co-chairs Phase 0 declared declared active Day 45 IAEA baseline inspection complete IAEA, Iranian AEOI Baseline report issued Day 90 Tranche 2: banking + asset release; first review Governance body Compliance score cycle close published Day Phase 0 Gate Review Ministerial review Phase 1 option or 180 extension Appendix D: Documentation and Modification Guide This framework document is constructed for modular extension and amendment. The following conventions facilitate future modification:

Section IDs: All sections carry unique HTML identifiers (e.g.,) for direct linking and cross- referencing Data Labels: All figures and tables use data-label attributes for automatic numbering Modular Annexes: Each annex is designed as a self-contained module that may be added, removed, or modified without affecting core provisions Priority Tiers: All mechanisms are labeled Tier 1 (essential), Tier 2 (conditional), or Tier 3 (optional) to guide negotiation prioritization

SSOT Layer: Core definitions and enforcement hierarchies are maintained in a Single Source of Truth layer that takes precedence over annex-specific provisions Modifications to this document should preserve the hierarchical conflict resolution principles and maintain institutional binding provisions. All amendments require governance body consensus for structural changes; procedural adjustments may be approved by working-level consultation.

Document Structure for Future Editors

This HTML document uses semantic sectioning with clear heading hierarchies (h1 for major sections, h2 for subsections, h3 for detailed provisions). CSS

classes are applied consistently: for summary callouts, .highlight-box for important principles, .overview-box for multi-element summaries. Charts are embedded as PNG images with figure captions. Tables use three-line styling with thead and tbody separation. All content is contained within the body element with no external dependencies beyond the assets folder. Appendix F: Document Control and Extension This document is designed for operational use and iterative extension. Future editors should observe the following protocols:

All sections carry persistent identifiers for stable cross-referencing. When adding new sections, use the format sec-[subject] for section IDs and fig-N or table-N for figure and table references. Numbering should follow sequential order within each category.

New annexes may be added using the next available letter designation. Each annex must specify: subject matter, activation phase, mandatory or optional status, and relationship to existing annexes. New annexes should be registered in the Annex Activation Matrix (Table 9) and cross-referenced in the Table of Contents.

Material amendments to core provisions require governance body consensus. Technical clarifications may be issued as interpretive guidance without formal

amendment. All interpretations are recorded in the Precedent Registry maintained by the governance secretariat.

This document is intended for: senior negotiators, technical implementation officers, legal and compliance officers, governance body secretariat staff, and authorized third-party guarantors. Distribution beyond these circles requires governance body authorization. Notice: This is a condensed reference edition of a broader

6 Implementation Sequencing Modules

framework architecture. For comprehensive operative text, consult the full master document and applicable annexes. This edition prioritizes accessibility and professional presentation over exhaustive procedural detail.

Implementation Sequencing Modules

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA) v1.5

MODULE IX — IMPLEMENTATION & SEQUENCING Document Identifier: RCSA-Impl-v1.5 Classification: Tier 1 (Implementation-Critical)

Status: Final Draft for Framework Integration Date: 2026-05-04

PREAMBLE: FROM NEGOTIATION TO OPERATION

The preceding eight module blocks of RCSA v1.5 establish the functional, legal, and institutional architecture of the Framework. This module translates that architecture into time-bound, event-driven action. It does not replace prior modules; it operationalizes them. Core design principles:

1. EVENT-DRIVEN PROGRESSION — Phase advancement depends on verified milestone

completion, not calendar expiration. Dates are indicative; gate criteria are

binding.

1. PARALLEL STREAMS — Nuclear verification, humanitarian access, economic

normalization, and proxy containment proceed simultaneously, not sequentially.

1. TIER 1 SURVIVAL — Any provision marked Tier 1 in prior modules survives regardless of Implementation phase status. Tier 1 obligations are

1. ROLLING RENEWAL — The Framework operates on renewable 5-year cycles with

7 automatic continuity unless a Sunset Trigger is activated per Module IV

1. GRACEFUL DEGRADATION — All sequencing assumes the 4-level Graceful Degradation Protocol (Addendum B, Section 11) as the backstop; sequencing never collapses to zero without passing through Levels 1-3. Cross-reference index for this module:

Tech: Verification & Technical Architecture (RCSA-Tech-v1.5) Enforce: Enforcement & Dispute Resolution (RCSA-Enforce-v1.5) Hum: Humanitarian & Civilian Protection (RCSA-Hum-v1.5)

Econ: Economic & Financial Architecture (RCSA-Econ-v1.5) AddB: Addendum B Stress-Tested Hardening (RCSA-AddB-v1.5) Crisis: Crisis-Management & De-Escalation (RCSA-Crisis-v1.5)

Inst: Institutional Integration (RCSA-Inst-v1.5) AddA: Hardened Regional Partner Protocols (Addendum A)

MODULE I — 100-DAY QUICK START (Days 1-100)

Purpose: Establish irreversible momentum in the four parallel streams before

political friction, bureaucratic inertia, or spoiler activity can stall the

Framework at birth. The 100-Day Quick Start is not a pilot; it is a forced-march deployment of binding Tier 1 infrastructure. Governance Skeleton for Days 1-100:

Executive Steering Group (ESG): Five permanent members (U.S., Iran, EU/EEAS, NACA [Non-Aligned Co-Administrator per AddB Section 5], Host Government of JMOC Geneva hub). Meets weekly via secure video. Decisions by consensus; deadlock falls to BAP expedited track (Enforce, Module I, Section 4).

Implementation Secretariat: Physically co-located with JMOC in Geneva; staffed by seconded personnel from ESG members. Manages daily milestone tracking, corridor logistics coordination, and scorecard data ingestion.

8 Joint Verification Task Force (JVTF): Drawn from IAEA, NACA technical cadre, and host-state observers. Operationalizes Tech Module I managed access protocols within 72 hours of Day 1 trigger.

Section 1: Nuclear / Sanctions Handshake Stream (Days 1-30)

Objectives: (a) Freeze expansion of sanctioned activities, (b) establish IAEA managed access baseline, (c) unlock escrow account for Phase 1 RDF seed funding. 1.1 Day 1-3 — Trigger & Notification

Upon signature/adoption of RCSA by all Framework Parties:

U.S. Treasury issues White Channel general license update per Hum

Module I, Section 3, authorizing pharmaceutical, medical device, and

agricultural commodity transactions with Iranian financial institutions designated under existing executive orders.

Iran issues diplomatic note to IAEA Director General inviting managed access teams to declared facilities within 72 hours per Tech Module I, Section 2.

EU/EEAS activates INSTEX-equivalent clearing node for humanitarian and RDF-qualifying trade (Econ Module II, Section 4). 1.2 Day 4-15 — Baseline Establishment

IAEA installs managed access equipment at Natanz, Fordow, and Isfahan conversion facilities per pre-negotiated equipment lists (Tech Module I, Annex A). NACA Co-Administrator observers present at all installations.

U.S. suspends application of sanctions specified in Annex B of the Sanctions Synchronization Module (Econ Module II) for a 90-day renewable period, conditioned on IAEA confirmation of no enrichment above 3.67%

U-235 at declared sites.

RDF escrow account at BIS/UNDP receives first tranche (\$250M) from voluntary donors (Econ Module I, Section 5).

1.3 Day 16-30 — Verification Checkpoint Alpha (VCA) Criteria to pass VCA:

9 (a) IAEA confirms installation completeness at 100% of declared sites.

(b) No detected diversion of declared nuclear material (quantitative). (c) U.S. confirms White Channel transactions clearing without OFAC interference (Hum Module I, Section 3.4).

(d) RDF escrow releases first micro-project envelope (\$25M) to Jordanian and Lebanese host-country implementing agencies. If VCA fails: ESG convenes within 48 hours. Default resolution: 15-day

extension with targeted remedial obligations. If VCA fails twice, Crisis Module

II 72-Hour De-Escalation Window is automatically invoked to preventFramework collapse.

Section 2: Humanitarian Surge Stream (Days 1-60)

Objectives: Demonstrate tangible civilian benefit within sixty days to inoculate Framework against domestic political backlash. 2.1 Day 1-14 — PHAR Activation

Protected Humanitarian Asset Registry (Hum Module II, Section 2) opens with initial entries: 4 major hospitals (Damascus, Sanaa, Tehran, Beirut), 2 water-treatment plants, 1 electricity substation, 1 refugee camp.

JMOC Geneva issues geofence coordinates to all Framework Parties and posts encrypted navigation files to PHAR Portal.

All Parties issue theater-wide instructions: PHAR-listed assets are strict-liability protected; any kinetic or cyber event triggers automatic

PERT activation (Crisis Module IV). 2.2 Day 15-30 — White Channel Surge

Target: 50 humanitarian transactions (pharma, medical devices, agri-goods) cleared through White Channel in 30 days.

HCVC (Humanitarian Corridor Verification Cell) per Hum Module I, Section 4 establishes physical presence at Port of Entry nodes: Umm Qasr (Iraq),

Beirut Port, Dubai Jebel Ali (transshipment), Port of Aden (conditional).

PHAR Registry expands to 12 installations.

10 2.3 Day 31-60 — Rapid Aid Deployment Boot-Up

Pre-positioned stockpiles per Hum Module III, Section 3 are released

from Qatar, Oman, and Turkey storage sites.

First CPMC (Civilian Protection Monitoring Cell) field team deploys to host location (Hum Module II, Section 3). Team composition: 6 monitors (2 legal, 2 medical, 2 security liaison), unarmed, under PHAR protection.

Target: 100,000 beneficiaries reached with food, medical, or shelter assistance within 60 days.

2.4 Day 60 Checkpoint — Humanitarian Viability Gate (HVG) Pass criteria: (a) ≥ 80 White Channel transactions cleared.

(b) PHAR Registry ≥ 10 active sites with zero integrity violations. (c) $\geq 75,000$ beneficiaries reached (75% of target allows passage). (d) CPMC field team operational and reporting.

HVG failure: Does not pause nuclear stream, but triggers ESG emergency humanitarian task force and unlocks AddB Section 6 (OFAC Failure Contingency) if White Channel blockage is the cause.

Section 3: Deconfliction & Security Stream (Days 15-45)

Objectives: Prevent accidental engagement between Framework Parties' military and proxy forces during the vulnerable startup period. 3.1 Day 15 — Hotline Protocol Activation (Crisis Module I)

All Tier 1 hotlines (Military-to-Military, Intelligence Liaison,

JMOC Operations, Humanitarian) are tested with 24-hour round-trip communication drills.

Proxy Forces Notification (Crisis Module III) issued to all identified non-state armed groups in PFZ-Alpha through PFZ-Epsilon per Crisis Module III, Annex. Notification includes geofence boundaries and

escalation ladder. 3.2 Day 20 — 72-Hour De-Escalation Window Live

11 Strike Buffer (Crisis Module II) becomes active. Any Party may invoke the 72-Hour Window by encrypted notification to JMOC. Default response: JMOC issues PAUSE advisory to all Parties within 4 hours.

Exception: Active Barrage Exemption (Crisis Module II, Section 3.2) is flagged but not yet exercised unless incoming fire exceeds threshold.

3.3 Day 30 — JMOC Geneva Fully Operational

24/7 watch floor staffed per Tech Module III, Section 2.

Dual-key control (AddB Section 1) active: U.S. and NACA each hold one cryptographic key for command-and-control system activation.

Real-time data feeds from IAEA, PHAR, IHTA tolling nodes (Econ Module III), and regional satellite courtesy reconnaissance. 3.4 Day 45 — Security Viability Gate (SVG)

Pass criteria: (a) Zero unintended kinetic engagements between Framework Party forces. (b) All hotlines respond within 4 hours (Tier 1 standard).

(c) JMOC watch floor achieves 99.5% uptime. (d) At least 3 proxy force acknowledgments of PFZ notification recorded. SVG failure: Activates Spoiler Containment Protocol Level 1 (Enforce

Module III) against non-compliant proxy elements.

Section 4: No-Surprise Window (Days 1-100 Continuous)

During the 100-Day Quick Start, all Framework Parties adhere to enhanced notification obligations beyond baseline RCSA requirements:

4.1 Military Movements

Any deployment of >500 personnel or major weapons systems (defined per Crisis Module I, Annex B) within 200km of a PFZ boundary requires

72-hour advance notice to JMOC, copied to all Parties. 4.2 Sanctions Designations

No new unilateral sanctions designations against Framework Party entities by any other Framework Party during Days 1-100, except under Spoiler

12 Containment Protocol (Enforce Module III) or BAP ruling (Enforce Module I).

4.3 Proxy Activity Cap

Proxy forces affiliated with Framework Parties maintain activity below pre-Framework baseline (measured by PERT incident frequency index, Crisis Module IV, Section 2). JMOC publishes weekly anonymized index. 4.4 Media / Narrative

Parties refrain from official statements characterizing other Parties as "terrorist state," "illegitimate regime," or equivalent terms during Days 1-100. Violations logged in Compliance Scorecard (Module III) but do not trigger automatic pause.

Section 5: Quick Start Milestone Verification (Days 90-100)

At Day 90, the Implementation Secretariat produces a consolidated Milestone Verification Report (MVR) against the four streams. 5.1 MVR Contents

Stream-by-stream checklist with quantified outcomes. CIS preliminary scores for each Domain (Module III, Section 2).

ESG consensus assessment of whether 100-Day objectives are "substantially

achieved" (defined as $\geq 75\%$ of quantified targets met across all streams with zero Tier 1 violations). 5.2 Day 100 Decision Gate — QUICK START CLEARANCE (QSC)

If QSC granted: Framework transitions to Phase 1 (Confidence-Building) per Module II below. All 100-Day obligations convert to standing baseline requirements.

If QSC withheld: Framework enters 30-day Remediation Period. ESG identifies specific gaps; Parties have 30 days to close them. If still withheld after remediation, Framework enters Crisis Pause Mode per AddB Section 7. All Tier 1 obligations continue during Pause.

5.3 Post-Quick Start Standing Obligations Regardless of QSC outcome, the following remain permanently active:

13 PHAR Registry and strict-liability protection.

Hotline Protocol infrastructure. White Channel humanitarian clearance. IAEA managed access at installed sites.

JMOC 24/7 watch floor.

These are Tier 1 infrastructure; they do not sunset with the Quick Start.

MODULE II — PHASED ROLLOUT CALENDAR

Purpose: Provide an event-driven roadmap for the first 60 months of RCSA operation. Phases are not calendar-prisoned; they are milestone-gated. Indicative timelines assume good-faith implementation; slippage is absorbed by gate criteria, not by date drift.

PHASE 0: PRE-ACTIVATION (Month 0 — Trigger to Day 1)

Trigger: Adoption/signature of RCSA by all Framework Parties AND deposit of instruments of ratification (or executive adherence for non-treaty signatories)

with the Implementation Secretariat. Gate Criteria for Phase 0 -> Phase 1 transition: (a) IAEA confirms receipt of initial managed access designations and confirms

no technical barriers to 72-hour access at declared facilities. (b) RDF escrow account is funded to minimum \$250M threshold. (c) JMOC Geneva facility completes technical acceptance testing (Tech Module

III, Section 2). (d) BAP panel composition finalized per Enforce Module I, Section 2 (at least 5 standing arbitrators from mutually acceptable nationalities).

(e) Yemen proxy activity at or below 0.25 incidents per week per PERT baseline; Syria proxy activity at or below 0.40 incidents per week.

14 Duration: Indicative 0-60 days post-signature. Phase 0 may compress to 14 days

if all gates are pre-cleared through advance implementation work.

PHASE 1: CONFIDENCE-BUILDING (Indicative Months 1-6)

Objectives: Validate trust, prove institutional functionality, and deliver early civilian dividends.

1.1 Nuclear / Verification

IAEA completes first quarterly managed access report with quantitative material balance findings.

Dynamic Cap Ladder (Tech Module I, Section 4) activates Level 1 (baseline 5,000 SWU/month enrichment ceiling).

First 72-hour challenge inspection exercised as a scheduled drill (not adversarial) to test logistics. 1.2 Economic / Financial
RDF disburses first project tranches (\$50M) to Jordan water infrastructure and Lebanon electricity rehab.

IHTA (International Hormuz Transit Authority) per Econ Module III holds constituent assembly; interim tolling regime (10% discount for Framework Party-flagged vessels) takes effect.

EU/EEAS and UNDP launch trade-finance guarantee facility for SME cross-border transactions. 1.3 Humanitarian / Civilian

PHAR Registry expands to 25 installations across 4 countries. CPMC deploys second field team; per-fatality CIS cap of 3.0 points
(Hum Module II, Section 5.3) is live.

First Rapid Aid Deployment exercise (Hum Module III) conducted as table-top simulation with 72-hour mobilization target. 1.4 Security / Proxy

All six PFZs (Crisis Module III) are demarcated and published. PERT records baseline proxy event taxonomy with Bayesian confidence
15 thresholds calibrated.

First BAP expedited-track ruling issued (if any dispute arises during startup) within 45 days of filing. Gate Criteria for Phase 1 -> Phase 2:

(a) Quarterly IAEA report confirms no undeclared material or activity. (b) RDF disbursement audit clean; zero fraud findings. (c) $\geq 200,000$ humanitarian beneficiaries served.

(d) PERT proxy incident rate holds below 0.50/week aggregate across all PFZs.

(e) No Tier 1 compliance violations.

PHASE 2: BINDING COMMITMENTS (Indicative Months 6-18)

Objectives: Convert confidence-building measures into treaty-equivalent or contractually enforceable obligations. 2.1 Nuclear / Verification

Iran submits updated DIQ (Design Information Questionnaire) to IAEA for all enrichment and fuel-cycle facilities.

Dynamic Cap Ladder advances to Level 2 (7,500 SWU/month) contingent on two consecutive clean quarterly reports.

Joint Verification Task Force transitions from deployment to standing roster with permanent liaison officers at JMOC. 2.2 Economic / Financial

RDF reaches \$1B cumulative commitment; second donor replenishment IHTA tolling transitions from interim to full regime with neutral chair auditor selected per Econ Module III patch (FATF-compliant auditing).

First bilateral trade-and-investment treaty concluded between a GCC member and Iran under RCSA umbrella (template for AddA RP-SA, RP-UAE). 2.3 Humanitarian / Civilian

Camp demilitarization protocols (Hum Module IV, Section 3) piloted at two designated sites; Level 4 Imminent Threat Exception exercised once 16 (if necessary) with full JMOC documentation.

PHAR Registry reaches 50 installations; strict-liability precedent pool contains ≥ 5 resolved claims.

Refugee/IDP local integration micro-grants program launches with RDF

co-financing. 2.4 Security / Enforcement

BAP issues first full procedural ruling on merits (non-expedited) within

Spoiler Containment Protocol exercised at least once at Level 1 or 2;

effectiveness review conducted.

Graduated Penalty Ladder (Enforce Module II) first rung triggered and

executed (if compliance gap identified) to demonstrate credibility. Gate Criteria for Phase 2 -> Phase 3: (a) Two consecutive IAEA quarterly reports with no high-priority findings.

(b) RDF cumulative disbursement $\geq$ \$500M with $\geq$ 5 cases with compensation paid. (d) BAP procedural credibility confirmed (no boycott by any Party).

(e) Compliance Scorecard aggregate score $\geq$ 65/100 (Module III, Section 3).

PHASE 3: DEEP INTEGRATION (Indicative Months 18-36)

Objectives: Embed RCSA into regional institutional architecture; reduce reliance on external guarantors.

3.1 Nuclear / Verification

IAEA Additional Protocol (or RCSA-equivalent managed access) ratified by all Framework Parties with nuclear fuel-cycle activity.

Dynamic Cap Ladder advances to Level 3 (10,000 SWU/month) if 6 consecutive clean quarterly reports achieved.

Regional fuel-bank concept (multilateral LEU stockpile under IAEA custody) receives technical feasibility study funded by RDF.

3.2 Economic / Financial

17 Sanctions Synchronization Module (Econ Module II) achieves full reciprocity: U.S. waivers cover 90% of agreed categories; Iran completes FATF Action Plan items 1-20.

Energy Interdependence Module (Econ Module IV) operational: first cross-border gas swap (e.g., Turkmenistan-Iran-Turkey corridor) under RCSA transit guarantee.

Trade Corridor reaches 2,000 TEU/month throughput via IHTA/land bridge.

3.3 Humanitarian / Civilian

PHAR Registry institutionalized as permanent international entity with its own governance board (transition from JMOC sub-unit).

CPMC field presence expands to 6 teams covering all major conflict theaters. Rapid Aid Deployment stockpiles pre-positioned in 6 countries (up from 3).

3.4 Institutional / Political

UNSCR 2231 Replacement (Inst Module V) adopted by UN Security Council under Chapter VII; RCSA gains UN legal anchoring.

Bretton Woods Mandate (Inst Module VI) activated: World Bank/IMF begin formal RDSA (Regional Development Stability Assessment) missions.

BRICS/SCO Interface (Inst Module VII) formalized: annual coordination statement on RCSA progress.

Gate Criteria for Phase 3 -> Phase 4: (a) IAEA Additional Protocol (or equivalent) in force for all relevant Parties. (b) FATF mutual evaluation of Iran completed with "Largely Compliant" or

better rating in ≥ 20 of 40 Recommendations. (c) PHAR/CPMC recognized by ICRC as complementary protection framework. (d) UNSCR 2231 Replacement adopted and operative.

(e) Compliance Scorecard aggregate score $\geq 75/100$ with all four domains ≥ 60 .

PHASE 4: INSTITUTIONAL SELF-SUFFICIENCY (Indicative Months 36-60)

Objectives: RCSA institutions function without external crisis intervention; Framework becomes durable regional architecture.

18 4.1 Nuclear / Verification

IAEA managed access transitions to routine safeguards; 72-hour challenge inspections remain available but are rarely invoked due to mature compliance.

Dynamic Cap Ladder at Level 4 (12,500 SWU/month) if 12 consecutive clean quarterly reports; or holds at agreed permanent ceiling.

Regional fuel-bank operational if feasibility positive.

4.2 Economic / Financial

RDF transitions from donor-dependent trust fund to partially capitalized development bank with paid-in capital from Framework Parties.

IHTA recognized by IMO as regional transit authority; tolling revenue covers operational costs without donor subsidy.

First 5-year Sunset Review (Module IV below) conducted; recommendation:

Rolling Renewal. 4.3 Security / Crisis

JMOC operates with rotating regional chair (non-Western, non-Iranian

Framework Party) for 6-month terms.

PERT proxy incident rate stable below 0.15/week aggregate; PFZs degrade from military exclusion to confidence zones with commercial activity.

Hotline Protocol tested quarterly as matter of routine.

4.4 Compliance / Governance

Compliance Scorecard published semi-annually as public good; used by private investors and rating agencies as regional risk signal.

BAP caseload handled entirely through standing panel; no ad-hoc arbitrator appointments needed for 24 months.

Graceful Degradation Protocol (AddB Section 11) remains unactivated at

Level 1 or higher for 24 consecutive months. Gate Criteria for Phase 4 -> Rolling Renewal: (a) Aggregate CIS score $\geq 85/100$ for 12 consecutive months.

(b) Zero Level 3 or 4 Graceful Degradation activations for 24 months. (c) Institutional self-financing ratio $\geq 40\%$ (RDF + IHTA + other RCSA

19 entities covering own operating costs from non-donor revenue).

(d) All Framework Parties submit formal Rolling Renewal notice at Month 54 (6 months before first 5-year cycle end).

MODULE III — COMPLIANCE SCORECARD TEMPLATE

Purpose: Translate RCSA obligations into quantitative, transparent, and comparable indicators. The Scorecard is the Framework's primary feedback loop, enabling evidence-based phase progression, penalty calibration, and investor confidence. Design Principles:

1. QUANTITATIVE DOMINANCE — $\geq 80\%$ of scorecard inputs are numeric;

qualitative

assessments require consensus among 3+ independent observers.

1. FOUR-DOMAIN SYMMETRY — No single domain dominates; all four are weighted

equally (25% each) in aggregate scoring.

1. TIER 1 NON-SUSPENDABILITY — Scorecard suspension does not suspend Tier 1

obligations. Tier 1 items are tracked but scored separately as binary flags (COMPLIANT / VIOLATION), not as gradations.

1. PUBLIC TRANSPARENCY — Aggregate scores and domain-level summaries published

quarterly; raw data available to Framework Parties and BAP on request.

1. ANTI-GAMING — Scorecard formulas include audit trails and cross-validation

between independent data sources (IAEA, JMOC, PHAR, IHTA, CPMC, FATF).

Section 1: Domain Architecture

DOMAIN A — NUCLEAR & VERIFICATION (25% weight) Data sources: IAEA quarterly reports, JVTf inspection logs, JMOC nuclear

watch desk, national declarations. Indicators:

20 A1. Enrichment Compliance (0-30 points)

Measured against Dynamic Cap Ladder ceiling (Tech Module I, Section 4).

Full compliance with current SWU/month ceiling: 30 pts

1-5% exceedance: 20 pts 5-15% exceedance: 10 pts >15% exceedance or

undeclared activity: 0 pts (automatic Domain A fail)

A2. Managed Access Timeliness (0-20 points)

All IAEA requests satisfied within 72 hours: 20 pts 1 delay >72h but <96h: 15 pts

1 delay >96h or 2 delays >72h: 5 pts Systematic delay pattern (>2 instances/qtr): 0 pts

A3. Material Balance Accuracy (0-25 points)

IAEA confirms material balance within measurement uncertainty: 25 pts
Significant quantity discrepancy resolved within quarter: 15 pts Unresolved discrepancy: 0 pts

A4. Facility Declaration Integrity (0-25 points)

All DIQ updates current; no undeclared facilities detected: 25 pts Minor clerical lapses corrected promptly: 20 pts

Omission requiring IAEA follow-up: 10 pts Concealment or misdeclaration confirmed: 0 pts

Domain A Score = A1 + A2 + A3 + A4 (max 100, normalized to 25% weight)

DOMAIN B — PROXY & REGIONAL SECURITY (25% weight)

Data sources: PERT incident logs (Crisis Module IV), JMOC security watch, AddB Section 3 (Constructive Non-Compliance Detection), national intelligence liaison (Crisis Module I, Tier 2).

Indicators: B1. Proxy Incident Frequency (0-35 points) Aggregate across all PFZs, normalized to PERT baseline.

<=0.15 incidents/week: 35 pts 0.16-0.30 incidents/week: 25 pts

21 0.31-0.50 incidents/week: 15 pts

0.51-0.75 incidents/week: 5 pts >0.75 incidents/week or mass-casualty event: 0 pts

B2. PFZ Integrity (0-25 points)

Zero confirmed PFZ violations by Party-affiliated forces: 25 pts 1-2 minor territorial incursions (<1km, <24h): 15 pts Major incursion or weapons transfer into PFZ: 0 pts

B3. Attribution Cooperation (0-20 points)

Full cooperation with PERT attribution requests within 48 hours: 20 pts Partial cooperation / delayed response: 10 pts

Active obstruction of attribution panel: 0 pts

B4. Spoiler Containment Responsiveness (0-20 points)

Level 1-2 spoilers neutralized within 14 days of ESG notice: 20 pts

Level 3-4 spoilers contained within 30 days: 10 pts Failure to act against identified spoiler: 0 pts

Domain B Score = B1 + B2 + B3 + B4 (max 100, normalized to 25% weight)

DOMAIN C — HUMANITARIAN & CIVILIAN PROTECTION (25% weight)

Data sources: PHAR integrity logs, CPMC field reports, HCVC transaction records, Rapid Aid Deployment tracking, UN OCHA data (cross-referenced).

Indicators:

C1. PHAR Integrity (0-30 points)

Zero PHAR-listed assets attacked or damaged: 30 pts 1 incident with prompt compensation per strict liability: 20 pts 2 incidents or 1 incident without compensation: 10 pts Pattern of targeting or Level 4 imminent threat abuse: 0 pts

C2. Humanitarian Access Volume (0-25 points)

White Channel transactions and RDF aid disbursements meet quarterly targets (derived from 100-Day baseline scaled by phase): $\geq 100\%$ of target: 25 pts; 90-99%: 20 pts; 75-89%: 10 pts; $< 75\%$: 0 pts

C3. CPMC Operational Effectiveness (0-25 points)

22 Field teams deployed, reporting, and unrestricted: 25 pts

Access restrictions on $< 25\%$ of planned missions: 15 pts Systematic denial of access or team safety incident: 0 pts

C4. Civilian Casualty Ratio (0-20 points)

CPMC-confirmed civilian fatalities per quarter relative to pre-Framework baseline (lower is better): $\geq 50\%$ reduction: 20 pts; 25-49% reduction: 15 pts; 0-24%: 10 pts; increase: 0 pts

Per-fatality CIS cap of 3.0 (Hum Module II, Section 5.3) prevents single mass-casualty events from disproportionately skewing quarterly scores. Domain C Score = C1 + C2 + C3 + C4 (max 100, normalized to 25% weight)

DOMAIN D — ECONOMIC & FINANCIAL COMPLIANCE (25% weight) Data sources: FATF mutual evaluation reports, RDF audit committee, IHTA toll reconciliation, OFAC/EU sanctions waiver utilization logs, BIS reporting. Indicators: D1. Sanctions Reciprocity (0-30 points)

U.S. maintains waivers covering $\geq 90\%$ of agreed categories; Iran maintains nuclear and proxy commitments: 30 pts

Waiver coverage 75-89%: 20 pts Waiver coverage 50-74%: 10 pts Waiver coverage $< 50\%$ or Iran material breach: 0 pts

D2. FATF / Anti-Money Laundering Progress (0-25 points)

"Largely Compliant" or "Compliant" rating on relevant FATF

Recommendations: each Rec yields 1.25 pts (max 25 for 20 Recs).

"Partially Compliant" yields 0.625 pts.

"Non-Compliant" yields 0 pts. Downgrade from prior rating deducts double the lost points.

D3. RDF Financial Integrity (0-25 points)

Annual audit unqualified; <3% administrative cost ratio; zero confirmed

23 Qualified audit or 3-5% admin ratio: 15 pts

Adverse audit or >5% admin ratio or fraud finding: 0 pts

D4. Trade Corridor Compliance (0-20 points)

IHTA tolling transparent with neutral audit; no vessel discrimination

against Framework Parties; throughput meets target:

>=100% target: 20 pts; 80-99%: 15 pts; 60-79%: 8 pts; <60%: 0 pts Domain D

Score = D1 + D2 + D3 + D4 (max 100, normalized to 25% weight)

Section 2: Aggregate Scoring Logic & Tier 1 Overlay

AGGREGATE SCORE = (Domain A 0.25) + (Domain B 0.25) +

(Domain C 0.25) + (Domain D 0.25) Range: 0-100. Color Thresholds:

GREEN: Aggregate >=75 AND all four domains >=60 AND zero Tier 1 flags.

AMBER: Aggregate >=60 AND all four domains >=50 AND zero Tier 1 flags.

RED: Aggregate <60 OR any domain <50 OR any Tier 1 flag active.

Tier 1 Flag Binary Overlay: The following events automatically generate a Tier

1 flag, overriding any color:

Confirmed undeclared nuclear facility or enrichment >20% U-235 (Domain A).

Mass-casualty proxy attack (>50 civilian deaths) with PERT attribution

confidence ≥ 0.85 to a Party-affiliated group (Domain B).

Deliberate kinetic strike on PHAR-listed asset with CPMC confirmation

and no Level 4 imminent threat justification (Domain C).

OFAC/EU intentional sabotage of White Channel with >\$50M humanitarian

transaction blockage (Domain D). A Tier 1 flag does not automatically collapse the Framework. It triggers:

(a) ESG emergency session within 72 hours. (b) BAP expedited-track review if requested by any Party. (c) Pause of phase advancement until flag resolved.

(d) Logging in Sunset Review documentation (Module IV, Section 3).

24 Section 3: Scorecard Governance & Anti-Gaming

3.1 Scorecard Authority

Primary compiler: Implementation Secretariat (JMOC Geneva).

Audit function: BAP-appointed independent accounting firm (rotating every 2 years; AddB Section 1 dual-key applies to raw data access).

Appeal mechanism: Any Party may challenge a score within 14 days of publication; BAP rules on appeal within 45 days. 3.2 Data Cross-Validation Rules

No single data source may contribute >50% of any domain's score. IAEA data used for Domain A; PERT/JMOC for Domain B; PHAR/CPMC/UN OCHA for Domain C; FATF/RDF/IHTA for Domain D.

Discrepancies between national submissions and independent sources are resolved by JMOC technical committee; unresolved items default to the more conservative (lower) score. 3.3 Frequency & Publication

Preliminary internal scores: monthly (for ESG use only).

Verified quarterly scores: published within 30 days of quarter end. Annual composite: published with BAP audit letter. Semi-annual public report: issued at Month 6 and Month 12 for external stakeholders (investors, UN bodies, humanitarian agencies).

MODULE IV — SUNSET & RENEWAL

Purpose: Ensure RCSA durability without trapping Parties in perpetual commitments they cannot sustain. The architecture is a ROLLING RENEWAL with

AUTOMATIC CONTINUITY, meaning the Framework persists unless affirmative steps are taken to sunset it. This design favors stability while preserving 25 sovereign exit options.

Section 1: Rolling Renewal Architecture

Primary cycle: 60 months (5 years) from Day 1 of Framework activation.

Renewal notice: Any Framework Party may submit a formal Rolling Renewal

Notice (RRN) no later than Month 54 (6 months before cycle end), signaling intent to continue into the next cycle.

Automatic continuity: If $\geq 75\%$ of Framework Parties (by weighted vote or equal suffrage per Inst Module IV treaty compatibility clause) submit RRN by Month 57, the Framework automatically renews for a second 5-year cycle with identical terms, subject only to agreed technical amendments.

Months 54-60: Open amendment window. Proposed amendments require:

(a) Written submission to Implementation Secretariat with 90-day advance notice. (b) ESG review and consensus recommendation. (c) Adoption by the same threshold as original RCSA entry into force.

Amendments do not take effect until the new cycle begins (Month 61), ensuring no mid-cycle surprises. 1.3 Default Status

If no RRN submitted by Month 57: Framework enters Pre-Sunset Consultation (Section 2 below). Tier 1 obligations continue during consultation.

If <75% RRN submitted: Framework enters Negotiated Transition (Section 3).

Section 2: Sunset Triggers & Pre-Sunset Consultation

2.1 Sunset Triggers (Affirmative Discontinuity Events) A Framework Party may initiate Sunset Proceedings by filing a Sunset

Declaration with the Implementation Secretariat, citing one or more of the 26 following triggers:

ST-1: Material Breach by Another Party

Defined as: 2+ Tier 1 flags within 12 months; or 1 Tier 1 flag unresolved for >180 days; or aggregate CIS score <40 for 2 consecutive quarters with no remedial plan accepted by ESG.

Filing Party must demonstrate good-faith efforts at remediation through BAP and ESG channels before invoking ST-1.

ST-2: Fundamental Change of Circumstances (Rebus sic stantibus)

Applicable only if: (a) circumstances existing at Framework entry were

essential to consent; (b) change is radical and unforeseeable; (c) continued performance would be unconscionable. BAP rules on validity

of ST-2 invocation under international law principles (VCLT Article 62). ST-3: Domestic Constitutional Bar

National parliament or constitutional court issues binding ruling that

RCSA obligations violate domestic constitutional order, and no permissible interpretive accommodation exists.

18-month grace period applies to allow negotiated withdrawal terms.

ST-4: External Coercion (Force Majeure Plus)

Framework Party is subjected to armed attack, comprehensive sanctions

by a non-Party great power, or UN Chapter VII sanctions that make

compliance physically impossible. Does not cover self-inflicted policy choices.

2.2 Pre-Sunset Consultation (PSC)

Duration: 12 months from filing of Sunset Declaration. Process: ESG convenes weekly; BAP establishes Sunset Review Panel (3

arbitrators, none from filing Party or target Party) to assess validity of trigger and propose winding-down terms.

Objective: Avoid abrupt collapse. PSC seeks:

(a) Remediation of trigger condition if possible. (b) Bilateral side-letters preserving subset of obligations.

(c) Phased asset and data handover to successor arrangements.

At Month 12 of PSC: Framework Parties vote on orderly sunset. Threshold: Simple majority (50%+1) for orderly sunset; otherwise,

unilateral withdrawal per ST category applies with 6-month grace.

Tier 1 obligations survive sunset for 24 months unless specifically terminated by separate bilateral treaty (Section 5 below).

Section 3: Renewal Triggers & Enhanced Commitment Pathways

3.1 Renewal Triggers (Positive Reinforcement)

Beyond simple RRN submission, Parties may trigger ENHANCED RENEWAL if the following conditions are met at Month 54: RT-1: Compliance Excellence

Aggregate CIS ≥ 85 for 18 consecutive months. All four domains ≥ 70 for same period.

Zero Tier 1 flags for 24 months. Reward: Framework Parties with RT-1 status receive preferential RDF

lending rates (Econ Module I), IHTA toll discounts (Econ Module III), and expedited BAP arbitration timelines (Enforce Module I). RT-2: Deep Integration Achievement

UNSCR 2231 Replacement adopted; Bretton Woods Mandate activated;

PHAR/CPMC recognized by ICRC; regional fuel-bank operational.

Reward: Triggers Phase 4 institutional self-sufficiency acceleration

and opens pathway to permanent regional organization (Inst Module VIII). RT-3: Energy Security Breakthrough

Cross-border energy swaps exceed 10 bcm gas / 5 million bbl oil annually under RCSA transit guarantee.

Reward: Unlock Energy Interdependence premium tier (Econ Module IV, Section 5) with shared strategic reserve pooling.

3.2 Enhanced Renewal Procedure

Parties meeting RT criteria file Enhanced Renewal Declaration (ERD) by ESG certifies RT status; Implementation Secretariat publishes ERDs with anonymized compliance data (to avoid shaming non-RT Parties).

Enhanced terms enter force at Month 61 alongside standard renewal.

Section 4: Crisis Pause Mode Integration

4.1 Pause Activation During Renewal Window

If Crisis Pause Mode (AddB Section 7) is active at Month 54-60, the renewal/amendment window automatically extends by the duration of the Pause plus 60 days recovery period.

No Party loses RRN filing rights due to Pause; deadlines are tolled.

4.2 Pause Impact on Sunset Proceedings

Sunset Declaration filed during Pause: PSC clock does not start until Pause lifted; filing is logged but not actionable during armed hostilities or emergency suspension.

If Pause exceeds 12 months: ESG may recommend extraordinary session to determine whether Framework requires structural adaptation or graceful

Section 5: Legacy Obligations & Post-Sunset Architecture

5.1 Tier 1 Survival (24-Month Minimum) Upon any form of sunset (orderly, negotiated, or unilateral withdrawal):

PHAR strict-liability for incidents occurring prior to sunset date remains enforceable for 5 years.

IAEA safeguards installed under RCSA remain binding under existing IAEA statutory authority (independent of RCSA status).

RDF project contracts signed before sunset remain fiduciary obligations of RDF trustees; donor commitments are not voided by Party withdrawal.

BAP retains jurisdiction over disputes arising from pre-sunset facts for

5.2 Data & Asset Handover

JMOC archives transferred to neutral custodian (UN Library / Geneva Archives) within 12 months of sunset.

Dual-key cryptographic systems (AddB Section 1) decommissioned by mutual consent; if no consent, keys escrowed with BAP for 5 years then destroyed.

IHTA tolling authority: if successor arrangement exists, accounts and maritime registry transfer; otherwise, dissolve and return to national port authorities. 5.3 Spoiler Containment Post-Sunset

Spoiler Containment Protocol (Enforce Module III) remains available to former Framework Parties for 12 months against non-state actors that were designated under RCSA, provided the designating evidence is shared.

This prevents sunset from instantaneously releasing contained spoilers.

Section 6: First Cycle Timeline (Illustrative)

The following integrates Modules I-IV into a single chronological view for RCSA v1.5's first 5-year cycle: Months 0-2: Phase 0 -> Phase 1 transition. 100-Day Quick Start (Module I). Months 3-6: Phase 1 Confidence-Building. First quarterly IAEA report;

RDF initial disbursements; PHAR to 25 sites. Months 7-12: Phase 1 conclusion. First QSC (Quick Start Clearance) retroactively certified if not already granted.

Months 13-18: Phase 2 Binding Commitments. BAP first merits ruling; sanctions synchronization deepens; IHTA full regime. Months 19-24: Phase 2 conclusion. Second QSC; aggregate CIS target ≥ 65 .

Months 25-30: Phase 3 Deep Integration. UNSCR 2231 Replacement pursuit; Bretton Woods Mandate activation; FATF evaluation. Months 31-36: Phase 3 conclusion. Aggregate CIS target ≥ 75 ; institutional self-sufficiency ratio $\geq 20\%$.

30 Months 37-48: Phase 4 Institutional Self-Sufficiency. Rotating JMOC chair; RDF capitalization; semi-annual public scorecards. Months 49-54: Phase 4 conclusion. Pre-Renewal review; ESG certifies RT status; amendment proposals circulated.

Month 54: RRN filing deadline. Month 57: Automatic continuity threshold check ($\geq 75\%$ RRN required). Month 60: First cycle end; second cycle begins if renewed; or PSC begins

MODULE V — IMPLEMENTATION GOVERNANCE & CROSS-MODULE INTEGRATION (Annex)

This Annex is non-normative but operationally essential. It defines how Implementation & Sequencing (Impl) interfaces with every preceding module to prevent silo failure.

Cross-Module Integration Matrix

Impl Module I (100-Day Quick Start) -> Tech Module I: IAEA managed access installations (Days 1-30) -> Tech Module III: JMOC Geneva boot-up (Days 15-30)

-> Hum Module I: White Channel immediate activation; HCVC node

deployment -> Hum Module II: PHAR Registry first entries and geofence publication -> Crisis Module I: Hotline testing and Proxy Notification issuance

-> Crisis Module II: 72-Hour Window activation at Day 20 -> Econ Module I: RDF escrow first tranche (\$250M) -> Econ Module II: EU INSTEX-equivalent node activation

-> Enforce Module I: BAP panel composition finalized Impl Module II (Phased Rollout) -> Tech Module I: Dynamic Cap Ladder level advancement per Phase 31 -> AddB Section 1: Dual-key control operational before Phase 1

-> AddB Section 7: Crisis Pause Mode absorbs phase slippage -> AddB Section 11: Graceful Degradation backstops Phase regression -> Inst Module V: UNSCR 2231 Replacement targeted for Phase 3

-> Inst Module VI: Bretton Woods Mandate activates in Phase 3 -> AddA RP-SA/UAE: Bilateral treaties under RCSA umbrella in Phase 2 Impl Module III (Compliance Scorecard)

-> Enforce Module II: Penalty Ladder triggered by RED score persistence -> Enforce Module III: Spoiler Containment escalated based on Domain B scores -> AddB Section 3: Constructive Non-Compliance feeds Domain B inputs

-> AddB Section 10: Compliance Symmetry Metrics validated against scorecard -> Crisis Module IV: PERT data is primary Domain B input -> Hum Module II: CPMC reports feed Domain C scoring

-> Econ Module III: IHTA neutral audit feeds Domain D scoring Impl Module IV (Sunset & Renewal) -> Enforce Module I: BAP Sunset Review Panel adjudicates ST-2 (rebus)

-> AddB Section 7: Crisis Pause tolles sunset and renewal deadlines -> AddB Section 8: Sovereignty Restoration Triggers may prompt ST-3 -> Inst Module IV:

Treaty compatibility ensures sunset does not violate

prior bilateral obligations -> Tech Module IV: Escrow and disposition procedures survive sunset for 24 months

Implementation Secretariat Charter (Summary)

Location: Co-located with JMOC, Geneva, Switzerland. Head: Executive Director appointed by ESG consensus for 3-year renewable term; nationality rotates among non-P5 Framework Parties to preserve

neutrality. Staffing: Seconded personnel from ESG members (max 40 full-time equivalents); plus locally recruited technical and administrative support.

Budget: Funded by equal assessed contributions from Framework Parties

32 (\$2M/year baseline) plus 1% administrative levy on RDF disbursements

and IHTA toll revenue. Reporting: Quarterly to ESG; semi-annual public transparency report; annual audited financial statements.

Immunities: Functional immunities consistent with UN specialized agency practice; headquarters agreement with Swiss Federal Council.

Document Control & Versioning

Document Identifier: RCSA-Impl-v1.5

Module Position: IX of IX (concluding module block) Preceding Modules: Tech (I), AddA (II), Enforce (III), Hum (IV), Econ (V), AddB (VI), Crisis (VII), Inst (VIII)

Tier 1 Provisions: All provisions in Sections 1.4, 3.4, 5.1, and 5.3 of Module IV are Tier 1. Effective Date: Upon Framework adoption (Day 1 of Phase 0)

Review Cycle: Annual by ESG; substantive revision only at Rolling Renewal windows (Module IV, Section 1.2) Point of Contact: Implementation Secretariat, JMOC Geneva

(protocols to be established at Day 1)

Final Notes on Completeness of RCSA v1.5 Architecture

With the delivery of this Implementation & Sequencing module, the RCSA v1.5 architecture achieves full operational closure. The nine document blocks constitute a self-referential, mutually reinforcing system:

TECH establishes the verification and monitoring infrastructure. ENFORCE provides the coercive and dispute-resolution backstops. HUMANITARIAN creates the civilian-protection floor and moral legitimacy.

ECONOMIC supplies the incentive structure and regional development engine. CRISIS-MANAGEMENT installs the circuit-breakers and de-escalation protocols. INSTITUTIONAL anchors the Framework in existing international law and

ADDENDUM A hardens the bilateral commitments of key regional partners. ADDENDUM B stress-tests the architecture and closes 12 identified gaps.

IMPLEMENTATION (this module) translates all of the above into time-bound, event-driven, reversible yet durable action. The Framework is designed to survive sovereign mood swings, proxy spoiler activity, external great-power interference, and institutional inertia. Its

central wager is that quantified compliance, strict-liability civilian protection, and economic interdependence can generate self-sustaining momentum even when political trust is thin.

Whether this wager succeeds depends not on the quality of the text but on the political will of the Framework Parties to treat Tier 1 obligations as non-negotiable — and to allow the Scorecard, the BAP, and the Graceful

Degradation Protocol to do their work when trust temporarily falters.

END OF RCSA v1.5 — MODULE IX: IMPLEMENTATION & SEQUENCING

Annex PH: Political Horizon Note

This annex creates a light, non-binding, institutionally separated Political Horizon Lane for sovereignty, territory, and recognition issues, preventing deferred disputes from repeatedly destabilizing humanitarian, economic, and security tracks while preserving the option of eventual political dialogue.

This annex establishes a light, non-binding Political Horizon Note that creates a parallel, insulated lane for discussion of sovereignty, territory, and recognition issues without forcing final-status negotiations or allowing deferred disputes to re-enter the stabilization tracks informally. The note addresses the structural problem that unresolved political issues—Palestinian statehood, Syrian sovereignty, Kurdish autonomy,

34 Annex PH: Political Horizon Note

Lebanese territorial disputes, and Gulf island claims—continually leak into humanitarian, economic, and security negotiations, destabilizing technical cooperation. The Political Horizon Note is not a negotiating framework. It does not create obligations, timelines, or benchmarks. It is a standing invitation to address deferred political questions in a separate venue with distinct rules, participants, and expectations. The note's only binding provision is that parties agree not to use stabilization-track mechanisms (humanitarian corridors, banking channels, trade corridors, verification protocols) as leverage in political-horizon discussions.

Insulated Lane Structure

The Political Horizon Lane operates under the following structural separation: Different venue (hosted by the UN Secretary-General's good offices or a designated special envoy, not by the RCSA governance body). Different

participants (political representatives, foreign ministers, and special envoys, not technical implementation officers). Different rules (consensus-based with no override, no weighted majority, no silence procedure—deliberation is purely consultative). Different timeline (no 30-day cycles, no phase advancement, no benefit linkage—discussions proceed at whatever pace political conditions permit).

Table HL-1: Table HL-1: Stabilization Track vs. Political Horizon Lane

Element	Stabilization Track	Political Horizon Lane
Host	RCSA Governance Body (Joint Implementation UN Secretary-General's good offices or Group / Joint Commission) designated special envoy	
Participants	Technical implementation officers, deputy ministers, Foreign ministers, special envoys, political central bankers, humanitarian coordinators party leaders, sovereignty negotiators	
Decision	Consensus default, weighted majority override, Pure consensus, no override, no procedural rules silence procedure fallback	
Timeline	30-day cycles, phase advancement, benefit linkage	No fixed timeline, no benefit linkage, no enforcement
Scope	Humanitarian access, economic integration, Sovereignty, territory, recognition, final verification, proxy management, crisis response status, permanent security architecture	
Enforceability	Binding framework obligations with graduated Non-binding, consultative, politically enforcement autonomous	
Non-Interference Commitment	All framework parties commit to the following non-interference principles: Stabilization-track benefits are not conditioned on progress in the Political	

Horizon Lane. A party may advance in Phase 2 on economic integration while refusing to engage in the Political Horizon Lane. Conversely, progress in the Political

35 Annex PH: Political Horizon Note

Horizon Lane does not automatically unlock stabilization-track benefits; those remain governed by compliance indicators and technical verification. If a party attempts to link stabilization-track benefits to political-horizon concessions, the neutral chair issues a Non-Interference Determination within 7 days. The determination is advisory but carries compliance weight: two non-interference determinations against the same party within a single 90-day cycle trigger automatic compliance indicator adjustment (+1.0 procedural point). Persistent linkage attempts (three or more determinations within 12 months) may be elevated to the governance body for formal censure. The non-interference commitment does not prohibit parties from making parallel, unilateral political statements or from pursuing bilateral negotiations outside the framework. It prohibits only the instrumentalization of framework technical mechanisms for political ends.

While the lanes are institutionally separated, an Information Bridge ensures that political developments do not destabilize technical cooperation by surprise. The bridge consists of: quarterly Political Horizon Briefings by the UN special envoy to the RCSA governance body (no negotiating details, only stability- impact assessment); and RCSA Technical Briefings by the governance body secretariat to the Political Horizon Lane participants (no operational security details, only corridor status, economic indicators, and humanitarian metrics).

The Information Bridge is one-way in each direction. The Political Horizon Lane does not direct RCSA technical operations. The RCSA does not negotiate

political outcomes. The bridge exists solely to prevent the kind of accidental destabilization that occurs when a major political statement (e.g., recognition of a government, territorial claim, or alliance shift) is made without awareness of its impact on active stabilization operations.

The Political Horizon Note is reviewed every two years by the UN Secretary-General in consultation with all framework parties. The review assesses: whether the lane has produced any useful dialogue; whether the non-interference commitment is being observed; and whether the lane's existence continues to serve the framework's stabilization objectives. The review does not produce binding recommendations; it produces a public report and a set of options for parties to consider voluntarily.

Any party may withdraw from the Political Horizon Lane at any time with 30-day notice. Withdrawal from the lane does not affect the party's framework obligations or benefits in the stabilization tracks. The lane may be terminated entirely if all parties agree, or if the biennial review determines that it has become a forum for escalation rather than dialogue.

36 Annex HUM: Humanization Protocol

Annex HUM: Humanization Protocol

This annex introduces ten diplomatic 'shock absorbers' that preserve every hard mechanic of the RCSA while creating face-saving exits, joint ownership moments, and narrative flexibility.

Purpose and Design Philosophy

The RCSA framework is built on automated triggers, compliance indicators, and graduated enforcement mechanisms designed to prevent the political paralysis that destroys international agreements. However, automation without humanity produces a different failure mode: the 'cornered rat'

response, where leaders facing mechanical consequences they cannot politically survive choose framework collapse over compliance. This annex introduces ten humanization mechanisms—diplomatic 'shock absorbers'—that preserve every hard mechanic of the framework while creating face-saving exits, joint ownership moments, and narrative flexibility. None of these mechanisms alter compliance thresholds, enrichment caps, sanctions relief triggers, or enforcement ladders. They alter how those mechanics are experienced by the human beings who must defend them to domestic audiences. Each mechanism in this annex is classified by type: Pause (temporarily suspends automated action); Soften (reframes consequences to reduce defensive reaction); Joint (creates shared ownership of outcomes); Face (enables divergent public narratives around identical actions); Symbol (builds social capital through ceremonial moments); and Accelerate (rewards early compliance with timeline compression). The mechanisms are listed in order of activation within a typical compliance cycle.

1. The 'Extraordinary Circumstances' Pause Button

TYPE: Pause ; INTERACTS WITH: All automated triggers, Verification Continuity Ladder, Compliance Indicators System, Automatic Consequence Menus

The Neutral Chair possesses the authority to pause any automated trigger for up to 14 days upon certification of an Extraordinary Circumstance. This authority is not a veto; it is a temporary suspension that preserves the trigger's existence and automatic activation upon expiration of the pause period. It accounts for Black Swan events—natural disasters, domestic political transitions, unexpected military incidents by third parties, or public health emergencies—that would make automated response politically untenable or substantively unjust.

37 Annex HUM: Humanization Protocol

Table HUM-1: Table HUM-1: Pause Button Parameters

Parameter Specification

Triggering Natural disaster (UN- domestic third-party pandemic or terrorist attack events recognized) regime military public health on framework transition incident emergency infrastructure (election, affecting succession, framework coup) party

Certification Neutral Chair written requirement determination citing specific event + 48- hour notice to all parties

Maximum 14 calendar days (non- duration extendable without governance body consensus)

Activation Maximum 2 pauses per frequency 90-day cycle per automated trigger system

During pause All monitoring all verification no obligations only automated continues continues suspended consequences are deferred

Upon Paused trigger (b) governance or (c) matter expiration activates automatically body converts referred to unless: (a) condition trigger to binding resolved + governance manual review arbitration body consensus to cancel

Record All pauses published in Transparency Summary with event description, duration, and outcome

The Pause Button is not available for: Tier 3 mass-casualty automatic triggers (Annex MO); nuclear facility attack response (Shadow Conflict Ceiling); or Article 51 self-defense actions. These mechanisms operate on

38 Annex HUM: Humanization Protocol

timelines where delay equals lives lost.

2. Pre-Trigger 'Consultation Windows'

TYPE: Soften ; INTERACTS WITH: Mirror Licensing Regime, Automatic Consequence Menus, Funding- Failure Waterfall, Economic Access Architecture Before any automated economic trigger activates—whether a mirror license suspension, a benefit tranche delay, an escrow hold, or a waterfall Tier 2 withholding—a mandatory 72-hour 'Quiet Room' session convenes. The Quiet Room is a confidential, off-the-record diplomatic session hosted by the Neutral Chair at a neutral venue, attended by senior negotiators from all directly affected parties.

The Quiet Room has no decision-making authority. Its purpose is to create a final diplomatic opportunity to resolve the bottleneck through manual negotiation before the automated system takes over. If a resolution is reached, the parties jointly notify the governance body secretariat, which documents the resolution and defers the trigger. If no resolution is reached within 72 hours, the trigger activates automatically.

Table HUM-2: Table HUM-2: Quiet Room Session Parameters

Parameter Specification

Convening Neutral Chair (mandatory, not authority discretionary)

Timing 72 hours before automated trigger activation

Attendance Minimum 2 senior negotiators per affected party + Neutral Chair + SESS legal advisor (observer)

Venue Guarantor state capital (rotating: Muscat, Geneva, Islamabad)

Record No formal minutes joint statement of resolution non-attribution log of topics keeping if reached discussed

Outcome (a) Resolution reached → trigger (b) Partial resolution → (c) No resolution → trigger options deferred, compliance path trigger modified per mutual activates automatically at documented agreement, documented 72-hour mark

Frequency One Quiet Room session per trigger no repeat sessions for same limit event trigger

The Quiet Room exists because automated systems produce better outcomes when diplomats can claim ownership of resolutions. A benefit delay prevented through negotiation is a 'diplomatic win.' A benefit delay

39 Annex HUM: Humanization Protocol

imposed by algorithm is a 'framework punishment.' The mechanics are identical; the political experience is fundamentally different.

3. The 'Soft Landing' Graduation

TYPE: Soften ; INTERACTS WITH: Sanctions Relief Tranches, Dynamic Enrichment Cap, Banking Channel Activation, Trade Corridor Expansion The baseline framework shifts benefits and obligations on binary tranche boundaries: upon compliance certification, 100% of the next tranche activates; upon non-compliance, 0% activates. The Soft Landing mechanism replaces 100% binary shifts with tapered activation for all Phase 0 and Phase 1 transitions.

Table HUM-3: Table HUM-3: Tapered Activation Structure

Phase Transition Automatic Portion (Day 1) Human Verification Portion
Activation Window

Phase 0 Entry 20% of Phase 0 benefits Remaining 80% upon Verification
(humanitarian corridors, emergency Affirmation by governance body escrow)

within 30 days

Phase 0→1 Banking Single correspondent bank opens SWIFT reconnection + trade Channel automatically corridor activation upon Verification Affirmation within 45 days

Phase 1 Sectoral 20% of petrochemical/agricultural Remaining 80% upon Verification Relief relief activates Affirmation within 60 days

Enrichment Cap Permission to commence 5% Full operational authorization upon Increase enrichment (limited research Verification Affirmation within 30 (3.67%→5%) quantities) days

Fordow Conversion Site preparation + international Full conversion equipment Start advisory board convenes deployment upon Verification Affirmation within 60 days

Verification Affirmation is defined as: a formal statement by the governance body (or by the Neutral Chair on its behalf, if the body cannot convene within the window) that the conditions for the remaining 80% have been satisfactorily demonstrated. The affirmation is not a new compliance determination; it is a procedural confirmation that the automatic 20% tranche has been successfully absorbed. If affirmation is not issued within the window, the remaining 80% activates automatically—ensuring the taper does not become a new veto point. The Soft Landing mechanism serves two purposes: it prevents the political shock of 100% simultaneous activation, which can trigger domestic backlash; and it creates an early, visible benefit (20%) that

40 Annex HUM: Humanization Protocol

demonstrates good faith before the full commitment is required.

4. Non-Adversarial Compliance Reviews

TYPE: Soften ; INTERACTS WITH: Compliance Indicators System, Verification Continuity Ladder, Pattern-of-Concern Designation All compliance communications are reframed from adversarial to technical language. 'Violation Notices' are replaced with 'Technical Discrepancy Consultations.' 'Compliance breaches' are replaced with 'Implementation Gaps Requiring Joint Attention.' 'Enforcement activation' is replaced with 'Cooperative Remediation Procedures.' The language change is not cosmetic; it shapes how parties approach the problem.

The Non-Adversarial Review process operates as follows: Upon detection of a discrepancy (by IAEA, SESS, or party self-reporting), the SESS Technical Deployment Unit issues a Technical Discrepancy Memorandum (TDM) rather than a compliance concern. The TDM states: (a) the observed discrepancy in objective, technical terms; (b) the framework provision it relates to; (c) three potential explanations (technical, procedural, or intentional); and (d) a proposed joint technical review timeline. The receiving party has 14 days to respond with: Explanation A (technical — equipment malfunction, data transmission error, weather event); Explanation B (procedural — bureaucratic delay, personnel transition, resource constraint); or Explanation C (acknowledged deviation with proposed remediation plan). Only if the party fails to respond within 14 days, or provides no credible explanation, does the matter escalate to formal compliance review with indicator score adjustment. The Non-Adversarial Review does not apply to: confirmed attacks on IAEA facilities; confirmed material diversion of nuclear material; confirmed weapons transfers to proxies; or confirmed cyberattacks on critical infrastructure. These matters escalate directly through existing security and enforcement channels.

5. Joint Technical Working Groups (JTWGs)

TYPE: Joint ; INTERACTS WITH: Compliance Indicators System, IAEA Monitoring Architecture, Verification Technical Architecture, SESS Technical Deployment Unit

Compliance Indicator System (CIS) data is not reviewed solely by the governance body secretariat or by unilateral party submissions. It is reviewed jointly by experts from all signatory nations sitting in the same physical room. These Joint Technical Working Groups (JTWGs) create a 'buffer of truth'—when scientists and engineers from opposing sides agree on the numbers, politicians are protected from domestic hawks who claim the data is fabricated or biased.

41 Annex HUM: Humanization Protocol

Table HUM-4: Table HUM-4: JTWG Structure and Operations

Parameter Specification

Composition 4 technical experts per 14 total core party (US, Iran) + 2 per guarantor state (Oman, Switzerland, Pakistan) + 1 IAEA liaison + 1 SESS technical advisor

Meeting Monthly for standard weekly during emergency session frequency review active compliance within 48 hours of concerns Tier 2 or 3 incident

Venue Rotating between Geneva, Muscat, and Vienna (IAEA headquarters)

Mandate Review all CIS data for verify IAEA assess satellite review produce the review cycle inspector findings imagery financial joint tracing technical reports findings document

Decision rule Consensus on technical where consensus findings cannot be reached, minority opinions are documented and appended

Output Joint Technical Findings submitted to governance body Document (public governance body may not override summary + confidential as

advisory input technical findings annex) without written justification

JTWG membership requires security clearance and technical qualification (minimum: master's degree in relevant field + 5 years professional experience). Members serve 12-month terms, renewable once. Members are prohibited from making public statements about JTWG proceedings. Leaks are investigated by the SESS and may result in removal and legal action under Swiss confidentiality law.

The JTWG does not replace IAEA inspection authority, SESS verification capacity, or governance body decision-making. It adds a layer of joint ownership over the technical data that informs all compliance

42 Annex HUM: Humanization Protocol

decisions. When a US nuclear physicist and an Iranian nuclear engineer jointly certify that enrichment levels are within agreed caps, both governments have political cover to accept the finding.

6. Opt-In 'Incentive Accelerators'

TYPE: Accelerate ; INTERACTS WITH: All milestone-based benefit activation, Phase Advancement Criteria, Compliance Indicators System The framework creates positive incentives for early compliance, not merely penalties for late compliance. If both core parties jointly certify that a milestone has been achieved ahead of schedule, they may vote to activate an Incentive Accelerator: a one-time skip of a probationary period, a compressed timeline for the next milestone, or an early preview of a Phase 1+ benefit.

Table HUM-5: Table HUM-5: Incentive Accelerator Menu

Accelerator Trigger Benefit Limitations

Probationary Both parties certify milestone Next milestone activates

Maximum 1 skip per phase Period Skip achieved >30 days early immediately without standard 30- per party day observation period

Timeline Both parties certify Next review cycle shortened to 15 Cannot compress nuclear Compression compliance sustained for 60 days, enabling faster phase or security milestones consecutive days (double the advancement below IAEA minimum standard 30-day cycle) inspection intervals

Benefit Both parties vote (simple Previewed benefit operates for 30 preview does not commit Preview majority) to preview a Phase days as a trial either party to early phase 1+ benefit during Phase 0 advancement

Joint Both parties achieve all Public commendation in Maximum 1 bonus per 90- Achievement milestones in a review cycle Transparency Summary + joint day cycle Bonus with zero discrepancies press opportunity + 0.5-point compliance indicator credit (procedural)

Accelerator activation requires: joint written certification by both core parties; confirmation by the SESS that early achievement is verified and not the result of data manipulation; and Neutral Chair concurrence that acceleration is technically sound and politically sustainable. Accelerators do not alter compliance thresholds; they compress the time between verified compliance and benefit activation.

43 Annex HUM: Humanization Protocol

7. Narrative Sovereignty Clauses

TYPE: Face ; INTERACTS WITH: All public communications, Transparency Summary, Press protocols, Domestic Veto Map, Public-Opinion Stabilization Dashboard

Each framework party retains full narrative sovereignty: the right to describe identical framework actions using its own domestic political framing in official

communications, press releases, parliamentary briefings, and public statements. The framework does not require parties to adopt common language, common branding, or shared public narratives.

Table HUM-6: Table HUM-6: Permitted Divergent Narratives

Framework Action	Permitted US Narrative	Permitted Iranian Narrative
Enrichment cap	'We forced Iran to halt weapons-grade enrichment under international law'	'We preserved our sovereign right to civilian 3.67% enrichment'
Sanctions relief	'We are rewarding verified compliance because micro-tranche with carefully calibrated relief' they have failed'	'The US is lifting its illegal sanctions'
IAEA inspector	'We secured the toughest inspection regime in history' to any advanced safeguard state'	'We voluntarily demonstrate transparency equal access'
Fordow conversion	'We neutralized a fortified enrichment facility as a military threat' humanity'	'We invested in medical science that serves facility as a military threat'
Proxy activity cap	'Iran has committed to restraining its independent foreign policy while regional proxies' preventing chaos in our neighborhood'	'We exercise independent foreign policy while regional proxies'
IHTA toll revenue	'We ensured freedom of navigation for our rightful share of Gulf maritime global commerce' governance'	'We secured our rightful share of Gulf maritime global commerce'

Narrative sovereignty has one limitation: parties may not make factually false statements about framework provisions. Claiming 'Iran surrendered all nuclear material' when the agreement specifies downblending to 3.67% is a factual misstatement, not a narrative frame. The SESS Legal Capacity Unit

issues a factual clarification (not a rebuke) when public statements contain verifiable factual errors. Clarifications are published in the Transparency Summary. The Narrative Sovereignty Clause also applies to regional partners. Saudi Arabia may describe normalization signals as 'expanding regional cooperation'; Iran may describe the same signals as 'pragmatic engagement that does not alter our principled positions.' Both descriptions are permitted.

44 Annex HUM: Humanization Protocol

8. The 'Human-in-the-Loop' Dispute Chamber

TYPE: Joint + Pause ; INTERACTS WITH: True Deadlock Protocol (Annex TD), Tiered Arbitration Architecture, Escalation Override Mechanism

Before the True Deadlock Protocol activates its three-phase emergency authority (Guarantor Joint Authority → Technical Committee Provisional Authority → UN SG Advisory Mandate), a Human-in-the-Loop Dispute Chamber convenes automatically. The Chamber consists of two Peer Mediators—former heads of state or government, one chosen by each core party, plus the Neutral Chair as facilitator.

45 Annex HUM: Humanization Protocol

Table HUM-7: Table HUM-7: Human-in-the-Loop Dispute Chamber

Parameter Specification

Timing 48 hours immediately runs preceding Phase 1 concurrently (Guarantor Joint with final Authority) activation governance body consultation attempts

Peer Each core party selects selection made Mediator one former head of within 7 days selection state/government from of triple-stall a pre-approved roster declaration of 10 (5 suggested by each party, approved by governance body)

Roster Former heads of (b) have prior (c) are (d) have no requirements state/government who: Middle East citizens of commercial (a) are no longer in diplomatic non- interests in active politics experience framework- framework-party states affected sectors

Chamber Closed session no formal Chatham 48-hour any settlement procedure record House Rule duration reached is documented as a joint recommendation to the governance body

Outcome (a) Settlement reached (b) Partial (c) No options → governance body framework → settlement → votes to ratify referred to True (consensus default) governance Deadlock body for Protocol refinement activates on schedule

46 Annex HUM: Humanization Protocol

Compensation Peer Mediators receive \$5,000/day + travel expenses from the enforcement resourcing pool

The Human-in-the-Loop Chamber does not replace or delay the True Deadlock Protocol. It operates as a 48- hour parallel track that runs during the final consultation window. If it produces a settlement, the deadlock is resolved. If it does not, the True Deadlock Protocol activates exactly as written in Annex TD. The Chamber is a face-saving opportunity, not a procedural obstacle.

9. Tiered Attribution Grace Periods

TYPE: Soften + Pause ; INTERACTS WITH: Semi-Autonomous Actor Protocol, Proxy Activity Cap System, Shock Response Envelope, Attributed-but-Uncontrolled Doctrine

The framework's proxy attribution system (Semi-Autonomous Actor Protocol) establishes three tiers of attribution based on evidentiary standards. The Tiered Attribution Grace Period adds a temporal dimension: upon a confirmed proxy action that would trigger automatic consequences, the state to which the

proxy is attributed receives a Verification Window to formally condemn the act, initiate an internal investigation, or demonstrate that the act was conducted by an unauthorized splinter faction.

Table HUM-8: Table HUM-8: Tiered Attribution Grace Periods

Attribution Trigger Grace Required State Response Consequence if Tier Period Response Provided

Tier 1: Material Confirmed provision of 48 Formal statement Pattern-of-concern Support weapons/financing to hours acknowledging designation (not proxy investigation launched automatic compliance penalty)

Tier 2: Direction Confirmed operational 24 Formal condemnation of Compliance indicator and Control orders to proxy hours the specific act + score adjustment halved commitment to internal (+0.5 instead of +1.0) disciplinary review

Tier 3: Confirmed knowledge 72 Remediation plan Advisory determination Beneficial without preventive action hours submitted + enhanced (non-binding) instead of Environment monitoring voluntarily formal compliance accepted concern

Mass-Casualty Any proxy action meeting 12 Immediate public Shock Response Column Event (25+ Shock Response Envelope hours condemnation + B defaults halved (15 fatalities) threshold cooperative investigation days instead of 30) with SESS

The grace period does not eliminate consequences. It reduces them when the attributed state takes visible, good-faith action to disassociate from the proxy act. The SESS assesses whether the state response is genuine

47 Annex HUM: Humanization Protocol

or performative. Performative responses (vague statements, no investigation, no disciplinary action) receive no grace period benefit.

10. Symbolic 'Grand Openings'

TYPE: Symbol ; INTERACTS WITH: Fordow Conversion, Humanitarian Corridor Activation, Banking Channel Restoration, IHTA Inauguration, Regional Development Bank Launch, Key Annex Milestones Technical milestones in the framework are not merely operational events; they are diplomatic moments. The framework mandates symbolic Joint Ribbon-Cutting Ceremonies for major technical milestones. These ceremonies do not change the physics, economics, or legal obligations of the agreement. They build the social capital—the trust reservoir—that sustains cooperation during dry spells when no milestones are being reached.

Table HUM-9: Table HUM-9: Mandatory Grand Opening Events

Event Timing Participants Symbolism

Fordow Medical Isotope Upon conversion Science ministers from Iran, Nuclear program Centre Groundbreaking commencement (Month US, WHO, IAEA + transformed from threat 6-12) international advisory board to healing

First Humanitarian Upon corridor activation Health ministers + UN OCHA Food and medicine as Corridor Truck Crossing (Day 1-30) representative + local mayor framework's first visible deliverable

Banking Channel First Upon correspondent Central bank governors of Iran Economic reconnection Transaction bank opening (Day 31- + correspondent state + US after years of isolation 90) Treasury observer

IHTA Inaugural Toll Upon IHTA activation Maritime ministers from all Shared governance of the Collection (Phase 1) littoral states + IHTA board world's most critical waterway

RDF First Loan Signing Upon first project Finance ministers from Regional self-financing (Phase 1) founding members + World determination through Bank president collective investment

Refugee Return First Upon safe return UNHCR high commissioner + Human dignity restored Convoy pathway activation foreign ministers of origin and through structured return (Phase 0-1) receiving states

Grand Openings are not optional. They are framework obligations with the same scheduling requirements as technical milestones. The governance body secretariat coordinates logistics. The SESS Rapid Mediation Unit manages press protocols and narrative sovereignty compliance (each party describes the event in its own terms). Joint photography is archived in a permanent Framework Visual History maintained by the SESS.

48 Annex HUM: Humanization Protocol

The SESS also coordinates Annual Framework Commemoration events on the anniversary of framework entry into force, rotating host cities among guarantor capitals. These events are not milestone-driven; they are relationship-maintenance moments that remind all parties why the framework exists.

Governance and Limitations

The ten humanization mechanisms are operative from framework entry into force. They are not optional; they are structural features of how the framework operates. However, they are subject to the following limitations: No humanization mechanism may delay a Tier 3 mass-casualty response or a confirmed nuclear facility attack response by more than the specified time (12 hours for mass-casualty, immediate for nuclear facility). No humanization mechanism may override the financing reality classification system

(Committed/Conditional/Aspirational). No humanization mechanism may alter enrichment caps, stockpile ceilings, or breakout time floors. No humanization mechanism may prevent the Compliance Indicators System from recording discrepancies; it may only reframe how those discrepancies are communicated. No humanization mechanism may substitute for verified compliance; it may only make the experience of compliance verification more diplomatically survivable.

If any party believes a humanization mechanism is being abused (e.g., Pause Button invoked for non- extraordinary circumstances, Quiet Room used as delaying tactic), the matter may be raised with the SESS Legal Capacity Unit for review. Abuse findings are published in the Transparency Summary and may result in temporary suspension of the abused mechanism for that party for one review cycle.

49 RCSA v1.6.4 Face-Saving Wins Edition De-escalation and Economic Off-Ramps

Diplomatic Working Document

May 2026 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

Annex OFO: Operation Freedom Override and Hormuz Transition Protocol
This annex establishes the immediate de-escalation mechanisms designed to create face- saving pathways for all parties to pause kinetic operations without appearing to retreat. It includes automatic trigger protocols, maritime separation frameworks, interim financial architecture, incident insulation mechanisms, nuclear narrative dual-framing, and U.S. domestic political packaging guidance. These mechanisms are designed to lower the temperature in the Gulf while preserving the core enforcement and verification architecture of the RCSA.

1. Operation Freedom Override Emergency Protocol

The Operation Freedom Override Emergency Protocol establishes a 14-day automatic freeze on all offensive military operations in the Persian Gulf upon triggering by either the United States or Iran through the Joint Implementation Group (JIG) hotline. This mechanism addresses the face-saving need for both parties to pause kinetic activity without appearing to capitulate to the other's demands.

The protocol recognizes that domestic audiences in both Washington and Tehran require a narrative of strength rather than retreat. By framing the freeze as an 'operational assessment period' rather than a ceasefire, both leaderships can claim they are recalibrating tactics rather than abandoning strategic objectives. The 14-day window is calibrated to provide sufficient time for back-channel negotiations to achieve tangible results while preventing either side from using the pause to rearm extensively.

Operation Freedom Override Trigger Conditions: Operation Freedom Override Trigger Conditions

Trigger Event Activation Freeze Scope Duration Override Method Authority

Verbal 24-hour notice to All offensive air, naval, 14 Either party may notification via Guarantor and missile operations calendar terminate with 72-JIG hotline Powers in Persian Gulf days hour notice

2 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

Detected Iranian Automatic via U.S. offensive 14 U.S. Secretary of missile fueling at JSTARS datalink operations only calendar Defense Kharg Island days

Detected U.S. carrier Automatic via Iranian offensive 14 Iranian Supreme strike group sortie coastal radar operations only calendar National Security beyond 26°N network days Council

Third-party 48-hour notice to All offensive 14 Unanimous Guarantor invocation both parties operations by calendar Guarantor consent (Russia, China, EU) both parties days required

The automatic nature of the freeze is critical to its face-saving function. Neither leader must personally order a stand-down; the mechanism triggers through pre-authorized military protocols. This insulates political leadership from accusations of weakness. The 72-hour override notice ensures that either party can resume operations if the other exploits the pause, providing a safety valve that makes the protocol politically viable.

Provides 14-day cooling-off window without requiring political capitulation Automatic triggers remove leadership from direct pause decision Bilateral and unilateral activation pathways for maximum flexibility Guarantor Powers serve as neutral arbiters of compliance 72-hour override notice prevents strategic exploitation

During the 14-day freeze, all parties commit to maintaining defensive postures. Naval vessels may remain on station but may not close within 50 nautical miles of the other party's territorial waters. Air defense assets remain active but may not illuminate fire-control radars against commercial or neutral military traffic. Ballistic missile units may remain fueled but may not elevate launch angles beyond 45 degrees. These specific technical constraints provide verifiable indicators of compliance without requiring visible withdrawal of forces.

2. Hormuz Standstill as Phase -2

The Hormuz Standstill mechanism introduces a seven-day military separation phase that precedes the formal Phase 1 implementation of the RCSA. Designated as 'Phase -2,' this pre-implementation period creates the physical and psychological space necessary for diplomatic traction without requiring

either party to formally acknowledge a change in strategic posture.

The standstill is designed as a 'force posture adjustment' rather than a withdrawal. Iranian Revolutionary Guard Corps naval units agree to maintain station beyond 12 nautical miles

3 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

from the centerline of the Strait of Hormuz shipping lanes. U.S. Fifth Fleet assets agree to position no closer than 25 nautical miles from Iranian territorial waters. These adjustments are framed as 'safety measures to deconflict maritime traffic' rather than concessions.

Hormuz Standstill Force Posture Adjustments: Hormuz Standstill Force Posture Adjustments

Party Normal Posture Standstill Narrative Frame Verification Posture Method

IRGC-N Interdiction patrols Patrols beyond Maritime safety Commercial AIS within 3nm of 12nm from deconfliction satellite shipping lanes centerline monitoring

U.S. Fifth CSG within 15nm CSG beyond Freedom of Open-source AIS Fleet of Iranian waters 25nm from navigation safety and guarantor territorial waters margin overflight

Coalition National patrols at National patrols Coordinated RDF maritime partners national discretion beyond 20nm regional maritime monitoring cell safety

Commercial Unescorted transit Voluntary Industry-led risk Lloyd's List and shipping convoying mitigation IHTA registration encouraged

The seven-day duration is specifically calibrated to allow two complete cycles of maritime traffic (approximately 48-72 hours per transit cycle) to proceed

without incident, generating positive commercial feedback that reinforces the standstill's value. This commercial validation creates a constituency of support among Gulf shipping insurers and energy traders that makes extending the standstill economically rational.

The standstill does not affect the International Hormuz Transit Authority (IHTA) or its tolling mechanisms. Rather, it creates the security conditions under which IHTA can begin operations without the immediate risk of naval interdiction. This sequencing is deliberate: the standstill proves that safe transit is possible, and IHTA then institutionalizes that safety through its regulatory and revenue framework.

3. Dual Escrow for Hormuz Transit

The Dual Escrow mechanism establishes a \$0.05 per gross ton transit fee managed through a Swiss-based escrow facility as an interim bridging mechanism between the Hormuz Standstill and full IHTA implementation. This micro-toll serves three functions: it creates a revenue stream that demonstrates the economic value of maritime safety; it provides a

4 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

neutral financial architecture that neither the U.S. nor Iran directly controls; and it establishes the operational precedent for the IHTA's larger tolling system.

The escrow is structured as a dual-account system: one account holds Iranian claims for frozen asset relief, and the other holds U.S. claims for sanctions enforcement costs. Neither account releases funds to the other party; rather, both accounts accumulate transit fees that serve as a 'confidence balance' demonstrating that mutual economic engagement is possible without requiring immediate trust. The Swiss escrow agent (proposed: Bank for

International Settlements or a designated Swiss cantonal bank) releases accumulated balances only upon mutual confirmation that a designated RCSA milestone has been reached.

Dual Escrow Architecture: Dual Escrow Architecture

Component Specification Rationale

Transit fee \$0.05 per gross ton Below cost threshold to affect trade, high enough to accumulate meaningfully

Escrow agent Swiss-domiciled bank with U.S. Neutral jurisdiction with established and Iranian pre-clearance financial oversight

Account Separate Iranian and U.S. sub- Prevents direct fund transfer, maintains structure accounts separation of claims

Release trigger Mutual JIG confirmation of Creates incentive for cooperation without milestone achievement requiring trust

Initial \$50M from RDF seed funding Provides operational liquidity before tolls capitalization accumulate

Auditing Quarterly KPMG or PwC review Standard international practice, acceptable to both parties

The \$0.05 rate is deliberately set below the 0.05% cargo value threshold that would trigger sanctions compliance scrutiny for most shipping insurers and commodity traders. At this level, the toll is economically negligible for a VLCC carrying 2 million barrels of crude (approximately \$100,000 per shipment at \$50/bbl), representing less than 0.1% of cargo value. This sub-threshold positioning ensures that the escrow does not become a sanctions enforcement flashpoint.

The Dual Escrow's face-saving function is substantial. Iran can present the

escrow as a 'pilot revenue mechanism' demonstrating that international shipping recognizes its role as a Gulf stakeholder. The United States can present it as a 'voluntary commercial fee' entirely separate from sanctions relief, thereby avoiding accusations that it is paying Iran for transit

5 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

rights. Both narratives are technically accurate, which is the hallmark of well-designed face- saving architecture.

4. Ceasefire Breach Amnesty Protocol

The Ceasefire Breach Amnesty Protocol establishes a graduated incident insulation mechanism that prevents single provocations from collapsing the entire framework. This mechanism directly addresses the vulnerability of all confidence-building measures to spoiler attacks, whether intentional (by actors opposed to the framework) or unintentional (by commanders operating under old rules of engagement).

The protocol creates three tiers of incident response based on severity and attribution certainty. Tier 1 (Isolated Tactical Incident) covers single events with limited casualties or damage, where attribution is unclear or points to non-state actors. Tier 2 (Attributed Violation) covers incidents where a state actor is identified but the action is denounced by that actor's central command as unauthorized. Tier 3 (Confirmed State-Level Breach) covers deliberate, authorized violations of framework obligations.

Ceasefire Breach Amnesty Tiers: Ceasefire Breach Amnesty Tiers

Tier Definition Response Amnesty Window Escalation Path

1 — Isolated Single event, ≤3 72-hour Full amnesty if JIG fact-finding Tactical casualties, investigation non-state mission unclear period, no attribution attribution automatic confirmed retaliation

2— State actor 48-hour disavowal Partial amnesty if Graduated penalty Attributed identified, required, joint corrective under Annex K Violation central investigation measures command implemented disavows

3— Authorized, Automatic No amnesty Full Annex K Confirmed deliberate graduated enforcement and State Breach framework response per potential violation Annex K framework suspension

The amnesty mechanism's face-saving power lies in its explicit insulation of leadership from rogue actions. If an IRGC unit or a U.S. Navy patrol acts outside authorized parameters, the central command of the offending party can disavow the action within 48 hours and avoid Tier 3 classification. This creates an internal incentive for both Washington

6 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol and Tehran to maintain strict command and control over their forces, while also providing a diplomatic pathway to contain incidents that neither leadership may have authorized.

The 72-hour and 48-hour windows are calibrated to domestic political cycles. Seventy-two hours allows a full news cycle to pass and provides time for intelligence assessment. Forty-eight hours matches the standard cycle for foreign ministry spokesperson statements in both capitals. These timeframes are tight enough to prevent deliberate stalling but long enough to allow genuine assessment and internal consultation.

5. Nuclear Deferral Acknowledgment Framework

The Nuclear Deferral Acknowledgment Framework provides a narrative architecture that allows both the United States and Iran to describe the same factual reality—an Iranian enrichment pause—using diametrically different public framings. This mechanism addresses the political impossibility of either

party explicitly acknowledging the other's core demands: Washington cannot publicly accept Iranian enrichment, and Tehran cannot publicly abandon its nuclear program.

The framework establishes a dual-narrative protocol under which the United States characterizes the Iranian posture as a 'technical operational pause for assessment,' while Iran characterizes its posture as 'continued sovereign enrichment with adjusted cascades for operational optimization.' Both descriptions refer to the same physical reality: cascades operating at reduced levels or idled for maintenance. The duality is not dishonest—it is politically necessary ambiguity that serves the same functional purpose as explicit agreement.

Under this framework, the IAEA publishes technical reports describing cascade performance in purely engineering terms without political characterization. The Joint Implementation Group endorses the IAEA reports as the 'authoritative technical baseline,' allowing both parties to reference the same data while attaching their own political interpretations. This is analogous to the 'creative ambiguity' that enabled the 1998 Good Friday Agreement in Northern Ireland, where the same constitutional text served different political narratives.

Nuclear Deferral Dual-Narrative Matrix: Nuclear Deferral Dual-Narrative Matrix

Physical U.S. Framing Iranian Framing IAEA Technical Reality Description

Cascades Technical pause for Cascades in standby Cascade performance: zero idled for 180 verification baseline optimization mode SWU for 180 days, all UF6 days establishment awaiting next operational feed diverted to storage cycle

7 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

Fordow Facility repurposed Fordow continues Facility configuration: converted to for non-enrichment sovereign nuclear cascades removed, medical research applications per research with modified isotope equipment installed, framework cascade configuration no HEU presence

Stockpile Stockpile limit within Natural accumulation of Total UF₆ mass: 200kg ±5%, capped at framework sovereign material under enrichment level: 3.67% U- 200kg parameters operational management 235

The face-saving function is profound. The U.S. administration can tell Congress and regional allies that Iran has 'frozen enrichment activities' without Iran having formally agreed to a freeze. The Iranian leadership can tell its parliament and public that 'enrichment continues at optimized levels' without contradicting the physical reality of reduced cascade activity. Both statements are politically sustainable because both are attached to the same IAEA-verified technical baseline, and neither requires the other party to publicly renounce its long-held positions.

6. Trump-Specific Domestic Packaging Protocol

The Trump-Specific Domestic Packaging Protocol provides a tailored communications framework designed to maximize the political viability of RCSA implementation within the United States during a potential second Trump administration. This protocol does not alter the substantive content of the framework but re-frames its presentation to align with the rhetorical and political preferences of the administration's domestic constituency.

The protocol recognizes that the success of any international agreement depends on its political saleability to domestic audiences. For the Trump administration's base, this requires emphasizing strength, American

leadership, economic return, and adversary containment rather than multilateral cooperation, diplomatic compromise, or institutional engagement. The packaging protocol translates RCSA mechanisms into this vocabulary without changing their operational function.

RCSA Mechanism Trump-Specific Reframing: RCSA Mechanism Trump-Specific Reframing

RCSA Standard Trump-Specific Framing Audience Mechanism Framing

Hormuz Mutual maritime American Navy dictates separation National security Standstill de-escalation terms, Iran complies conservatives

Dual Escrow Swiss-managed American-led toll system on Iranian Economic neutral fee waters, revenue held pending nationalists behavior

8 Annex OFO: Operation Freedom Override and Hormuz Transition Protocol

Proxy Freeze Graduated proxy Trump Doctrine extension — proxies MAGA base Zones disarmament disarmed by American resolve, not diplomacy

Sanctions relief Calibrated relief for Maximum pressure victory — Iran Sanctions tranches verified compliance earns relief only after full hawks capitulation to American terms

IAEA Multilateral American intelligence dominance Intelligence monitoring verification with international cover community architecture

RDF Regional American investment protected by Business investment development fund American security guarantees community

The protocol also provides specific messaging guidance for key domestic constituencies. For evangelical voters, the Jerusalem Custodianship provisions (see Annex RIL) are elevated as 'protecting Christian holy sites through American leadership.' For Rust Belt workers, the Sovereign Recovery Bonds

and diaspora reconstruction programs are framed as 'creating American jobs through Middle East reconstruction contracts.' For fiscal conservatives, the graduated sanctions relief is presented as 'ending the \$50 billion annual cost of Middle East force posture through Iranian compliance.'

The protocol explicitly prohibits any substantive modification of framework terms to accommodate packaging requirements. The reframing is purely presentational. This limitation is critical to maintaining the framework's integrity and international credibility. The Joint Implementation Group retains full authority over operational implementation; the packaging protocol operates exclusively through national communications channels and does not appear in international framework instruments.

A dedicated U.S. Communications Cell within the JIG is established under this protocol, staffed by personnel with prior experience in political communications rather than traditional diplomatic messaging. This cell coordinates with the White House communications office to ensure that daily talking points, social media content, and congressional briefing materials consistently reflect the Trump-specific framing. The cell does not participate in operational decision-making and has no authority to modify framework obligations.

9 Annex ECO: Emergency Economic Off-Ramp Architecture

Annex ECO: Emergency Economic Off-Ramp Architecture This annex establishes the economic mechanisms designed to create immediate, tangible benefits for Iran while providing face-saving framing for all parties. It includes a humanitarian asset release tranche, sovereign bond conversion, currency stabilization, private sector sanctions shielding, banking channel restoration, export pricing liberalization, diaspora professional return, and agricultural export authorization. These mechanisms are calibrated to produce visible

economic wins within 90 days of framework activation without requiring comprehensive sanctions relief or political capitulation.

7. Immediate Relief Tranche (Tranche 0.5)

The Immediate Relief Tranche, designated 'Tranche 0.5,' establishes a \$500 million humanitarian release of frozen Iranian assets held in third-party escrow accounts, triggered automatically upon Hormuz Standstill activation. This tranche precedes the formal Tranche 1 release scheduled for Phase 1 of the RCSA implementation roadmap, providing an immediate, tangible economic demonstration that cooperation produces material benefits.

The \$500 million amount is deliberately calibrated to be significant enough to register in the Iranian economy—equivalent to approximately two weeks of oil import revenue or one month of pharmaceutical import requirements—while remaining small enough that its release does not trigger congressional notification thresholds under U.S. law. This sub-threshold positioning is critical to face-saving: the U.S. executive can authorize release without legislative confrontation, while Iran can demonstrate that its assets are being unfrozen.

Tranche 0.5 Release Architecture: Tranche 0.5 Release Architecture

Parameter Specification Rationale

Amount \$500 million Significant for Iranian humanitarian needs, below U.S. congressional notification threshold

Source Frozen accounts in South Existing escrowed funds, no new money required Korea, Japan, India, Oman

10 Annex ECO: Emergency Economic Off-Ramp Architecture

Trigger Hormuz Standstill Day 3 Links economic benefit to security

confirmation behavior without formal sanctions relief

Use restriction Humanitarian goods only Prevents military or nuclear diversion, (medicine, food, agricultural inputs) satisfies U.S. oversight

Release Letter of credit through designated Standard trade finance, no direct U.S.- mechanism Swiss bank Iran banking

Verification Quarterly IAEA + WHO audit Independent verification ensures compliance with use restrictions

Reversibility Clawback if Tier 3 breach Protects U.S. interests, creates Iranian confirmed within 90 days incentive for compliance

The Tranche 0.5 narrative architecture is critical. The United States presents the release as 'humanitarian exception consistent with existing Treasury licenses,' not as sanctions relief. Iran presents it as 'first installment of asset repatriation under framework.' Both framings are factually defensible: the funds were already frozen and their release for humanitarian purposes is consistent with existing OFAC general licenses. The innovation is the automatic trigger that removes the bilateral negotiation requirement for each release decision.

The use restrictions are enforced through a letter-of-credit architecture rather than direct fund transfers. The Swiss bank issues letters of credit to approved pharmaceutical and food suppliers, who ship goods to Iran and present bills of lading for payment. Iranian authorities never take custody of the dollars directly; rather, the Swiss bank pays suppliers upon delivery confirmation. This financial architecture prevents both direct diversion and accusations of funding terrorism, while still providing Iran with the economic benefit of import capacity.

8. Sovereign Recovery Bonds

The Sovereign Recovery Bond mechanism transforms a portion of frozen Iranian assets into 10-year bearer bonds issued by the Regional Development Fund (RDF), creating a financial instrument that serves both Iranian economic recovery needs and international investor confidence. This mechanism addresses the political challenge that outright release of frozen assets appears as a 'reward' to U.S. audiences, while structured bond issuance can be presented as 'market-based investment.'

Under this mechanism, \$5 billion of frozen Iranian assets (approximately 10% of the estimated \$50-70 billion total across various jurisdictions) are converted into RDF sovereign recovery bonds with the following terms: 10-year maturity, 4.5% coupon paid semi-annually, RDF full faith and credit guarantee, and secondary market trading through

11 Annex ECO: Emergency Economic Off-Ramp Architecture

Euroclear. The bonds are denominated in euros to minimize dollar-clearing complications and are registered through a Luxembourg clearing facility.

Sovereign Recovery Bond Terms: Sovereign Recovery Bond Terms

Term Specification Benefit to Iran Benefit to International Community

Principal \$5 billion frozen asset Access to capital Asset remains structured, conversion without appearing as not released for diversion direct relief

Maturity 10 years with 3-year Long-term planning Duration aligns with call option horizon for framework implementation reconstruction

Coupon 4.5% semi-annual \$225M annual income Market-rate return (EUR) stream competitive with similar EM debt

Guarantee RDF full faith and Sovereign-grade Multilateral institution credit backing support reduces individual country risk

Denomination Euro (EUR) Avoids U.S. dollar European banks can trade clearing and OFAC without secondary sanctions jurisdiction exposure

Trading Euroclear Luxembourg Liquid secondary Standard international market for emergency settlement infrastructure sales

Use of Iranian infrastructure Visible domestic Creates reconstruction proceeds and energy economic improvement constituency modernization

Audit Annual Big Four audit Transparency for International confidence in published domestic Iranian fund stewardship accountability

The face-saving architecture is substantial. For Iran, the bonds represent 'international recognition of Iran's sovereign creditworthiness' rather than charity or relief. The Iranian Central Bank can hold the bonds as reserve assets and use them as collateral for trade finance, effectively monetizing frozen assets without requiring a politically toxic 'unfreezing' announcement in Washington. For the United States, the bond conversion can be presented as 'converting frozen liabilities into structured RDF assets that strengthen regional stability.'

12 Annex ECO: Emergency Economic Off-Ramp Architecture

The 4.5% coupon is set at approximately 150 basis points above comparable RDF member sovereign yields, reflecting Iran's elevated risk profile while remaining below distress levels. This pricing provides genuine economic value to Iran (an effective \$225 million annual income stream) while also offering an attractive yield to RDF bondholders, including European pension funds and Gulf sovereign wealth funds seeking emerging market exposure with multilateral backing.

9. Rial Stabilization Bridge

The Rial Stabilization Bridge establishes a \$1 billion Swiss-denominated

currency swap line collateralized by Iranian gold reserves held at the Bank for International Settlements, designed to arrest rial volatility during the critical Phase 0 to Phase 1 transition period. This mechanism addresses the acute vulnerability of the Iranian economy to speculative currency attacks during any framework implementation period, when uncertainty about sanctions relief timing can trigger capital flight.

The swap line operates through a standard central bank liquidity facility architecture. The Swiss National Bank (SNB) provides CHF 850 million (approximately \$1 billion equivalent) in overnight and term liquidity to the Central Bank of Iran (CBI) against gold collateral transferred to SNB custody at the BIS. The CBI uses this liquidity to intervene in the Tehran Foreign Exchange Center (TFEC), purchasing rial to stabilize the USD/IRR rate within a +/- 5% band around a target rate agreed with the IMF.

Rial Stabilization Bridge Architecture: Rial Stabilization Bridge Architecture

Component Specification Rationale

Swap size CHF 850M (~\$1B equivalent) Sufficient for 30 days of TFEC intervention at average daily volume

Collateral Iranian gold reserves (approx. Gold is sanctions-resistant collateral, BIS 125 tonnes) at BIS is neutral venue

Counterparty Swiss National Bank Credible, neutral central bank with existing EM liquidity programs

Target band USD/IRR 420,000 +/- 5% Prevents extreme depreciation while allowing market adjustment

Intervention CBI purchases rial via TFEC Transparent, market-based, avoids black mechanism electronic platform market distortion

Duration 6 months renewable by mutual consent without open-ended commitment

13 Annex ECO: Emergency Economic Off-Ramp Architecture

Conditionality No new UN Security Council Simple, verifiable trigger linked to broad sanctions posture

Exit Gradual reduction as sanctions Prevents sudden reversal that could materializes trigger renewed volatility

The gold collateralization is a critical face-saving element. Iran is not 'borrowing from the West'; it is monetizing its own gold reserves through a neutral Swiss intermediary. This framing is domestically sustainable in Tehran because it does not involve dollar transactions, U.S. institutions, or American political conditions. The Swiss framing is equally sustainable: the SNB is providing a standard liquidity facility against adequate collateral, with no political dimension beyond standard BIS protocols.

The 6-month initial duration with renewable terms provides a stability bridge without creating permanent dependency. As sanctions relief tranches unlock (Tranche 1, Tranche 2, etc.), the CBI gradually reduces swap utilization and transitions to normal market operations. The exit is designed to be gradual: a 20% reduction in swap line utilization per quarter as formal RDF and World Bank program lending comes online. This prevents the 'cliff effect' that often destabilizes emerging markets when temporary facilities expire abruptly.

10. Private Sector Shield

The Private Sector Shield establishes an OFAC advisory opinion mechanism that provides explicit secondary sanctions protection for non-U.S. persons engaging in RCSA-authorized trade with Iran. This mechanism addresses the primary barrier to Iranian economic normalization: not U.S. primary

sanctions on American entities, but the deterrent effect of secondary sanctions on European, Asian, and Gulf companies that would otherwise trade with Iran.

The mechanism operates through a pre-certification system administered by a dedicated OFAC RCSA Compliance Desk. Non-U.S. companies submit a compliance certification describing their proposed Iranian transactions. The Compliance Desk issues an advisory opinion within 30 days either confirming that the transaction falls within RCSA-authorized categories (and is therefore shielded from secondary sanctions) or identifying specific compliance requirements that must be met. Once issued, the advisory opinion is binding on OFAC for 24 months.

Private Sector Shield Advisory Opinion Framework: Private Sector Shield Advisory Opinion Framework

Element Specification Rationale

14 Annex ECO: Emergency Economic Off-Ramp Architecture

Applicant Any non-U.S. person (individual or entity) Addresses the secondary sanctions deterrent, not primary sanctions

Application Online portal, standard form, \$5,000 Self-funding, streamlined, no legal processing fee representation required

Categories Humanitarian, RDF-funded infrastructure, Covers the core economic IHTA-registered shipping, licensed cooperation areas without broad technology transfer authorization

Processing 30 calendar days Fast enough for commercial time decision-making, thorough enough for compliance

Binding period 24 months from issuance Provides planning certainty for multi-year contracts

Renewal Simplified renewal with 10-day processing Reduces compliance burden for ongoing commercial relationships

Enforcement Advisory opinion holders exempt from Creates genuine legal protection, shield secondary sanctions for covered not merely guidance transactions

Revocation Only for material misrepresentation or Protects against bad faith without Tier 3 framework breach creating chilling effect

Publication Anonymous summary statistics published Transparency without revealing quarterly competitive intelligence

The face-saving function is dual-sided. For non-U.S. companies, the Shield provides the legal certainty necessary to resume Iranian trade without fear of Treasury Department enforcement actions that could freeze their dollar operations or bar them from U.S. markets. For the United States, the Shield is presented not as 'allowing Iran trade' but as 'certifying compliant engagement within a negotiated framework.' The certification requirement ensures that no trade is automatically authorized; every transaction is reviewed and approved individually, preserving the principle of sanctions oversight.

The \$5,000 processing fee serves two purposes. First, it funds the OFAC Compliance Desk without requiring congressional appropriation, insulating the mechanism from U.S. legislative politics. Second, it creates a minor friction that discourages frivolous applications while remaining economically negligible for genuine commercial transactions. The fee is set at approximately 0.1% of the value of a typical €5 million Iranian trade transaction, well within standard due diligence costs.

15 Annex ECO: Emergency Economic Off-Ramp Architecture

11. Banking Channel Fast-Track (Euro Clearing Window)

The Euro Clearing Window establishes a dedicated TARGET2-compliant banking channel for RCSA-authorized Iranian transactions, bypassing the SWIFT disconnection and correspondent banking freeze that has blocked Iranian international payments since 2018. This mechanism does not restore Iran's full access to the global financial system but creates a narrow, supervised corridor for framework-approved transactions.

The channel operates through a consortium of European banks designated as 'RCSA Authorized Correspondents' (RACs), each pre-cleared by their national regulators and the ECB. Iranian banks designated as 'RCSA Authorized Iranian Banks' (RAIBs) maintain nostro accounts with RACs in euros. All transactions pass through a joint compliance layer staffed by ECB, Bundesbank, and Banque de France personnel, with real-time OFAC visibility but not OFAC veto authority.

Euro Clearing Window Architecture: Euro Clearing Window Architecture

Layer Function Institutions Controls

Iranian origin RAIB initiates payment 3 designated Iranian Pre-cleared by ECB, for RCSA-authorized banks (CBI, Bank limited to authorized transaction Mellat, Bank Pasargad) categories

Compliance Automated screening ECB + national Real-time screening, filter against EU sanctions list regulators rejects non-authorized and RCSA category transactions registry

Correspondent RAC processes payment 6 European banks (2 Pre-authorized by ECB, layer through TARGET2 German, 2 French, 1 capital requirements Italian, 1 Dutch) waived for RCSA business

International Payment reaches Standard Only RCSA-authorized settlement beneficiary bank correspondent network beneficiary banks may outside Iran

receive

U.S. oversight Real-time OFAC OFAC RCSA Compliance Monitoring without veto visibility into all Desk to preserve European transactions regulatory autonomy

Dispute Transaction rejection Joint JIG Financial 24-hour resolution for resolution appeals Working Group humanitarian transactions, 5 days for commercial

16 Annex ECO: Emergency Economic Off-Ramp Architecture

The face-saving architecture is carefully layered. For Iran, the Euro Clearing Window represents 'reconnection to the international banking system through European partners,' avoiding any appearance of dependence on American financial infrastructure. For the United States, the architecture ensures 'full transparency without relinquishing oversight,' as OFAC maintains real-time visibility even without veto authority. For European banks, the ECB waiver of capital requirements for RCSA business provides a powerful commercial incentive while the pre-clearance process removes the compliance uncertainty that has deterred Iranian banking since 2018.

The channel is explicitly narrow: only three Iranian banks are designated as RAIBs, and only transactions in pre-authorized categories (humanitarian, RDF-funded projects, IHTA shipping tolls, and licensed technology transfer) may pass through. This narrowness is a feature, not a bug. It prevents the channel from becoming a sanctions evasion conduit and provides a politically sustainable scope for U.S. and European legislators. If the channel proves effective and compliance remains strong, the category registry can be expanded through standard Annex P amendment procedures.

12. Iranian Export Pricing Autonomy

The Iranian Export Pricing Autonomy mechanism permits IHTA-registered

Iranian exporters to set prices for designated commodities (petrochemicals, metals, agricultural products) without the current requirement for Ministry of Commerce pre-approval and anti-dumping alignment. This mechanism addresses a critical non-sanctions barrier to Iranian trade: the bureaucratic pricing controls that make Iranian exports uncompetitive regardless of sanctions status.

The mechanism is limited to exporters who register with the IHTA and agree to semi-annual price reporting (not pre-approval) to a joint Iran-EC trade monitoring office. Registered exporters gain the autonomy to negotiate prices directly with international buyers, accept payment through the Euro Clearing Window, and enter forward contracts up to 18 months. The monitoring office tracks actual transaction prices for statistical purposes and identifies potential market manipulation, but does not set prices or block transactions.

Export Pricing Autonomy Scope: Export Pricing Autonomy Scope

Commodity	Current Restriction	Autonomy Grant	Monitoring Requirement	IHTA Registration	Category
-----------	---------------------	----------------	------------------------	-------------------	----------

Petrochemicals	Ministry-set price	Full price	Quarterly	Yes, plus RDF (methanol, urea, reference price negotiation average price environmental polyethylene) +/- 2% reporting compliance	
----------------	--------------------	------------	-----------	--	--

17 Annex ECO: Emergency Economic Off-Ramp Architecture

Base metals	Export price floor	Negotiated pricing	Semi-annual	Yes, plus labor (steel, copper, at production cost with cost structure standards aluminum) + 15% documentation disclosure certification	
-------------	--------------------	--------------------	-------------	---	--

Agricultural	Government Direct export of	Annual	Yes, plus (pistachios, procurement surplus crop volume and phytosanitary saffron, dates) monopoly for 40% price reporting compliance of crop	
--------------	-----------------------------	--------	--	--

Medical devices Price ceiling at Export pricing at Quarterly Yes, plus WHO (domestic import parity market rates transaction quality production) reporting certification

Handicrafts and Export guild Full pricing Annual Simplified carpets pricing schedules autonomy reporting only registration

Technology Service export Contract-by- Project Yes, plus IP services licensing regime contract completion compliance (software, registration reporting engineering)

The face-saving function operates on multiple levels. For Iranian reformers, the autonomy represents 'economic liberalization consistent with the 20-year development vision,' reducing the power of opaque bureaucratic gatekeepers. For conservative elements, the IHTA registration requirement ensures that pricing autonomy is granted only to 'framework-compliant' exporters who have accepted international regulatory oversight. For international buyers, the monitoring office provides price transparency that reduces the information asymmetry currently embedded in Iranian trade.

The mechanism is designed to create visible, rapid economic wins. Iranian pistachio exporters, for example, can immediately offer competitive forward contracts to European buyers at prices 15-20% below U.S. and Turkish competitors due to Iran's production cost advantage. Petrochemical exporters can clear excess inventory accumulated during sanctions years through spot sales to Asian buyers. These tangible commercial victories create a domestic Iranian constituency for framework compliance that is independent of the broader political debate over nuclear policy.

13. Diaspora Reconstruction Corps

The Diaspora Reconstruction Corps establishes a \$200 million RDF-funded

program to recruit Iranian professionals living abroad—engineers, physicians, academics, technologists—for time-limited return assignments to RDF-funded infrastructure projects. This mechanism addresses two challenges simultaneously: the brain drain that has depleted

18 Annex ECO: Emergency Economic Off-Ramp Architecture

Iran's technical capacity over two decades of sanctions, and the political need to demonstrate that framework participation produces direct benefits for Iranian families.

The program operates through 6-month to 24-month 'reconstruction sabbaticals' during which diaspora professionals receive RDF-funded compensation at international market rates, housing in secure project sites, and legal guarantees that their participation in RDF projects does not expose them to sanctions liability or Iranian domestic legal jeopardy. The legal guarantee is critical: many Iranian professionals abroad have avoided engagement with home-country projects due to fear of OFAC enforcement or Iranian security service scrutiny.

Diaspora Reconstruction Corps Structure: Diaspora Reconstruction Corps Structure

Parameter Specification Rationale

Budget \$200M over 4 years (\$50M Funded from RDF general allocation, no annually) new donor required

Eligible Iranian citizens or dual nationals Captures experienced professionals with participants with 10+ years abroad international credentials

Sabbatical 6-24 months Long enough for meaningful duration contribution, short enough to maintain foreign residence

Compensation International market rate + 30% Attracts high-quality applicants, hardship premium competitive with Gulf expat packages

Housing Secure RDF project compounds Addresses security concerns, particularly with international staff for dual nationals

Legal protection OFAC advisory opinion + Iranian Removes the dual legal threat that deters judiciary non-prosecution participation guarantee

Fields Energy infrastructure, water, Aligns with RDF priority sectors and healthcare, education, technology Iranian development needs

Reintegration Alumni network and follow-on Maintains engagement beyond consulting contracts sabbatical, builds professional community

Host projects RDF-funded infrastructure only Ensures international oversight, reduces corruption risk

The face-saving power of this mechanism is profound. For the Iranian government, the return of high-skill diaspora professionals demonstrates that 'sanctions relief is bringing

19 Annex ECO: Emergency Economic Off-Ramp Architecture

our children home'—a politically potent narrative in a society where emigration has been a visible symbol of economic failure. For diaspora professionals, the program provides a 'safe return' pathway that does not require abandoning foreign residency or navigating opaque Iranian bureaucracy. For the RDF and donor countries, the program creates visible, high- quality infrastructure outcomes that demonstrate the tangible value of framework investment.

The legal architecture is specifically designed to address the dual-citizenship vulnerability. Participants receive a blanket OFAC advisory opinion confirming

that RDF project participation is authorized under the Private Sector Shield. Simultaneously, the Iranian judiciary issues a binding non-prosecution guarantee for all program activities, issued under the authority of the Supreme Leader's representative to the judiciary. This dual guarantee is unprecedented in post-revolutionary Iran and represents a significant concession to international norms, balanced against the domestic political value of diaspora return.

14. Agricultural Independence Protocol

The Agricultural Independence Protocol authorizes unconditional Iranian export of three designated agricultural commodities—pistachios, saffron, and dates—through the Euro Clearing Window with simplified IHTA registration and no end-use certification requirements. This mechanism is designed as a 'quick win' that produces visible Iranian economic benefits within the first 90 days of framework activation, creating domestic political momentum for further cooperation.

The choice of these three commodities is deliberate. Pistachios, saffron, and dates are politically neutral products with no dual-use military application, strong existing European and Asian demand, established Iranian competitive advantage, and symbolic cultural value. Unlike oil or petrochemicals, agricultural exports do not trigger the intense political scrutiny that accompanies energy trade. Unlike technology or metals, agricultural products face no non-proliferation objections.

Agricultural Independence Protocol Specifications: Agricultural Independence Protocol Specifications

Commodity Iranian Global Protocol Benefit Target Simplified Market Share
Market Mechanism

Pistachios 35% (world's Unconditional export EU, China, IHTA 'Green Lane' largest authorization, no end-use India registration, 24-hour producer) cert approval

20 Annex ECO: Emergency Economic Off-Ramp Architecture

Saffron 90% (near- Direct price EU, UAE, Japan Simplified monopoly negotiation, bypass registration, quarterly producer) state trading volume reporting only monopoly

Dates 15% (major Unrestricted forward Indonesia, Green Lane producer) contracting up to 18 Malaysia, registration, annual months Bangladesh price reporting

Combined ~\$800M Immediate foreign Global Simplified customs export value annually at exchange earnings processing at Bandar full capacity Abbas and Chabahar

The 'Green Lane' registration is a simplified IHTA category requiring only basic exporter identity verification, product phytosanitary compliance (certified by EU-approved Iranian laboratories), and quarterly volume reporting. Approval is granted within 24 hours through an automated IHTA portal. This is in contrast to standard IHTA registration, which requires detailed beneficial ownership disclosure, end-use certification, and 5-10 day processing. The Green Lane does not bypass all oversight but reduces friction to the minimum consistent with international agricultural trade norms.

The face-saving function is immediate and visible. Iranian farmers and agricultural exporters—many of whom are politically conservative and reside in rural constituencies— see direct, unmediated access to international markets for the first time in a decade. The rural constituency benefit is strategically important because it broadens the domestic political base for

framework compliance beyond the urban reformists who have traditionally supported diplomatic engagement. When a pistachio farmer in Rafsanjan can sell directly to a German importer at world market prices, the abstract debate over nuclear policy becomes concrete economic reality.

21 RCSA v1.6.4 Face-Saving Wins Edition Security, Proxy, and Nuclear Architecture

Diplomatic Working Document

May 2026 Annex SPA: Security and Proxy Architecture

Annex SPA: Security and Proxy Architecture This annex establishes the security mechanisms designed to transform proxy relationships and military postures without requiring humiliating disarmament or strategic capitulation. It includes enhanced stabilization zones with civilian governance and economic layers, expedited PMF federal integration, a phased Hezbollah political transition track, a Houthi maritime stand-down with monthly benefit tranches, a regional counterterrorism working group for technical-level cooperation, and a cyber non-aggression pact with graduated verification. These mechanisms create face-saving pathways for all armed actors to transition from military confrontation to political and economic integration.

15. Stabilization Zones (Proxy Freeze Zone Enhancement)

The Stabilization Zone mechanism enhances the existing Proxy Freeze Zones established in Annex D by adding a civilian governance and economic reconstruction layer designed to transform military de-escalation into sustainable territorial stability. This enhancement addresses the critical gap in the original freeze zone concept: the absence of a positive vision for what replaces proxy activity once it is frozen.

Each Stabilization Zone is designated as a 50-kilometer radius area centered

on a current proxy activity hotspot (e.g., the Syria-Lebanon border, northern Yemen, southern Iraq). Within this zone, three layers operate simultaneously: a Military Separation Layer (existing Annex D provisions), a Civilian Governance Layer (new municipal administration support), and an Economic Reconstruction Layer (RDF micro-project funding). The three layers are administered by a Zone Management Council comprising local civil society, national government representatives, and RDF personnel.

Stabilization Zone Three-Layer Architecture: Stabilization Zone Three-Layer Architecture

Layer	Function	Personnel	Funding Source	Duration
Military	Buffer between UN observers + local RDF security			Indefinite,
Separation	opposing forces joint patrols		allocation reviewed quarterly	
Civilian	Restored Local civil society + RDF governance			3-year initial
Governance	municipal services national fund (\$5M per zone mandate (water, power, government liaison annually) health)			

2 Annex SPA: Security and Proxy Architecture

Economic	Micro-projects	Local	RDF reconstruction	3-year initial
Reconstruction	employing former contractors + fund (\$10M per mandate with proxy fighters diaspora zone annually) renewal option			technical advisors

Zone Coordination, 7 members (3 Administrative Continuous Management dispute resolution, local, 2 budget from RDF Council compliance national, 2 RDF) monitoring

The key innovation is the Economic Reconstruction Layer's explicit targeting of former proxy fighters for employment. RDF-funded micro-projects—road repair, irrigation restoration, small-scale solar installation—are required to maintain a 30% hiring quota for demobilized proxy personnel who have

registered with the Zone Management Council. This quota is not a demobilization requirement (which would face proxy leadership resistance) but an employment incentive that creates an alternative livelihood pathway.

The face-saving architecture operates at multiple levels. For proxy leadership, the Stabilization Zones are presented not as 'disarmament areas' but as 'protected development zones where our constituents receive priority employment.' For national governments (Syria, Yemen, Iraq, Lebanon), the zones represent 'restored sovereignty over previously ungoverned territory.' For international donors, the zones demonstrate that 'security investment produces governance outcomes.' For local populations, the zones provide tangible service restoration that is independent of which faction currently controls the district.

16. PMF Federal Integration Fast-Track

The PMF Federal Integration Fast-Track accelerates the existing Iraq Stabilization and PMF Integration framework (Annex H) by establishing a 90-day expedited pathway for PMF brigades that meet pre-verified compliance criteria to transition to full Iraqi federal force status. This fast-track addresses the political reality that incremental PMF integration over years creates windows for spoiler violence, while an immediate, visible integration win for compliant brigades creates positive demonstration effects.

The fast-track operates through a 'compliance pre-verification' system administered by the Joint Iraq Stabilization Monitoring Group (JISMG). PMF brigades that have maintained zero cross-border operations for 12 months, zero attacks on U.S. or coalition facilities for 18 months, and zero involvement in domestic sectarian violence for 24 months are pre-certified as 'Fast-Track Eligible.' Upon RCSA activation, eligible brigades submit integration

3 Annex SPA: Security and Proxy Architecture

petitions that are processed within 90 days rather than the standard 12-month integration timeline.

PMF Fast-Track Eligibility and Integration: PMF Fast-Track Eligibility and Integration

Criterion Verification Method Fast-Track Standard Track Requirement

Zero cross-border Iraqi NSA + U.S. CENTCOM 12 months 24 months operations intelligence review continuous

Zero attacks on U.S. base incident logs + Iraqi 18 months 36 months coalition MoD records continuous

Zero sectarian UNAMI human rights 24 months 48 months violence monitoring + Iraqi judiciary continuous records

Commander Iraqi judiciary + INTERPOL No outstanding No outstanding background check screening warrants warrants

Equipment JISMG physical inspection Full disclosure of Full disclosure of inventory heavy weapons heavy weapons

Personnel registry Biometric enrollment + salary 90% brigade 90% brigade account creation enrollment enrollment

Integration Federal force status, national 90-day processing 12-month outcome salary, standard chain of processing command

The 90-day processing timeline is achievable because the fast-track leverages pre-verified compliance data. Rather than initiating a new investigation upon petition, the JISMG reviews existing monitoring records and confirms continued compliance during the 90-day window. This reduces administrative burden while maintaining standards. Brigades that fail to maintain compliance during the 90-day window revert to standard-track processing.

The face-saving architecture is designed for Iraqi domestic consumption. PMF brigades that achieve fast-track integration receive a formal ceremony at the Iraqi Ministry of Defense, public recognition by the Prime Minister, and a federal force designation that includes the same salary, pension, and equipment provisions as conventional army units. This is presented not as 'PMF disbandment' but as 'PMF elevation to full national force status.' For Iranian stakeholders, the fast-track preserves PMF personnel and organizational structures within the Iraqi state rather than eliminating them. For U.S. stakeholders, the fast-track accelerates the transition of PMF units from Iranian-aligned militias to Iraqi national forces.

4 Annex SPA: Security and Proxy Architecture

17. Hezbollah Political Transition Track

The Hezbollah Political Transition Track establishes a structured pathway for Hezbollah's transformation from a combined military-political organization into a purely political party with a demilitarized social service wing, while preserving its electoral legitimacy and domestic political role in Lebanon. This mechanism addresses the fundamental incompatibility between Hezbollah's armed status and Lebanese state sovereignty, without requiring the immediate military defeat or political marginalization that Hezbollah leadership would reject.

The track is organized into three phases over 36 months, each with specific benchmarks and corresponding Lebanese political rewards. Phase 1 (Months 1-12): Military Separation. Hezbollah's military wing declares a unilateral freeze on cross-border operations, rocket launches, and weapons transfers. In exchange, Lebanon receives immediate RDF stabilization funding (\$200M), U.S. non-objection to Lebanese Armed Forces modernization, and Israeli commitment to a 12-month northern border standstill. Phase 2 (Months 13-24):

Territorial Transition. Hezbollah military units withdraw from positions south of the Litani River and transfer heavy weapons (rockets, missiles, anti-tank systems) to Lebanese Armed Forces custody under international supervision. In exchange, Lebanon gains EU association agreement advancement and World Bank program lending restoration. Phase 3 (Months 25- 36): Institutional Integration. Hezbollah's military wing formally disbands; personnel choose between integration into Lebanese Armed Forces (with rank preservation) or civilian transition packages. Hezbollah's political party and social service networks (hospitals, schools, welfare) remain fully operational. In exchange, Lebanon receives full sanctions relief, U.S. bilateral assistance restoration, and NATO partnership consideration.

Hezbollah Political Transition Three-Phase Architecture: Hezbollah Political Transition Three- Phase Architecture

Phase	Duration	Hezbollah	Lebanese	Reward	Verification	Face-Saving	Obligation Narrative
-------	----------	-----------	----------	--------	--------------	-------------	----------------------

1—	12	Cross-border freeze, rocket stabilization, LAF satellite modernization, monitoring sovereignty weapons transfer freeze standstill strength'	\$200M RDF UNIFIL + U.S. 'Protecting Military months				
----	----	---	--	--	--	--	--

5 Annex SPA: Security and Proxy Architecture

2—	12	Withdrawal south of Litani, advancement, weapons state authority Transition heavy weapons World Bank inventory, to all Lebanese transfer to LAF restoration international territory' custody	EU association IAEA-style 'Extending Territorial months				
----	----	--	---	--	--	--	--

3—	12	Formal military Full sanctions Biometric 'Completing Institutional months wing relief, U.S. enrollment, Lebanese Integration disbandment,					
----	----	---	--	--	--	--	--

assistance, weapons national personnel NATO destruction integration, integration or partnership verification not foreign civilian imposition' transition

The face-saving architecture is the most politically critical element of this track. Hezbollah leadership can present Phase 1 as 'protecting Lebanon from Israeli aggression by demonstrating restraint that exposes Israeli intransigence.' Phase 2 can be presented as 'supporting the Lebanese state in extending its authority to the south, consistent with Hezbollah's long-standing commitment to Lebanese sovereignty.' Phase 3 can be presented as 'transitioning to a new phase of national service, not surrender.' Each framing is attached to tangible Lebanese state benefits that provide a political rationale independent of external pressure.

For Israel, the track provides a structured alternative to the military elimination of Hezbollah that has proven strategically costly and politically unsustainable. The Israeli government can present the track as 'diplomatic achievement of what military operations could not accomplish—Hezbollah's demilitarization without regional war.' The 12-month northern border standstill in Phase 1 is particularly valuable to Israel because it provides a security dividend that is immediately visible to Israeli border communities.

For the United States, the track resolves the long-standing contradiction between supporting Lebanese state institutions and tolerating Hezbollah's armed status. The phased structure allows Washington to provide rewards incrementally, ensuring that Hezbollah compliance is verified before each tranche of benefits is released. This 'verify then trust' sequencing aligns with U.S. political preferences and provides congressional oversight points at each phase transition.

18. Houthi Maritime Stand-Down

The Houthi Maritime Stand-Down establishes a reciprocal de-escalation mechanism in the Red Sea and Bab el-Mandeb strait under which Houthi forces cease all maritime interdiction operations in exchange for a graduated package of Yemeni economic and

6 Annex SPA: Security and Proxy Architecture

humanitarian benefits delivered through the RCSA Yemen Stabilization Framework (Annex F). This mechanism addresses the immediate security threat to global shipping while providing the Houthi leadership with a face-saving narrative and tangible governance benefits.

The stand-down is structured as a 12-month renewable agreement with monthly verification cycles. Houthi forces commit to: (a) cessation of all missile, drone, and small boat attacks on commercial and naval vessels in the Red Sea, Gulf of Aden, and Bab el- Mandeb; (b) withdrawal of maritime interdiction forces to positions beyond 20 nautical miles of international shipping lanes; (c) permitting UNVIM (UN Verification and Inspection Mechanism) monitoring of all coastal installations previously used for maritime operations. In exchange, the following benefits are delivered in monthly tranches contingent on verified compliance.

Houthi Maritime Stand-Down Monthly Benefit Tranches: Houthi Maritime Stand-Down Monthly Benefit Tranches

Month Houthi Compliance Delivered Benefit Face-Saving Frame Verification

1-3 Zero maritime \$50M RDF humanitarian 'Protecting Yemeni civilian incidents, UNVIM site corridor funding (food, interests through maritime access medicine, fuel) restraint'

4-6 Continued zero Port of Hodeidah 'Restoring Yemeni port incidents, UNVIM rehabilitation begins (\$30M capacity through quarterly report infrastructure)

responsible governance' positive

7-9 Six-month clean Sana'a airport international 'Reconnecting Yemen to the compliance record flight authorization (medical world through diplomatic and humanitarian) achievement'

10-12 Nine-month clean RDF \$100M reconstruction 'Building Yemeni future record program launch (water, through sustained power, health) cooperation'

Renewal Annual UNVIM Extension of all benefits, 'Continuing Yemeni certification consideration of broader progress through verified economic normalization commitment'

The face-saving architecture is designed around the Houthi leadership's need to present the stand-down as a Yemeni national achievement rather than a military capitulation. The monthly benefit tranches are all framed as civilian infrastructure and humanitarian improvements, not as payments to Houthi forces. The Port of Hodeidah rehabilitation and

7 Annex SPA: Security and Proxy Architecture

Sana'a airport reopening are particularly powerful because they are visible symbols of Yemeni sovereignty restoration that benefit all Yemenis regardless of political affiliation.

The verification architecture combines UNVIM physical inspections (which the Houthis have previously accepted under the Stockholm Agreement), commercial shipping AIS data (which is publicly available and independently verifiable), and U.S./UK/French naval surveillance (which does not require Houthi cooperation). This layered verification provides confidence to international stakeholders without requiring Houthi transparency that they would view as intrusive. The monthly cycle ensures that any violation is detected quickly and that the response—suspension of the next month's

tranche—is immediate and proportionate.

19. Regional Counterterrorism Working Group

The Regional Counterterrorism Working Group (RCTWG) establishes a standing intelligence and operational coordination body comprising the counterterrorism services of all RCSA signatory states plus designated observer states (Jordan, Egypt, UAE, Qatar). This mechanism addresses the shared threat of ISIS resurgence, al-Qaeda in the Arabian Peninsula (AQAP) activity, and emerging transnational terrorist networks, while providing a security cooperation framework that does not require political normalization between adversarial states.

The RCTWG operates under a 'dual-key' principle: all shared intelligence is sanitized to remove sources and methods that could compromise national security, and all coordinated operations require unanimous consent of the directly affected states. This architecture allows Iran and Israel, for example, to share ISIS threat intelligence through the RCTWG without sharing Israeli intelligence sources with Iranian personnel or requiring Israeli approval for Iranian CT operations.

RCTWG Structure and Operations: RCTWG Structure and Operations

Element Specification Rationale

Membership CT services of RCSA signatories (Iran, Iraq, Covers all states with active CT Syria, Lebanon, Yemen, Saudi Arabia, plus concerns Israel as 'security participant')

Observer Jordan, Egypt, UAE, Qatar, Turkey Adds capacity and geographic states coverage without requiring full RCSA commitment

Secretariat Rotating annually among members, staffed Neutral administrative function, by 12 seconded officers no operational authority

8 Annex SPA: Security and Proxy Architecture

Intelligence Sanitized threat assessments, shared Removes source/method exposure sharing through RDF secure portal risk

Coordinated Unanimous consent of affected states Prevents one state's CT operation operations required from compromising another

Training Joint CT exercises, 2 per year, hosted Builds trust and operational by rotating members interoperability

Analytical Quarterly regional CT threat Shared situational awareness, no products assessment (classified, members only) attribution requirements

Crisis response 72-hour activation for imminent Rapid coordination without full JIG threat convening

The face-saving function is substantial. For Iran, participation in the RCTWG is 'regional leadership in combating terrorism that threatens all Muslims,' not cooperation with Israel or the United States. For Israel, RCTWG membership is 'protecting Israeli citizens from ISIS and AQAP through regional intelligence access,' not normalization with Iran. For Saudi Arabia and the Gulf states, the RCTWG is 'Gulf security architecture that includes rather than excludes Iran,' addressing the strategic reality that Iranian intelligence has unique access to Shia militant networks that threaten Gulf monarchies.

The working group also provides a critical back-channel function. Because RCTWG meetings occur at the technical (not political) level, Iranian and Israeli CT officers can sit in the same room, review the same threat assessments, and discuss operational coordination without the political symbolism of formal diplomatic contact. These technical relationships build the interpersonal trust and communication habits that make crisis de-escalation possible even when political relationships remain adversarial.

20. Cyber Non-Aggression Pact

The Cyber Non-Aggression Pact establishes a bilateral commitment between the United States and Iran to refrain from offensive cyber operations against each other's critical infrastructure during RCSA implementation, with a graduated verification and confidence- building architecture that addresses the unique attribution challenges of cyberspace. This mechanism addresses the escalating cyber conflict between the two states that has targeted financial systems, power grids, water treatment facilities, and military command networks.

The pact defines three categories of protected infrastructure: Category A (life-critical infrastructure: water treatment, hospital networks, emergency services communications), Category B (economic infrastructure: central bank systems, stock exchanges, major commercial payment networks), and Category C (government infrastructure: non-military

9 Annex SPA: Security and Proxy Architecture

government data centers, civilian aviation systems, weather monitoring). The pact prohibits offensive cyber operations against all Category A infrastructure unconditionally, Category B infrastructure unless specifically exempted by the JIG Cyber Working Group, and Category C infrastructure unless associated with confirmed military command functions.

Cyber Non-Aggression Pact Protected Categories: Cyber Non-Aggression Pact Protected Categories

Category Infrastructure Protection Exemption Verification Method Type Level Process

A — Life- Water treatment, Absolute None Endpoint monitoring critical hospitals, prohibition + international Red emergency comms Team audits

B— Central banks, stock Prohibited JIG Cyber Financial sector ISAC Economic exchanges, unless JIG Working Group reporting + central payment networks exempted unanimous bank monitoring consent

C— Civilian Prohibited JIG intelligence Government network Government government data unless military review of target monitoring + third- centers, aviation, command status party audit weather confirmed

D — Military Armed forces C2, Not covered by N/A N/A — military cyber weapons systems, pact operations remain intelligence governed by existing laws of armed conflict

The verification architecture is the pact's most innovative element. Because cyber attribution is inherently uncertain, the pact relies on 'confidence-building transparency' rather than forensic attribution. Both parties commit to quarterly 'Red Team' exercises in which internationally recognized cybersecurity firms (pre-cleared by both parties) attempt to penetrate designated test networks in each country. The results are shared bilaterally but not publicly, providing each party with an independent assessment of the other's defensive posture and a baseline for detecting anomalous activity. Additionally, both parties commit to publishing anonymized statistics on critical infrastructure intrusion attempts through a joint portal, allowing each side to monitor whether attack volumes decrease during pact implementation.

The face-saving architecture is carefully designed. The United States can present the pact as 'establishing cyber deterrence boundaries that protect American critical infrastructure from Iranian attacks, backed by the threat of overwhelming retaliation if violated.' Iran can present the pact as 'international recognition of Iran's cyber sovereignty and a framework

10 Annex NPA: Nuclear Pause Architecture

that prevents U.S. cyber aggression against Iranian civilian infrastructure.' Both framings are sustainable because the pact is genuinely reciprocal: each party gains protection from the other's cyber operations while retaining full freedom of action against military targets and third-party actors.

The pact includes a specific 'graduated response' protocol for violations. Because attribution uncertainty makes immediate retaliation risky, the protocol establishes a 30-day joint investigation period during which both parties share technical data through the JIG Cyber Working Group. If attribution confidence reaches 80% (assessed by a joint technical panel), the offended party may implement proportionate countermeasures against Category C infrastructure of the offending party. If confidence reaches 95%, the offended party may suspend the pact and resume unrestricted cyber operations. This graduated structure provides time for technical assessment and political de-escalation before either party escalates to full cyber conflict.

Annex NPA: Nuclear Pause Architecture This annex establishes the nuclear mechanisms designed to create technical confidence and verification transparency without requiring explicit rhetorical concessions from either party. It includes a renewable six-month operational pause with dual framing, a blockchain- anchored transparency ledger for immutable compliance records, a facility conversion pathway for Fordow, structured dialogue with the Nuclear Suppliers Group, and a real-time breakout time monitoring dashboard. These mechanisms transform the nuclear debate from political confrontation to technical management, creating sustainable conditions for long-term resolution.

21. Nuclear Pause Mechanism

The Nuclear Pause Mechanism establishes a time-bound, reversible suspension of specific Iranian enrichment activities that is not labeled as a

'freeze' or 'halt' in official Iranian communications but produces the same functional effect: zero growth in Iran's enriched uranium stockpile and cascade inventory during the pause period. This mechanism addresses the irreconcilable rhetorical requirements of both parties while creating the technical conditions for sustained negotiation.

The pause operates on a six-month renewable cycle. During each cycle, Iran commits to: (a) no new centrifuge installation at Natanz, Fordow, or any declared facility; (b) no increase in the total enriched uranium stockpile beyond the 200kg UF₆ cap; (c) no enrichment above 3.67% U-235; (d) no conversion of research facilities to enrichment use. These commitments

11 Annex NPA: Nuclear Pause Architecture

are verified through standard IAEA monitoring plus additional technical measures agreed with the IAEA. In exchange, the United States commits to no new sanctions designations under existing executive orders and a temporary suspension of 'snapback' rhetoric at the UN Security Council.

Nuclear Pause Commitment Architecture: Nuclear Pause Commitment Architecture

Commitment Iranian Framing U.S. Framing Verification Duration

No new 'Cascade 'Iran agrees not to IAEA containment 6 months, centrifuge optimization expand enrichment and surveillance renewable installation maintenance, no infrastructure' expansion required'

Stockpile cap at 'Natural inventory 'Iran agrees to IAEA quarterly 6 months, 200kg UF₆ management within stockpile limitation' inventory renewable operational parameters'

No enrichment 'Continued peaceful 'Iran agrees to low- IAEA 6 months, above 3.67% enrichment within enrichment ceiling' environmental renewable NPT

parameters' sampling

No facility 'Stable research 'Iran agrees not to IAEA design 6 months, conversion configuration' convert facilities' information renewable verification

U.S. reciprocal Not applicable 'No new sanctions, U.S. Treasury 6 months, no snapback public renewable rhetoric during designation freeze pause'

The face-saving architecture is the mechanism's core innovation. Iran's leadership describes the pause to domestic audiences as 'continuing Iran's peaceful nuclear program with adjusted operational parameters in line with national planning.' The U.S. leadership describes the same activities as 'Iranian enrichment freeze verified by the IAEA.' Both descriptions refer to the same physical reality, and neither requires the other to adopt its framing. The IAEA publishes purely technical reports that both parties cite as supporting their respective narratives.

The six-month renewable structure is politically critical. A fixed-duration pause would create pressure for comprehensive agreement before expiration, incentivizing bad-faith negotiating tactics. An indefinite pause would be politically unsustainable in Washington. The renewable six-month cycle creates a 'rolling verification window' that sustains cooperation as long as both parties see benefit, while allowing either party to non-renew

12 Annex NPA: Nuclear Pause Architecture

with 60 days' notice without triggering immediate crisis. The non-renewal notice period provides time for diplomatic salvage efforts and prevents surprises.

22. Transparency Ledger

The Transparency Ledger establishes a public, blockchain-anchored record of

all Iranian nuclear material movements, IAEA inspection results, and framework compliance milestones, designed to provide both parties with an authoritative, tamper-evident baseline that prevents disputes over 'who did what when.' This mechanism addresses the chronic problem of divergent historical narratives that have poisoned previous U.S.-Iran nuclear negotiations.

The ledger operates on a permissioned blockchain architecture (Hyperledger Fabric) maintained by the RDF with nodes hosted by neutral parties (Switzerland, Singapore, Brazil, South Africa). Each entry is cryptographically signed by the responsible entity: IAEA inspectors sign material movement records, Joint Implementation Group personnel sign milestone confirmations, and national authorities sign policy declarations. The blockchain structure ensures that once an entry is recorded, it cannot be altered without detection, while the permissioned structure ensures that only authorized parties may create entries.

Transparency Ledger Data Architecture: Transparency Ledger Data Architecture

Data Source Update Public Visibility Verification Category Frequency

Iranian IAEA inspectors at Weekly Total kg and IAEA seal + uranium facility enrichment level inspector stockpile public, location biometric aggregate only

Centrifuge IAEA containment Monthly Total count public, Dual-key IAEA + inventory cameras + physical cascade configuration Iranian inspection aggregate signatory

Facility access IAEA + Iranian Real-time Access count public, Automated logs nuclear authority inspector identity sensor + manual pseudonymized log

Compliance JIG Working Group As achieved Status public, JIG unanimous

milestone negotiation details confirmation status confidential

13 Annex NPA: Nuclear Pause Architecture

Sanctions relief OFAC + RDF As Amount and date public, Dual-key tranche release triggered beneficiary confidential Treasury + RDF signatory

Dispute Annex K Upon Ruling summary public, Panel chair resolution arbitration issuance deliberations confidential signature rulings panel

The face-saving function is subtle but profound. For Iran, the ledger represents 'unprecedented transparency that demonstrates Iran's commitment to peaceful nuclear activity'—a voluntary confidence-building measure rather than an imposed inspection regime. For the United States, the ledger provides 'permanent, tamper-proof verification that prevents Iranian cheating'—a technological upgrade to the IAEA's existing capabilities. For the international community, the ledger creates a shared factual baseline that makes disputes about compliance easier to resolve, because both parties can reference the same immutable record.

The blockchain anchoring is particularly valuable for domestic political audiences in both countries. Iranian officials can show the ledger to parliament as proof that 'every gram of uranium is accounted for in a system Iran helped design.' U.S. officials can show Congress that 'we have real-time, immutable verification of Iranian compliance, not the paper reports that were manipulated in the past.' The technological sophistication of the ledger makes it politically durable because both sides can claim to have gained a verification advantage.

23. Fordow Medical Pivot

The Fordow Medical Pivot transforms the Fordow Fuel Enrichment Plant (FFEP) from an enrichment facility into a medical isotope production center,

providing a civilian-use narrative for a facility that has been at the center of international proliferation concerns due to its deeply buried, hardened construction. This mechanism addresses the political reality that Fordow's existence as an enrichment site is a permanent flashpoint, while its conversion to medical isotope production provides a face-saving alternative that preserves Iranian technical employment and international relevance.

The pivot involves the physical removal of all IR-1 and IR-2m centrifuge cascades from Fordow, their verified destruction or transfer to IAEA-monitored storage, and the installation of medical isotope production equipment including technetium-99m generators, molybdenum-99 irradiation targets, and iodine-131 processing lines. The facility retains its deeply buried structure, which now provides physical protection for medical isotope

14 Annex NPA: Nuclear Pause Architecture

production against conventional military attack—a characteristic that is commercially valuable given the global shortage of Mo-99 production capacity.

Fordow Medical Pivot Implementation: Fordow Medical Pivot Implementation

Phase Duration Activities Verification Benefits

1— 6 months All cascades removed, IAEA continuous Removes Centrifuge inventoried, sealed monitoring + enrichment removal physical capability from inspection hardened site

2— 12 months Medical isotope IAEA design Creates civilian Equipment production lines information medical production installation installed verification + capacity supplier audit

3— 6 months WHO + IAEA Joint WHO/IAEA Qualifies Fordow Production certification of isotope inspection mission for international certification purity and safety medical isotope market

4— Ongoing Production and export Quarterly IAEA + Revenue Commercial of medical isotopes to WHO audit generation, operations regional markets technical employment preservation

Personnel Parallel Enrichment Technical training Preserves Iranian transition technicians retrained certification by technical workforce for isotope production IAEA and WHO

Security Continuous Facility protected by Standard IAEA Iran maintains framing Iranian military as facility protection military presence at 'critical medical protocols converted facility infrastructure'

The face-saving architecture operates on multiple levels. For Iran, the pivot is 'converting a military-targeted facility into a center of medical excellence that serves the Muslim world'— a narrative of civilian technological leadership rather than strategic retreat. The preservation of the underground complex as a 'medical isotope fortress' allows Iran to maintain the military protection of the site without the proliferation implications of enrichment. For the United States, the pivot is 'verifiably eliminating Iran's most threatening enrichment facility'—a concrete, irreversible disarmament achievement. For

15 Annex NPA: Nuclear Pause Architecture

the international community, the pivot addresses the global Mo-99 shortage, which has reached crisis levels following the retirement of aging European and Canadian reactors.

The employment dimension is critical to Iranian domestic acceptance. Fordow employs approximately 1,200 Iranian scientists, engineers, and technicians. The pivot preserves all 1,200 positions through retraining and reassignment to medical isotope production. This employment guarantee is a politically potent selling point for Iranian leadership because it demonstrates that 'the

imperialists did not destroy our facility or fire our people—they were forced to accept our conversion to a more advanced purpose.' The retraining is funded by the RDF as part of its nuclear transition support program, adding no cost to the Iranian budget.

24. NSG Dialogue Track

The NSG Dialogue Track establishes a structured engagement between Iran and the Nuclear Suppliers Group (NSG) that does not require Iran's immediate NSG membership but creates a pathway toward eventual participation based on verified compliance and international confidence-building. This mechanism addresses Iran's long-standing demand for international recognition of its nuclear program legitimacy while providing the NSG and its member states with assurance that Iranian participation would not compromise non-proliferation standards.

The dialogue operates through quarterly 'Technical Cooperation Meetings' (TCMs) hosted by neutral NSG member states on a rotating basis (Argentina, South Africa, Kazakhstan, Singapore). Each TCM addresses a specific technical topic: nuclear safety standards, export control implementation, physical protection protocols, safeguards technology, and civilian nuclear commerce. Iranian technical experts participate alongside NSG members in working-level discussions, building the professional relationships and institutional familiarity that would eventually support formal membership consideration.

NSG Dialogue Track Architecture: NSG Dialogue Track Architecture

Meeting Format Frequency Host Rotation Topics Outputs Iranian Benefit

Technical Quarterly Argentina, South Africa, Cooperation Kazakhstan, Singapore, Meeting Austria

16 Annex NPA: Nuclear Pause Architecture

Nuclear Joint International safety technical professional standards, reports, recognition, export best- standards controls, practice alignment physical sharing protection, safeguards, civilian commerce

Observer Annual By NSG chair Iran observes Understanding Reduced Participation NSG invitation NSG of NSG decision- information plenary deliberations as making asymmetry 'interested party'

Bilateral As Individual Specific Informal Pathways to Consultations requested NSG technology or understandings, legitimate members trade issues trust-building nuclear trade

Compliance Annual IAEA + NSG Iranian Public Demonstrated Review chair safeguards compliance adherence to implementation report international against NSG standards guidelines

Membership Upon Full NSG NSG consensus Formal Long-term Application Iranian membership decision participation in strategic request procedures global nuclear objective after 36 governance months of dialogue

The face-saving architecture is carefully structured. For Iran, the TCMs are 'international recognition of Iran's nuclear expertise and a seat at the table from which we were unjustly excluded.' The participation of Iranian experts alongside their international counterparts demonstrates that 'the West cannot deny Iran's technical competence or isolate our scientists.' For NSG members, the dialogue is 'conditional engagement that provides Iran with an incentive to maintain compliance without granting premature membership privileges.' The NSG retains full control over whether and when to advance Iranian participation.

17 Annex NPA: Nuclear Pause Architecture

The 36-month minimum dialogue period before formal membership

application is a critical design element. This duration provides sufficient time for Iranian compliance patterns to be established and verified, for NSG members to become comfortable with Iranian technical personnel, and for the political climate to evolve. It also prevents the dialogue from being perceived as a 'backdoor' to immediate membership, which would trigger opposition from NSG members concerned about proliferation risks. The minimum period is not a maximum —Iran may choose to delay application if it assesses that the political conditions for consensus approval are not yet favorable.

25. Breakout Time Monitoring Dashboard

The Breakout Time Monitoring Dashboard establishes a real-time, publicly accessible metric of Iran's theoretical nuclear breakout timeline based on IAEA-verified stockpile and cascade data, designed to transform the abstract political debate over 'how close is Iran to a bomb' into a concrete, continuously updated technical indicator. This mechanism addresses the persistent problem of politically motivated estimates that have ranged from 'two weeks' to 'two years' depending on the estimator's institutional affiliation and political objectives.

The dashboard is maintained by the IAEA with data feeds from standard inspections and monitoring equipment. It calculates breakout time using a transparent, published methodology that considers: (a) current stockpile of UF₆ at various enrichment levels; (b) installed and operating centrifuge numbers and types; (c) facility capacity and operational history; (d) reconversion and weaponization steps (modeled, not measured). The methodology is published in full and subject to annual peer review by an independent panel of physicists from nuclear-armed and non-nuclear-armed states alike.

Breakout Dashboard Methodology and Display: Breakout Dashboard

Methodology and Display

Parameter	Data Source	Calculation	Update	Display	Format	Method	Frequency
-----------	-------------	-------------	--------	---------	--------	--------	-----------

Low-enriched UF6	IAEA quarterly	Direct	Quarterly	Bar chart: kg vs. stockpile (3.67%)	inventory measurement	200kg cap	
------------------	----------------	--------	-----------	-------------------------------------	-----------------------	-----------	--

High-enriched UF6	IAEA verification	Direct	Immediate if Red alert:	kg and stockpile (if any)	measurement detected location		
-------------------	-------------------	--------	-------------------------	---------------------------	-------------------------------	--	--

Installed	IAEA containment	Direct count	Monthly	Stacked bar: IR-1, centrifuges + surveillance	IR-2m, IR-4, IR-6, advanced		
-----------	------------------	--------------	---------	---	-----------------------------	--	--

18 Annex NPA: Nuclear Pause Architecture

Operating	IAEA operational	Direct	Monthly	Percentage of installed centrifuges records	measurement capacity online		
-----------	------------------	--------	---------	---	-----------------------------	--	--

Single-batch	Modeled from Published	Weekly	Single number: days to breakout time	stockpile + cascade algorithm	sufficient HEU for one data device		
--------------	------------------------	--------	--------------------------------------	-------------------------------	------------------------------------	--	--

Scenario	Modeled with Published	Monthly	Three scenarios: breakout times assumptions	algorithm demonstrated, projected, worst-case			
----------	------------------------	---------	---	---	--	--	--

The face-saving function is substantial for both parties. For the United States and Israel, the dashboard provides an early warning system that is more reliable than intelligence estimates because it is based on direct IAEA observation rather than remote sensing and inference. If breakout time drops below a threshold (e.g., 90 days), automatic alerts are sent to all framework parties and Guarantor Powers, triggering consultation under Annex L Crisis Management protocols. For Iran, the dashboard demonstrates that 'Iran has nothing to hide—our breakout time is published for the world to see, updated weekly, based on data we provide to the IAEA.' This transparency is a powerful confidence-building measure that is difficult for Iranian hardliners to oppose

because it is framed as demonstrating technical confidence rather than strategic vulnerability.

The dashboard's public accessibility is critical to its political function. Unlike classified intelligence estimates that can be selectively leaked to support political arguments, the dashboard is available to all citizens, journalists, and analysts worldwide. This democratization of verification data reduces the space for political manipulation and creates a shared factual baseline. When a U.S. senator claims Iran is 'weeks from a bomb,' the dashboard provides a counter-reference. When an Iranian official claims 'breakout is impossible under current conditions,' the dashboard provides the technical basis for that claim. The transparency does not eliminate political debate but elevates it to a shared factual foundation.

19 RCSA v1.6.4 Face-Saving Wins Edition Regional Integration and Legitimacy Diplomatic Working Document

May 2026 Annex RIL: Regional Integration and Legitimacy

Annex RIL: Regional Integration and Legitimacy This annex establishes the mechanisms designed to create regional legitimacy, institutional permanence, and societal transformation beyond the immediate security and economic concerns of the framework. It includes a Saudi-Iranian bilateral chamber of commerce, a multilateral Jerusalem custodianship council, a regional energy security compact with automatic supply sharing, a youth exchange corridor for cross-generational relationship building, and a framework Nobel protocol for recognizing peace contributions. These mechanisms transform the RCSA from a crisis management instrument into a sustainable regional architecture with deep societal roots.

26. Saudi-Iranian Chamber of Commerce

The Saudi-Iranian Chamber of Commerce establishes a bilateral commercial institution with joint headquarters in Riyadh and Tehran, designed to provide a structured, government-backed framework for resuming direct trade and investment between the two largest economies in the Gulf. This mechanism addresses the economic vacuum created by decades of Saudi-Iranian commercial estrangement, which has cost both nations billions in forgone trade and forced regional commerce through inefficient third-party intermediaries.

The Chamber operates as a non-governmental organization chartered by both governments but managed by private-sector boards in each capital. Its functions include: trade dispute arbitration (binding on member companies), commercial intelligence sharing (market opportunities, regulatory changes), joint venture facilitation (matching Iranian manufacturing capacity with Saudi capital and Gulf market access), and financial coordination (working with the Euro Clearing Window and RDF to settle bilateral transactions). Membership is open to any company registered in either country that accepts the Chamber's arbitration jurisdiction and transparency standards.

Saudi-Iranian Chamber of Commerce Structure: Saudi-Iranian Chamber of Commerce Structure

Function Riyadh Office Tehran Office Joint Mechanism

Arbitration Saudi commercial Iranian commercial Binding split-panel decisions with law panel law panel neutral chair

2 Annex RIL: Regional Integration and Legitimacy

Intelligence Gulf market analysis, Iranian production Shared monthly bulletin, Saudi regulatory capacity, export licensing quarterly sector reports updates guidance

Joint ventures Saudi capital and Gulf Iranian manufacturing Chamber-facilitated distribution matching and engineering introductions, matching standardized term sheets

Financial Euro Clearing Window Rial liquidity support, Bilateral transaction coordination liaison, RDF project Iranian banking settlement support matching introduction

Membership Saudi-registered firms Iranian-registered firms Cross-border membership available with dual registration

Governance 6-member Saudi board 6-member Iranian board Co-chairs rotate annually, neutral secretary from RDF

The face-saving architecture is essential because both governments have invested heavily in the narrative of the other as an existential threat. The Chamber is not presented as 'friendship' or 'alliance' but as 'commercial pragmatism that serves national economic interests.' The Saudi board can describe the Chamber as 'organizing Gulf access to Iranian production capacity on terms favorable to Saudi investors.' The Iranian board can describe it as 'restoring Iran's natural role as the manufacturing hub of the Muslim world, with Saudi capital participating on Iranian terms.' Both descriptions are commercially accurate.

The Chamber's first-year target is modest but meaningful: \$500 million in bilateral trade facilitated (not direct, as many transactions will still involve third-party financial settlement). Target sectors include petrochemical intermediates, construction materials, food processing equipment, and medical supplies—categories where Iranian production capacity and Saudi market demand are structurally complementary. These early wins create commercial constituencies in both countries that have a vested interest in preventing political disruption of trade relationships.

27. Jerusalem Custodianship Council

The Jerusalem Custodianship Council establishes a multilateral guardianship framework for the holy sites of Jerusalem, composed of religious authorities from the three Abrahamic faiths plus the Hashemite Kingdom of Jordan (as historical custodian of Jerusalem Islamic sites), the State of Israel (as sovereign authority), and the Palestinian Authority (as representative of the Palestinian population). This mechanism addresses the explosive

3 Annex RIL: Regional Integration and Legitimacy

potential of Jerusalem status disputes by creating a functional governance mechanism that operates regardless of the unresolved political sovereignty question.

The Council does not resolve sovereignty. Its mandate is exclusively custodial: preservation, access, security, and administration of religious sites. The Council's jurisdiction covers the Old City and its immediate environs, including the Haram al-Sharif/Temple Mount complex, the Church of the Holy Sepulchre, the Western Wall, and all other sites of recognized religious significance. The Council has no authority over civilian governance, policing, or municipal services, which remain under the respective authorities of Israel and the Palestinian Authority.

Jerusalem Custodianship Council Architecture: Jerusalem Custodianship Council Architecture

Function Composition Authority Operational Mechanism

Site Technical experts from Recommendations to Joint conservation preservation all faiths + UNESCO sovereign authorities teams, shared funding

Access Religious authorities Determines prayer Rotating daily regulation from each faith schedules, visitor quotas management by faith tradition

Security Israeli police + Maintains order, prevents Tripartite patrols with coordination Palestinian liaison + violence designated no-weapon international zones observers

Dispute Council chair + two Non-binding mediation, 72-hour mediation, 14-mediation rotating religious binding arbitration day arbitration if leaders available mediation fails

Administrative RDF endowment Financial independence Independent audit, funding (\$50M) + voluntary from political authorities public financial contributions reporting

Holy site Unanimous council No physical alteration Architectural review expansion consent without all-party board, UNESCO agreement standards

Education and Interfaith council Promotes mutual Annual pilgrimage dialogue secretariat understanding coordination, youth religious education programs

The face-saving architecture is the Council's most critical design element. For Israel, the Council is 'international recognition of Israeli sovereignty with guaranteed religious

4 Annex RIL: Regional Integration and Legitimacy

access'—a formulation that preserves the underlying sovereign claim while providing practical benefits. For Palestinians, the Council is 'international protection of Palestinian religious and cultural rights in Jerusalem'—a step toward political recognition without requiring Israeli concession of sovereignty. For Jordan, the Council formalizes the Hashemite custodial role that has been recognized informally since 1994. For international partners, the Council is 'preventive diplomacy that protects irreplaceable world heritage from political violence.'

The Council's explicit non-sovereignty mandate is its political viability. Because

it does not address the ultimate political status of Jerusalem, it does not require either party to abandon its core positions. This is analogous to the functional cooperation that has allowed Greek and Turkish Cypriots to manage Nicosia International Airport as a UN-administered zone despite the unresolved Cyprus division. Functional cooperation can persist for decades, creating habits of joint governance that make ultimate resolution easier even if they do not directly produce it.

28. Regional Energy Security Compact

The Regional Energy Security Compact establishes a multilateral framework for Gulf energy infrastructure protection, emergency supply sharing, and coordinated response to energy market disruptions. This mechanism addresses the shared vulnerability of all Gulf producers—Iran, Saudi Arabia, Iraq, UAE, Qatar, Kuwait, Oman—to attacks on energy infrastructure, whether by state actors, proxy forces, or non-state terrorist groups.

The Compact operates through three pillars: Infrastructure Protection (joint maritime patrols, pipeline monitoring, refinery security coordination), Supply Sharing (agreed allocation of emergency production increases during member supply disruptions), and Market Stability (coordinated release from strategic reserves and joint statements to prevent panic pricing). The Compact is administered by an Energy Security Secretariat hosted by the RDE, with operational centers in Dubai, Doha, and Tehran.

Regional Energy Security Compact Pillars: Regional Energy Security Compact Pillars

Pillar Function Participation Operational Mechanism

Infrastructure Joint maritime patrols, All members contribute Monthly coordination Protection pipeline/aircraft assets proportionally to meetings,

quarterly monitoring, refinery production joint exercises security

5 Annex RIL: Regional Integration and Legitimacy

Supply Sharing Emergency production All members commit Automatic trigger when increase allocation during to surge capacity member declares force member disruption percentages majeure

Market Coordinated reserve All members 24-hour consultation Stability release, joint market contribute to mechanism, unanimous statements collective reserve consent for release pool

Cyber Shared threat intelligence Voluntary Quarterly Red Team protection for SCADA and energy participation, exercises, joint control systems anonymized standards development reporting

Renewable Regional grid All members Technical working coordination interconnection planning, group, RDF funding for green hydrogen standards feasibility studies

The face-saving architecture is substantial. For Iran, the Compact is 'Gulf recognition that Iranian energy security is inseparable from regional energy security'—an implicit acknowledgment of Iran's regional stakeholder status without requiring explicit diplomatic normalization. For Saudi Arabia and the UAE, the Compact is 'responsible regional leadership that includes all producers for collective benefit'—a narrative of Gulf statesmanship rather than capitulation to Iranian demands. For the United States and China (as major importers), the Compact is 'regional self-help that reduces great-power energy security burdens.'

The Compact's most innovative element is the automatic supply-sharing trigger. When a member declares force majeure due to attack, disaster, or technical failure, other members automatically increase production by pre-

agreed percentages (e.g., Saudi Arabia +8%, UAE +5%, Iraq +4%, Kuwait +3%, Iran +3%, Qatar +2%). These surges are calibrated to cover approximately 70% of the disrupted member's normal export volume, with the remaining 30% covered by strategic reserve release. The automatic nature removes the political negotiation requirement during crises when speed is essential.

29. Youth Exchange Corridor

The Youth Exchange Corridor establishes a multilateral educational and cultural exchange program for citizens aged 18-30 from all RCSA signatory states, designed to build interpersonal relationships and regional identity among the generation that will eventually assume leadership of the framework. This mechanism addresses the profound societal

6 Annex RIL: Regional Integration and Legitimacy

alienation between the peoples of the region, who have been separated by conflict, sanctions, and political propaganda for decades.

The Corridor operates through three tracks: Academic Exchange (university semester swaps, joint research programs, shared online courses), Vocational Training (apprenticeships in regional industries, technology transfer programs, agricultural exchanges), and Cultural immersion (language programs, heritage tourism, arts festivals). Each track is funded by the RDF at \$25 million annually and administered by a joint secretariat hosted at the American University of Beirut with satellite offices in Tehran, Riyadh, Baghdad, and Dubai.

Youth Exchange Corridor Tracks: Youth Exchange Corridor Tracks

Track Activities Annual Funding Face-Saving Participants Framing

Academic University semester 2,000 RDF \$10M 'Building the region's Exchange swaps, joint research, students future intellectual shared online degrees

leaders through shared education'

Vocational Apprenticeships in 3,000 trainees RDF \$10M 'Creating regional Training energy, agriculture, technical capacity for technology, healthcare reconstruction and development'

Cultural Language programs, 5,000 RDF \$5M 'Preserving shared Immersion heritage tourism, arts participants cultural heritage and music festivals across political boundaries'

Alumni Professional Ongoing Self-funded by 'Maintaining regional Network networking, alumni professional entrepreneurship contributions relationships for mentoring, policy future cooperation' forums

Emergency Rapid reunification of As needed RDF emergency 'Humanitarian family Reunion separated families fund reunification, not during crises political normalization'

The face-saving architecture recognizes that direct people-to-people contact is often more politically sensitive than government-to-government negotiation. Each participating country describes the Corridor in terms consistent with its domestic narrative. Iran

7 Annex RIL: Regional Integration and Legitimacy

describes it as 'introducing Iranian youth to the wider Muslim world and correcting misconceptions propagated by hostile media.' Saudi Arabia describes it as 'leading regional educational excellence and building the human capital of the Gulf.' Israel describes academic track participation as 'technological and scientific cooperation that benefits Israeli innovation.' Each framing is locally sustainable while the underlying activity—mixed groups of Iranian, Saudi, Israeli, and Iraqi young people studying, working, and traveling together—produces the transformative interpersonal contact that makes

future conflict less likely.

The alumni network is the Corridor's most strategically important long-term product. As participants age into positions of professional and political influence, they carry with them personal relationships that transcend national hostility. An Iranian petroleum engineer who studied in Dubai, a Saudi medical resident who trained in Tehran, an Iraqi entrepreneur whose startup was mentored by Israeli technologists—these individuals become natural constituencies for regional cooperation because their personal success is intertwined with cross-border relationships. The alumni network does not require political agreement to function; it operates as a professional community that creates *de facto* integration even in the absence of formal diplomatic normalization.

30. Framework Nobel Protocol

The Framework Nobel Protocol establishes a structured, non-political mechanism for recognizing individual and institutional contributions to regional peace through the RCSA, modeled on the Nobel Peace Prize's nomination and selection process but operating independently and with a specific focus on operational, technical, and humanitarian achievements within the framework. This mechanism addresses the powerful human need for recognition and legacy that motivates political leadership, while providing a mechanism for celebrating RCSA successes that is independent of domestic political cycles.

The Protocol creates two annual awards: the RCSA Peace Prize, recognizing an individual who has made exceptional personal contributions to framework implementation (nominated by any signatory government, selected by a seven-person independent committee); and the RCSA Institutional Excellence Award, recognizing an organization that has achieved measurable improvements in

regional stability (nominated by the JIG, selected by the same committee). Each award carries a \$1 million prize funded by the RDF endowment and is presented at an annual ceremony hosted by rotating member states.

Framework Nobel Protocol Award Structure: Framework Nobel Protocol Award Structure

Award Eligibility Nomination Selection Prize Ceremony

8 Annex RIL: Regional Integration and Legitimacy

RCSA Peace Any individual Any signatory 7-person \$1 million Annual, Prize (official or government independent + medal rotating host citizen) from or 10,000 committee (2 city signatory state citizen former Nobel or Guarantor petitions laureates, 2 Power former heads of state, 3 civil society leaders)

RCSA Any JIG Working Same \$1 million Annual, same Institutional organization Groups or independent + ceremony as Excellence implementing RDF committee certificate Peace Prize RCSA Secretariat mechanisms

RCSA Youth Youth Exchange Alumni Independent \$100,000 + Annual, same Recognition Corridor alumni network vote committee sub- certificate ceremony under age 35 panel

Special Exceptional Unanimous Independent \$500,000 + Ad hoc, Recognition crisis de- JIG consent committee medal within 60 escalation or (expedited) days of humanitarian achievement action

Posthumous Deceased Any signatory Independent Medal Annual Honor individuals who government committee only (no ceremony contributed to prize) framework foundations

The face-saving function is both personal and institutional. For political leaders, the prospect of RCSA Peace Prize recognition creates a personal legacy

incentive that complements political calculations. A leader who retires with a Nobel Prize and an RCSA Peace Prize has achieved the highest international recognition in both the general and regional contexts. For technical personnel—the IAEA inspectors, RDF administrators, JIG working group members who do the invisible daily work of framework maintenance—the Institutional Excellence Award provides public validation of their contributions. For civil society organizations working on interfaith dialogue, refugee assistance, or cross-border environmental projects, the awards provide funding and visibility that amplify their impact.

The independence of the selection committee is critical to the Protocol's legitimacy. Unlike awards controlled by governments (which are perceived as political), the RCSA awards are

9 Annex RIL: Regional Integration and Legitimacy

selected by a committee that includes former Nobel laureates who bring the credibility of the Nobel institution, former heads of state who understand the political constraints on leadership, and civil society leaders who represent the populations affected by framework implementation. This composition ensures that selections are seen as legitimate across political divides. The committee operates under published selection criteria and releases detailed citations explaining each award, creating a public record of framework achievements that serves as a historical narrative independent of government propaganda.

COMPREHENSIVE ANALYTICAL SUPPLEMENT

Historical Context and Evolution of Regional Diplomacy

The Regional Cooperation and Stability Architecture v2.0 represents the culmination of decades of diplomatic effort aimed at managing the complex

security challenges of the Middle East. Understanding the historical context within which this architecture emerged is essential for appreciating both its innovations and its limitations. This section provides a comprehensive historical review of the diplomatic initiatives, agreements, and institutional developments that preceded and informed the RCSA's design.

P>The modern history of Middle East nuclear diplomacy begins with the Iranian Revolution of 1979, which transformed Iran from a Western ally into a revolutionary state whose regional ambitions and ideological orientation fundamentally altered regional dynamics. The subsequent Iran-Iraq War (1980-1988) demonstrated the catastrophic potential of regional conflicts and provided Iran with powerful incentives to develop military capabilities including nuclear and missile programs. The war also established patterns of proxy conflict, asymmetric warfare, and sectarian mobilization that continue to shape regional security.

P>The discovery of Iran's clandestine nuclear program in 2002 marked a turning point in international engagement with Iranian nuclear activities. The exposure of facilities at Natanz and Arak triggered an extended diplomatic confrontation involving the IAEA, the UN Security Council, the European Union, and ultimately the United States. This confrontation produced a series of Security Council resolutions demanding suspension of enrichment, the imposition of progressively stringent sanctions, and the eventual negotiation of the Joint Comprehensive Plan of Action (JCPOA) in 2015.

The JCPOA represented a landmark diplomatic achievement that established many of the technical and institutional concepts incorporated into the RCSA. The JCPOA's verification mechanisms, benefit structures, and snap-back procedures provided important precedents for the RCSA's design. However, the JCPOA's limitations, including its narrow scope focused exclusively on nuclear

matters, its failure to address regional security issues, and its vulnerability to unilateral U.S. withdrawal, also informed the RCSA's more comprehensive approach.

The U.S. withdrawal from the JCPOA in 2018 and the subsequent collapse of the agreement demonstrated the vulnerability of narrow bilateral or trilateral agreements to changes in government in participating states. This experience informed the RCSA's emphasis on broader multilateral support, institutional embedding, domestic constituency building, and mechanism design that increases the costs of unilateral withdrawal. The RCSA also explicitly addresses the specific vulnerabilities exposed by the JCPOA's collapse.

The Abraham Accords of 2020, which normalized relations between Israel and several Arab states, further transformed the regional landscape by creating new diplomatic alignments and opening possibilities for regional security architecture that previously seemed unattainable. While the Accords did not address the Iranian nuclear issue directly, they created conditions for broader regional cooperation that the RCSA seeks to build upon and institutionalize.

Comparative Analysis with Other Regional Security Architectures

The RCSA can be productively compared with other regional security architectures that have addressed nuclear and broader security challenges in different regional contexts. These comparisons illuminate the distinctive features of the Middle East context, identify lessons from other regions' experiences, and highlight the RCSA's innovations relative to previous frameworks.

The European security architecture established after World War II and consolidated during the Cold War provides the most developed example of

comprehensive regional security cooperation. The European experience demonstrates the value of institutionalized cooperation, confidence-building measures, and economic integration in transforming adversarial relationships. However, the European experience also reflects unique conditions including U.S. security guarantees, Soviet threat consolidation, and shared democratic values that do not fully apply to the Middle East context.

The Southeast Asian security architecture, centered on the Association of Southeast Asian Nations (ASEAN), demonstrates the possibility of security cooperation among states with diverse political systems and historical antagonisms. ASEAN's emphasis on consensus decision-making, gradual institutional development, and non-interference in internal affairs provides a model for cooperative security that accommodates political diversity. However, ASEAN's relatively weak institutional mechanisms and limited security integration also illustrate the tradeoffs involved in consensus-based approaches.

The nuclear-weapon-free zone concept, implemented in Latin America (Tlatelolco Treaty), the South Pacific (Rarotonga Treaty), Africa (Pelindaba Treaty), Central Asia (CANWFZ), and Southeast Asia (Bangkok Treaty), provides precedents for regional approaches to nuclear non-proliferation. These zones demonstrate the potential for regional agreements to reinforce global non-proliferation norms while addressing regional-specific concerns. The Middle East's failure to establish a comparable zone, despite longstanding proposals, highlights the distinctive challenges of nuclear diplomacy in this region.

Technical Annex: Verification Technology Assessment

The effectiveness of architecture verification depends critically on the capabilities of the monitoring technologies employed. This technical annex

provides a comprehensive assessment of current and emerging verification technologies relevant to architecture implementation. The assessment covers detection capabilities, operational limitations, vulnerability to countermeasures, and integration requirements for each technology category.

Satellite imagery analysis provides wide-area monitoring capabilities that can detect construction activities, facility modifications, and movement patterns indicative of proscribed activities. Current commercial satellite imagery achieves spatial resolutions of approximately 0.3 meters in panchromatic mode and 1.2 meters in multispectral mode, sufficient to identify individual vehicles and structures. Synthetic aperture radar (SAR) sensors provide all-weather, day-night imaging capabilities that complement optical sensors. Emerging technologies including hyperspectral imaging, video from space, and small satellite constellations promise enhanced temporal and spectral resolution.

Environmental sampling and analysis detects trace amounts of nuclear materials that indicate enrichment, reprocessing, or other nuclear activities. Swipe sampling using cotton or cellulose materials collects surface contaminants that are analyzed by thermal ionization mass spectrometry (TIMS) or inductively coupled plasma mass spectrometry (ICP-MS). These techniques can detect femtogram quantities of uranium and plutonium and determine isotopic composition with high precision. Air sampling using high-volume air collectors captures particulate matter that may contain nuclear signatures from undeclared activities.

Seismic monitoring detects underground nuclear explosions through analysis of seismic waves generated by the explosion. The International Monitoring System established under the Comprehensive Nuclear-Test-Ban Treaty provides global seismic coverage capable of detecting explosions above

approximately one kiloton equivalent yield. Regional seismic networks with closer station spacing can achieve lower detection thresholds and improved location accuracy. Infrasound and hydroacoustic monitoring complement seismic detection for atmospheric and underwater explosions respectively.

Radiation detection technologies identify the presence and type of radioactive materials through measurement of gamma rays, neutrons, and other radiation signatures. Handheld detectors provide portable capabilities for inspector use in the field. Portal monitors screen vehicles and personnel at border crossings and facility entrances. Standoff detectors identify radiation sources at distances up to hundreds of meters. Advanced spectroscopic analysis determines the specific isotopes present, distinguishing nuclear materials from naturally occurring and medical radiation sources.

Economic Impact Assessment Methodology

The architecture's economic impact assessment employs computable general equilibrium (CGE) modeling, sectoral impact analysis, and microeconomic household surveys to estimate the effects of architecture implementation on participating economies. The assessment methodology addresses both the direct effects of sanctions relief and benefit delivery and the indirect effects of confidence building, risk reduction, and regional integration on investment, trade, and growth.

CGE modeling captures the economy-wide effects of architecture implementation by simulating how changes in trade costs, investment flows, and technology access propagate through national economies. The models incorporate detailed sectoral structures, factor market rigidities, and fiscal and monetary policy constraints that shape how exogenous shocks affect economic outcomes. Model parameters are calibrated to national accounts data and estimated using econometric techniques applied to historical data.

P>Sectoral impact analysis examines how architecture implementation affects specific industries including energy, banking, insurance, transportation, and manufacturing. Different sectors are affected differently depending on their exposure to sanctions, their dependence on international trade and finance, and their capacity to benefit from architecture-related opportunities. Sectoral analysis identifies winners and losers from implementation, enabling targeted support for adversely affected sectors and regions.

P>Distributional analysis examines how architecture benefits and costs are distributed across population groups defined by income, geography, gender, and employment status. Aggregate economic gains may mask distributional inequities that generate political opposition even when overall impacts are positive. Distributional analysis informs program design to ensure that benefits reach vulnerable populations and that transition costs are fairly shared.

Legal Commentary on Treaty Obligations

P>This section provides detailed legal commentary on the architecture treaty's principal provisions, examining their legal character, relationship to other international obligations, implications for domestic legal systems, and potential interpretive controversies. The commentary draws upon the Vienna Convention on the Law of Treaties, relevant state practice, international judicial and arbitral decisions, and academic legal scholarship.

P>The architecture treaty's legal character as a binding international agreement is established through the traditional indicia of treaty formation: agreement among states on specific obligations, expressed in written form, intended to create legal rights and obligations under international law. The treaty's designation as such, the formality of its negotiation and signature, the involvement of the UN Secretary-General as depositary, and the ratification

procedures all confirm its treaty status.

P>The relationship between architecture obligations and UN Security Council resolutions requires careful analysis. Where architecture obligations parallel resolution requirements, the architecture provides a mechanism for fulfilling resolution obligations through cooperative rather than coercive means. Where architecture obligations exceed resolution requirements, the additional obligations are legally binding on architecture parties but do not create obligations for non-parties. Where resolutions impose requirements not addressed by the architecture, resolution requirements continue to apply independently.

P>The domestic legal effect of architecture obligations depends on each state's constitutional provisions regarding treaty implementation. Monist states, in which treaties automatically become part of domestic law upon ratification, require fewer implementing measures than dualist states, which require specific domestic legislation to give effect to treaty obligations. The architecture accommodates both systems through provisions that authorize but do not require monist implementation.

P>Potential interpretive controversies include the scope of certain verification rights, the conditions for consequence activation, the allocation of costs for specific activities, and the procedures for architecture amendment. The commentary identifies provisions most susceptible to divergent interpretation and analyzes the arguments supporting different interpretations. Where provisions are genuinely ambiguous, the commentary recommends interpretive approaches that align with the treaty's object and purpose as expressed in its preamble and negotiating history.

Annotated Bibliography of Supporting Research

P>This annotated bibliography identifies the principal research and analytical works that informed the architecture's design. The bibliography encompasses international relations theory, nuclear non-proliferation studies, Middle East regional analysis, international law, conflict resolution, and development economics. Entries are organized by subject matter and include both academic works and policy-oriented analyses.

International relations theory contributions include institutionalist analyses of international cooperation, realist assessments of regional power dynamics, and constructivist examinations of identity and normative change in the Middle East. These theoretical perspectives informed the architecture's integration of institutional binding, security guarantees, and narrative transformation mechanisms.

Nuclear non-proliferation literature includes historical analyses of proliferation decisions, technical assessments of verification capabilities, and policy evaluations of previous non-proliferation agreements. These works informed the design of the four nuclear pathways, the verification architecture, and the consequence mechanisms.

Middle East regional analysis includes country-specific political assessments, historical examinations of regional conflicts, and forward-looking scenario analyses. These works informed the architecture's country-specific provisions, its conflict management mechanisms, and its scenario planning frameworks.

International law contributions include analyses of treaty law, international institutional law, and the law of state responsibility. These works informed the architecture's legal structure, its dispute resolution mechanisms, and its relationship to existing international legal obligations.

Future Research and Development Agenda

The architecture's implementation will generate new knowledge requirements that should be addressed through a structured research and development agenda. This agenda identifies priority research areas, recommended methodologies, and institutional arrangements for ensuring that implementation decisions are informed by the best available evidence.

Priority research areas include verification technology development, political risk assessment methodologies, economic impact measurement techniques, conflict prevention effectiveness evaluation, and institutional design optimization. Within each area, specific research questions are identified that address implementation challenges expected to arise during architecture operation.

Research methodologies should combine quantitative and qualitative approaches, academic rigor with policy relevance, and theoretical sophistication with practical applicability. Recommended approaches include statistical analysis of implementation data, case study examination of specific implementation experiences, simulation modeling of alternative policy options, and participatory research that engages implementation stakeholders in knowledge generation.

Institutional arrangements for research support include architecture-funded research grants, partnerships with academic institutions and think tanks, internal research capabilities within architecture institutions, and international research networks that bring together scholars and practitioners from multiple countries. These arrangements should ensure research independence while maintaining relevance to implementation needs.

Implementation Timeline and Milestone Framework

This section provides a comprehensive implementation timeline that maps the

architecture's phased implementation across all components, identifying key milestones, decision points, and interdependencies. The timeline recognizes that different components proceed at different speeds depending on their complexity, political sensitivity, and technical requirements.

Phase One (Months 1-6): Institutional Establishment focuses on creating the Governance Body, secretariat, JMOC, and SESS. This phase includes ratification processes, staffing, facility preparation, and system deployment. Key milestones include the inaugural Governance Body session, the appointment of the Executive Secretary, and the operational declaration of the JMOC.

Phase Two (Months 6-18): Initial Implementation focuses on commencing the nuclear pathway selected by Iran, activating early benefit tranches, establishing verification systems, and launching confidence-building measures. Key milestones include initial IAEA verification reports, the release of Tranche One benefits, and the first CBM notifications.

Phase Three (Months 18-36): Consolidation focuses on achieving the first pathway milestones, expanding economic cooperation, deepening security engagement, and building institutional capacity. Key milestones include the first centrifuge reduction certifications, the first RDF project completions, and the first annual compliance assessment.

Phase Four (Months 36-60): Maturation focuses on achieving intermediate pathway milestones, establishing self-sustaining cooperation patterns, and preparing for long-term architecture evolution. Key milestones include intermediate enrichment constraints, expanded regional participation, and the first architecture amendment review.

Phase Five (Months 60+): Sustainability focuses on maintaining long-term implementation, adapting to changing circumstances, and transitioning to self-sustaining cooperation. Key milestones include pathway completion,

graduation from assistance dependence, and architecture review for potential expansion or consolidation.

Game-Theoretic Analysis of Architecture Incentives

The architecture's incentive structure can be analyzed through game-theoretic frameworks that examine the strategic interactions among participating states. This analysis demonstrates that the architecture creates equilibrium conditions in which compliance is the rational strategy for all parties, even assuming purely self-interested behavior. The equilibrium is sustained through benefit structures that reward compliance, consequence mechanisms that punish violation, and verification systems that make violation detectable.

The repeated game framework is particularly relevant because architecture implementation unfolds over extended time periods with multiple interaction opportunities. In repeated games, cooperation can be sustained as equilibrium behavior through strategies that reward past cooperation with future cooperation and punish past defection with future defection. The architecture's benefit tranches and snap-back mechanisms formalize these tit-for-tat strategies in institutional terms.

P>The shadow of the future refers to the degree to which actors value future interactions relative to immediate payoffs. The architecture enhances the shadow of the future through long-duration commitments, automatic renewal provisions, and benefit structures that accumulate over time. As the value of continued cooperation increases, the incentive to defect for short-term gain decreases. The twenty-year moratorium in Pathway B exemplifies this approach by extending the future payoff horizon substantially.

P>The Folk Theorem of repeated games demonstrates that when actors sufficiently value future interactions, virtually any cooperative outcome can

be sustained as equilibrium behavior. The architecture operationalizes this theoretical insight through specific mechanisms that make continued cooperation preferable to defection. Verification reduces the temptation to defect covertly. Consequences reduce the net benefit of overt defection. Benefit accumulation increases the opportunity cost of losing cooperation benefits.

H2>International Political Economy of Sanctions Relief

Sanctions relief generates complex economic effects that extend beyond the immediate lifting of restrictions to encompass broader changes in trade patterns, investment flows, financial relationships, and market expectations. Understanding these complex effects is essential for designing sanctions relief that generates maximum political benefit for compliance while minimizing unintended negative consequences.

Sanctions relief effects follow a temporal sequence. Announcement effects occur when relief is announced but before implementation. Markets begin pricing in improved trade prospects, generating positive expectations even before physical trade resumes. Implementation effects occur when legal restrictions are actually removed and transactions can legally proceed. Businesses begin planning for resumed trade. Operational effects occur when new trade and investment relationships are actually established, generating visible economic activity. Equilibrium effects occur when trade and investment reach new steady-state levels reflecting normalized economic relationships.

P>The sequencing of sanctions relief creates complex incentive dynamics. Front-loaded relief generates immediate economic benefits that create domestic political support for continued compliance. However, front-loading also reduces the remaining leverage available for ensuring continued compliance with later milestones. Back-loaded relief preserves leverage but

delays visible benefits that generate political support. The architecture's tranche structure balances these considerations through graduated benefit release.

P>Sanctions relief interacts with private sector expectations and risk perceptions. Even when sanctions are legally removed, private firms may hesitate to engage if they perceive risk of future sanctions restoration. This private sector hesitation can substantially reduce the economic benefits of sanctions relief below their theoretical maximum. The architecture addresses this hesitation through the Framework Commercial Insurance Facility, which mitigates reimposition risk through insurance products.

H2>Comparative Institutional Design Analysis

The architecture's institutional design can be compared with alternative approaches that have been employed in other international contexts. This comparative analysis illuminates the tradeoffs involved in different design choices and provides empirical evidence regarding design features associated with successful cooperation.

P>Supranational versus intergovernmental institutional design represents a fundamental choice in international architecture. Supranational designs delegate authority to institutions that can make binding decisions on member states. Intergovernmental designs retain decision-making authority at the national level, using institutions primarily for coordination. The RCSA employs a primarily intergovernmental design with limited supranational elements in verification and compliance assessment. This choice reflects the political reality that participating states are unwilling to delegate sovereignty over security matters but recognize the value of independent technical assessment.

P>Consensus versus majority decision-making involves tradeoffs between legitimacy and efficiency. Consensus ensures that all parties support decisions

but can produce paralysis when genuine disagreement exists. Majority enables action but creates the risk that minority views will be overridden. The RCSA employs tiered decision procedures that match decision thresholds to decision significance, using consensus for fundamental matters and weighted majority for operational decisions.

P>Hard law versus soft law involves tradeoffs between binding commitment and flexibility. Hard law creates legally binding obligations enforceable through specified mechanisms. Soft law creates political and reputational commitments without legal enforceability. The RCSA employs predominantly hard law for core commitments, particularly nuclear constraints, while using soft law for cooperative activities where flexibility is valuable.

H2>Regional Security Complex Theory and the Middle East

Regional Security Complex Theory provides a framework for understanding the Middle East as a distinct security subsystem within the broader international security system. The theory identifies regional security complexes as groups of states whose primary security concerns are so closely linked that their national security problems cannot be reasonably analyzed or resolved apart from one another.

P>The Middle East security complex includes states whose security calculations are fundamentally interdependent. Actions by any major state affect the security of multiple others, creating a web of security relationships that defines the regional security dynamic. External powers affect regional security but do not determine it; regional states possess substantial agency in shaping their own security environment.

P>The theory identifies securitization as the process through which issues are constructed as existential threats requiring emergency measures. In the Middle East, nuclear proliferation, sectarian conflict, and proxy warfare have

been securitized to varying degrees by different states. The architecture addresses securitized issues through desecuritization strategies that transform existential threats into manageable risks addressable through normal political procedures.

P>The architecture's regional scope reflects security complex boundaries. Including only states whose security is directly affected by Iranian nuclear activities ensures that all parties have genuine stakes in the architecture's success while excluding states whose participation would dilute regional focus. The architecture's extension provisions enable subsequent expansion as security complex boundaries evolve.

H2>Transnational Actor Dynamics and Non-State Threats

P>Transnational actors including terrorist organizations, criminal networks, and extremist movements pose distinctive challenges that state-centric security architectures struggle to address. The RCSA incorporates transnational threat provisions that complement its state-level commitments with measures targeting non-state actors who operate across borders and exploit gaps in national jurisdictions.

P>Terrorist organizations active in the region include both Sunni extremist groups and Shia militant organizations that may seek to acquire weapons of mass destruction or disrupt architecture implementation. Counterterrorism cooperation under the architecture includes intelligence sharing, financial tracking, border security, and capacity building for states with limited counterterrorism capabilities.

P>Criminal networks engage in smuggling, money laundering, and trafficking that can facilitate proliferation and undermine sanctions enforcement. The architecture's counter-proliferation finance and border security measures address criminal network activities through information sharing, joint

operations, and legal cooperation that disrupts network operations.

P>Extremist ideologies that promote violence against architecture parties or the architecture itself represent a more diffuse threat than organized groups. The architecture addresses ideological threats through strategic communications that counter extremist narratives, community engagement that addresses root causes of radicalization, and support for moderate voices that promote alternative visions of regional politics.

H2>Climate Security and Environmental Dimensions

P>Climate change represents a significant threat multiplier in the Middle East that interacts with nuclear security, water scarcity, food insecurity, and migration pressures. The architecture acknowledges these environmental dimensions through provisions that address climate-related security risks and that promote environmental cooperation as a confidence-building measure.

P>Water scarcity in the region is projected to worsen significantly due to climate change, creating pressures that could exacerbate interstate tensions. The architecture's economic development programming includes substantial investment in water efficiency, desalination, wastewater treatment, and transboundary water cooperation. These investments address water scarcity before it reaches crisis levels that could generate conflict.

P>Food security is threatened by climate impacts on regional agriculture, including reduced precipitation, increased temperatures, and more frequent extreme weather events. The architecture supports agricultural modernization, drought-resistant crop development, food import diversification, and social safety nets that protect vulnerable populations from food price shocks.

P>Climate migration may increase pressure on regional states as climate

impacts render parts of the region uninhabitable. The architecture addresses migration pressures through economic development that creates employment in migrant-sending areas, regional labor mobility arrangements that channel migration through legal pathways, and social integration programs that reduce migration-related tensions in receiving communities.

Emerging Technology Governance

Emerging technologies including artificial intelligence, autonomous weapons, hypersonic delivery systems, and quantum computing could fundamentally alter regional military balances and verification challenges. The architecture establishes frameworks for monitoring emerging technology developments and for addressing their security implications before they destabilize the region.

P>Artificial intelligence applications in military systems could accelerate decision-making beyond human response capabilities, potentially reducing crisis stability. The architecture's crisis management procedures address AI-accelerated decision environments through pre-authorized response protocols and human oversight requirements for critical decisions.

P>Autonomous weapons systems raise questions about human control over lethal decisions and the potential for unintended escalation. The architecture includes principles on autonomous weapons governance that emphasize meaningful human control and prohibit fully autonomous lethal systems pending international agreement on governance frameworks.

P>Hypersonic delivery systems could compress decision timelines and undermine existing missile defense architectures. The architecture's missile restraint provisions include notification requirements for hypersonic testing and development that provide transparency regarding capabilities that could

affect regional stability.

P>Quantum computing could eventually compromise cryptographic protections that secure verification data and communications. The architecture's cybersecurity framework addresses this long-term risk through quantum-resistant cryptography development and migration planning that prepares for post-quantum security requirements.

Neuroscience of Decision-Making Under Uncertainty

Understanding the cognitive and neurological processes through which leaders make decisions under the uncertainty inherent in nuclear diplomacy provides important insights for architecture design. Research in decision neuroscience reveals that human decision-making under uncertainty involves both rational calculation and emotional processes that can systematically bias judgments in predictable ways.

P>Loss aversion, the tendency to weight potential losses more heavily than equivalent potential gains, has profound implications for nuclear diplomacy. Leaders may resist agreements that require visible concessions because the perceived loss of concession items weighs more heavily than the perceived gain of agreement benefits. The architecture addresses loss aversion through benefit structures that front-load visible gains before requiring visible concessions.

P>Temporal discounting, the tendency to value immediate outcomes more highly than future outcomes, affects willingness to undertake long-term agreements. Leaders may prefer immediate benefits over larger future benefits, creating pressure for front-loaded agreement designs. The architecture addresses temporal discounting through early benefit tranches that generate immediate positive returns.

P>Probability neglect, the tendency to focus on worst-case scenarios while neglecting their actual probability, can drive exaggerated threat assessments that make cooperation appear too risky. Leaders may overestimate the probability of worst-case outcomes and underestimate the probability of successful cooperation. The architecture addresses probability neglect through risk communication that presents probability information in accessible formats.

P>Groupthink and conformity pressures can lead decision-making groups toward consensus that suppresses dissent and critical evaluation. In nuclear diplomacy, groupthink can produce premature closure on confrontational strategies that preclude cooperative alternatives. The architecture addresses groupthink through devil's advocate procedures, external expert consultation, and decision review requirements.

Anthropological Dimensions of Cross-Cultural Negotiation

P>Cross-cultural negotiation in the Middle East involves profound differences in cultural frameworks that affect how negotiators interpret signals, frame issues, and evaluate proposals. Anthropological analysis of negotiation culture reveals systematic differences that can create misunderstanding if not properly understood and managed.

P>Face and honor cultures in the Middle East place high value on maintaining dignity and avoiding public humiliation. Negotiation tactics that embarrass counterparts or require visible public concessions may trigger resistance even when substantively reasonable. The architecture addresses face concerns through private negotiation forums, indirect communication styles, and packaging that frames concessions as mutual sacrifices rather than unilateral capitulation.

P>Relationship-oriented versus task-oriented negotiation styles affect how negotiators build the trust necessary for cooperation. Relationship-oriented negotiators prioritize building personal connections before addressing substantive issues. Task-oriented negotiators prefer to address substance directly and build relationships through successful cooperation. The architecture accommodates both styles through phased engagement that permits relationship development alongside substantive negotiation.

P>High-context versus low-context communication styles affect how much meaning is conveyed explicitly versus implicitly. High-context communication relies on shared understanding, nonverbal cues, and situational context to convey meaning. Low-context communication relies on explicit verbal statements. Miscommunication can occur when negotiators from different communication styles fail to recognize how their counterparts convey meaning.

Mathematical Modeling of Verification Effectiveness

P>The effectiveness of architecture verification can be analyzed through mathematical models that quantify detection probabilities, false alarm rates, and the overall confidence provided by multi-layer verification systems. These models provide rigorous foundations for verification design and enable optimization of resource allocation across different verification modalities.

P>Detection probability models calculate the probability that a given violation will be detected by the verification system. Detection probability depends on the magnitude of the violation, the sensitivity of detection methods, the frequency of monitoring, and the resources allocated to verification. Models enable assessment of whether specified verification configurations provide adequate detection confidence.

P>False alarm models calculate the probability that the verification system will indicate violation when no violation has occurred. False alarms create costs including wasted investigation resources, political friction, and potential consequence activation. Models enable calibration of verification sensitivity to balance detection confidence against false alarm costs.

P>System effectiveness models combine detection and false alarm probabilities into overall assessments of verification system performance. These models examine how multiple verification layers interact to produce combined performance superior to any individual layer. Optimal system design allocates resources across layers to maximize overall effectiveness within budget constraints.

Psychology of Verification and Trust Development

P>Verification serves both technical and psychological functions in international agreements. Technically, verification detects violations. Psychologically, verification builds trust by demonstrating that parties are fulfilling their commitments. Understanding the psychological dimensions of verification is essential for designing verification systems that build rather than erode trust.

P>Transparency in verification processes enables parties to observe the verification process and confirm that it is conducted fairly and competently. Transparency reduces suspicion that verification is manipulated for political purposes. The architecture's transparency provisions include observer rights, data sharing, and publication of verification procedures and results.

P>Reciprocity in verification arrangements creates balanced obligations that distribute verification burdens equitably. Unilateral verification in which one party is subject to intensive monitoring while others escape scrutiny generates

resentment that undermines trust. The architecture's verification architecture subjects all parties to appropriate monitoring, though the intensity of monitoring varies based on the proliferation risk of authorized activities.

P>Graduated trust development enables verification intensity to decrease as confidence accumulates over time. Early in implementation, intensive verification provides the information required to build initial confidence. As confidence accumulates, verification can be reduced without undermining trust, provided that capability to re-intensify verification is maintained. The Sovereignty Restoration Ladder operationalizes this graduated approach.

Historical Analysis of Agreement Survival and Collapse

P>Historical analysis of why some international agreements survive while others collapse provides empirical guidance for architecture design. Comparative analysis of agreement durability identifies factors associated with long-term survival and factors associated with premature collapse.

P>Survival factors include broad domestic support across political factions, creation of domestic constituencies with vested interests in continuation, institutional embedding that raises the costs of withdrawal, international reputation costs for defection, verification that makes violation detectable, and consequences that make defection costly. Agreements with multiple survival factors are substantially more durable than those dependent on any single factor.

P>Collapse factors include narrow political support concentrated in single factions, absence of domestic constituencies beyond the negotiating elite, purely executive commitments reversible by executive decision, low international reputation costs, verification gaps that permit covert defection, and weak consequence mechanisms. Agreements with multiple collapse

factors rarely survive political transitions or implementation challenges.

P>The JCPOA's collapse illustrates the interaction of survival and collapse factors. Initial JCPOA implementation created limited domestic constituencies, primarily among the Iranian business community seeking sanctions relief. Institutional embedding was weak, with the agreement structured as a political commitment rather than treaty. International reputation costs were asymmetric, with Iran facing substantial costs for defection but the United States facing limited costs for withdrawal. Verification was robust but consequences required Security Council action vulnerable to veto.

Complex Systems Analysis of Regional Security Dynamics

P>Regional security in the Middle East can be analyzed through complex systems theory, which examines how multiple interacting elements produce emergent behaviors that cannot be predicted from the properties of individual elements alone. This perspective reveals why linear policy interventions often fail to produce expected results and why comprehensive architectures may succeed where narrow interventions have failed.

P>Nonlinear causality in regional security means that small changes can produce disproportionately large effects through feedback loops and cascading interactions. A minor incident can trigger a chain of responses that escalates into major conflict. Conversely, a modest confidence-building measure can generate positive feedback that transforms regional relationships. The architecture seeks to trigger beneficial nonlinear effects through multiple reinforcing interventions.

P>Path dependence means that historical events constrain future possibilities in ways that are difficult to reverse. Decades of adversarial relationships create institutional habits, political constituencies, and psychological

frameworks that resist cooperative transformation. The architecture addresses path dependence by creating new institutional pathways that gradually replace adversarial patterns with cooperative ones.

P>Phase transitions in complex systems occur when incremental changes accumulate to produce sudden qualitative transformation. Regional security relationships may appear stable under incremental pressure until a critical threshold is crossed, producing rapid transformation. The architecture monitors for pre-transition indicators and seeks to manage transitions toward cooperative rather than confrontational outcomes.

Philosophical Foundations of International Cooperation

P>The architecture rests on philosophical foundations regarding the nature of international cooperation, the possibility of trust among adversaries, and the moral obligations of states to their populations and to the international community. These philosophical foundations inform the architecture's design and justify its aspirations.

P>The possibility of cooperation among adversaries is supported by philosophical arguments from multiple traditions. Rationalist arguments demonstrate that cooperation can be mutually beneficial even among actors with fundamentally divergent interests. Constructivist arguments show that identities and interests are malleable rather than fixed, enabling transformation of adversarial relationships. Contractualist arguments justify cooperation as mutually advantageous arrangements that respect the autonomy of all parties.

P>The moral obligations of states include obligations to their own populations to pursue policies that promote security and prosperity. They also include obligations to other states and the international community to refrain from

actions that cause harm beyond national boundaries. The architecture addresses these obligations by creating arrangements that serve both national interests and international order.

P>The concept of trust in international relations is philosophically complex, involving questions about whether trust can exist without shared values, whether trust can be built incrementally, and whether institutions can substitute for interpersonal trust. The architecture's design reflects a pragmatic approach that builds trust incrementally through verified cooperation while creating institutional substitutes for trust in areas where interpersonal trust is insufficient.

Decision Neuroscience and Crisis Management

P>Crisis decision-making under the extreme stress of nuclear threats involves neurobiological processes that can impair rational judgment. Understanding these neurobiological effects is essential for designing crisis management procedures that compensate for cognitive impairments under stress.

P>Acute stress triggers the sympathetic nervous system, releasing cortisol and adrenaline that prepare the body for fight-or-flight responses. These hormones enhance physical performance but can impair complex cognitive functions including working memory, impulse control, and perspective-taking. Leaders under acute stress may become more reactive, less able to consider alternatives, and more prone to binary thinking.

P>The architecture's crisis management procedures compensate for stress-induced cognitive impairment through several mechanisms. Pre-authorized response options reduce the need for creative problem-solving during crises. Structured decision procedures impose analytical discipline on emotional responses. Required consultation with multiple advisors provides cognitive

diversity that compensates for individual stress effects. Cooling-off periods create time for stress hormones to dissipate before irreversible decisions are made.

P>Sleep deprivation, common during prolonged crises, further impairs judgment through effects on attention, emotional regulation, and risk assessment. The architecture's crisis rotation procedures ensure that decision-makers have adequate rest by distributing crisis management responsibilities across teams. Sleep requirements are explicitly incorporated into crisis protocols rather than being left to individual judgment.

Organizational Behavior and Bureaucratic Politics

P>Architecture implementation involves large organizations with complex internal dynamics that affect how decisions are made and implemented. Organizational behavior analysis examines how bureaucratic structures, professional cultures, and internal politics shape architecture outcomes.

P>Bureaucratic politics refers to competition among organizational units for resources, influence, and policy outcomes. Different agencies may favor different approaches to implementation based on their organizational interests rather than objective assessment. The architecture addresses bureaucratic politics through governance structures that require coordination across agencies and through oversight that identifies parochial interests.

P>Standard operating procedures shape how organizations respond to situations. Well-designed SOPs enable rapid, consistent response but may also produce rigid behavior that fails to adapt to novel circumstances. The architecture balances SOP development with requirements for adaptive judgment in unusual situations.

P>Organizational culture affects how personnel interpret ambiguous

situations and respond to uncertainty. Cultures that reward risk-taking may produce more proactive but potentially reckless behavior. Cultures that reward caution may produce more careful but potentially paralyzed behavior. The architecture's training programs explicitly address organizational culture effects.

Risk Communication and Public Understanding of Nuclear Issues

P>Public understanding of nuclear issues is shaped by risk communication that translates technical concepts into accessible information. Effective risk communication enables informed public engagement with nuclear policy, while poor communication can generate irrational fear, complacency, or confusion.

P>Risk perception research reveals that public risk judgments follow distinctive patterns that differ from expert risk assessments. The public tends to judge risks as more serious when they are involuntary, unfamiliar, catastrophic, and delayed. Nuclear risks score highly on all these dimensions, contributing to public anxiety that complicates nuclear policy.

P>Risk communication principles for nuclear issues include transparency about both risks and benefits, acknowledgment of uncertainty rather than false precision, comparison with familiar risks that provide context, and acknowledgment of public concerns even when experts judge them unfounded. Communication that dismisses public concerns as ignorant generates backlash that undermines trust.

P>The architecture's public communication employs risk communication best practices including multi-channel dissemination, two-way engagement that permits public input, culturally appropriate messaging for diverse audiences,

and partnership with trusted intermediaries including health professionals, religious leaders, and community organizations.

Institutional Memory and Knowledge Preservation

P>Sustained architecture implementation requires preservation of institutional knowledge that accumulates over years of operation. Knowledge preservation addresses the risk that expertise, lessons learned, and operational capabilities will be lost to personnel turnover, organizational change, or political disruption.

P>Knowledge management systems capture, organize, and disseminate architecture knowledge. Systems include document repositories that maintain organizational records, expert databases that identify personnel with specific expertise, lessons learned databases that capture insights from implementation experience, and best practice guides that synthesize effective approaches.

P>Succession planning ensures that critical positions can be filled promptly when incumbents depart. Planning includes identification of potential successors, development programs that prepare successors for advancement, and transition procedures that transfer knowledge during leadership changes.

P>Historical documentation preserves the record of architecture development and implementation for future reference and learning. Documentation includes negotiating records, decision rationales, implementation experiences, and evaluation findings. Historical records inform future decision-makers and prevent repeated mistakes.

Complex Adaptive Systems and Architecture Resilience

P>The architecture can be understood as a complex adaptive system

comprising multiple interacting agents whose collective behavior produces emergent outcomes that may differ from individual intentions. This systems perspective illuminates why architecture resilience requires more than robust individual components.

P>Agent interaction in the architecture includes states, international organizations, non-state actors, and domestic constituencies. Each agent pursues its own interests through strategies that adapt to other agents' behavior. The architecture's governance structures shape agent interactions by creating forums, incentives, and constraints that influence emergent outcomes.

P>Feedback loops amplify or dampen the effects of initial actions. Positive feedback loops can amplify small perturbations into major effects, contributing to both rapid escalation and rapid cooperation expansion. Negative feedback loops stabilize systems by counteracting deviations from equilibrium. The architecture seeks to dampen escalation feedback while amplifying cooperation feedback.

P>Adaptive capacity enables the architecture to adjust to changing circumstances without collapsing. Adaptation occurs through learning, rule modification, and structural evolution. The architecture's amendment procedures, stress testing program, and scenario planning capabilities provide adaptive capacity.

Quantum Computing and Future Verification Challenges

P>Quantum computing represents a long-term challenge to cryptographic protections that secure architecture information systems. While current quantum computers cannot break modern encryption, future quantum computers may compromise the cryptographic algorithms that protect

classified data, communications, and verification records.

P>Post-quantum cryptography refers to encryption algorithms that remain secure even against quantum computer attacks. The architecture's cybersecurity framework includes migration planning that transitions information systems to post-quantum algorithms before quantum computers become capable of breaking current encryption. Migration timelines are based on expert assessments of quantum computing development.

P>Quantum key distribution provides theoretically unbreakable encryption based on quantum mechanical principles rather than computational complexity. Quantum key distribution is currently limited by distance and infrastructure requirements but may become practical for securing architecture communications in the future.

P>Quantum sensing offers potential improvements in detection capabilities including more sensitive radiation detection, more precise navigation, and more accurate timing. Quantum sensing research is monitored for applications that could enhance architecture verification or security capabilities.

Biotechnology and Dual-Use Research Governance

P>Advances in biotechnology create dual-use risks analogous to nuclear dual-use concerns. Biological research with legitimate medical or agricultural applications can also produce capabilities relevant to biological weapons development. The architecture's dual-use governance framework addresses these converging risks.

P>Dual-use research of concern (DURC) refers to research that could be misapplied to pose significant threats. DURC oversight includes institutional review boards, funding agency oversight, publication review, and

international guidelines. The architecture supports DURC governance that prevents misuse while preserving beneficial research.

P>Biosecurity provisions in the architecture include pathogen security standards, laboratory accreditation, personnel vetting, and export controls on biological materials and equipment. Biosecurity measures complement nuclear security to address the full range of weapons of mass destruction threats.

P>Global health security cooperation addresses pandemic preparedness that intersects with biosecurity concerns. The architecture supports health surveillance, pathogen sharing for research, vaccine development, and emergency response capabilities that serve both health security and biosecurity objectives.

Computational Social Science and Negotiation Simulation

P>Computational social science techniques including agent-based modeling, network analysis, and machine learning provide tools for simulating negotiation dynamics and predicting implementation outcomes. These techniques complement traditional qualitative analysis by generating quantitative insights from large-scale data and complex simulations.

P>Agent-based modeling simulates negotiation and implementation by creating artificial agents that represent states, institutions, and non-state actors. Agents follow behavioral rules based on empirical research and interact in simulated environments that represent regional conditions. Multiple simulation runs generate probability distributions for outcomes under different scenarios.

P>Network analysis examines the relationships among actors in the architecture to identify key nodes, structural vulnerabilities, and potential

intervention points. Network metrics including centrality, density, and clustering reveal patterns of influence and dependence that shape architecture dynamics.

P>Machine learning techniques analyze large datasets of historical agreements to identify features associated with success and failure. Predictive models estimate the probability of architecture survival based on design features, political conditions, and implementation patterns. Machine learning provides data-driven insights that complement expert judgment.

Evolutionary Game Theory and Cooperation Dynamics

P>Evolutionary game theory examines how cooperative strategies evolve and persist in populations of interacting actors. The theory provides insights into the conditions under which cooperation can emerge and survive even among actors with short-term incentives for defection.

P>The evolution of cooperation depends on the structure of interactions among actors. Repeated interactions between the same actors create opportunities for reciprocity that can sustain cooperation. Network structures that cluster cooperators can protect cooperation from exploitation by defectors. Reputation mechanisms enable indirect reciprocity that sustains cooperation even among actors who do not interact directly.

P>The architecture's design incorporates evolutionary insights by creating conditions favorable to cooperation evolution. Repeated interactions through architecture institutions create reciprocity opportunities. Benefit structures that reward cooperation and punish defection create selection pressure favoring cooperative strategies. Reputation mechanisms that publicize compliance and violation create indirect reciprocity incentives.

Social Network Analysis of Regional Influence

P>Social network analysis maps the relationships among regional actors to identify influence structures, alliance patterns, and potential brokers who can facilitate cooperation. Network maps reveal patterns that may not be apparent from bilateral relationship analysis alone.

P>Influence networks identify which actors have the greatest ability to affect others' behavior. Influence may derive from material capabilities, institutional position, information access, or social prestige. Network analysis reveals influence structures that differ from formal hierarchy.

P>Brokerage positions identify actors who connect otherwise disconnected network segments. Brokers occupy structural positions that enable them to facilitate communication, build coalitions, and resolve disputes between disconnected parties. The architecture identifies and cultivates brokers who can support cooperative outcomes.

P>Network density and closure affect cooperation dynamics. Dense networks with many interconnections create social pressure for cooperation through reputation effects. Closed networks with strong internal ties may resist external influence but also enable internal cooperation enforcement.

Behavioral Economics and Commitment Mechanisms

P>Behavioral economics research reveals systematic deviations from rational choice predictions that have important implications for architecture design. Understanding these behavioral patterns enables design of commitment mechanisms that work with rather than against human psychology.

P>Present bias leads actors to overvalue immediate outcomes relative to future outcomes. The architecture addresses present bias through front-loaded benefits that generate immediate positive returns and through automatic

mechanisms that reduce the scope for present-biased decisions to derail long-term cooperation.

P>Loss framing affects how actors respond to concessions and gains. Framing concessions as losses makes them more painful than framing equivalent gains as wins. The architecture employs framing techniques that present commitments as mutual gains rather than unilateral losses.

P>Commitment devices are arrangements that make future behavior more predictable by increasing the costs of deviation. The architecture incorporates multiple commitment devices including international legal obligations, domestic legislation, institutional embedding, and public announcement that increase the costs of reversal.

P>Social preferences including fairness, reciprocity, and altruism affect willingness to cooperate even when self-interest favors defection. The architecture appeals to social preferences through equity provisions, reciprocity structures, and humanitarian objectives that create non-material incentives for cooperation.

Cognitive Biases in Nuclear Risk Assessment

P>Cognitive biases systematically distort risk judgments in ways that can undermine nuclear diplomacy. Understanding these biases enables design of procedures that compensate for distorted judgment and improve decision quality.

P>Availability bias leads to overestimation of risks that are easily recalled from memory, such as dramatic nuclear accidents, while underestimating risks that are less memorable, such as gradual proliferation. The architecture's risk communication addresses availability bias by providing balanced information about all relevant risks.

P>Confirmation bias leads to selective attention to information that confirms existing beliefs while dismissing contradictory information. Negotiators may selectively interpret ambiguous evidence as supporting their preferred outcomes. The architecture addresses confirmation bias through structured analytical procedures that require consideration of alternative interpretations.

P>Anchoring bias leads to excessive influence of initial information on subsequent judgments. First proposals in negotiation may anchor subsequent discussion around initial positions regardless of their substantive merits. The architecture addresses anchoring through procedures that generate multiple alternatives before evaluating options.

P>Overconfidence bias leads to excessive certainty in judgments and underestimation of uncertainty. Leaders may be overconfident in their ability to control nuclear risks or in their assessment of adversary intentions. The architecture addresses overconfidence through devil's advocate procedures and structured uncertainty analysis.

Artificial Intelligence and Diplomatic Support

P>Artificial intelligence technologies offer potential applications for supporting architecture implementation including data analysis, pattern recognition, language translation, and decision support. AI applications must be developed responsibly to avoid errors, biases, and over-reliance that could undermine rather than support implementation.

P>Data analysis applications process large volumes of monitoring data to identify anomalies, trends, and patterns that may indicate compliance concerns. Machine learning algorithms can detect subtle patterns in complex datasets that human analysts might miss. However, AI analysis requires human validation to avoid false positives and algorithmic biases.

P>Language translation applications facilitate communication among participants with different native languages. Neural machine translation enables real-time translation of documents, conversations, and media content. Translation quality continues to improve but still requires human review for sensitive diplomatic communications.

P>Decision support applications provide information summaries, scenario modeling, and option analysis that assist human decision-makers. Support systems do not replace human judgment but augment it by processing information more rapidly and comprehensively than unaided humans. Decision-makers retain responsibility for final decisions.

P>AI governance ensures that AI applications are developed and deployed responsibly. Governance includes bias testing, performance validation, human oversight requirements, and accountability frameworks. AI governance prevents over-reliance on automated systems for decisions requiring human judgment.

Game Theory of Sanctions and Economic Coercion

Economic sanctions are a central instrument of international coercion employed both within and outside architecture frameworks. Game-theoretic analysis of sanctions reveals their strategic logic, their limitations, and the conditions under which they are likely to achieve their objectives.

P>The sanctions game involves two players: the sender state that imposes sanctions and the target state that is subject to sanctions. The sender chooses whether to impose sanctions and at what intensity. The target chooses whether to comply with sender demands or endure sanctions. Payoffs depend on the costs of compliance, the costs of sanctions, and the benefits of the demanded behavior change.

P>Sanctions are most likely to succeed when the target's compliance costs are low relative to the sanctions costs, when the target's domestic politics permit compliance, and when the sender's commitment to sanctions is credible. Sanctions are least likely to succeed when the target's compliance costs are high, when domestic politics prevent compliance, and when the target doubts sender commitment.

P>The architecture addresses sanctions limitations through several mechanisms. Benefit structures reduce the target's net compliance costs by providing offsetting benefits. Verification reduces target uncertainty about what compliance requires. Automatic consequence mechanisms increase sender commitment credibility by making consequence implementation independent of ongoing political decisions.

Information Economics and Verification Design

P>Information economics examines how information asymmetries affect market outcomes and institutional design. In nuclear diplomacy, information asymmetries between states regarding nuclear activities create challenges for cooperation that verification addresses through information revelation.

P>The principal-agent framework examines relationships in which one party (the principal) delegates tasks to another party (the agent) who has private information about task performance. In the architecture, the international community acts as principal delegating nuclear constraint to Iran as agent. Verification addresses the agency problem by monitoring agent performance.

P>Signaling theory examines how actors with private information send credible signals to uninformed actors. Compliance with verification measures serves as a costly signal of genuine commitment. The costliness of verification measures makes them credible signals because insincere actors would not

accept such intrusive monitoring.

P>Screening theory examines how uninformed actors design mechanisms that induce informed actors to reveal their private information. Architecture benefit structures screen between sincere and insincere participants by offering benefits that are valuable only to sincere participants. Insincere participants find the benefit-cost ratio unattractive.

Contract Theory and International Agreements

P>Contract theory examines how incomplete contracts address situations where all future contingencies cannot be specified ex ante. International agreements are inherently incomplete because negotiators cannot anticipate all future circumstances. The architecture addresses contractual incompleteness through several mechanisms.

P>Relational contracts rely on repeated interaction and reputation rather than formal enforcement to sustain cooperation. The architecture creates relational contracting through long-term engagement, repeated interactions, and reputation mechanisms that make defection costly.

P>Option contracts create flexibility by specifying decision rights rather than specific actions. The architecture includes option-like provisions including the moratorium renewal decision, pathway transition options, and modular adoption choices that preserve flexibility for future decisions.

P>Contingent contracts specify different obligations under different contingencies. The architecture includes contingent provisions including the Partial Continuity Agreement, crisis procedures, and economic emergency response mechanisms that adjust obligations to circumstances.

P>Hostage mechanisms create mutual vulnerability that supports cooperation by making both parties worse off if cooperation fails. The architecture creates

hostages through institutional investments, economic interdependence, and political commitments that create costs for all parties if cooperation collapses.

Behavioral Game Theory and Negotiation Behavior

P>Behavioral game theory integrates insights from psychology and experimental economics to explain how actual negotiation behavior deviates from standard game-theoretic predictions. These deviations have important implications for architecture design.

P>Reciprocity in behavioral games is stronger than predicted by purely self-interested models. Players often cooperate even in one-shot prisoner's dilemmas when they expect reciprocity from partners. The architecture leverages reciprocity through repeated interaction structures that reward cooperative behavior.

P>Fairness concerns affect bargaining behavior. Players reject offers they perceive as unfair even when rejection reduces their own payoff. The architecture addresses fairness through benefit structures that distribute gains equitably and through the Compliance Symmetry Index that identifies perceived inequities.

P>Trust development in behavioral experiments follows patterns of gradual trust building through repeated trustworthy actions. The architecture's graduated verification reduction and benefit tranches mirror experimental trust-building patterns.

P>Framing effects demonstrate that equivalent outcomes are evaluated differently depending on how they are described. The architecture's narrative layer addresses framing by presenting cooperation in terms that resonate with target audiences' values and identities.

Economic Geography and Regional Development

P>Economic geography examines how spatial factors shape economic activity and development outcomes. The architecture's economic development programming incorporates economic geography insights to maximize the impact of regional development investments.

P>Agglomeration economies arise when economic activities cluster in geographic concentrations that generate productivity advantages. The architecture supports economic clusters in transportation hubs, border regions, and cities that can serve as regional growth poles.

P>Transportation infrastructure shapes economic geography by reducing the costs of moving goods, people, and information. The architecture prioritizes transportation investments that improve connectivity between population centers, production areas, and international markets.

P>Border effects create economic discontinuities at national boundaries that reduce trade and investment even when formal barriers are low. The architecture addresses border effects through trade facilitation, regulatory harmonization, and cross-border infrastructure that reduces the economic costs of borders.

P>Resource geography affects development patterns by concentrating natural resources in specific locations. The architecture addresses resource geography through resource revenue management that prevents rent-seeking and corruption, and through economic diversification that reduces dependence on geographically concentrated resources.

Demographic Transition and Youth Bulge Implications

P>Demographic factors profoundly affect regional stability and architecture implementation prospects. The Middle East's youthful population creates both

opportunities for economic dynamism and risks of political instability.

P>The youth bulge, the disproportionate share of young people in the population, affects labor markets, political dynamics, and security risks. Youth bulges create labor market pressures when economies cannot absorb new entrants. Youth unemployment generates grievances that can fuel political mobilization and extremism.

P>The architecture addresses youth bulge challenges through economic development programming that creates employment opportunities, education programs that improve workforce skills, and youth engagement that channels energy into constructive participation. Addressing youth grievances is essential for long-term stability.

P>Demographic dividend refers to the economic growth potential created when a large working-age population supports fewer dependents. The architecture seeks to capture the demographic dividend through investments in education, health, and employment that enable productive workforce participation.

P>Demographic transition toward aging populations will eventually reshape regional societies. Long-term architecture planning considers demographic transition implications including pension system sustainability, healthcare demands, and changing labor force composition.

Water-Energy-Food Nexus and Resource Security

P>The water-energy-food nexus describes the interdependencies among water resources, energy production, and agricultural output. The architecture addresses nexus challenges because resource interdependencies create vulnerabilities that can generate conflict.

P>Water for energy refers to the substantial water requirements for thermal

power generation, hydropower, biofuels, and energy extraction. Water scarcity limits energy options and creates competition between energy and other water uses. The architecture promotes water-efficient energy technologies and integrated water-energy planning.

P>Energy for water refers to the energy required for water pumping, treatment, desalination, and distribution. Energy costs affect water availability and affordability. The architecture promotes renewable energy for water systems that reduces cost volatility.

P>Water for food refers to the dominant role of irrigation in agricultural water use. Agriculture accounts for the majority of water consumption in the region. The architecture promotes water-efficient agriculture that maintains food production while reducing water demand.

P>Energy for food refers to the energy required for agricultural mechanization, processing, transportation, and storage. Energy costs affect food prices and availability. The architecture promotes energy-efficient food systems that reduce cost and environmental impact.

P>Nexus governance addresses resource interdependencies through integrated planning that optimizes across water, energy, and food objectives rather than optimizing each sector independently. Integrated governance prevents unintended consequences when sectoral policies ignore cross-sector effects.

Science Diplomacy and Technical Cooperation

P>Science diplomacy employs scientific cooperation as a tool for building international relationships and addressing shared challenges. The architecture incorporates science diplomacy mechanisms that leverage technical cooperation to build trust and create shared interests.

P>Joint research programs bring together scientists from participating states to collaborate on research of mutual interest. Research topics include nuclear physics, materials science, climate science, and medical research. Joint research builds professional relationships and demonstrates that cooperation produces superior results to isolation.

P>Scientific exchanges enable researchers to work in laboratories and institutions across the region. Exchanges transfer knowledge, build networks, and create personal connections. Exchange programs include fellowships, sabbaticals, and collaborative projects.

P>Shared scientific facilities provide expensive research infrastructure that individual states cannot afford independently. Shared facilities include research reactors, supercomputing centers, and large experimental facilities. Shared use creates mutual dependence and shared stakes in facility operation.

P>Scientific advisory mechanisms incorporate independent scientific expertise into architecture governance. Advisory panels provide technical assessments, evaluate emerging technologies, and advise on verification matters. Scientific advice enhances architecture credibility and effectiveness.

Public Health Security and Pandemic Preparedness

P>Public health security is closely linked to regional stability and architecture implementation. Pandemics can disrupt economies, strain health systems, and generate political instability that affects architecture sustainability. The architecture incorporates health security measures that address these linkages.

P>Disease surveillance networks monitor infectious disease outbreaks across the region. Networks employ laboratory capacity, reporting systems, and epidemiological analysis. Surveillance enables early detection and rapid

response to emerging health threats.

P>Vaccine cooperation includes joint research, production capacity sharing, and equitable distribution mechanisms. Cooperation ensures that participating states have access to vaccines regardless of manufacturing location or commercial constraints.

P>Health system strengthening develops the capacity of national health systems to respond to health emergencies. Strengthening includes infrastructure, workforce development, supply chain management, and emergency preparedness. Strong health systems are more resilient to health shocks.

P>Health architecture integration links the architecture to international health institutions including the World Health Organization, ensuring coordinated response to health emergencies that affect architecture implementation.

Education Diplomacy and Academic Cooperation

P>Education diplomacy uses educational exchange and academic cooperation as tools for building international understanding and relationships. The architecture promotes educational cooperation that develops human capital while building cross-national relationships.

P>Student exchanges enable students from participating states to study in each other's countries. Exchanges create personal relationships, language skills, and cultural understanding that support long-term cooperation. Exchange programs include scholarships, academic credit transfer, and alumni networks.

P>University partnerships link institutions across the region through joint programs, faculty exchange, and collaborative research. Partnerships create institutional relationships that sustain cooperation beyond individual

exchanges. Partnership areas include peace and conflict studies, nuclear engineering, international law, and regional studies.

P>Curriculum development creates shared educational content that promotes understanding of regional history, shared challenges, and cooperative solutions. Curriculum materials are developed collaboratively and adapted to national educational contexts.

P>Alumni networks maintain relationships among exchange program participants after they return home. Networks provide professional connections, mutual support, and channels for continued engagement with architecture-related issues.

Ethics of Nuclear Diplomacy and Proliferation Prevention

P>Nuclear diplomacy raises profound ethical questions about the morality of threatening nuclear destruction, the fairness of non-proliferation norms, and the legitimacy of coercive measures employed to prevent proliferation. The architecture acknowledges these ethical dimensions and seeks to ground its provisions in ethically defensible foundations.

P>The ethics of deterrence examines whether threatening mass destruction can be morally justified even when intended to prevent aggression. Just war theory, consequentialist ethics, and deontological ethics offer different perspectives on deterrence morality. The architecture addresses ethical concerns by seeking pathways that reduce reliance on nuclear threats.

P>The ethics of non-proliferation examines whether restrictions on nuclear capabilities are fair given that some states possess nuclear weapons while others are denied them. Critics argue that non-proliferation is discriminatory; defenders argue that proliferation increases catastrophic risks. The architecture addresses fairness concerns through disarmament commitments

and equal application of verification.

P>The ethics of sanctions examines whether economic coercion that harms civilian populations can be justified by the goal of proliferation prevention. Sanctions ethics concerns the proportionality of collective punishment and the responsibility to protect civilian welfare. The architecture addresses ethical concerns through humanitarian exemptions and targeted sanctions.

P>The ethics of verification examines whether intrusive monitoring that compromises sovereignty and privacy can be justified by security benefits. Privacy advocates argue that verification violates human rights; security advocates argue that verification prevents greater harms. The architecture addresses ethical concerns through proportionality principles and sovereignty restoration provisions.

Religious Perspectives on Peace and Security

P>Religious traditions in the region offer resources for supporting or resisting cooperation. Religious perspectives on peace, justice, and human dignity can inform architecture implementation and public engagement.

P>Islamic perspectives on peace include concepts of sulh (reconciliation), wasatiyya (moderation), and ijtiḥad (reasoned interpretation) that can support cooperative approaches to conflict. Islamic jurisprudence on warfare provides principles of proportionality, discrimination, and necessity that align with architecture humanitarian protections.

P>Christian perspectives on peace include just war theory, pacifism, and reconciliation theology that offer frameworks for evaluating architecture commitments. Christian social teaching on human dignity, solidarity, and the common good supports architecture humanitarian objectives.

P>Jewish perspectives on peace include concepts of shalom (comprehensive

peace), pikuach nefesh (preservation of life), and tikkun olam (repairing the world) that align with architecture purposes. Jewish ethics on warfare and diplomacy inform approaches to security and cooperation.

P>Interfaith dialogue brings together religious leaders from different traditions to identify shared values that support cooperation. Dialogue creates moral foundations for architecture implementation that transcend particular religious affiliations.

Future Technology Horizons and Architecture Adaptation

P>Looking beyond current technologies, the architecture must prepare for emerging capabilities that could transform verification, security, and cooperation. Future technology horizons inform architecture planning and adaptation.

P>Quantum sensing technologies may enable more sensitive detection of nuclear materials and activities. Quantum sensors could detect anomalies at greater distances, with higher precision, and in more challenging environments. The architecture monitors quantum sensing research for potential verification applications.

P>Artificial general intelligence, if achieved, could fundamentally alter decision-making, analysis, and strategic planning. The architecture considers potential AGI implications for verification, crisis management, and negotiation support without assuming specific timelines for AGI development.

P>Advanced materials including metamaterials, nanomaterials, and superconductors may enable new capabilities for shielding, detection, and energy applications. The architecture monitors materials science developments that could affect proliferation or verification.

P>Space commercialization may increase the number and diversity of actors

with space access, affecting satellite monitoring, communication, and navigation. The architecture considers how space commercialization affects verification capabilities and security.

P>Biotechnology convergence with information technology creates new capabilities for biological design, modification, and analysis. The architecture monitors convergence developments that could affect biosecurity and dual-use governance.

P>The architecture's adaptive mechanisms are designed to accommodate technologies that do not yet exist. Flexibility provisions, regular review procedures, and emerging technology assessment ensure that the architecture remains relevant as technology evolves.

Final Concluding Reflections on Architecture Sustainability

The Regional Cooperation and Stability Architecture v2.0 represents an ambitious but necessary endeavor to transform the Middle East security environment through comprehensive, verifiable, and sustainable cooperation. The architecture's success depends not merely on its technical design but on the political will, institutional capacity, and human commitment that sustain it through inevitable challenges.

The four nuclear pathways provide alternative routes to the shared objective of preventing nuclear proliferation while respecting the political and technical diversity of regional circumstances. No single pathway is universally optimal; the appropriate pathway depends on the specific conditions prevailing at the time of implementation. The architecture's modular design permits adaptation as conditions evolve.

The twelve core annexes and numerous supporting documents provide the institutional depth required for sustained implementation. These provisions

address the full range of implementation challenges including verification, enforcement, financing, governance, crisis management, and humanitarian protection. The comprehensiveness of the architecture distinguishes it from narrower agreements that have proven vulnerable to disruption.

The signable moratorium instrument under Pathway B, witnessed by the UN Secretary-General, represents a historic commitment that places the authority of the international community behind nuclear restraint. This instrument provides a concrete, legally binding mechanism that transcends the political fortunes of individual governments and creates enduring obligations that serve the interests of all humanity.

The veto player matrices and hundred-day quick start mechanisms address the critical challenge of domestic political sustainability. By understanding the political constraints facing all parties and designing strategies that can build winning coalitions, the architecture enhances the probability that commitments will survive political transitions and implementation challenges.

Ultimately, the architecture's success will be measured not in documents signed or institutions established but in the tangible security and prosperity delivered to the populations of the Middle East. The human dimension remains the ultimate purpose of all architecture activities. This document, with all its technical complexity and institutional detail, serves the simple but profound goal of enabling the people of the region to live in peace, security, and dignity.

APPENDIX A

Response Window. Use of Chemical/Biological Agents: Threshold: Confirmed use by any actor in framework-

affected theater. Activation: Crisis Lock (30 days); OPCW/WHO field team deployment within 24 hours; PERT activation;

6-hour Shock Response Window.

1. CRISIS LOCK MECHANICS

2.1 What the Crisis Lock Stops

Upon activation, the following framework activities are frozen for the Lock duration:

New economic benefit tranche activation (all domains). Phase advancement ceremonies or track readiness

Banking channel expansion or new SWIFT tier

Normalization acceleration measures (diplomatic exchange expansion, trade representation upgrades).

IAEA access expansion beyond existing Phase

Force posture transition drawdown in affected

New infrastructure project commitments or contract

Proxy freeze zone geographic expansion. Hostage exchange window initiation (existing

exchanges in progress continue).

2.2 What the Crisis Lock Protects (Strictly Non-Suspendable) The following operations continue regardless of Crisis Lock status and may not be suspended by any party or

governance body vote:

IAEA remote data mirroring to Vienna and Geneva

IAEA inspector safety and mission continuity;

emergency inspector withdrawal only if facility under active kinetic threat.

Gaza humanitarian corridor operations (Rafah, Kerem

Shalom, Erez, aid-by-sea).

Lebanon emergency fuel supply and medical supply

Yemen Hudaydah port humanitarian inspection and

Sana'a airport medical evacuation flights.

Syria humanitarian corridor protection in all zones. Banking channel transactions below \$10 million

per transfer for pre-cleared humanitarian and

Medical evacuation pathways (Gaza to Egypt; Lebanon

to Turkey/Egypt; Yemen to regional facilities).

Proof-of-life verification for registered detainees. ICRC access to all detention facilities. Hotline operations (all tiers + humanitarian

42 UN OCHA humanitarian coordination functions. Commercial Continuity Protection for certified

contracts already in execution.

2.3 Lock Duration and Extension

Initial duration: Tier 1 = 14 days; Tier 2 = 21

days; Tier 3 = 30 days.

Extension: Governance body may extend by majority

vote; maximum total Lock duration: 42 days (Tier 1/2) or 60 days (Tier 3).

Early termination: Unanimous governance body vote

+ certified remediation by responsible party may terminate Lock before expiration.

Lock Override: If governance body determines by

weighted majority that a Crisis Lock is being abused to stall implementation, Lock may be lifted early with 24 hours' notice; appealing party may

request guarantor review but override remains operative. 2.4 Anti-Abuse Safeguards

Frequency Limit: No party may trigger more than

one Crisis Lock per 90-day period. Additional trigger within 90 days logged but does not

activate new freeze unless neutral chair (Oman) issues written justification.

Escalating Cost: Party triggering Lock based on

fabricated/exaggerated claims faces: (a) +1.0 CIS procedural penalty; (b) loss of Crisis Lock triggering privilege for 180 days; (c) mandatory

public correction of trigger claim.

Default Action During Lock: While status-quo

changes freeze, protected operations (listed in

43 2.2) continue under "protected operations" status.

1. PRE-CLEARED RETALIATION MENU (COLUMN A / COLUMN B)

3.1 Menu Structure The Emergency Override Mechanism provides a pre-cleared,

rapid-activation protocol producing a framework-mandated response within 24 hours of a mass-casualty proxy event. The governing party (state responsible for constraining

the proxy or bearing responsibility for the attributed act) must select at least one measure from Column A within 24 hours. Failure to select triggers automatic Column B

defaults. 3.2 Column A: Governing Party Voluntary Actions (Available to the party associated with the spoiler/

attacker; must select at least one within 24 hours) A1 — Public Condemnation: Senior state official (ministerial level or

above) issues public statement condemning the specific attack, identifying it as violation of framework obligations, and affirming commitment

to constraint/remediation. Verification: Statement transmitted to JMOC and governance body; published via official media

within 24 hours. A2 — Proxy Operative Detention: Arrest or detention of identified spoiler operatives directly responsible for the attack.

Names and detention locations provided to governance body within 48 hours. Verification: ICRC or UN access to detainees

within 72 hours; forensic evidence chain preserved.

44 A3 — Financial/Logistical Channel Cutoff:

Formal order freezing or severing known financial transfers, weapons supply

routes, or communication channels to the spoiler entity.

Documentation of cutoff provided to JMOC financial tracking cell. Verification:
Banking records or customs

declaration showing channel interruption within 7 days. A4 — Cooperative Investigation:

Commitment to joint investigation with PERT or framework investigative team; provision of intelligence access (sanitized); agreement to

publish joint findings within 30 days. Verification: Investigation terms of reference signed within 48 hours; team deployed within

72 hours. A5 — Remediation Plan Commitment: Submission of binding 14-day remediation plan to

governance body detailing specific measures to prevent recurrence. Plan must include: accountability measures; institutional reforms;

monitoring enhancements; and compensation for civilian victims. Verification: Plan approved by governance body

within 7 days; implementation monitored by JMOC. A6 — Enhanced Monitoring Acceptance:

Acceptance of enhanced monitoring in the affected theater for 90 days: additional satellite tasking; third-party inspector presence;

45 real-time incident reporting; and hotline

connectivity to JMOC. Verification: Monitoring agreement signed within 48 hours; first enhanced report within 7 days.

3.3 Column B: Automatic Defaults (Activate automatically if Column A not selected within 24 hours; all measures are temporary and

reversible) B1 — Benefit Tranche Suspension: Next scheduled benefit tranche in the affected

domain suspended for 30 days. Scope: If security incident, next security- linked benefit frozen (e.g., proxy freeze zone

expansion, militia integration funding). If nuclear incident, next nuclear-related benefit frozen (e.g., centrifuge R&D access, fuel supply

guarantee acceleration). Reversibility: Automatic release upon Column A selection within 30 days; otherwise continues

until Step 3 remediation certified. B2 — Enhanced Monitoring Activation: Enhanced monitoring activated in all proxy-

affected theaters (not just incident theater) for 90 days. Scope: Additional satellite monitoring; PERT

pre-activation status; weekly incident registry publication; and third-party inspector deployments where consented.

B3 — Asset Release Freeze: Next asset release tranche frozen pending governance body review.

46 Scope: Applies to escrow drawdowns, sovereign

asset unfreezing, and reconstruction fund pre-positioning in affected domain.

Exception: Humanitarian escrow (\$500M Layer 1)

not affected; medical and food procurement continues. B4 — Diplomatic Demarche:

Public governance body statement noting non- cooperation by the governing party; transmitted to all guarantors (Oman, Pakistan, Switzerland)

and UN Secretary-General. Scope: Statement does not assign criminal liability;

notes framework obligation default

and calls for remediation. Published in quarterly Transparency Summary. B5
— Compliance Indicator Score Adjustment:

Automatic +2.0 points added to Security and Proxy domain (or Nuclear and Verification domain if nuclear facility attack).

Effect: May push cumulative score toward Step 3 or Step 4 threshold if combined with existing points.

3.4 Kinetic Operations Ceiling The Emergency Override Mechanism explicitly limits permitted retaliatory or defensive actions to prevent

framework-ending escalation: Permitted Under Crisis Lock (if attributed to spoiler/third party):

Precision kinetic strikes strictly limited to

identified spoiler military facilities, weapons depots, or launch sites directly linked to the

47 attack. Requires JMOC PERT attribution

confirmation at $\geq 75\%$ confidence.

Counter-battery fire against active, continuous

missile/drone barrages under 12-hour reduced

Third-Party Strike Buffer (per Edit 13).

Defensive naval interdiction of vessels

confirmed en route to conduct additional attacks.

Cyber defensive operations to neutralize

confirmed spoiler command-and-control networks (no critical infrastructure

targeting). Prohibited Under Crisis Lock (treated as material breach if undertaken):

Strikes on population centers, civilian infrastructure, or declared IAEA-monitored Strikes on framework party state territory outside spoiler-affected theater without governance body authorization.

Use of weapons of mass destruction or indiscriminate area bombardment.

Assassination of senior state officials (as distinguished from spoiler field commanders).

Comprehensive economic sanctions or trade embargo reimposition outside snapback friction ladder timeline.

Territorial seizure or permanent military

1. SHOCK RESPONSE ENVELOPE — FULL OPERATIONAL SEQUENCE

4.1 Activation-to-Response Timeline

48 T+0 to +2 hours: Incident confirmation by JMOC,

ICRC, UN OCHA, OPCW, or IAEA. Crisis Lock activated by affected party notification to

governance body neutral chair. T+2 to +6 hours: PERT preliminary attribution begins. Evidence collection:

satellite, signals, open-source, forensic. Alternative hypotheses logged.

T+6 to +12 hours: PERT preliminary attribution report. If confidence $\geq 70\%$: governing party identified;

Column A/Column B protocol activated. If confidence $< 70\%$: Assessment Hold recommended;

enhanced monitoring; continued investigation. T+12 to +24 hours: Formal attribution notification

to governance body co-chairs. 24-hour Column A selection window opens for governing party.

T+24 hours: Column A deadline. If selected: voluntary measures implemented; monitoring verifies. If not

selected: Column B defaults activate automatically. T+24 to +48 hours: Guarantor mediation window if

cooling-off invoked (one cooling-off permitted per event). Oman and Pakistan attempt bilateral

T+48 to +72 hours: If cooling-off succeeds: Column B defaults suspended pending negotiated resolution. If cooling-

off fails or not invoked: Column B defaults fully operative. 4.2 Domestic Political Function

The Emergency Override exists primarily to manage domestic political pressure:

Leaders can defend response as "framework-mandated, not unilateral."

Opposition parties cannot attack leaders for

"failing to respond" or "overreacting" — both are governed by pre-cleared

menu.

Media narrative: "Framework required automatic response; our government selected least escalatory option from pre-cleared menu."

If preliminary attribution later reversed: Column

B measures lifted retroactively with compensation; no lasting political damage to

1. THIRD-PARTY STRIKE BUFFER INTEGRATION

5.1 Standard Buffer (72 Hours)

Any attack attributed to a third party (not a framework core party) triggers a 72-hour attribution confirmation period before any framework party may take retaliatory

action. During buffer:

Intelligence shared through guarantor channels

(Oman relay, Swiss protecting power, Pakistani technical assessment).

PERT convenes (2 Iranian + 2 U.S. + 1 neutral

Guarantors issue preliminary attribution

assessment by T+48 hours.

Retaliatory action before buffer expiration is

considered unilateral act outside framework authorization; may trigger framework suspension. 5.2 Reduced Buffer (12 Hours) — Active Continuous Barrage

For active, continuous missile/drone barrages (3+ projectiles within 6-hour

period with ongoing threat to life or critical infrastructure):

Targeted states retain right to immediate counter-

battery fire and active defense measures without awaiting full attribution confirmation.

12-hour reduced buffer applies exclusively to

kinetic self-defense and counter-battery operations.

Broader retaliatory measures (strikes on suspected

launch sites or supply depots) remain subject to standard 72-hour buffer unless ongoing barrage creates imminent threat to civilian population

centers, in which case Article 51 UN Charter override governs.

All counter-battery fire under 12-hour exception

must be reported to governance body and guarantors within 2 hours. 5.3

Article 51 Override

Under Operational Hardening (Edit 12), the targeted state's inherent right to self-defense under Article 51 of the UN Charter supersedes the Crisis Lock if an attack is ongoing and kinetic interception is required

51 State notifies governance body and guarantors

within 2 hours of initiating kinetic interception.

Crisis Lock suspended in affected theater for

duration of active kinetic engagement.

Post-engagement, state submits after-action report

to JMOC within 24 hours; PERT reviews whether force used was proportionate and necessary.

If PERT finds disproportionate use: +1.0 CIS point

to Security domain; governance body consultative session convened.

APPENDIX TO ENFORCEMENT & DISPUTE RESOLUTION MODULES

A. DOCUMENT CROSS-REFERENCE MAP Module I (Binding Arbitration Panel):

Supersedes: Tiered Arbitration Architecture

(Stage 2: Binding Determination mutual opt-in).

Integrates with: CIS scoring adjustments;

escrow enforcement; sovereign immunity waiver.

Deposited with: PCA Registry, The Hague; UN

Secretariat, Geneva. Module II (Graduated Penalty Ladder):

Supersedes: Graduated Response Framework (Step

1-4); Compliance Indicators System.

Integrates with: Verification Continuity Ladder;

Pattern-of-Concern designation; Deadlock Penalty Clock.

Automated triggers: CIS scoring engine (JMOC

52 backend); governance body override window.

Module III (Spoiler Containment 2.0):

Supersedes: Semi-Autonomous Actor Protocol;

Attribution Tiers for Semi-Autonomous Actors.

Integrates with: Proxy Activity Cap System;

Base Protection Compact; PMF Integration Pathway.

Operational lead: JMOC Proxy Event Response

Team. Module IV (Emergency Override):

Supersedes: Shock Response Envelope; Crisis

Lock and De-escalation; Third-Party Strike Buffer Rule.

Integrates with: Mass-Casualty Automatic

Triggers; Pre-Authorized Response Bands; Hotline Architecture.

Activation authority: JMOC Director +

Governance Body Neutral Chair. B. ABBREVIATIONS AND TERMS USED IN

APPENDIX A: CANONICAL CORE DEFINITIONS AND CONCEPTUAL FRAMEWORK

Architecture and Governance Definitions

Architecture (or Framework): The comprehensive system of treaties, annexes, protocols, institutional arrangements, and implementation mechanisms established by the Regional Cooperation and Stability Architecture v2.0. The term encompasses both the formal legal instruments and the operational practices that constitute the architecture's functioning.

Governance Body: The supreme decision-making body of the architecture, comprising representatives from all participating states, with authority to establish policy, approve programs, adopt rules of procedure, and make

decisions on matters not delegated to subsidiary bodies. The Governance Body operates through specified voting procedures and decision-making thresholds.

Executive Secretary: The chief administrative officer of the architecture, appointed by the Governance Body, responsible for directing the secretariat, implementing Governance Body decisions, and coordinating architecture activities across all institutions.

Participating State: Any state that has ratified or acceded to the architecture treaty and is in good standing with its architecture obligations. Participating states have rights and obligations specified in the treaty and its annexes.

Core Parties: Iran, the United States, and the three E3 states (France, Germany, and United Kingdom), whose ratification is required for architecture entry into force and whose participation is essential for architecture effectiveness.

Depositary: The UN Secretary-General, who performs specified administrative functions including receiving instruments of ratification, maintaining the authoritative treaty text, and certifying the status of parties.

Nuclear and Technical Definitions

Enrichment: The process of increasing the concentration of specific isotopes of uranium, typically U-235, above their natural abundance. Enrichment technologies include gas centrifuge, gaseous diffusion, electromagnetic separation, and laser isotope separation.

Highly Enriched Uranium (HEU): Uranium enriched to 20 percent or greater U-235 concentration. HEU is used in research reactors and naval propulsion systems and can be further enriched to weapons-grade levels.

Weapons-Grade Uranium: Uranium enriched to 90 percent or greater U-235 concentration, suitable for use in nuclear weapons.

Breakout: The process of diverting declared civilian nuclear facilities and materials to the production of weapons-grade nuclear material. Breakout time refers to the estimated period required to produce sufficient weapons-grade material for a nuclear device.

Dual-Use Technology: Technology, equipment, or materials that have both civilian and military applications. In the nuclear context, dual-use items include enrichment equipment, reprocessing technology, and certain nuclear materials that can be used for either peaceful purposes or weapons production.

Additional Protocol: The additional protocol to IAEA safeguards agreements that provides expanded inspector access, including access to undeclared locations, and enhanced information requirements beyond standard comprehensive safeguards.

Comprehensive Safeguards: The system of IAEA verification measures applied to all nuclear material in non-nuclear-weapon states under the NPT, including facility declarations, material accounting, inspections, and containment and surveillance measures.

Centrifuge: A device that enriches uranium by spinning uranium hexafluoride gas at high speeds to separate isotopes by mass difference. The most common enrichment technology in current use.

Cascade: An interconnected array of centrifuges arranged to progressively enrich uranium from natural abundance to the desired enrichment level.

Separative Work Unit (SWU): A measure of the effort required to enrich uranium. One SWU represents one kilogram of separative work, which quantifies the enrichment capacity of a centrifuge or cascade.

Security and Implementation Definitions

Compliance: Conformity of a participating state's activities with its obligations under the architecture treaty and its annexes. Compliance assessments evaluate whether activities conform to specified requirements.

Verification: The process of confirming compliance through monitoring, inspection, and analysis. Verification encompasses IAEA safeguards, architecture-specific monitoring, national technical means, and other information sources.

P>Non-Compliance: Any failure to comply with architecture obligations. Non-compliance may be technical (involving minor deviations correctable through cooperative measures) or material (involving significant violations warranting consequence activation).

P>Material Breach: A significant violation of architecture obligations that fundamentally undermines the agreement's purposes. Material breach triggers the architecture's most serious consequence mechanisms.

Confidence-Building Measure (CBM): An action taken to increase transparency, reduce uncertainty, and build trust among participating states. CBMs include information exchanges, notification requirements, observation rights, and voluntary constraints.

Proxy Actor: An individual, group, or organization that conducts activities affecting regional security with varying degrees of support, direction, or tolerance from a state sponsor. Proxy actors may be paramilitary groups, militias, terrorist organizations, or other non-state armed actors.

Spoiler: An actor who seeks to undermine the architecture through violence, subversion, political obstruction, or other means. Spoilers may be inside actors (participating states or their constituents) or outside actors (non-parties or transnational groups).

Crisis Pause Mode: A temporary suspension of architecture activities in response to crisis situations, preserving core commitments while pausing non-essential cooperation to create space for de-escalation.

Silence Procedure: A decision-making mechanism under which proposed decisions are deemed adopted if no participating state objects within a specified timeframe.

Zero-Regret Principle: The design principle that architecture components should generate positive value even if other components fail or are not adopted. Zero-regret actions are beneficial under all scenarios.

H2>Financial and Economic Definitions

P>Regional Development Fund (RDF): The architecture's principal financing mechanism, capitalized at \$50 billion, supporting infrastructure development, economic diversification, and human capital formation across participating states.

P>Framework Commercial Insurance Facility (FCIF): The architecture's risk mitigation mechanism that provides political risk insurance, trade finance guarantees, and investment protection to encourage private sector participation in architecture-related economic activities.

P>Standing Enforcement Support Secretariat (SESS): The permanent architecture institution responsible for monitoring implementation, assessing compliance, coordinating consequences, and providing technical support to the Governance Body.

P>Joint Monitoring Operations Center (JMOC): The architecture institution responsible for security monitoring, information integration, and crisis coordination.

P>Binding Arbitration Panel (BAP): The architecture's dispute resolution body

with authority to issue binding decisions on disputes arising from the architecture treaty.

P>Non-Aligned Co-Administrator (NACA): A role in architecture governance reserved for a representative of a state without formal alliance ties to major powers, providing institutional balance and neutral oversight.

P>Humanitarian Firewall: The principle and institutional arrangements that prevent security measures from impeding essential humanitarian services.

Pathway-Specific Definitions

P>Pathway A (Gradual Cap and Rollback): The nuclear pathway that maintains limited enrichment with progressive constraints over an eight-year timeline, culminating in zero enrichment with full international fuel supply guarantees.

P>Pathway B (Comprehensive Zero-Enrichment Compact): The nuclear pathway that requires immediate cessation of all enrichment, dismantlement of enrichment infrastructure, transfer of enriched uranium stockpiles to international custody, and a legally binding twenty-year moratorium witnessed by the UN Secretary-General.

P>Pathway C (Multilateral Regional Fuel-Bank Consortium): The nuclear pathway that replaces national enrichment with a collectively administered regional fuel bank under multilateral governance.

P>Pathway D (Limited Civilian Program with Enhanced Safeguards): The nuclear pathway that permits strictly limited enrichment at Natanz under the most rigorous safeguards regime ever implemented, including continuous monitoring and automatic consequence systems.

P>Benefit Tranche: A defined package of economic and political benefits provided upon verified achievement of specified implementation milestones.

Tranches create graduated incentives for progressive compliance.

P>Snap-Back: The automatic restoration of suspended sanctions upon detection of specified violations, without requiring new Security Council action.

P>Sovereignty Restoration Ladder: The mechanism under which the intensity of international oversight is progressively reduced as confidence in compliance accumulates over time.

P>Partial Continuity Agreement (PCA): The mechanism that preserves core architecture commitments during periods of crisis that require suspension of broader cooperation.

Technical Glossary of Nuclear Terms

Absorber: A material used to absorb neutrons in a nuclear reactor, controlling the rate of the nuclear reaction.

Actinide: Any of a series of radioactive metallic elements in the periodic table with atomic numbers 89 through 103, including uranium, plutonium, and americium.

Activation Product: A radioactive isotope produced when a stable material is bombarded with neutrons.

Alpha Particle: A positively charged particle emitted from the nucleus of certain radioactive materials, consisting of two neutrons and two protons.

Atom: The basic unit of matter, consisting of a dense central nucleus surrounded by a cloud of negatively charged electrons.

Atomic Number: The number of protons in an atom's nucleus, which determines the element's identity.

Atomic Mass: The total number of protons and neutrons in an atom's nucleus.

Back End: The stages of the nuclear fuel cycle involving spent fuel management, reprocessing, storage, and disposal.

Batch: A specific quantity of nuclear material processed together under uniform conditions.

Beta Particle: A high-energy, high-speed electron or positron emitted by the radioactive decay of an atomic nucleus.

Biological Shield: A thick barrier of concrete, water, or other material used to protect personnel from radiation.

Breed: To produce fissile material in a reactor through neutron capture by fertile material.

Burnup: The amount of energy extracted from nuclear fuel, typically measured in megawatt-days per metric ton.

Cadmium: A metal used as a neutron absorber in control rods because of its high neutron absorption cross section.

Chain Reaction: A self-sustaining series of nuclear fissions in which neutrons released from one fission trigger additional fissions.

Cladding: The metal tube that encloses nuclear fuel pellets to prevent radioactive material from escaping.

Cold Shutdown: A reactor condition in which the temperature is below a specified level and the reactor is not producing power.

Containment: The structures and systems designed to prevent the release of radioactive materials to the environment.

Control Rod: A rod containing neutron-absorbing material that can be inserted

or withdrawn from a reactor core to control the reaction rate.

Coolant: A fluid used to remove heat from a nuclear reactor core and transfer it to a steam generator or turbine.

Critical Mass: The minimum amount of fissile material needed to sustain a nuclear chain reaction.

Criticality: The condition in which a nuclear chain reaction is self-sustaining.

Cross Section: A measure of the probability of a nuclear reaction occurring, expressed in units of area.

Decay Heat: The heat produced by the radioactive decay of fission products after a reactor is shut down.

Decommissioning: The process of removing a nuclear facility from service and reducing residual radioactivity to a level that permits release of the property.

Depleted Uranium: Uranium with a lower than natural concentration of U-235, resulting from enrichment activities.

Deuterium: A stable isotope of hydrogen with one proton and one neutron, used as a moderator in some reactors.

Disassembly: The process of taking apart a nuclear weapon or nuclear device.

Dose: The quantity of radiation energy absorbed by a material or organism, measured in sieverts or rem.

Electron: A subatomic particle with a negative elementary charge, found in all atoms.

Element: A pure substance consisting of atoms with the same atomic number.

Enrichment: The process of increasing the proportion of a particular isotope in an element, especially U-235 in uranium.

Fertile Material: A material that can be converted into fissile material by neutron capture, such as U-238 or thorium-232.

Fissile Material: Material capable of sustaining a nuclear chain reaction, such as U-235, Pu-239, and U-233.

Fission: The splitting of a heavy atomic nucleus into two lighter nuclei, releasing energy and neutrons.

Fission Product: A nuclide produced by nuclear fission, many of which are radioactive.

Fissionable Material: Material that can undergo fission, including both fissile and fertile materials.

Front End: The stages of the nuclear fuel cycle preceding reactor use, including mining, milling, conversion, enrichment, and fuel fabrication.

Fuel Assembly: A bundle of fuel rods arranged in a specific geometric pattern for insertion into a reactor core.

Fuel Fabrication: The manufacture of nuclear fuel elements from enriched uranium or plutonium.

Fuel Rod: A long, slender tube containing nuclear fuel pellets, used in a reactor core.

Gamma Ray: A high-energy electromagnetic wave emitted from the nucleus of certain radioactive materials.

Graphite: A form of carbon used as a moderator in some nuclear reactors.

Half-Life: The time required for half of the atoms of a radioactive substance to decay.

Heavy Water: Water in which the hydrogen atoms are replaced by deuterium,

used as a moderator and coolant in some reactors.

Hot Cell: A heavily shielded enclosure for handling radioactive materials remotely.

Induced Fission: Fission that occurs when a nucleus is struck by a neutron or other particle.

Ionizing Radiation: Radiation with enough energy to remove electrons from atoms, creating ions.

Isotope: A variant of a chemical element with the same number of protons but different numbers of neutrons.

Light Water: Ordinary water used as a moderator and coolant in most power reactors.

Moderator: A material used in a reactor to slow down neutrons, increasing the probability of fission.

Neptunium: A radioactive metallic element with atomic number 93, produced when uranium captures a neutron.

Neutron: A subatomic particle with no electric charge, found in atomic nuclei.

Nucleus: The central part of an atom containing protons and neutrons.

Plutonium: A radioactive metallic element with atomic number 94, produced by neutron capture in U-238.

Prompt Critical: A condition in which a chain reaction is self-sustaining without delayed neutrons.

Proton: A subatomic particle with a positive electric charge, found in atomic nuclei.

Radiation: Energy in the form of particles or electromagnetic waves emitted by

radioactive substances.

Radioactive Decay: The spontaneous transformation of an unstable atomic nucleus into a different nucleus, emitting radiation.

Radioisotope: A radioactive isotope of an element.

Reactor Core: The central portion of a nuclear reactor containing the fuel, moderator, and coolant.

Reprocessing: The chemical processing of spent nuclear fuel to separate plutonium and uranium from fission products.

Scram: The rapid insertion of all control rods into a reactor core to shut down the chain reaction.

Source Material: Uranium or thorium in any physical or chemical form, excluding enriched uranium.

Spent Fuel: Nuclear fuel that has been irradiated in a reactor and can no longer efficiently sustain a chain reaction.

Tails: The depleted uranium stream from an enrichment process, with lower U-235 concentration than natural uranium.

Tritium: A radioactive isotope of hydrogen with one proton and two neutrons, produced in reactors and used in nuclear weapons.

Yellowcake: Uranium oxide powder obtained from uranium ore through milling and chemical processing.

Zirconium: A metal used for nuclear fuel cladding because of its low neutron absorption and corrosion resistance.

Table of Physical Constants and Conversion Factors

The following physical constants and conversion factors are referenced

throughout this document for technical calculations and assessments.

Avogadro's Number: $6.02214076 \times 10^{23} \text{ mol}^{-1}$

Speed of Light: 299,792,458 m/s

Elementary Charge: $1.602176634 \times 10^{-19} \text{ C}$

P>Planck Constant: $6.62607015 \times 10^{-34} \text{ J s}$

P>Atomic Mass Unit: $1.66053906660 \times 10^{-27} \text{ kg}$

P>Electron Volt: $1.602176634 \times 10^{-19} \text{ J}$

P>Uranium-235 Atomic Mass: 235.0439299 u

P>Uranium-238 Atomic Mass: 238.05078826 u

P>Plutonium-239 Atomic Mass: 239.052163 u

P>Natural Uranium Isotopic Composition: U-234 0.0055%, U-235 0.720%, U-238 99.2745%

P>Density of Uranium Metal: 19.1 g/cm^3

P>Density of UF₆ Solid: 4.68 g/cm^3

P>Density of UF₆ Gas at 60C: 15.9 kg/m^3

P>Conversion: 1 SWU = 1 kg of separative work

P>Conversion: 1 metric ton = 1000 kg

P>Conversion: 1 tonne UF₆ = 676.2 kg uranium

P>Conversion: 1 kiloton TNT equivalent = $4.184 \times 10^{12} \text{ J}$

P>Conversion: 1 year = 8760 hours (non-leap)

P>Decay Constant for U-235: $9.8487 \times 10^{-10} \text{ per year}$

P>Decay Constant for U-238: $1.5514 \times 10^{-10} \text{ per year}$

P>Half-Life of U-235: 703.8 million years

P>Half-Life of U-238: 4.468 billion years

P>Half-Life of Pu-239: 24,110 years

P>Half-Life of Tritium: 12.32 years

P>Critical Mass of U-235 (bare sphere): approximately 52 kg

P>Critical Mass of Pu-239 (bare sphere): approximately 10 kg

P>Thermal Neutron Fission Cross Section U-235: 585 barns

P>Thermal Neutron Capture Cross Section U-238: 2.68 barns

P>Thermal Neutron Capture Cross Section Cadmium: 2,520 barns

P>Thermal Neutron Capture Cross Section Boron-10: 3,840 barns

C. DOCUMENT CONTROL AND AMENDMENT These modules are classified Tier 1 (must survive in any framework version). Structural amendments require governance body consensus. Technical clarifications may be issued by the Dispute Resolution Sub-Committee via Silence Procedure (72-hour auto-adoption if no

objection). All modifications recorded in the Precedent Registry maintained by the governance body secretariat. Document Identifier: RCSA-Enforce-v1.5

Classification: Framework Enforcement & Dispute Resolution Reference Depositary: UN Secretary-General (upon framework entry

into force) Preparation Date: 2026

Annex ES: Standing Enforcement Support Secretariat (SESS)

This annex creates a pre-funded, permanently staffed enforcement support

body with legal capacity, technical deployment capability, and rapid mediation resources, ensuring the framework possesses operational depth beyond weighted-majority decisions and referral pathways.

Establishment and Mandate

The Standing Enforcement Support Secretariat (SESS) is established as a permanent, pre-funded operational body supporting the governance body's enforcement, dispute resolution, and compliance verification functions. The SESS is not a decision-maker; it is a capacity provider that ensures the framework has

54 Annex ES: Standing Enforcement Support Secretariat (SESS)

professional, rapidly deployable resources beyond the procedural mechanisms of weighted-majority votes and referral pathways. The SESS operates under the joint authority of the governance body and the triple guarantor architecture (Oman, Switzerland, Pakistan). Its mandate covers: legal capacity (treaty interpretation, arbitration support, enforcement drafting); technical deployment (forensic accounting, nuclear material analysis, satellite imagery verification); and rapid mediation (emergency facilitator deployment, hotline management, crisis- session preparation).

Table EN-1: Table EN-1: SESS Structure and Functions

Unit Staff Functions Annual Budget

Legal Capacity 6 attorneys (2 international law, 2 Treaty interpretation, enforcement \$1.2M Unit sanctions/compliance, 1 arbitration, 1 drafting, arbitration procedure support, domestic law) compliance determination briefs

Technical 8 specialists (2 nuclear material, 2 Challenge inspection support, material \$1.8M Deployment Unit forensic accounting, 2 satellite imagery, 1 balance verification, financial tracing, cyber forensics, 1 engineering)

infrastructure assessment

Rapid Mediation 4 senior facilitators (rotating from Emergency deployment within 48 \$800K Unit guarantor states) hours, hotline duty rotation, crisis-session preparation, preliminary fact-finding

Administrative 3 staff (finance, HR, IT) Budget management, procurement, \$400K Core secure communications, archive maintenance

Pre-Funding and Sustainability

The SESS is pre-funded through an endowment of \$12 million, deposited in a Swiss-administered trust account at framework entry into force. The endowment generates investment income targeting 3-4% annually, sufficient to cover base operating costs. Supplemental contributions are solicited every three years through a pledging conference hosted by the neutral chair. The endowment is classified as Committed capital under the Financing Reality Annex classification system. Operating budgets are approved annually by the governance body. The SESS may not incur obligations exceeding its approved annual budget plus a 15% contingency reserve without governance body authorization.

If the endowment income falls below operating requirements for two consecutive years, the SESS may draw up to 20% of the endowment principal as a one-time bridge. Any principal draw triggers automatic

55 Annex ES: Standing Enforcement Support Secretariat (SESS)

governance body review of long-term funding sustainability and may activate an extraordinary pledging conference.

The SESS maintains three deployment readiness states: Standby (routine operations, no active deployment); Alert (pre-positioned team identified, 48-hour mobilization capability); and Active (team deployed in theater,

continuous reporting to governance body). Deployment decisions are made by the SESS Director in consultation with the neutral chair and the governance body secretariat.

Table EN-2: Table EN-2: SESS Deployment Triggers and Response Times

Trigger	Required Response	Team Composition	Duration
Compliance indicator	Technical assessment team	to 2 technical specialists + 1 legal	14 days, breach (8.0+) affected facility advisor extendable
Alleged sanctions	Forensic accounting team	to 2 forensic accountants + 1	21 days violation banking channel sanctions lawyer
Dispute over IAEA	Legal support team	to Vienna 1 international lawyer + 1 technical	Duration of access + field advisor dispute
Proxy incident	Preliminary fact-finding team	1 facilitator + 1 intelligence liaison	7 days, attribution to theater + 1 regional expert extendable to 30
Crisis Lock activation	Full crisis support cell	to All three units represented,	Duration of neutral venue minimum 6 personnel Crisis Lock

Independence and Accountability

SESS staff are employed under Swiss-contracted terms, personally bound by confidentiality obligations enforceable under Swiss law, and prohibited from concurrent employment with any framework party's government or intelligence services. The SESS Director serves a single 4-year term, renewable once by governance body consensus. Removal requires supermajority vote (75%) plus neutral chair concurrence. The SESS publishes an annual Activity and Expenditure Report that details all deployments, findings (sanitized for party confidentiality where required), and budget utilization. The report is reviewed by the governance body and audited by an independent external

firm from the auditor standing pool. SESS staff enjoy functional immunity for acts performed in their official capacity, limited to: protection from civil suit in framework participant states; inviolability of SESS premises and archives; and exemption from taxation on SESS salaries in Switzerland.

56 Annex BA: Binding Arbitration Conversion

Annex BA: Binding Arbitration Conversion

This annex converts escrow release, access scheduling, indicator scoring, and milestone verification disputes from advisory or opt-in treatment to presumptively binding arbitration, with accelerated procedures, mandatory three-member tribunals, and enforceable awards under the New York Convention.

Presumptive Binding Scope

This annex converts the treatment of specified dispute categories from advisory, opt-in, or consultative status to presumptively binding arbitration. The categories are: Escrow Release Disputes (disagreements over whether escrow conditions have been met for drawdown); Access Scheduling Disputes (disagreements over IAEA inspection timing, humanitarian corridor scheduling, or banking channel access windows); Indicator Scoring Disputes (disagreements over compliance indicator calculations, weighting, or threshold determinations); and Verified Implementation Milestone Disputes (disagreements over whether a concrete, verifiable milestone has been achieved for benefit activation. For these four categories, arbitration is the default dispute resolution mechanism. A party wishing to avoid arbitration must opt out by written notification within 14 days of the dispute's formal registration. Opt-out is permitted once per 90-day cycle per party. If both parties opt out, the dispute returns to standard governance body consultation. If one party opts out and the other does not, the non-opting party may

unilaterally invoke arbitration, and the opting party is bound to participate under the framework's arbitration procedures.

Table EN-4: Table EN-4: Dispute Categories and Arbitration Treatment

Category	Previous Treatment	New Opt-Out	Enforceability	Treatment Available
Escrow release	Governance body consensus	Binding	Yes, once per Arbitral award enforceable or advisory arbitration cycle under New York Convention	
Access	Governance body consultation	Binding	Yes, once per Award enforceable, specific scheduling + technical committee advice arbitration cycle performance available	
Indicator	Compliance review +	Binding	Yes, once per Award may revise score or scoring governance body judgment arbitration cycle remand for recalculation	
Milestone	Governance body certification	Binding	Yes, once per Award may certify milestone verification arbitration cycle or prescribe remedial action	

57 Annex BA: Binding Arbitration Conversion

Arbitration Procedures

Binding arbitration under this annex follows the framework's existing tiered arbitration architecture with the following modifications: Tribunal composition is mandatory three-member panel (one arbitrator appointed by each disputing party, one neutral chair appointed by the two party-appointed arbitrators or, if they cannot agree, by the President of the International Court of Justice). Timeline is accelerated: statement of claim within 14 days; defense within 21 days; hearing within 60 days; award within 90 days of hearing. Emergency interim relief is available within 7 days of request. The tribunal's jurisdiction is limited to the specific dispute registered. It may not: amend

framework terms; create new obligations; alter phase structures; or issue advisory opinions on matters beyond the registered dispute. The tribunal may, however: order specific performance (e.g., release escrow upon verified conditions); issue declaratory awards (e.g., certify that a milestone has been achieved); and award costs (including reasonable legal fees, capped at \$250,000 per party).

Arbitral awards are final and binding. Enforcement is governed by the New York Convention. The framework's limited sovereign immunity waiver (Economic and Financial Architecture) explicitly covers arbitral awards under this annex. Awards are deposited with the UN Secretary-General and constitute framework-linked instruments of international law.

Relationship to Governance Body

Binding arbitration does not replace the governance body; it operates as a specialized track for technical disputes that the governance body is poorly equipped to resolve through political negotiation. The governance body retains authority over: structural framework amendments; new annex activation; benefit suspension at Step 3 or above; and military response authorization. All other matters falling within the four categories are channeled to arbitration unless both parties opt out. The governance body may, by supermajority vote (75%), override an arbitral award on grounds of: manifest procedural irregularity; newly discovered evidence that could not have been presented during arbitration; or fundamental incompatibility with framework security. Override requires written justification, 30-day notice to the tribunal, and automatic referral to the Permanent Court of Arbitration for threshold review within 14 days. The override power is intentionally narrow and procedurally burdensome to prevent political abuse.

58 Annex AC: Automatic Consequence Menus for Arbitral Non-Compliance

Annex AC: Automatic Consequence Menus for Arbitral Non-Compliance

This annex establishes pre-defined, graduated automatic consequence menus—covering benefit delays, escrow holds, monitoring enhancement, and domain freezes—that activate upon non-compliance with binding arbitral awards, ensuring predictable responses before matters escalate to ministerial review or UN referral.

This annex establishes automatic consequence menus for non-compliance with binding arbitral awards. The menus replace ad hoc political deliberation with pre-defined, graduated responses that activate upon verified award non-compliance. The objective is to create immediate, predictable consequences that both parties can defend domestically as framework-mandated rather than unilaterally chosen.

The menus are organized by dispute category and severity level. Each menu specifies: the consequence; the activation trigger; the duration; the review mechanism; and the conditions for lift. Consequences are temporary, reversible, and proportionate. No military action, territorial sanction, or population-level economic measure appears in any menu.

59 Annex AC: Automatic Consequence Menus for Arbitral Non-Compliance

Table EN-5: Table EN-5: Automatic Consequence Menus by Category and Severity

Category	Severity	Consequence	Duration	Review	Lift	Conditions
----------	----------	-------------	----------	--------	------	------------

Escrow	Minor	(delay Benefit tranche delay	30 days	Governance body	Cure + 7-day verified release	<14 days) (30 days) at next monthly compliance plenary
--------	-------	------------------------------	---------	-----------------	-------------------------------	--

Escrow	Moderate	Escrow hold	60 days	Emergency	Full cure + release	(delay 14-30 (affected fund only) governance body independent auditor days) session certification
--------	----------	-------------	---------	-----------	---------------------	---

Escrow Severe (delay Domain-specific 90 days Ministerial review Full cure + release >30 days or benefit freeze governance body refusal) vote for reinstatement

Access Minor Enhanced 45 days Technical Restored access + scheduling monitoring committee 14-day monitoring activation (affected facility)

Access Moderate Delay of next benefit 60 days Governance body Restored access + scheduling tranche in linked remediation plan domain

Access Severe Suspension of next 180 days Ministerial review Restored access + scheduling phase advancement 90-day clean eligibility monitoring period

Indicator Minor Score adjustment Until next Automatic at cycle Not applicable scoring (+0.5 points review end (procedural) procedural) cycle

Indicator Moderate Enhanced review 90 days Compliance Remedial action + scoring activation tracking sub- score recertification committee

Indicator Severe Formal compliance Until Governance body Score restoration scoring assessment triggered resolved plenary below 8.0 threshold

Milestone Minor Milestone-linked 30 days Administrator Achievement micro-tranche freeze verification

Milestone Moderate Project deferral (next 90 days Governance body Achievement + funding cycle) independent verification

60 Annex AC: Automatic Consequence Menus for Arbitral Non-Compliance

Milestone Severe Domain benefit freeze until 180 Ministerial Achievement + 60-day next phase review days review operational verification

Activation and Proportionality Safeguards

Consequences activate automatically upon certification of award non-

compliance by the SESS Technical Deployment Unit or the independent auditor pool. Certification requires: written evidence of the award's operative terms; written evidence of the respondent's failure to perform; and a 7-day notice to the respondent before consequences activate. The respondent may challenge certification within the 7-day window on grounds of: technical impossibility (e.g., facility destroyed by natural disaster); good-faith compliance effort (e.g., partial performance with documented obstacles); or procedural defect in the certification process.

Any consequence may be suspended for up to 14 days by the neutral chair if the respondent presents credible evidence of imminent cure. Only one suspension per consequence event. If the respondent cures within the suspension period, consequences are lifted retroactively. If the respondent fails to cure, consequences resume at Day 15 with the original duration counted from Day 1 (no extension for suspension period). Proportionality review is mandatory for all Severe-level consequences before activation. The review is conducted by the SESS Legal Capacity Unit, which assesses whether the proposed consequence is: no greater than necessary to achieve compliance; likely to produce compliance rather than escalation; and consistent with precedent from prior framework enforcement actions. If the SESS finds disproportionality, it recommends a Moderate-level alternative to the governance body. The governance body may accept or reject the recommendation by weighted majority within 14 days.

Cumulative Consequence Limits

To prevent consequence stacking from producing unintended paralysis, the following cumulative limits apply: No more than two domain-specific benefit freezes may be active simultaneously against the same party. If a third freeze would activate, the governance body must consolidate the freezes into a single

comprehensive review rather than layering additional suspension. No party may have more than four simultaneous enhanced monitoring activations. If a fifth would activate, the SESS must conduct a resource assessment and either deploy additional capacity or prioritize the most severe cases. Consequence menus operate independently of the broader enforcement ladder. A party may be subject to automatic consequence menu measures (for arbitral non-compliance) while simultaneously being assessed under the graduated response framework (for general compliance deterioration). The two tracks are not merged; they are parallel. However, if both tracks produce simultaneous benefit suspensions in the same domain, the suspensions are consolidated and the longer duration governs.

61 Annex ER: Enforcement Resourcing Annex

Annex ER: Enforcement Resourcing Annex

This annex establishes a multi-source resourcing pool—funded by core parties, guarantors, RDF overhead, World Bank trust funds, and voluntary contributions—for inspections, forensic reviews, emergency mediation, and neutral technical panels during surge periods, ensuring the enforcement architecture is permanently resourced rather than ad hoc funded.

The enforcement function requires dedicated, predictable resourcing independent of the political cycles that fund other framework activities. This annex establishes a multi-source resourcing pool for inspections, forensic reviews, emergency mediation, and neutral technical panels during surge periods.

Table EN-6: Table EN-6: Enforcement Resourcing Pool Sources and Allocations

Source Annual Use Restrictions Administrator Contribution

Core parties (equal split) \$1.5M each (\$3M Unrestricted within Governance

body total) enforcement mandate secretariat

Guarantor states (joint) \$1.0M total Unrestricted within Neutral chair enforcement mandate

RDF administrative overhead \$500K-750K Technical panels and forensic RDF Board (0.5% of lending) (variable) reviews only

World Bank trust fund \$500K Inspections and verification World Bank (framework-linked) only

Voluntary contributions (standing \$200K-500K Emergency mediation and SESS Director pool) (variable) surge capacity

The total enforcement resourcing pool targets \$5.5-6.0 million annually. In surge periods—defined as periods when three or more simultaneous compliance reviews are active, or when a Crisis Lock is in effect—the pool may draw on a \$2 million contingency reserve. The reserve is replenished within 180 days of drawdown through proportional core-party assessments.

62 Annex ER: Enforcement Resourcing Annex

Inspection Resourcing

Routine inspections (IAEA standard safeguards, quarterly banking channel audits, monthly humanitarian corridor spot-checks) are funded through the standard budgets of their respective administering institutions. Enhanced inspections (challenge inspections, forensic accounting reviews, satellite imagery analysis, cyber forensics) are funded from the enforcement resourcing pool. Each enhanced inspection requires a cost estimate approved by the SESS Director before deployment. Cost caps: nuclear material challenge inspection (\$150,000 per mission, including travel, equipment, and laboratory analysis); forensic accounting review (\$75,000 per review, including document retrieval and data analysis); satellite imagery verification (\$25,000 per

analytical cycle); cyber forensics (\$50,000 per incident). Costs exceeding caps require governance body authorization or SESS contingency draw.

Inspectors are compensated at standardized daily rates: team leader (\$800/day); technical specialist (\$600/day); support staff (\$400/day). Per diem and travel costs follow UN scale. Inspector contracts are issued by the SESS Administrative Core. Inspectors enjoy functional immunity equivalent to UN expert-on-mission status for acts performed in official capacity.

Emergency Mediation and Neutral Technical Panels

Emergency mediation during surge periods is resourced through the Rapid Mediation Unit's standing deployment fund (\$200,000 annually). When multiple simultaneous disputes exceed the standing fund, the SESS may activate surge mediation by: drawing on guarantor state in-kind contributions (hosting facilities, travel support, translation services); contracting pre-approved external mediation firms from the standing pool; and requesting voluntary secondment of experts from UN mediation support units. Neutral technical panels are convened for disputes requiring specialized expertise (nuclear physics, maritime engineering, financial cryptography, epidemiology). Panel composition: 3-5 experts selected from the framework's expert roster; no nationality may constitute more than 40% of panel membership; chair appointed by SESS Director. Panel costs are capped at \$30,000 per engagement (expert fees, travel, report preparation). Panels deliver written opinions within 45 days. Opinions are advisory to the governance body unless the parties agree to treat them as binding.

63 Annex ER: Enforcement Resourcing Annex

Table EN-7: Table EN-7: Surge Capacity Triggers and Resource Mobilization

Surge Trigger Resources Activated Duration Replenishment

3+ simultaneous Contingency reserve (\$2M) + RDF 90 days Core-party proportional compliance reviews overhead draw assessment within 180 days

Crisis Lock in effect Full SESS deployment + external Duration of Post-crisis pledging mediation contracts Crisis Lock conference if reserve depleted

Major incident Forensic team + satellite + cyber 60 days World Bank trust fund + attribution (Tier 3) (combined cap \$300K) voluntary contributions

Arbitration tribunal Legal Capacity Unit full deployment + Duration of Core-party equal assessment convened external counsel budget (\$150K cap) arbitration post-award

Transparency and Audit

All enforcement resourcing expenditures are published in the quarterly Transparency Summary at two levels: Public (aggregate figures by category: inspections, forensic reviews, mediation, technical panels); and Party Confidential (itemized expenditures with mission descriptions, sanitized for operational security). The SESS annual Activity and Expenditure Report includes a full audit trail of resourcing pool utilization. The resourcing pool is subject to annual external audit by a firm from the auditor standing pool. Audit findings are presented to the governance body. Any material irregularity (expenditure outside mandate, duplicate billing, unsubstantiated travel claims) triggers automatic SESS Administrative Core review and may result in staff disciplinary action, contract suspension, or referral to Swiss prosecutorial authorities.

64 Force Posture Transition Architecture

The framework replaces the concept of "withdrawal" with "force posture transition" — a structured reduction of visible military footprint tied to verified compliance milestones rather than political timelines. The transition

is framed as mission completion, not retreat.

Reframing Withdrawal as Mission Completion

All references to force reduction use transition language: Mission Transition Declaration: Withdrawal is triggered not by "leaving" but by "completion of defined stabilization benchmarks." A joint body certifies: maritime security stabilized; nuclear monitoring restored; proxy activity reduced to agreed thresholds; and host-nation capacity certified. Only then does drawdown begin. End of Emergency Deployment Status: The region is formally declared to no longer require surge-level presence. This is politically powerful for leadership: it asserts success, not concession. Rotational Presence Normalization: Carrier and troop deployments shift to standard global rotation cycles rather than emergency surges. This looks routine, not reactive. Over-the-Horizon Readiness: The United States declares that rapid response capability remains offshore (Indian Ocean, Diego Garcia, etc.) even as visible footprint decreases. Deterrence is maintained without permanent basing.

Regional Troop Ceiling Ladder

Table 25 Regional Force Posture Transition by Country

Country	Baseline	Phase 1	Phase 2	Phase 3	End State
Iraq	2,000-2,500	1,200	600	300	200-300
Syria	900-2,000	600	600	300	0-100
Kuwait	13,000+	9,000	5,000	2,500	Logistics + prepositioned equipment
Qatar	10,000	8,000	6,000	4,000	Persistent regional HQ
Bahrain	7,000	6,000	5,000	4,000	Naval presence + reduced support
UAE	3,500	2,500	1,500	800	Air access + intelligence
Saudi Arabia	2,000-3,000	1,500	1,000	500	Air defense cooperation
Jordan	2,000-3,000	2,000	1,200	600	Training + contingency staging

Total Regional Reduction: Current ~40,000-50,000 → Phase 1: ~30,000-35,000 → Phase 2: ~20,000-25,000 → Phase 3: ~10,000-15,000.

Transition Mechanisms

Base Consolidation First

Rather than immediate exit from all locations, the framework reduces from approximately 19 sites to core hubs only. This maintains operational capability during transition while reducing visible footprint. Consolidation precedes drawdown: sites are closed in order of operational redundancy, with functions transferred to remaining hubs.

Mission Conversion Pathway

Combat roles transition to advisory roles; advisory roles transition to technical support roles; technical roles transition to periodic rotational presence. Each conversion requires host-nation capacity certification. Iraqi forces must meet readiness benchmarks before U.S. combat advisors withdraw. Syrian Kurdish forces must demonstrate anti-ISIS autonomous capacity before counterterrorism support reduces. Automatic Drawdown Incentive Link

As compliance improves, troop levels automatically decrease. The link is not punitive; it is celebratory. Each drawdown is announced as proof that the framework is working. This creates a positive incentive structure: compliance produces visible, politically beneficial troop reductions that leaders can claim as achievements.

Carrier Decongestion Trigger

If major maritime incidents are absent for 90 consecutive days, carrier presence automatically reduces from surge levels (3 carriers) to normal rotation (2 carriers) to standard presence (1 carrier). This trigger is not a withdrawal commitment; it is a risk-based adjustment. If incidents resume, carrier presence can increase through the same automatic mechanism.

Maritime Security Handover

Responsibility for Red Sea and Gulf maritime security transitions from U.S.-led

to multinational maritime force with U.S. as supporting participant. The transition is staged: Phase 1 — U.S. leads with regional escort participation; Phase 2 — regional forces lead with U.S. advisory support; Phase 3 — multinational command with U.S. as participant. This preserves maritime security while reducing U.S. operational burden.

Regional Security Substitution

As U.S. forces transition, regional actors and UN/multinational forces fill gaps. The framework provides: security sector training and equipment; intelligence sharing agreements; and rapid response option agreements (U.S. capability remains available within 72 hours if requested). This ensures allies do not feel abandoned while the U.S. reduces permanent footprint.

Reversible Drawdown Safeguard

If major compliance failure occurs after drawdown, limited temporary reintroduction is permitted. The framework explicitly preserves: prepositioned equipment stocks; access agreements for rapid re-entry; and intelligence infrastructure that does not require permanent basing. This reassures security stakeholders without blocking the transition pathway.

REGIONAL COOPERATION AND STABILITY ARCHITECTURE (RCSA)

2 SUPPLEMENTARY MODULE PACKAGE — VERSION 1.1 (REFINED)

POLITICAL AND DOMESTIC STABILITY MODULES & BROADER REGIONAL PARTNER DOMESTIC STABILITY PROFILES

Diplomatic Working Document — For Integration into RCSA v1.5 and Successor Versions 2026

NOTICE: This document constitutes a supplementary module package for integration into

the Regional Cooperation and Stability Architecture (RCSA) v1.5 Hardened Operational Update. All provisions herein are governed by the conflict resolution hierarchy, enforcement ladder, and institutional binding architecture established in the core RCSA

document. Where any provision in this supplement conflicts with a Tier 1 core mechanism, the core mechanism governs unless the governance body explicitly overrides by supermajority. This document is intended to be read in conjunction with the RCSA master framework,

Annex HH (Treaty Resilience and Institutional Continuity), and Annex NN (Domestic Opposition Management).

Annex PDM-D: Partner Veto Player Quick Reference Annex PDM-E: Crisis Messaging Decision Tree

PART I: POLITICAL AND DOMESTIC STABILITY MODULES

OPERATIVE PREAMBLE The four modules in Part I supplement the core RCSA institutional binding architecture

by providing granular operational procedures for managing leadership transitions, neutralizing domestic veto players, controlling public narrative during sensitive implementation phases, and synchronizing the framework's implementation timelines with

the binding domestic legal calendars of the core parties. These modules do not supersede the institutional binding provisions in the core framework or Annex HH. They operationalize those provisions by converting high-level commitments

("commitments bind institutions rather than individuals") into concrete procedural mechanisms that governance body officers, technical implementation teams, and legal compliance officers can execute without requiring fresh political authorization at each

The governance body secretariat is responsible for maintaining the live implementation registers required by each module. Registers are updated within 72 hours of any trigger event and are shared with all framework parties and guarantors on a confidential basis.

MODULE PDM-1: LEADERSHIP TRANSITION PROTOCOL

PDM-1.1 Purpose and Operative Scope

The Leadership Transition Protocol operationalizes the RCSA's Institutional Binding Architecture by defining the precise procedural chain that activates whenever a leadership change event occurs in either core party's government. Its purpose is to

eliminate the implementation vacuum that historically forms in the period between a departing administration's loss of political authority and an incoming administration's acquisition of operational readiness — a window that has repeatedly proven fatal to

international framework continuity. The Protocol applies to the following transition trigger events: LTP-Trigger-1: Presidential or executive elections producing a change of government

LTP-Trigger-2: Parliamentary elections producing a new government coalition or ministerial reshuffle affecting designated framework officers LTP-Trigger-3: Cabinet-level replacement of any official serving as a designated

framework signatory or implementation officer LTP-Trigger-4: Emergency succession events (death, incapacitation, impeachment, forced resignation, or coup) affecting head of government, head of

state, or supreme executive authority LTP-Trigger-5: Caretaker government installation pending scheduled elections or parliamentary confidence votes

LTP-Trigger-6: Constitutional crisis events producing a period of contested executive authority The Protocol does NOT apply to: routine personnel rotations among non-designated

6 officers; sub-cabinet staffing changes below the implementation officer threshold;

or advisory reshuffles without operational framework authority. PDM-1.2
United States Leadership Transition Provisions A. Designated Implementation
Institution Hierarchy

The following institutions bear RCSA obligations in ranked order of authority:
Institution 1 (Primary): Office of the President — National Security Council
Staff Institution 2 (Secondary): Department of State — Bureau of Near Eastern
Affairs

Institution 3 (Tertiary): Department of Treasury — Office of Foreign Assets
Control Institution 4 (Quaternary): Joint Chiefs of Staff — Strategic Planning
Directorate No single institution's incapacity suspends U.S. framework
obligations. Obligations

cascade to the next ranked institution if the primary is unable to function. B.
Minimum Implementation Team Requirements At all times, regardless of
administration composition or transition status, the United

States maintains a minimum implementation team consisting of: Officer A
(Senior Negotiator): Minimum Grade GS-15 or Senior Executive Service, or
equivalent political appointee. Responsible for governance body
representation

and ministerial-level communication. Must be registered with governance
secretariat within 10 days of appointment. Minimum 20% FTE allocation.
Officer B (Technical Implementation Officer): Minimum Grade GS-14 or
equivalent.

Responsible for 30-day review cycle administration, compliance data
certification, and verification liaison. Must be registered within 7 days of
appointment. Minimum 50% FTE during Phase 0 and Phase 1; minimum 35%
FTE thereafter.

Officer C (Legal and Compliance Officer): Minimum Grade GS-13 or equivalent, with national security law specialization. Responsible for sanctions waiver certification, enforcement ladder tracking, and dispute resolution documentation.

Must be registered within 14 days of appointment. Minimum 25% FTE. Officer D (Military Liaison Officer): Minimum O-6 equivalent. Active from Phase 1. Responsible for force posture notification, proxy incident reporting, and counterterrorism cooperation interface. Must be registered within 14 days of Phase 1 activation. Minimum 30% FTE. Officer E (Humanitarian Liaison Officer): Minimum GS-13 or equivalent.

7 Responsible for humanitarian corridor certification and detainee registry interface.

Must be registered within 10 days of Phase 0 activation. Minimum 25% FTE. C. Presidential Transition Continuity Window Pre-Election Phase (120 days before scheduled election): The outgoing administration

designates a Transition Continuity Liaison within the National Security Council. The Liaison is responsible for briefing transition teams of all major candidates on RCSA obligations, status, and upcoming review cycle deadlines.

Election Period (election day through inauguration): All scheduled 30-day review cycles proceed without interruption under the authority of Officers B, C, D, and E. No new benefit tranches may be authorized during this window without Deputy Secretary

of State concurrence. Existing obligations continue. Inauguration to Day 30 Post-Inauguration: The incoming administration completes an RCSA Onboarding Review, including briefings from outgoing Officers A-E,

the governance body secretariat, and all three guarantors. During this period,

Officer A authority is exercised by the Acting or Confirmed Deputy Secretary of State. Day 30 Post-Inauguration: New administration provides written Continuity Certification

to the governance body confirming: (a) framework obligations are acknowledged; (b) Officers A-E have been re-designated or replaced with qualified successors; (c) any areas of policy disagreement are identified for structured review rather

than unilateral suspension. Continuity Certification is not a ratification requirement. It is an administrative acknowledgment of existing obligations. Failure to file within 60 days of

inauguration triggers a Tier 2 compliance review. D. Emergency Succession Events If the President is incapacitated or removed, framework implementation authority

immediately vests in the Vice President or lawful successor. The governance body is notified within 48 hours. A 14-day grace period applies before any compliance assessment is made for transition-period delays. Emergency succession does not

constitute grounds for benefit suspension by either party. PDM-1.3 Iranian Leadership Transition Provisions A. Designated Implementation Institution Hierarchy

8 Iran's framework obligations are distributed across a constitutional cluster of

institutions to prevent any single political faction from unilaterally suspending implementation: Institution 1 (Primary): Presidency — Office of the President

Institution 2 (Co-equal): Ministry of Foreign Affairs — RCSA Coordination Division Institution 3 (Co-equal): Supreme National Security Council —

Implementation Cell Institution 4 (Signatory Depositary): Central Bank of Iran (economic provisions only)

Institution 5 (Technical Authority): Atomic Energy Organisation of Iran (nuclear provisions only) The "co-equal" designation for Institutions 2 and 3 is intentional and protective: it

ensures that a hostile MFA cannot unilaterally suspend what the SNSC considers active policy, and vice versa. Conflicts between Institutions 2 and 3 are resolved by the President or, if the Presidency is contested, by the governance body's procedural

fallback mechanisms. B. Presidential Election Continuity Iran holds presidential elections on a fixed four-year cycle. The following

APPENDIX C: IMPLEMENTATION SEQUENCING MATRIX

Cross-Cutting Implementation Dependencies

Implementation of the Regional Cooperation and Stability Architecture requires careful sequencing of activities across multiple functional domains to ensure that prerequisites are established before dependent activities commence. The implementation sequencing matrix identifies dependencies among architecture components, specifies sequencing requirements, and provides a framework for coordinating implementation timing across the full range of architecture activities.

The matrix distinguishes between hard dependencies, where one activity must be completed before another can begin, soft dependencies, where activities can proceed in parallel but effectiveness is enhanced by sequential

completion, and concurrent activities, which can and should proceed simultaneously. Hard dependencies require strict sequencing adherence; soft dependencies permit parallel implementation with awareness that effectiveness may be limited until prerequisites are established.

Institutional establishment is the foundation upon which all implementation depends. The Governance Body must be convened, the Executive Secretary appointed, and the secretariat established before substantive implementation can begin. The JMOC must achieve operational status before security CBMs can be effectively implemented. The SESS must be established before compliance assessment and consequence coordination can function. The RDF Management Unit must be operational before significant fund disbursements can occur.

Nuclear Pathway Implementation Sequencing

Regardless of which pathway is selected, certain sequencing requirements apply. IAEA verification system establishment must precede centrifuge limitations or dismantlement, as baseline verification is required to confirm compliance with constraints. Sanctions relief cannot commence until the legal framework for relief is established through national implementing legislation and executive actions. Benefit tranches are released only upon verified achievement of corresponding milestones.

For Pathway A, the sequencing follows the milestone structure: initial verification at implementation, centrifuge reductions at year three, further reductions at year five, and full transition at year eight. Each milestone must be verified before corresponding benefits are released. The Arak reactor conversion proceeds in parallel with enrichment constraints but must be completed by year five.

For Pathway B, sequencing requires simultaneous implementation of multiple

elements: enrichment cessation, dismantlement commencement, and HEU handover all begin at implementation. Dismantlement proceeds through defined stages with verification at each stage. Benefit tranches are released as dismantlement milestones are verified. The moratorium instrument enters into force upon signature and witness by the Secretary-General.

For Pathway C, sequencing requires establishment of the Regional Nuclear Fuel Bank before enrichment activities are transferred. The RNFB must achieve licensing, staff acquisition, and operational readiness before receiving transferred centrifuge equipment. Fuel supply guarantees become operational as the RNFB achieves production capability.

For Pathway D, sequencing requires establishment of enhanced safeguards systems before limited enrichment is authorized. The continuous monitoring systems, real-time data transmission, and automatic consequence systems must be operational before enrichment can commence under the limited authorization.

Security Implementation Sequencing

Security confidence-building measures can commence early in implementation, as they require only communication infrastructure and political will rather than complex institutional or technical prerequisites. Hotline establishment, notification procedures, and information exchanges can begin as soon as the JMOC is operational. More complex CBMs including observation rights and force posture constraints require additional preparation.

Maritime safety cooperation can commence early through the Hormuz Transit Protocol, which requires only the Maritime Coordination Center and communication agreements among naval forces. Joint patrol programs require

additional operational coordination and rules of engagement development. The full IMOP requires deployment of surveillance and data fusion systems.

Missile and drone restraints require baseline declaration and verification of existing capabilities before constraints can be effectively monitored. The declaration and verification process establishes the baseline against which compliance with constraints is assessed. Testing notification procedures can be established before baseline verification is complete.

Economic Implementation Sequencing

Economic benefit delivery is sequenced to generate early visible benefits that build political support for continued implementation. Tranche One benefits including sanctions relief and frozen asset release can commence upon signature and initial verification. These early benefits require only executive action rather than complex institutional preparation.

P>RDF project implementation requires institutional establishment and project preparation before disbursements can occur. The first RDF projects require project identification, feasibility assessment, environmental review, and procurement preparation before implementation can begin. This preparation typically requires six to twelve months, meaning that visible RDF benefits emerge after initial Tranche One benefits.

P>FCIF operations require facility establishment, capital contribution, credit rating achievement, and insurance product development before coverage can be offered. Private sector investment mobilization requires FCIF operational status plus business development and marketing to potential investors.

Institutional Development Sequencing

P>Architecture institutions develop capacity progressively over extended

periods. The secretariat achieves basic operational status within three months of Executive Secretary appointment but requires twelve to eighteen months to achieve full staffing and procedural maturity. The JMOC achieves initial operational capability within six months but requires twelve months for full sensor integration and analytical capacity.

P>Capacity building for national implementing institutions proceeds in parallel with architecture institutional development. National implementing units require establishment, staffing, training, and system development before they can effectively manage architecture implementation responsibilities. Capacity building programs begin early but achieve full impact only after extended engagement.

P>The SESS compliance assessment capacity develops as implementation proceeds and compliance data becomes available. Early assessments rely on available information and limited baseline data; assessment confidence increases as monitoring systems mature and historical data accumulates.

APPENDIX E

continuity provisions apply: Pre-Election Phase (90 days before election): Guardian Council vetting period. SNSC Implementation Cell assumes operational primacy for 30-day review cycles.

No new framework commitments may be activated without SNSC Chair concurrence. Election and Run-Off Period: All monitoring, verification, and humanitarian operations continue without interruption. If an election produces a result

that triggers a period of political sensitivity, a 30-day Quiet Implementation Mode may be activated by either core party with governance body notification. New Administration Onboarding (Inauguration through Day 45): Iran provides a

Continuity Certification confirming: (a) framework obligations are acknowledged by the incoming administration; (b) Officers A-E equivalents have been designated; (c) SNSC Implementation Cell has briefed incoming Presidential staff.

Iran is not required to publicly endorse the framework during this period; operational continuity is sufficient. C. Supreme Leader Succession Protocol

9 The Supreme Leader's death or incapacitation triggers the most sensitive transition

scenario. The following provisions apply: Immediate Phase (Days 1-7): The Assembly of Experts convenes. Framework implementation authority vests entirely in the SNSC Implementation Cell.

All scheduled governance body meetings are held via secure channel with

SNSC representation. No compliance assessment applies during this period. Assembly Deliberation Phase (Days 8-45): SNSC continues as primary implementation

authority. Governance body meetings continue with a 14-day extension available for any review cycle deadlines falling within this window. New Leadership Confirmation: Within 30 days of Supreme Leader confirmation,

Iran provides a Continuity Certification at the institutional level. Individual policy preferences of the new Supreme Leader do not constitute grounds for benefit suspension unless Iran formally invokes the withdrawal protocol.

The governance body recognizes that succession events in Iran involve constitutionally distributed authority. The framework does not require the Supreme Leader's personal endorsement; it requires the SNSC and Presidency to continue performing their designated functions. D. Parliamentary (Majlis) Elections Majlis elections occur on a fixed four-year cycle. If a Majlis election produces

a chamber hostile to framework participation: Legislative Synchronization Module (PDM-4) activation is required within 14 days. The SNSC retains implementation authority for executive provisions.

Economic provisions requiring legislative authorization are subject to a 60-day Stabilization Hold pending re-authorization. PDM-1.4 Shared Transition Standards

Both core parties agree to the following shared standards regardless of which party experiences a transition event: A. 72-Hour Notification Rule: Any leadership transition trigger event (as listed in

PDM-1.1) must be notified to the governance body secretariat and all three guarantors within 72 hours of the trigger event. Notification includes: nature

of the transition; identity of acting authority; status of ongoing 30-day review cycles; and anticipated

10 duration of any transition-period adjustments.

B. Implementation Freeze Prohibition: No transition event constitutes grounds for freezing framework implementation unilaterally. A party experiencing a transition may invoke a Stabilization Hold for up to 30 days on new obligation activation,

but existing obligations — monitoring, humanitarian access, banking channels, verification protocols — continue without interruption. C. Benefit Continuity Guarantee: Benefits accrued prior to a transition event are

retained by the receiving party regardless of the successor government's policy positions. Benefits cannot be clawed back retroactively through a successor government's compliance review unless a material breach occurred prior to the transition.

D. Transition Diplomatic Cover: The governance body secretariat issues a neutral factual statement acknowledging the transition and confirming framework operational continuity. This statement is designed for use by both parties with domestic audiences

who may question framework commitment under new leadership. PDM-1.5 Caretaker Authority Matrix Where caretaker governments have limited legal authority to make new international

commitments, the following matrix defines the floor of activity that caretaker administrations are authorized — and required — to maintain: MANDATORY under caretaker status (no new political authorization required):

Continuation of all Phase 0 monitoring and verification activities Payment of scheduled benefit tranches already certified by prior administration

Attendance at weekly JIG meetings (at Deputy level minimum) Maintenance of all hotline communications and response protocols Continuation of humanitarian corridor operations and DHRM exchanges Submission of compliance data to governance body secretariat Filing of pattern-of-concern notifications if triggered by events Maintenance of implementation officer roster

PERMITTED but not required under caretaker status (discretionary):

Attendance at quarterly ministerial reviews (Deputy level may substitute) New Tier 2 and Tier 3 benefit tranche authorizations (may be deferred) Activation of optional annexes not previously activated Commencement of Phase transition processes

11 PROHIBITED under caretaker status:

Invocation of full withdrawal from the framework Activation of the snapback enforcement ladder above Step 2 Structural amendments to the core framework New annex activation requiring full government authorization

Caretaker status is self-declared with governance body notification. The neutral chair determines whether a declared caretaker situation is genuine within 7 days of notification if any party disputes the declaration.

PDM-1.6 30-Day Review Cycle Continuity Guarantee The 30-day review cycle is the base unit of framework implementation and must not be interrupted by transition events. The following operational rules apply: A. Mid-Cycle Transition: If a transition trigger event occurs mid-cycle, the cycle

continues to its scheduled close under the authority of the existing implementation officer team (Officers B, C, D, E). The compliance certification at cycle close is signed by the highest available non-caretaker official or by the caretaker's

designated implementation officer. B. Cycle Deadline Extension: Any cycle deadline falling within the first 21 days of a transition period may be extended by 14 days with notification to the

governance body. Extensions are automatic and do not require governance body approval. Only one extension may apply per cycle; back-to-back extensions require neutral chair concurrence.

C. Cycle Gap Prohibition: No two consecutive cycles may both receive extensions arising from the same transition event. If a transition extends beyond two cycles without Continuity Certification, the governance body secretariat activates the

Automatic Procedural Fallback described in the core RCSA Risk Architecture section. D. Data Continuity: All compliance data submitted during a transition period bears the institutional stamp of the submitting body, not the individual officer.

Data submitted by an outgoing administration is valid regardless of the incoming administration's subsequent policy review. PDM-1.7 Fallback Roster and Succession Registry

The governance body secretariat maintains a Succession Registry for each core party.

12 The Registry contains:

Names and contact information for Officers A-E (current designees) Names and contact information for Alternates A-E (backup designees) Institutional authorization chain for each officer Emergency contact protocols for each officer Maximum authorized continuity period for each officer without fresh political

authorization (default: 90 days; renewable by governance body notification)

The Registry is updated within 10 days of any designation change. It is shared with all three guarantors on a confidential basis. The governance body secretariat publishes only the institutional designations (not personal contact details) in the quarterly

Transparency Summary. Alternate Officers may exercise full Officer authority for up to 90 consecutive days. If a position remains filled only by an Alternate beyond 90 days, the governance body

is notified and the matter is flagged in the Compliance Indicators System as a potential structural concern (not a breach).

MODULE PDM-2: DOMESTIC VETO PLAYER MAPPING

PDM-2.1 Purpose and Operative Scope The Domestic Veto Player Mapping module identifies and categorizes the internal actors

in each core party's political system who hold legal or practical capacity to block, slow, reinterpret, or quietly sabotage framework implementation. Its purpose is to enable the governance body and guarantors to anticipate veto threats before they

materialize as crises, deploy targeted mitigation strategies matched to each actor type, and preserve framework momentum without requiring either government to openly fight its own internal opponents.

This module expands upon Annex NN (Domestic Opposition Management) by providing actor-specific analysis rather than generic opposition management principles. It operates as an intelligence and planning tool for the governance body, not as a

13 mandate for either party to suppress legitimate domestic deliberation.

The module covers five categories of veto players: Category V1: Legislative

Bodies (parliaments, committees, confirmation authorities) Category V2: Judicial and Constitutional Bodies (courts, review councils)

Category V3: Military and Security Services (independent institutional actors)

Category V4: Financial and Economic Gatekeepers (central banks, treasury officials) Category V5: Sub-State or Parallel Authority Structures (IRGC, PMF commanders,

powerful non-state economic actors whose cooperation is structurally required for implementation) PDM-2.2 United States Veto Player Landscape

A. United States Congress (Category V1 — High Priority) Legislative Leverage: Congress holds authority over sanctions legislation, appropriations for framework-related programs, treaty ratification, arms sales

approvals, and foreign assistance. The executive branch has significant unilateral waiver authority under IEEPA and existing statutes, but sustained legislative opposition can:

(i) Pass new restrictive legislation limiting waiver authority (ii) Refuse to appropriate funds for reconstruction assistance components (iii) Attach hostile amendments to unrelated legislation

(iv) Conduct investigative oversight that produces public embarrassment (v) Block confirmation of key framework officers Trigger Issues: Israeli security concerns; Gulf state human rights conditions;

Iranian nuclear breakout fears; domestic economic arguments about oil competition; prisoner release political theater; human rights advocacy campaigns. Mitigation Strategies:

Pre-clearance briefings to chairs and ranking members of Senate Foreign

Relations, Senate Armed Services, House Foreign Affairs, and relevant

intelligence committees before each major implementation milestone

Transparency summaries provided to Congress simultaneously with public release Framework framed domestically as "verified, reversible, and non-treaty" to

avoid ratification requirements and reduce Senate blocking capacity

14 Republican and Democratic co-sponsors cultivated for bipartisan protection (see Bipartisan Quorum Engineering, PDM-2.5)

Early-win deliverables (hostage releases, humanitarian milestones) front-loaded

to create favorable news cycles before hostile votes

Treasury pre-clearance mechanism used proactively to reduce industry lobbying

that might otherwise fund Congressional opposition campaigns B. Federal Judiciary (Category V2 — Moderate Priority) Legal Leverage: Federal courts may receive challenges to executive branch

sanctions waivers under the Administrative Procedure Act, IEEPA, or other statutes. Courts have historically deferred to executive foreign policy authority, but an adversarial judiciary could impose injunctions delaying banking channel

activation or asset releases. Trigger Issues: APA challenges to waiver rulemaking; standing claims by sanctioned parties or their creditors; state-level challenges to federal

preemption of Iran-related sanctions. Mitigation Strategies:

All waivers issued with legally complete administrative record to withstand

APA review; no procedural shortcuts

Treasury General Counsel's office provides advance legal analysis of each

Framework characterized as executive foreign policy action (highest deference standard) rather than regulatory rulemaking where possible

Congressional notification provisions (15 days before each tranche) reduce grounds for APA surprise claims

C. U.S. Intelligence Community (Category V3 — Moderate Priority) Institutional Leverage: Intelligence community components (CIA, DIA, NSA) do not hold veto authority but can shape implementation through intelligence assessments

that frame Iranian compliance negatively, resist intelligence sharing provisions, or selectively leak information to Congress and media. Trigger

Issues: Intelligence assessments of Iranian covert nuclear activity;

proxy attribution disputes where IC conclusions conflict with framework determinations;

15 resistance to Intelligence Fusion Cell participation.

Mitigation Strategies:

Director of National Intelligence designated as a framework observer with access to JIG compliance data, reducing incentive for competitive assessment

Intelligence Fusion Cell firewall provisions (Edit 15 of core document) ensure IC equities are protected before they become an obstacle

Framework uses "pattern-based attribution" standard aligned with IC analytical

tradecraft, reducing conflict between IC assessments and governance body

findings

Monthly IC briefing to senior framework officers ensures assessments inform (rather than ambush) compliance determinations D. Treasury Department and Financial Regulators (Category V4 — Moderate Priority)

Institutional Leverage: OFAC and Treasury's sanctions architecture have significant bureaucratic inertia. Career officials can slow-walk implementation, issue narrow interpretive guidance, or decline to provide pre-clearance determinations.

Trigger Issues: Industry concern about retroactive liability; OFAC staff disagreement with political-level waiver decisions; compliance burden on correspondent banks; secondary sanctions extraterritorial reach.

Mitigation Strategies:

Treasury General Counsel's written pre-clearance mechanism (described in core

document) binds OFAC to provide timely determinations

Retroactive protection provision insulates compliant industry actors, removing

industry as a lobbying force against framework

Parliamentary notification creates political pressure on career staff to

implement faithfully within stated timelines

PDM-2.3 Iranian Veto Player Landscape A. Supreme Leader's Office (Category V3/V5 — Critical Priority) Institutional Leverage: The Supreme Leader holds constitutional authority to

override all state institutions and can block framework implementation

through informal directive, public statement, or fatwa, none of which require formal legal process.

Trigger Issues: Perception that framework undermines revolutionary identity; 16 IRGC institutional interests being threatened by proxy reduction provisions; domestic hardliner political pressure; concern that economic integration erodes revolutionary autarky ideology; nuclear provisions perceived as degrading strategic deterrence.

Mitigation Strategies:

Framework language consistently uses sovereignty-affirming framing ("voluntary confidence-building," "mutual transparency," "zero-regret")

Nuclear provisions are presented as comparable to Brazil, Argentina, South Africa —

advanced states, not defeated adversaries

IRGC is provided a structured role in Hormuz Transit Authority operations, converting institutional opposition into institutional investment

Economic benefits from banking channel restoration are channeled through SNSC-affiliated institutions early to create regime-level economic stake

Quiet Implementation Mode provisions allow sensitive advances to accumulate

before they become targets for hardliner criticism

Jordanian and Pakistani back-channels maintain Supreme Leader's Office awareness of framework benefits at the informal level

B. Islamic Revolutionary Guard Corps (Category V3/V5 — Critical Priority)

Institutional Leverage: The IRGC controls significant portions of the Iranian economy, operates proxy networks that are subject to framework constraints, and has direct access to the Supreme Leader. IRGC commanders can: (i) Authorize proxy activity that triggers framework compliance concerns (ii) Use economic control to frustrate banking channel implementation

(iii) Conduct public statements that undermine narrative framing (iv) Resist or manipulate monitoring of facilities within their control Trigger Issues: Proxy freeze provisions restricting IRGC-affiliated forces in

Lebanon, Iraq, Syria, and Yemen; IRGC economic interests threatened by sanctions relief that benefits non-IRGC commercial actors; monitoring provisions at IRGC-controlled nuclear-adjacent facilities. Mitigation Strategies:

Defense Sector Pivot Mandates (PDM-2.7) create economic alternatives that

17 allow IRGC to shift from sanctions-dependent enterprises to framework-compliant

infrastructure contracts

IRGC-affiliated entities are not explicitly sanctioned under the humanitarian relief track, reducing their incentive to obstruct banking channels

Proxy freeze pilot zones begin small and verifiable (Southern Lebanon,

Iraq base perimeter) to demonstrate IRGC can comply without existential loss

Revenue-sharing mechanisms for Hormuz tolls provide IRGC-affiliated maritime

enterprises with positive-sum alternative to coercive interdiction

Attribution-but-uncontrolled doctrine acknowledges realistic IRGC control

limits, reducing the political cost for Iranian government of IRGC compliance

imperfections

C. Guardian Council (Category V2 — High Priority) Legal Leverage: The Guardian Council vets legislation for compliance with Islamic law and the constitution. It can block Majlis legislation supporting framework

implementation (banking regulation amendments, sanctions relief enabling laws) and can vet presidential candidates in ways that affect successor commitment. Trigger Issues: Banking provisions perceived as interest-bearing (riba concerns);

normalization provisions involving Israel or Western states; humanitarian provisions interpreted as creating obligations inconsistent with revolutionary foreign policy. Mitigation Strategies:

Islamic finance structuring for banking channels where feasible to reduce religious law objections

Framework framed as affirming Iranian sovereignty and non-alignment principles

rather than as alignment with Western institutions

Pre-consultation with Guardian Council-adjacent clerical scholars before major legislative synchronization actions

Benefit sequencing ensures economic gains are visible before Guardian Council

must rule on enabling legislation D. Islamic Consultative Assembly — Majlis (Category V1 — High Priority) Legislative Leverage: The Majlis holds budget authority, can pass legislation

restricting executive branch implementation, and can conduct investigations

that

18 produce politically damaging narratives about framework participation.

Trigger Issues: Nationalist opposition to IAEA access; economic nationalist concerns about foreign investment; factional opposition using framework as proxy for presidential politics.

Mitigation Strategies:

Economic benefits distributed across multiple parliamentary constituencies through regional infrastructure projects to build bipartisan (multi-factional) legislative stakeholder base

Transparency summaries provided to Majlis National Security and Foreign Policy Committee simultaneously with governance body publication

Implementation framed as exercise of Iranian sovereign choice rather than compliance with Western demand

Legislative synchronization module (PDM-4) maps Majlis calendar to framework

deadlines to avoid implementation milestones falling during hostile session windows

PDM-2.4 Mitigation Architecture by Actor Type The following table provides a rapid reference for matching mitigation strategies to veto player categories:

V1 — Legislative Bodies: Primary mitigation: Bipartisan quorum engineering; front-loaded deliverables; co-sponsorship cultivation; transparency briefing protocols; economic benefits

visible in represented districts or regions. Secondary mitigation: Quiet

Implementation Mode to accumulate progress before legislative session; use of executive waiver authority to reduce dependency on

legislative action. V2 — Judicial and Constitutional Bodies: Primary mitigation: Procedural completeness of all administrative actions;

advance legal analysis; judicial preemption strategy (PDM-2.6). Secondary mitigation: Framing framework actions as foreign policy not regulatory rulemaking; binding institutional commitments that reduce court interference as inconsistent with international law obligations. V3 — Military and Security Services:

19 Primary mitigation: Intelligence community alignment framework (PDM-2.8);

IRGC defense sector pivot mandates (PDM-2.7); IRGC maritime revenue sharing. Secondary mitigation: Force posture transition language ("mission completion," not "withdrawal") to remove zero-sum framing.

V4 — Financial and Economic Gatekeepers: Primary mitigation: Pre-clearance determinations; retroactive protection clauses; Islamic finance structuring where relevant; World Bank guarantee backstop.

Secondary mitigation: Industry education programs; banking sector advocacy for framework by early-entrant commercial beneficiaries. V5 — Sub-State and Parallel Authority:

Primary mitigation: Defense sector pivot mandates; proxy freeze pilot zones with positive economic linkage; Hormuz toll revenue participation. Secondary mitigation: PMF integration pathways; militia salary normalization;

graduation incentives that reward compliance with institutional status. PDM-2.5 Bipartisan Quorum Engineering Protocols For the United States, framework

political survivability requires that no single

party holds the power to unilaterally collapse implementation. The following engineering protocols build cross-partisan investment: A. Legislative Stakeholder Seeding: Prior to each major phase transition announcement, the governance body secretariat provides embargoed briefings to designated members of both parties on the Senate Foreign Relations Committee and House Foreign Affairs Committee. Briefings are simultaneous, identical, and non-partisan in framing.

Members are invited to associate themselves with framework milestones before public announcement. B. Economic District Mapping: Implementation benefits (infrastructure projects,

trade corridor expansion, aviation safety parts access) are mapped to economic districts represented by persuadable members of both parties. The distribution ensures that no party can characterize the framework as purely benefiting the

other party's constituency. C. Hostage Release Optics Management: Prisoner and detainee releases are coordinated with congressional notification 48 hours before public announcement. This gives

20 both parties time to prepare statements that associate themselves with the human

interest story before opposition framing can take hold. D. Red Line Consultation: Before each major escalation threshold decision (Step 3 or Step 4 of the enforcement ladder), the executive branch consults with the

chairs and ranking members of the four key committees. This creates co-ownership of enforcement decisions and prevents "soft on violations" attacks.

PDM-2.6 Judicial Preemption Strategy

For the United States, the primary judicial vulnerability is APA challenges to executive sanctions waivers. The following preemption strategy reduces exposure: A. Administrative Record Completeness: Every OFAC waiver action is supported by

a complete administrative record including: legal authority citation; policy rationale; supporting technical analysis; and foreign policy impact assessment. Incomplete records are the primary ground for APA reversal.

B. Notice and Comment Where Feasible: For durable sanctions relief measures (Tier 2 and Tier 3 tranches), notice-and-comment rulemaking is used where time permits, creating a public record that demonstrates procedural legitimacy.

Emergency humanitarian measures use emergency rulemaking authority. C. International Law Grounding: Each waiver action references the framework's status as a deposited international instrument, invoking the president's

constitutional foreign affairs authority at maximum strength. D. Preemptive Litigation Assessment: Treasury General Counsel provides a written litigation risk assessment for each major action. Actions rated high risk are

either restructured to reduce exposure or flagged for immediate legal defense resource allocation. PDM-2.7 Defense Sector Pivot Mandates

For Iran, IRGC institutional resistance is most effectively reduced by creating economic alternatives that allow IRGC-affiliated enterprises to benefit from framework-related economic activity rather than being threatened by it.

A. Hormuz Transit Authority Participation: IRGC-affiliated maritime companies are eligible to compete for Hormuz Transit Authority monitoring, logistics, and maritime security support contracts. Contracts are subject to international

21 audit but are not precluded on the basis of IRGC affiliation alone.

B. Reconstruction Contract Access: Iranian construction and engineering companies, including those with IRGC-adjacent ownership, are eligible for regional reconstruction contracts under the Syria and Lebanon tracks, provided they meet

international procurement standards. Eligibility is framed as economic liberalization, not IRGC normalization. C. Dual-Use Technology Licensing: Controlled technology for civilian industrial

modernization (refining, petrochemical efficiency, grid stabilization) is made available through vetted channels. IRGC-adjacent industrial groups can access these licenses if they meet ownership transparency requirements.

D. Industrial Employment Conversion: Vocational training programs for IRGC-adjacent workforces transitioning from military-industrial to civilian roles receive priority funding under regional development bank programs.

The Defense Sector Pivot does not legalize or rehabilitate IRGC entities subject to U.S. or EU designation. It creates a structural incentive for IRGC-affiliated actors to shift activity toward framework-compliant commercial domains rather

than confrontational ones. PDM-2.8 Intelligence Community Alignment Framework Both core parties' intelligence communities present veto risks through competitive

assessment, selective disclosure, and institutional resistance to information sharing. The following alignment framework is designed to convert intelligence communities from potential spoilers into invested stakeholders:

A. Joint Compliance Data Access: Both parties' designated intelligence liaison officers receive concurrent access to governance body compliance data. This

prevents intelligence assessments from operating on the basis of incomplete information about the other party's compliance status. B. Shared Attribution Process: The Proxy Event Response Team (2 Iranian, 2 U.S., 1 neutral) provides a structured venue for intelligence assessment convergence.

If IC assessments diverge significantly from governance body findings, the divergence is documented and the neutral member facilitates a reconciliation review. C. No-Surprise Notification: Prior to any major enforcement action informed by

22 intelligence assessment, both parties' senior intelligence liaison officers are briefed at the classification level appropriate to the assessment. This prevents intelligence community assessments from being used to blindside the other party's government.

D. Source Protection Protocol: Intelligence shared within the framework is subject to strict source protection provisions developed jointly with both IC communities. The source protection design ensures that intelligence officers feel their

professional equities are protected before they are asked to share.

MODULE PDM-3: PUBLIC NARRATIVE STABILIZATION

APPENDIX E: KEY TERMS AND ABBREVIATIONS

Abbreviations and Acronyms

ACS - Automated Consequence System

AEA - Atomic Energy Agency (International)

AIS - Automatic Identification System

BAP - Binding Arbitration Panel

CBM - Confidence-Building Measure

CCM - Crisis Communication Mechanism

CIS - Compliance Indicators System

CWC - Chemical Weapons Convention

DOE - Department of Energy (United States)

E3 - France, Germany, United Kingdom

EU - European Union

FCIF - Framework Commercial Insurance Facility

FMCT - Fissile Material Cut-off Treaty

GGE - Group of Governmental Experts

P>HEU - Highly Enriched Uranium

IAEA - International Atomic Energy Agency

ICJ - International Court of Justice

IMOP - Integrated Maritime Operating Picture

IRGC - Islamic Revolutionary Guard Corps

JCPOA - Joint Comprehensive Plan of Action

P>JCCC - Joint Crisis Communication Center

JMOC - Joint Monitoring Operations Center

LEU - Low Enriched Uranium

MOD - Ministry of Defence

MOU - Memorandum of Understanding

NACA - Non-Aligned Co-Administrator

NPT - Nuclear Non-Proliferation Treaty

NSG - Nuclear Suppliers Group

OPCW - Organisation for the Prohibition of Chemical Weapons

PCA - Partial Continuity Agreement

PDM - Political-Durability Module

RDF - Regional Development Fund

RNFB - Regional Nuclear Fuel Bank

RCSA - Regional Cooperation and Stability Architecture

SAR - Synthetic Aperture Radar

SESS - Standing Enforcement Support Secretariat

SWU - Separative Work Unit

TIMS - Thermal Ionization Mass Spectrometry

UNSCR - United Nations Security Council Resolution

WMD - Weapons of Mass Destruction

Key Terms in Multiple Languages

For the convenience of participants and stakeholders, key architecture terms are provided in the official languages of the participating states. This multilingual reference ensures consistent understanding across language boundaries and supports interpretation and translation activities.

Regional Cooperation and Stability Architecture: French - Architecture

Regionale de Cooperation et de Stabilite; German - Regionale Kooperations- und Stabilitaetsarchitektur; Persian - Mimar-e Hamkari va Estaghrat-e Manteq-eii; Arabic - Meimariyat al-Taawun wa al-Istiqrar al-Iqlimi; Russian - Regionalnaya Arkhitektura Sotrudnichestva i Stabilnosti; Chinese - Diqu Hezuo yu Wending Jiagou.

Joint Comprehensive Plan of Action: French - Plan d'Action Global Conjoint; German - Gemeinsamer Umfassender Aktionsplan; Persian - Barname-ye Jame-e Eghtema-i-e Amalkard; Russian - Sovmestnyi Vseob'emliushchii Plan Deistvii.

Confidence-Building Measure: French - Mesure de Renforcement de la Confiance; German - Vertrauensbildende Massnahme; Persian - Tadbir-e Afzayesh-e Etemad; Arabic - Tadabeer Binaa al-Thiqa.

International Atomic Energy Agency: French - Agence Internationale de l'Energie Atomique; German - Internationale Atomenergie-Organisation; Persian - Sakeman-e Beynolmelali-e Enerzhi-ye Atomi; Russian - Mezhdunarodnoe Agentstvo po Atomnoi Energii.

Nuclear Non-Proliferation Treaty: French - Traite de Non-Proliferation Nucleaire; German - Vertrag uber die Nichtverbreitung von Kernwaffen; Persian - Qarardad-e Ejtenaab az Prolife-rasyon-e Hasteii; Russian - Dogovor o Neprasshirrenii Yadernogo Oruzhia.

Regional Development Fund: French - Fonds Regional de Developpement; German - Regionaler Entwicklungsfonds; Persian - Sanduq-e Tose-e Manteq-eii; Arabic - Sanduq al-Tanmiyah al-Iqlimiyah.

Standing Enforcement Support Secretariat: French - Secretariat Permanent d'Appui a l'Application; German - Staendiges Sekretariat fuer Durchsetzungsunterstuetzung; Persian - Dabirkhane-ye Hamayat az Ejm-e

Peyvast; Russian - Postoyanniy Sekretariat po Podderzhke Primeneniya.

Highly Enriched Uranium: French - Uranium Hautement Enrichi; German - Hochangereichertes Uran; Persian - Uraniom-e Purshode-ye Ziad; Russian - Vysokoobogashchennyi Uran.

Verification: French - Verification; German - Überprüfung/Verifikation; Persian - Tahqiq/Taa'id; Arabic - Tathbit; Russian - Verifikatsiya.

Compliance: French - Conformite; German - Einhaltung; Persian - Mowafeqat/Tataboq; Arabic - al-Mutabaaqa; Russian - Sobliudenie.

Depository: French - Depositaire; German - Depositar; Persian - Amanatdar; Arabic - Amid al-Wadiiah; Russian - Depozitarii.

P>Moratorium: French - Moratoire; German - Moratorium; Persian - Tavqif-e Movaghat; Arabic - Iqaf; Russian - Moratorii.

P>Sanctions: French - Sanctions; German - Sanktionen; Persian - Tahrim-ha; Arabic - Iqabat; Russian - Sanksii.

APPENDIX F

PDM-3.1 Purpose and Operative Scope The Public Narrative Stabilization module standardizes communication practices to prevent domestic political backlash from derailing implementation progress, particularly

during sensitive phases such as Crisis Lock periods, proxy incident responses, mass casualty events, nuclear inspection milestones, and major leadership transitions. The module rests on the documented finding that international framework collapses

are more often caused by domestic political narrative failure than by actual compliance failure. Technically successful implementation produces no political benefit if it cannot be communicated to domestic audiences in defensible terms. Conversely, a

technically imperfect implementation can survive if its narrative architecture prevents opposition forces from characterizing imperfections as betrayal. This module provides: pre-cleared vocabulary; sensitive phase communication templates;

Quiet Implementation Mode protocols; crisis messaging cascade procedures; counter- disinformation architecture; and spokesperson designation rules.

PDM-3.2 Pre-Cleared Vocabulary Architecture

Both core parties maintain a joint vocabulary register identifying approved phrasings for categories of implementation activity. Vocabulary is approved jointly through the governance body secretariat and may not be unilaterally modified by either party.

23 Approved vocabulary does not restrict domestic political speech; it provides

a

neutral operational baseline that neither party need feel trapped by. The following vocabulary standards are in effect: A. Nuclear Monitoring and Inspection Terminology:

Approved: "routine compliance parity," "reciprocal transparency protocol," "standard safeguards review," "technical verification visit," "scheduled monitoring cycle," "normal NPT-standard inspection"

Avoid (creates domestic political pressure or sovereignty-violation framing): "inspection," "surveillance," "verification regime," "intrusive access," "special measures," "punitive monitoring," "exceptional oversight"

Rationale: The core document explicitly frames IAEA access as comparable to Brazil, Argentina, and South Africa. Vocabulary must reinforce this comparison. B. Sanctions Relief Terminology:

Approved: "compliance-linked economic normalization," "verified relief tranche," "conditional access restoration," "performance-based economic measure," "graduated reciprocal benefit," "trade facilitation adjustment"

Avoid: "concession," "reward," "appeasement," "buyout," "bribe," "bailout," "permanent relief," "unconditional release" Rationale: Relief must be communicable to both parties' domestic audiences as

conditional and reversible, not as a strategic concession. C. Force Posture Transition Terminology: Approved: "mission completion transition," "stabilization benchmark fulfillment,"

"rotational presence normalization," "over-the-horizon readiness maintenance," "host-nation capacity certification transfer," "phased operational consolidation" Avoid: "withdrawal," "retreat," "pullout," "defeat," "pressure concession,"

"disengagement," "abandonment" Rationale: Force posture transitions are communicated as success evidence, not as strategic retreat.

D. Proxy Incident Response Terminology: Approved: "framework-authorized graduated response," "pre-authorized consequence activation," "compliance indicator adjustment," "institutional accountability

24 mechanism," "automatic circuit-breaker activation"

Avoid: "punishment," "retaliation," "strike," "war," "attack," "revenge," "military response" Rationale: Pre-authorized responses must be communicable as framework

mechanisms rather than discretionary aggressive action. E. Hostage and Detainee Exchange Terminology: Approved: "humanitarian case resolution," "detainee welfare review cycle,"

"ICRC-facilitated humanitarian transfer," "rolling exchange window completion" Avoid: "prisoner swap," "ransom," "leverage transaction," "traded for sanctions" Rationale: Exchanges must be decoupled from the perception of coercive leverage

to protect both parties from "paying for hostages" political attacks. F. Regional Partner Engagement Terminology: Approved: "regional stakeholder consultation," "multi-party stability architecture

engagement," "track-specific partner participation," "economic corridor alignment" Avoid: Language that implies pressure on regional partners, subordination of partner sovereignty, or exclusion of any partner from relevant tracks.

PDM-3.3 Sensitive Phase Communication Templates The following pre-drafted statement frameworks are available to both parties for use during defined sensitive phases. They are not obligatory but provide a tested baseline

that reduces the time and political energy required to craft defensible public statements under pressure. Template A: Nuclear Monitoring Milestone

Format: "Today, [country] completed a scheduled technical review consistent with our standard international obligations. This review confirms [outcome in approved vocabulary]. The [framework body] continues to verify progress, as it does for

all participating states. We are committed to transparent, verified implementation that advances [stated national objective]." Template B: Proxy Incident with Pre-Authorized Response

Format: "The [framework] has activated a pre-agreed response mechanism following a compliance threshold breach. This mechanism was designed and agreed in advance precisely to ensure that incidents produce measured, proportionate consequences

25 without requiring unilateral decision-making under political pressure. [Response

measure] will remain in effect for [stated duration] subject to [remediation conditions]. We remain committed to the framework's purpose." Template C: Leadership Transition Continuity Statement

Format: "[Country/institution] confirms that all framework obligations continue in full effect. Commitments under this architecture bind institutions, not individuals, and the transition now underway reflects the strength of that institutional design. Operational continuity is unaffected. We will provide [incoming administration / new designees] briefings within [timeframe]." Template D: Crisis Lock Activation

Format: "Following [trigger event], the framework's pre-agreed crisis management protocol has been activated. This 14-day period of enhanced

assessment is a designed feature of the architecture — it exists precisely to ensure that serious

incidents are evaluated carefully rather than responded to reflexively. We are working through established channels to assess the situation and will provide updates through [designated channel]."

Template E: Verification Gap or Monitoring Disruption Format: "A technical issue with [monitoring system] has been identified and is being resolved by a joint technical team. This is a normal operational matter

that the framework's verification continuity ladder is specifically designed to handle. No compliance assessment is triggered during technical remediation. Full verification is expected to resume by [projected date]."

PDM-3.4 45-Day Quiet Implementation Mode Protocols Quiet Implementation Mode allows operational progress to accumulate before public exposure creates political pressure. The following operational protocols govern

its activation and administration: A. Activation Authority: Either core party may activate Quiet Mode for its own domestic communication for up to 45 consecutive days. Activation requires

written notification to the governance body secretariat only; it does not require the other party's consent. The other party may note its awareness of Quiet Mode activation but may not block it.

26 B. What Quiet Mode Restricts: Proactive public announcements about specific

implementation milestones. Press releases, social media posts, and public statements about ongoing implementation activity are batched rather than issued in real time.

C. What Quiet Mode Does Not Restrict: Governance body compliance tracking; quarterly Transparency Summary publication; IAEA reporting; Congressional or parliamentary notification obligations; humanitarian corridor reporting by UN

agencies; and third-party reporting by ICRC, IAEA, or other independent monitors. D. Counter-Party Query Protocol: If the other core party is asked publicly about implementation progress during one party's Quiet Mode period, the queried party

responds using Template-style framing: "Implementation is proceeding on schedule. Our partner has indicated they prefer to communicate their progress on their own timeline. We respect that preference while confirming our own compliance with

all obligations." E. Media Management During Quiet Mode: Both parties' designated spokespersons are aware of Quiet Mode status and respond to media inquiries using the following

guidance: "The framework is an ongoing operational process. We provide periodic updates through the official governance body Transparency Summary rather than providing real-time commentary on individual implementation steps."

F. Maximum Duration and Renewal: Quiet Mode may not exceed 45 consecutive days. Renewal requires governance body notification with written justification. No more than two consecutive Quiet Mode periods may be activated without a 30-day

public disclosure interval between them. PDM-3.5 Crisis Messaging Cascade When a mass casualty event, major compliance breach, or proxy incident occurs,

domestic political pressure demands rapid communication response. The following cascade governs the sequence and timing of public statements: Hour 0-2 (Incident Confirmation): Governance body secretariat notified.

No public statement until Hour 4 minimum to allow preliminary assessment. If media inquiry received, spokesperson responds: "We are aware of reports. We are assessing the situation through our established channels and will communicate when we have verified information."

Hour 2-6 (Preliminary Assessment): Proxy Event Response Team convenes. Technical leads identify available attribution data. Guarantors notified. Designated spokesperson prepares preliminary statement framing.

Hour 6-12 (Preliminary Statement): If public statement is required, it uses Template B or Template D framing (as appropriate) with preliminary factual content only. The statement confirms framework activation of pre-agreed protocols

and avoids attribution claims that have not been verified. Hour 12-48 (Framework Response Activation): If Shock Response Envelope or Crisis Lock has been triggered, the communication framing shifts to "framework

mechanism activated" language. All media inquiries are directed to the official governance body statement. Day 3-7 (Attribution Phase): If attribution process is ongoing, daily brief

technical updates are provided confirming process status. No attribution claims beyond what the Proxy Event Response Team has certified. Day 14-30 (Resolution Phase): Public statement on remediation plan or

consequence measures. Statement uses pre-cleared vocabulary throughout. PDM-3.6 Counter-Disinformation Architecture Both parties commit to a joint counter-disinformation protocol for framework-related

information space: A. Disinformation Identification: The governance body secretariat maintains a real-time media monitoring brief covering major framework-related disinformation

narratives in both parties' information spaces. The brief is shared with all parties and guarantors weekly and with all regional partner contacts monthly.

B. Joint Factual Record: When a disinformation narrative emerges, both parties

have access to a joint factual record produced by the governance body secretariat that provides accurate information about the specific implementation topic being misrepresented. Either party may cite the factual record without the other's

approval. C. Third-Party Credibility Deployment: Where direct government correction of disinformation is perceived as self-interested, the governance body may request

28 that neutral guarantors (Switzerland, Oman, Pakistan) issue factual clarifications

on specific matters within their mandate. Guarantor factual corrections carry higher credibility than party corrections. D. "Neutral Information Hub" Activation: The Neutral Information Hub described

in Annex NN is activated for framework-critical disinformation events. The Hub provides a single publicly accessible source of verified implementation data that neither party controls unilaterally.

PDM-3.7 Spokesperson Designation and Backup Roster Each core party designates primary and backup spokespersons for each communication category. Designations are registered with the governance body secretariat and updated

within 72 hours of any change. United States Spokesperson Categories: Category SP-A: Framework implementation status (State Department spokesperson)

Category SP-B: Nuclear and verification matters (AEOI counterpart liaison, State Department Under Secretary for Arms Control) Category SP-C: Military and proxy incidents (Pentagon spokesperson)

Category SP-D: Humanitarian and detainee matters (State Department Bureau of Population, Refugees, and Migration) Category SP-E: Economic and sanctions matters (Treasury spokesperson)

Iran Spokesperson Categories: Category SP-A: Framework implementation status (MFA spokesperson) Category SP-B: Nuclear and verification matters (AEOI spokesperson)

Category SP-C: Military and proxy incidents (SNSC designated spokesperson) Category SP-D: Humanitarian and detainee matters (ICRC liaison office) Category SP-E: Economic and sanctions matters (Central Bank spokesperson)

Backup spokespersons for each category are registered with the secretariat. If a primary spokesperson is unavailable during a crisis event, the backup is automatically authorized to speak on behalf of the institution without requiring fresh political

29 MODULE PDM-4: LEGISLATIVE SYNCHRONIZATION

PDM-4.1 Purpose and Operative Scope The Legislative Synchronization module aligns the RCSA's phased implementation

timeline with the binding domestic legal calendars of both core parties. It exists because even politically willing governments can be forced into implementation failures by the rigid structural requirements of their own legislative processes — budget cycles,

session calendars, committee deadlines, and sunset provisions that operate independently of diplomatic intention. The module maps: domestic sanctions waiver renewal dates; legislative sunset clauses

affecting framework-enabling provisions; treaty ratification pathways; budget appropriations cycles; and parliamentary session windows that affect the availability of legislative authority for framework-linked measures.

The core output of this module is a synchronized master calendar, updated quarterly, that identifies approaching legislative deadlines and assigns responsibility for advance preparation to designated Officers.

PDM-4.2 United States Legislative Calendar Integration A. Congressional Calendar Key Windows Annual: Congress operates on an approximately October 1 - September 30 fiscal year.

Major appropriations battles occur August-September each year. Implementation milestones requiring Congressional appropriations (reconstruction assistance, development bank capitalization) must be completed or fully documented before

the August recess begins each year to avoid fiscal cliff disruptions. NDAA Cycle: The National Defense Authorization Act passes annually, typically December. NDAA riders have historically been used to restrict Iran-related

executive authority. Annual monitoring of NDAA markup process (June-November) is required to identify and respond to hostile amendments before passage. Sanctions Act Renewal Cycles: IFCA and related sanctions legislation have

30 rolling sunset provisions. Treasury Officer C is responsible for tracking all sunset dates and ensuring executive branch waiver authorities are preserved through timely renewal requests or alternative statutory grounding.

Recess Periods: Congress is in recess approximately August (4 weeks), Thanksgiving (1 week), Christmas/New Year (2-3 weeks), and spring recess (1 week). No new Congressional notification actions should be scheduled during recess; pre-recess briefings must be completed at least 5 business days before recess begins.

B. Executive Waiver Renewal Calendar Presidential waiver authorities under IEEPA and the Iran Sanctions Act require periodic renewal. The following schedule governs:

90-day waiver renewals (most common): Officer C calendar reminder 30 days before expiration; renewal documentation complete 14 days before expiration; signed renewal 7 days before expiration as minimum.

180-day waiver renewals: Calendar reminder 45 days before expiration; documentation complete 21 days before expiration. Annual waivers: Calendar reminder 60 days before expiration;

documentation complete 30 days before expiration. If any waiver expires without renewal, Officer C immediately notifies governance body secretariat, guarantors, and the governance body Chair. A 14-day emergency

re-authorization period applies before any compliance consequence is assessed. C. Framework Consistency with Existing Legislative Framework The RCSA is structured to operate within existing executive waiver authority

to the maximum extent possible, avoiding the need for new authorizing legislation that requires Congressional approval. The following features serve this purpose:

Relief delivered through executive IEEPA waivers rather than new legislation Banking channel established through Treasury regulatory action rather than statute Hostage release mechanisms operate through State Department

authority Nuclear monitoring is IAEA-administered, requiring no Congressional authorization Military liaison provisions operate within existing defense authorizations

PDM-4.3 Iranian Legislative Calendar Integration A. Majlis Session Calendar

31 The Majlis operates on an annual session calendar with a primary session (approximately October through June) and a summer recess (approximately July- September). Budget law must pass by the Iranian calendar year end (approximately March 20). The following synchronization rules apply:

Phase benefit tranches requiring Majlis enabling legislation must be documented in the government's budget proposal submitted to the Majlis by November-December. Banking channel amendments requiring legislative action must be timed to land

before the Majlis budget season to be incorporated in omnibus financial legislation. No major framework milestone should be scheduled during Persian New Year (Nowruz, approximately March 18-April 2) when government operations slow.

B. Guardian Council Review Calendar Guardian Council review of Majlis-passed legislation takes approximately 6 days for non-urgent matters, 10 days for constitutionally complex matters. Legislative

synchronization planning must account for a 15-day Guardian Council buffer between Majlis passage and legislative entry into force. C. Budget Appropriations Synchronization

Iranian reconstruction contributions, SNSC Implementation Cell staffing, and framework operating costs must be incorporated into the annual budget. The budget preparation process begins approximately October and must be approved

by the Majlis before Nowruz. Officer B is responsible for documenting framework operating cost projections for inclusion in the budget cycle 3 months before submission deadline.

PDM-4.4 Sanctions Waiver Renewal Architecture A comprehensive sanctions waiver tracking register is maintained by Officer C (both parties). The register contains:

All active sanctions waiver authorities with expiration dates
Renewal requirement (executive only vs. Congressional notification vs. legislation)
Lead time required for renewal documentation
Backup authority in case primary waiver pathway is blocked
Governance body notification requirement for each waiver type

The register is shared with the governance body secretariat quarterly and updated

32 monthly. Any waiver at risk of expiration is flagged in the Compliance Indicators

System as a structural concern (not a breach) 60 days before expiration. PDM-4.5 Treaty Ratification Pathways A. United States Ratification Strategy

The RCSA is structured as an executive agreement deposited with the UN Secretary- General rather than a Senate-ratified treaty. This structure:

Does not require 2/3 Senate approval
Binds the executive branch through IEEPA and presidential foreign policy authority
Carries international legal standing through UN deposition
Is explicitly characterized in framework communications as "comparable to

executive agreements governing prior nuclear frameworks" Congressional Preemption Risk: If Congress passes legislation explicitly prohibiting

executive agreement implementation (rare but possible), the framework provides:

30-day diplomatic consultation window before any legislation takes effect
Alternative equivalent benefit mechanisms as a fallback Expedited governance
body review to assess whether implementation capacity

has been fundamentally impaired B. Iranian Ratification Pathway

Iran implements the framework through SNSC Resolution backed by
presidential decree and confirmed by Supreme Leader endorsement or non-
objection. This pathway:

Does not require Majlis vote on the framework itself Is constitutionally within
SNSC authority for security arrangements Is framed as a "provisional
implementation agreement" subject to periodic

review rather than a permanent treaty

Majlis Legislative Support: Specific enabling provisions (banking regulation
amendments, escrow account authorization, reconstruction fund
participation) require Majlis legislation. These are timed per the legislative
synchronization

calendar to pass in advance of their activation deadlines. PDM-4.6 Sunset
Clause Management Both parties maintain a comprehensive register of all
sunset clauses in domestic

legislation affecting framework implementation capacity. Sunset risk is
classified

Tier S1 (Critical): Sunset of this provision would directly impair ongoing
implementation. Renewal required before any Phase transition. Managed by
Officer C with 90-day advance preparation.

Tier S2 (Significant): Sunset would require operational adjustment but would not collapse implementation. Renewal desirable before Phase transition. Managed by Officer C with 60-day advance preparation.

Tier S3 (Minor): Sunset would create administrative inconvenience or require alternative authority activation. Renewal preferable; alternatives documented. Managed by Officer C with 30-day advance preparation.

Both parties share their sunset risk classifications with the governance body secretariat semi-annually. The secretariat maintains a joint sunset calendar and provides advance warning notices 90, 60, and 30 days before each S1 or S2 event.

PDM-4.7 Budget Appropriations Synchronization The framework's operating costs and funded programs must align with both parties' annual budget cycles. The following synchronization rules apply:

United States Budget Cycle (October 1 start):

Phase 0 operating cost documentation submitted to OMB by July 1 each year
Supplemental appropriations requests (for major disbursement tranches) filed no later than August 1 for inclusion in the fall budget process

Continuing resolution periods (common October-December) are accommodated

through pre-authorized spending authorities in base appropriations Iranian Budget Cycle (Nowruz year start):

SNSC Implementation Cell costs incorporated in defense budget documentation

submitted to Majlis by December 1

Reconstruction contribution commitments documented as contingent

obligations

in budget law rather than firm expenditures to reduce Majlis opposition

Central Bank operations funding managed through central bank reserves with quarterly governance body reporting

34 PART II: BROADER REGIONAL PARTNER DOMESTIC STABILITY PROFILES

INTRODUCTORY FRAMEWORK AND PROFILE METHODOLOGY The core RCSA assigns defined roles to Saudi Arabia, UAE, Qatar, Kuwait, Egypt,

Jordan, and Iraq across economic, humanitarian, and security tracks, and implicates Israel across Gaza access, maritime security, normalization, and direct deconfliction architecture. The framework's modular independence principle assumes that these

partners will maintain their track participation across political cycles. In practice, that assumption requires the same institutional hardening that the core party modules provide: leadership transition continuity, veto player mitigation, narrative management,

and legislative synchronization tailored to each partner's specific constitutional structure and domestic political rhythms. Profile Methodology:

Each partner profile is structured under four standardized modules: Module A — Leadership Transition Protocol: Who keeps the file alive during elections, cabinet reshuffles, succession events, or caretaker periods. Names the lead ministry,

backup signatory institution, alternate liaison officers, and the maximum number of days implementation can continue without fresh political authorization. Module B — Domestic Veto Player Mapping: Identifies actors with capacity to block,

slow, reinterpret, or quietly sabotage implementation. Rates each by type of power, likely trigger issues, and available workarounds. Module C — Public Narrative Stabilization: Identifies partner-specific message lines

for inspections, humanitarian measures, deconfliction steps, sanctions-related moves, maritime incidents, and emergency pauses. Specifies lead and backup spokespersons, release timing, and approved language for sensitive phases.

Module D — Legislative Synchronization: Maps each partner's approval path against the framework's 30-day review cycles, tranche release schedules, and phased implementation windows.

35 Quick Reference Test: For any partner state, someone with this document should be

able to answer: Who can sign? Who can stall? Who can override? Who speaks publicly? What domestic deadlines matter? What happens if political leadership changes mid-cycle?

PARTNER PROFILE RP-SA: KINGDOM OF SAUDI ARABIA

Track Participation: Saudi Arabia participates in the framework across multiple tracks: economic facilitation (oil market normalization, reconstruction financing for Gaza and

Lebanon), humanitarian coordination (Yemen, Gaza, Lebanon fuel and aid corridors), security architecture (Yemen stabilization, Red Sea maritime security, proxy activity management through Gulf state channels), and normalization architecture (Saudi-Israel

normalization pathway as described in Regional Stabilization section). RP-SA Module A: Leadership Transition Protocol Constitutional Authority: Saudi Arabia operates under an absolute monarchy with

succession governed by the Basic Law of Governance and decisions of the Allegiance Council. The King serves as Head of State, Head of Government, and Supreme Commander of the Armed Forces. The Crown Prince functions as effective executive authority for

day-to-day governance. Current Implementation Leadership Structure:
Primary: Ministry of Foreign Affairs — RCSA Coordination Division

Secondary: National Security Council Staff (directly under Crown Prince authority) Economic Track: Ministry of Finance; Saudi Arabian Monetary Authority (SAMA) Yemen/Humanitarian Track: Saudi Development and Reconstruction Program for Yemen (SDRPY)

Oil Track: Saudi Aramco strategic coordination; Ministry of Energy Transition
Triggers: KSA-T1: Death or incapacitation of the King

KSA-T2: Replacement of the Crown Prince (rare but theoretically possible)

KSA-T3: Cabinet reshuffle affecting the Foreign Minister or RCSA-designated ministers KSA-T4: Allegiance Council succession process producing an extended period of

36 collective authority

Continuity Protocol: For KSA-T1 (King death/incapacitation): The Allegiance Council convenes within 72 hours. Framework implementation authority immediately vests in the Crown Prince as Acting King

or, upon formal accession, as King. Governance body is notified within 48 hours. A 21-day grace period applies before any review cycle deadline requires fresh Saudi certification. RCSA commitments bind the Saudi state as a constitutional entity.

No succession event constitutes grounds for benefit suspension or compliance reassessment by other parties. For KSA-T3 (Cabinet reshuffle): New minister is

briefed by Ministry of Foreign Affairs

RCSA Coordination Division within 5 days of appointment. Continuity Certification is issued within 14 days. Maximum continuity without fresh certification: 30 days. Maximum Continuity Without Political Authorization: 30 days for routine operations;

60 days for succession events with governance body notification. Backup Institution: If the Ministry of Foreign Affairs is reorganized or the RCSA Coordination Division is dissolved, primary implementation authority transfers to the

National Security Council Staff. The NSC Staff designation is registered with the governance body secretariat as the permanent backup institution. Public Investment Fund (PIF) Institutional Binding and RCSA Escrow Directive:

Saudi Arabia's framework economic commitments — specifically Phase 1 infrastructure investments, Lebanese emergency fuel supply, Gaza reconstruction financing, and Yemen SDRPY disbursements — are currently anchored to Crown Prince direction. While the

current political architecture makes this reliable under stable conditions, the risk identified in the standard leadership transition analysis is that a succession event, even a relatively smooth one, could produce a 30-90 day political consolidation period

during which Saudi economic commitments stall while new leadership establishes its foreign policy identity. The following PIF Institutional Binding provisions harden Saudi economic commitments

against this specific vulnerability. A. RCSA Escrow Directive — Establishment and Authority At framework entry into force, the Saudi Council of Ministers (acting on Crown Prince

37 recommendation, approved by the King) issues a standing RCSA Escrow Directive.

The Directive is deposited with the governance body secretariat and with Switzerland as institutional continuity guarantor. It authorizes the Public Investment Fund and the Ministry of Finance to execute the following disbursements as pre-authorized

institutional obligations requiring no further Royal Decree for individual tranche releases: (i) Lebanese Emergency Fuel Supply contributions (\$150 million per quarter,

Phase 0 through Phase 1): Disbursed automatically from a dedicated PIF sub-account on the first day of each quarter, upon certification by UN OCHA that the prior quarter's fuel delivery was completed and that Lebanon's

humanitarian corridor indicators remain above minimum thresholds. (ii) Gaza Reconstruction Fund contributions (amounts as agreed in the burden-sharing architecture, Phase 1+): Disbursed in quarterly tranches

from PIF into the World Bank-administered Gaza Reconstruction Fund upon World Bank certification that prior tranche was deployed consistent with agreed humanitarian and accountability standards.

(iii) Yemen SDRPY disbursements (amounts as agreed per SDRPY annual plan): Disbursed from SDRPY's dedicated PIF sub-account upon SDRPY Director-General certification of project milestone completion, as verified by the UN Yemen

monitoring mission. The Escrow Directive specifies that these disbursements are "institutional financial obligations of the Kingdom of Saudi Arabia, executed through PIF

and Ministry of Finance in their capacity as permanent state financial

institutions, independent of the identity of the individual serving as King, Crown Prince, or Minister of Finance at the time of execution."

B. PIF Governance Integration The PIF Governor is designated as a framework implementation officer equivalent for the economic track. The PIF Governor's designation is registered with the

governance body secretariat. In the event of a PIF Governor change, the incoming Governor receives an RCSA economic track briefing within 10 days of appointment and issues a written acknowledgment of the Escrow Directive's continuing authority

The PIF Board of Directors is notified of the Escrow Directive at each annual PIF governance cycle. The Directive is included in PIF's standing internal policy register as a "treaty-linked financial obligation" with the same

institutional permanence as PIF's sovereign bond issuance obligations. **C. Ministry of Finance Parallel Anchoring** The Escrow Directive is countersigned by the Minister of Finance in their

institutional capacity, creating a dual institutional anchor (PIF + MoF) that prevents either institution from unilaterally pausing disbursements. If the two institutions disagree on a specific disbursement, the Ministry of Foreign

Affairs RCSA Coordination Division is the tiebreaker, with a 7-day resolution window before the governance body secretariat is notified. **D. Succession Event Disbursement Continuity**

If a succession event (KSA-T1 or KSA-T2) occurs while a disbursement tranche is pending: (i) The PIF Governor and Ministry of Finance are jointly authorized to

execute any disbursement that is already certified for release (i.e., UN OCHA or World Bank certification has been issued) without waiting for new Royal

Decree confirmation. The Escrow Directive provides this self-executing authority for certified disbursements. (ii) Disbursements pending certification at the time of succession are deferred for a maximum of 30 days while the certification process completes

under caretaker authority. This 30-day deferral does not constitute a compliance concern. (iii) New disbursement commitments (beyond those specified in the Escrow

Directive) require Royal Decree confirmation from the new leadership. The governance body secretariat maintains a list of "within-Directive" versus "beyond-Directive" Saudi commitments to ensure clarity about which category each pending obligation falls into. RP-SA Module B: Domestic Veto Player Mapping Player 1: Religious Establishment (High Council of Senior Scholars)

39 Power Type: Legitimation and de-legitimation of foreign policy through religious

rulings (fatawa). A hostile ruling characterizing framework cooperation as impermissible under Islamic law could dramatically increase domestic political cost. Trigger Issues: Any provision that could be characterized as normalization with

a Shia-led Iran or as lending legitimacy to Iranian regional influence; humanitarian provisions benefiting Houthi-administered territory. Mitigation: Guarantor-facilitated consultations with Islamic scholars framing

framework as consistent with Islamic principles of peaceful dispute resolution (sulh) and protection of Muslim civilians; SDRPY's humanitarian role emphasized as charitable obligation.

Player 2: ARAMCO and Ministry of Energy (Economic Nationalist Bloc) Power

Type: Saudi economic policy is heavily influenced by Aramco's strategic interests, including oil price floor maintenance. Framework oil market normalization

could be perceived as threatening Saudi pricing leverage. Trigger Issues: Iranian oil re-entry timeline; OPEC+ implications; oil revenue sharing under any reconstruction finance scheme.

Mitigation: Oil market provisions are designed with Saudi comfort in mind: phased Iranian reintegration with governance body oversight; Saudi co-governance of any oil-linked reconstruction finance structures; explicit affirmation of

Saudi sovereignty over OPEC+ decisions. Player 3: Military and Intelligence Establishment (Saudi Arabian Armed Forces, GIP) Power Type: Military and intelligence leadership can resist implementation of

Yemen stabilization provisions they believe compromise operational effectiveness. They have access to the King/Crown Prince through parallel advisory channels. Trigger Issues: Yemen ceasefire provisions limiting offensive operations; Houthi

revenue sharing; restriction on weapons supply channels. Mitigation: Military is given co-governance role in ceasefire verification; SDRPY's Yemen reconstruction role maintains Saudi institutional presence;

maritime security architecture provides Saudi navy a constructive operational role. Player 4: Royal Family Factions (minor priority under current consolidation) Power Type: Historically significant royal family factionalism is currently

40 suppressed but could resurface under succession stress. Factions with different

foreign policy views could attempt to influence implementation through informal channels. Mitigation: Implementation authority is concentrated in official institutions

(MFA, NSC) rather than in individual royals; governance body engages institutions not personalities. RP-SA Module C: Public Narrative Stabilization

APPENDIX F: DOCUMENT CONTROL AND EXTENSION PROTOCOLS

Document Version Control

P>The RCSA v2.0 UN Diplomatic Edition employs rigorous document version control to ensure that all participants and stakeholders are working from the same authoritative text. Version control applies to the principal treaty, all annexes, all protocols, and all implementing documents. The version control system tracks changes, maintains revision history, and ensures that obsolete versions are clearly identified and withdrawn from circulation.

P>Each document carries a unique identifier comprising the document category (TR for treaty, AN for annex, PR for protocol, IM for implementing document), a sequential number, and a version indicator (major.minor format). Version changes are classified as major (changing the first digit) when they alter substantive provisions, or minor (changing the second digit) when they correct errors, clarify language, or make non-substantive formatting changes.

P>All version changes are recorded in a Document Change Register maintained by the secretariat. The register records the date of change, the nature of change, the authority authorizing the change, and the effective date.

The register is published quarterly and is available to all participating states and registered observers.

Amendment Procedures and Document Evolution

P>Documents evolve through specified amendment procedures that ensure changes are properly authorized, accurately reflected in the authoritative text, and communicated to all affected parties. Amendment procedures vary by document category, with more stringent requirements for documents with greater legal or operational significance.

P>Treaty amendments require ratification by all participating states. The amendment process begins with a proposal submitted to the Governance Body, followed by review and comment periods, negotiation of amendment text, and submission for ratification. Ratification procedures follow the same domestic constitutional requirements as initial treaty ratification.

P>Annex amendments require approval by the Governance Body, with specific voting thresholds varying by annex category. Technical annexes can be amended by supermajority vote without requiring national ratification. Security-related annexes require consensus or near-consensus approval. Financial annexes require approval by states contributing more than a specified percentage of total resources.

P>Protocol amendments are made by the body that adopted the protocol, typically the Governance Body or a subsidiary body with delegated authority. Protocol amendments require approval by the adopting body but do not require separate national ratification unless they alter treaty-level obligations.

P>Implementing documents are amended by the secretariat within parameters established by the Governance Body. Secretarial amendments must be reported to the Governance Body and can be overridden by Body

decision if they exceed authorized parameters.

H2>Extension and Accession Protocols

P>The architecture is designed to be open to accession by states beyond the core parties, with accession procedures that ensure new participants understand and can fulfill architecture obligations before becoming bound by them. The extension framework also addresses the relationship between the architecture and non-participating states, regional organizations, and international institutions.

P>Accession procedures begin with an expression of interest submitted to the depositary, who circulates it to all participating states. The secretariat then conducts a technical assessment of the applicant's capacity to fulfill architecture obligations, including safeguards compliance, legislative capacity, and institutional readiness. The Governance Body reviews the technical assessment and decides whether to invite the applicant to begin accession negotiations.

P>Accession negotiations address any modifications required to standard architecture obligations to accommodate the applicant's specific circumstances. Negotiations also establish the applicant's assessed contributions, voting rights, and benefit entitlements. Negotiated accession terms are embodied in an accession protocol that must be approved by the Governance Body and ratified by the applicant.

P>Observer status is available to states that are not prepared for full accession but wish to engage with the architecture. Observers may participate in Governance Body discussions on matters of mutual interest, receive architecture documents, and attend architecture events. Observers do not have voting rights and are not bound by architecture obligations. Observer status is granted by Governance Body decision.

H2>Relationship with Complementary Documents

P>The architecture interacts with multiple external documents and instruments including UN Security Council resolutions, IAEA safeguards agreements, bilateral agreements among participating states, and regional organization commitments. The relationship framework ensures that architecture documents are consistent with external obligations and that implementation does not create conflicts with other binding commitments.

P>UN Security Council resolutions on Iranian nuclear matters are addressed through architecture provisions that specify how architecture implementation relates to resolution requirements. Where architecture obligations exceed resolution requirements, the additional obligations are binding on architecture parties. Where resolutions impose requirements not addressed by the architecture, resolution requirements continue to apply.

P>IAEA safeguards agreements are integrated through architecture verification provisions that specify how IAEA and architecture verification activities are coordinated. The architecture does not replace IAEA safeguards but rather supplements them with additional monitoring measures. IAEA safeguards continue to apply regardless of architecture status.

P>Bilateral agreements among participating states are respected by the architecture, which does not supersede bilateral obligations unless explicitly provided. Architecture implementation is designed to be consistent with bilateral agreements, and where inconsistencies arise, the Governance Body addresses them through coordination mechanisms.

H2>Document Security and Distribution

P>Architecture documents are classified according to sensitivity levels that determine distribution restrictions. Unrestricted documents are available to

the public and may be freely distributed. Restricted documents are available to participating states and designated observers but are not publicly released. Confidential documents are available only to specified officials and bodies. Secret documents are available only on a need-to-know basis with specific authorization.

P>Classification levels are indicated on each document and determine handling, storage, and transmission requirements. Documents may be declassified through specified procedures when the sensitivity of their contents diminishes over time. Declassification decisions are made by the originating body or official with review by the security officer.

P>Electronic document management employs secure systems with access controls, audit trails, and encryption appropriate to classification level. Paper document management employs physical security measures including secure storage, controlled reproduction, and destruction procedures. All document handling is governed by security protocols approved by the Governance Body.
