

A DRAFT INSTRUMENT

The Framework for Graduated Reciprocal Assurance

*A Micro-Treaty Architecture for Incremental
Confidence-Building Between the United States
and the Islamic Republic of Iran*

Version 1.2 | Human-in-the-Loop Architecture

May 2026

Table of Contents

Preamble

Part I: Core Principles

- 1.1 Reciprocity as Foundation
- 1.2 Verifiability as Currency
- 1.3 Reversibility as Risk Mitigation
- 1.4 Graduation as Political Lubricant
- 1.5 Human-in-the-Loop Governance

Part II: The Ten Mechanisms

- Mechanism 1: Graduated Reciprocal Trust Architecture
- Mechanism 2: Joint Sovereign Custody Protocol
- Mechanism 3: Reversible Commitment Instruments
- Mechanism 4: Parallel Confidence Reservoirs
- Mechanism 5: Civilian Nuclear Joint Enterprise
- Mechanism 6: Youth Observer Corps Protocol
- Mechanism 7: Maritime Mutual Stewardship Compact
- Mechanism 8: Technological Transparency Depository
- Mechanism 9: Regional Economic Integration Corridor
- Mechanism 10: Evergreen Reciprocity Architecture

Part III: Implementation Architecture

- 3.1 The Joint Secretariat
- 3.2 The Neutral Custodian Consortium
- 3.3 Verification and Monitoring

Part IV: Dispute Resolution and Adaptation

- 4.1 The Escalation Ladder
- 4.2 The Adaptation Protocol

Part V: Final Provisions

- 5.1 Entry into Force
- 5.2 Duration and Review
- 5.3 Signature and Ratification

Preamble

"Whereas prolonged confrontation has proven its inability to resolve the fundamental questions of security, sovereignty, and economic dignity that animate the grievances of both parties; and whereas history demonstrates that the most enduring peace instruments are those that distribute risk equitably, verify compliance transparently, and permit political breathing room for leaders on all sides..."

The following Framework is offered not as a final settlement, but as a **ladder of incremental, verifiable, and reversible steps** designed to break the current negotiating deadlock. It draws upon historical insights from successful peace instruments across five centuries of diplomatic practice, while recognizing that no two conflicts are identical and that creative adaptation, not mechanical copying, is the essence of statesmanship.

The architects of this Framework have sought to internalize a fundamental lesson: the most durable agreements are those that **transform zero-sum confrontations into positive-sum relationships**. They do not demand that either side capitulate on core interests; rather, they create architectures in which the protection of one party's essential interests becomes intertwined with the protection of the other's.

This instrument proposes ten original mechanisms, none of which has been previously employed in international agreements. Each mechanism is designed to address a specific friction point in the current impasse while generating tangible benefits for both parties. They are presented not as an all-or-nothing package, but as a menu of **interlocking, self-reinforcing instruments** that gain strength from their mutual deployment.

The Framework assumes that both parties share, at a minimum, the following interests: avoiding further military escalation whose costs would exceed any plausible benefit; preserving sovereign dignity and domestic political viability for decision-makers on both sides; creating a pathway to economic normalization that delivers measurable improvements to citizens; preventing the proliferation of nuclear weapons capabilities in the region; establishing institutional relationships that outlast individual political administrations; and maintaining freedom of navigation and maritime security in the Persian Gulf and the Strait of Hormuz.

Where these interests converge, this Framework builds. Where they diverge, it bridges through creative institutional design. Where they conflict, it offers graduated trade-offs that permit each side to claim defense of its core positions while making measured progress toward mutual accommodation.

The name of this instrument reflects its essential character: **Graduated**, because it proceeds by discrete, escalating steps rather than dramatic leaps; **Reciprocal**, because every concession is paired with a counter-concession of commensurate value; and **Assurance**, because its ultimate purpose is not to humiliate either party but to assure both that their most vital interests will be respected.

Part I: Core Principles

All ten mechanisms described in Part II operate within a shared architecture of foundational principles. These principles are not merely aspirational; they are the operational DNA of the Framework, encoded into the design of each mechanism and its implementation protocols.

1.1 Reciprocity as Foundation

The principle of reciprocity holds that **no party shall be required to make a concession without receiving, in the same implementation phase, a concession of comparable political and practical value from the other party.** This is not merely a negotiating posture but a structural feature built into each mechanism through paired obligations.

Reciprocity operates at three levels within this Framework. **Macro-reciprocity** governs the overall sequencing of the Framework itself. Neither party is asked to deliver its most politically sensitive concessions in early phases. Instead, the Framework front-loads mutual confidence-building measures that require modest political capital while generating visible benefits, reserving the most consequential exchanges for later phases when institutional trust has accumulated.

Meso-reciprocity governs the activation of each individual mechanism. Every mechanism described in Part II contains paired trigger conditions: Side A's obligation to act is contingent upon Side B's completion of a defined prior step, and vice versa. These are not handshake agreements but technically specified conditions verified by the Neutral Custodian Consortium described in Part III.

Micro-reciprocity governs the continuous adjustment of implementation details. If either party encounters genuine technical or political obstacles to meeting a specific milestone, it may request reciprocal adjustments from the other party through the Joint Secretariat, preserving the balance of obligations even when circumstances change.

1.2 Verifiability as Currency

In an environment of profound mutual distrust, promises alone are worthless. **Verification is the currency in which this Framework trades.** Every commitment, whether large or small, must be accompanied by a verification protocol that is transparent, technically robust, and politically sustainable.

Verifiability in this Framework rests upon five pillars. **Technical transparency** requires that each party provide the monitoring infrastructure necessary to confirm compliance. **Third-party authentication** ensures that verification is not a bilateral accusation mechanism but a neutral technical process. **Political sustainability** demands that verification protocols be designed to survive changes in government on either side. **Graduated intrusiveness** recognizes that highly intrusive monitoring may be politically unacceptable in early phases; verification begins with less invasive methods and escalates in proportion to the sensitivity of the activities being monitored. **Mutual exposure** ensures that verification is not one-sided; where one party accepts monitoring of its activities, the other party accepts corresponding monitoring of its reciprocal obligations.

Definition of a Cyber Violation. For the purposes of this Framework, a "cyber violation" constitutes an active digital intrusion, originating from or traced via verified multi-party forensic analysis to sovereign government infrastructure of either signatory state, that directly alters data logs maintained by the Joint Secretariat or Neutral Custodian Consortium, disrupts operational telemetry at safeguarded facilities, or causes physical damage to listed nuclear installations, financial escrow systems, or monitoring equipment. Passive intelligence gathering, open-source

network scanning, and defensive cybersecurity operations shall not constitute a cyber violation. Any incident suspected to involve cyber compromise shall be subject to joint forensic investigation by the Joint Secretariat's Cyber Incident Response Team (CIRT) before any compliance determination is made.

HUMAN-IN-THE-LOOP

Calibrated Intrusiveness Focus Groups

Before any level of monitoring intrusiveness escalates, a joint **Inspector Liaison Council** shall convene in person at the affected facility to review the psychological and operational impact of enhanced verification measures on facility staff. The Council is composed of one senior inspector from each party and one neutral IAEA representative. Their assessment, documented in a written memorandum, informs but does not veto the decision to escalate. The Council's purpose is to humanize the verification presence and prevent monitoring from becoming gratuitously adversarial.

1.3 Reversibility as Risk Mitigation

One of the most powerful obstacles to diplomatic breakthrough is the fear of irreversible concession. Leaders on both sides worry that once they give something up, they cannot get it back if the other side cheats or if domestic politics shift. **This Framework systematically addresses this fear by designing reversibility into every commitment.**

Reversibility operates through several technical devices. **Cooling-off clauses** permit either party to pause implementation of its obligations if the other party fails to meet a defined milestone within a specified timeframe. These pauses are not treaty violations; they are built-in safety valves. **Escrow arrangements** ensure that tangible assets transferred under the Framework are held in neutral custody until reciprocal verification is complete, with automatic return protocols if reciprocity fails. **Glide-path provisions** specify that if the Framework is terminated, neither party snaps immediately back to confrontation; instead, a pre-negotiated glide path governs the unwinding of concessions over a defined period. **Evergreen architecture** ensures that commitments are maintained through automatic renewal unless either party actively opts out, transforming the political question from "Will you give up X forever?" to "Will you continue the current suspension of X, which renews automatically as long as both sides perform?"

1.4 Graduation as Political Lubricant

The most successful peace instruments in history have proceeded not by dramatic leaps but by graduated sequences that allow political systems to absorb change incrementally. **Graduation is the political lubricant that reduces friction at each step of the process.**

The Framework implements graduation through **phase sequencing** that moves from low-cost, high-visibility confidence-building measures through medium-stakes institutional building to high-stakes structural changes, with each phase unlocking only upon satisfactory completion of the prior phase. **Automatic triggers** provide the technical architecture for graduation, but as specified in Section 1.5, no phase transition occurs without human political clearance. **Visible milestones** generate regular positive media coverage and public endorsement, creating constituencies for continued progress. And **political camouflage** frames early steps in non-ideological, technical language rather than as grand diplomatic concessions, giving leaders room to advance without appearing to capitulate.

1.5 Human-in-the-Loop Governance

The systemic vulnerability of automated diplomatic frameworks lies in their rigidity. By reducing statecraft to algorithmic sequences of "if/then" triggers, instruments risk creating catastrophic cascades where automated compliance alarms are tripped by bureaucratic delays, technical glitches, or misinterpreted data. **This Framework explicitly rejects pure automation in favor of a human-in-the-loop (HITL) architecture that restores strategic discretion, diplomatic agency, and psychological safety.**

The HITL principle operates through five governing concepts:

Automation informs; humans decide. Throughout the Framework, automated verification systems, escrow ledgers, and sequence management tools perform the technical work of detection, measurement, and tracking. However, no automated output triggers a binding diplomatic consequence without explicit human authorization at the appropriate level of seniority. Technical milestones are verified by automation; political consequences require human sign-off.

Dual-key authorization. Any transition that materially alters the obligations of either party requires simultaneous authorization from designated senior officials on both sides. This prevents either party from being dragged into escalation by its own automated systems or by the other party's unilateral actions.

Grace over rigidity. The Framework builds generous buffer windows, discretionary extension authorities, and consultative pauses into every timeline. A party that needs an extra 48 hours because its treasury office is closed for a national holiday is not treated as a violator; it is treated as a partner whose administrative rhythms deserve accommodation.

Humanitarian primacy. Assets designated for medical, nutritional, or humanitarian relief are managed through human review panels that may override any automated freeze, release, or reversal protocol. No escrow lockup, no matter how severe the compliance dispute, shall impede the flow of humanitarian goods.

Qualitative judgment. The Framework establishes standing panels of historians, sociologists, retired statesmen, and operational practitioners who provide continuous qualitative feedback on how the agreement is changing societal perceptions, workplace dynamics, and strategic cultures. This steering function prevents the Framework from degenerating into cold, programmatic stagnation.

Specific HITL provisions are embedded throughout the mechanisms described in Part II and the implementation architecture described in Part III. Where they appear, they are identified by the "Human-in-the-Loop" marker.

Part II: The Ten Mechanisms

This Part presents the operational core of the Framework: ten original mechanisms, each designed to address a specific dimension of the current impasse while generating mutual benefits. None of these mechanisms has been previously employed in an international agreement. Each is designed to be politically defensible, technically verifiable, and structurally reciprocal. The mechanisms are presented in recommended sequencing order, with early mechanisms requiring modest political investment while building the institutional infrastructure and mutual habits necessary for later, more consequential exchanges.

Throughout this Part, provisions marked with the **Human-in-the-Loop** identifier represent discretionary, human-mediated checkpoints designed to prevent automated systems from driving diplomatic outcomes without political judgment.

MECHANISM 1

The Graduated Reciprocal Trust Architecture

Purpose: To replace the all-or-nothing negotiating dynamic with a staircase of micro-commitments, each unlocking the next upon verified completion and explicit human authorization.

Conceptual Foundation

The central psychological obstacle to a comprehensive agreement is that both parties perceive themselves as being asked to make their most painful concessions first, in exchange for promises of future reciprocity that may never materialize. The Graduated Reciprocal Trust Architecture (GRTA) eliminates this problem by **atomizing the negotiating agenda into a sequence of discrete, low-stakes micro-steps, each paired with a reciprocal micro-step from the other side.**

Step 1 might involve Iran permitting a specific additional monitoring camera at a declared facility; its reciprocal action might involve the United States issuing a specific license for a humanitarian medicine transaction. Neither action is politically earth-shattering, but both generate tangible benefits and establish the behavioral pattern of reciprocal compliance. Each step is modestly more significant than the last but never requires a leap of faith.

Technical Design

The GRTA operates through a **Joint Technical Sequence Committee (JTSC)** composed of engineers, lawyers, and verification specialists from both parties plus neutral members. The JTSC maintains the Master Sequence Document, which defines each step with precision: action specification (exactly what physical act must be performed, expressed in Total Separative Work Units (SWU) per Month rather than raw machine counts), verification protocol (how compliance will be confirmed), reciprocal pair (the matching obligation from the other party), trigger condition (the objective criteria that make a step eligible for advancement), timeline (the window within which each step must be completed), and escape clause (conditions under which a party may pause without penalty). The Master Sequence Document is published to both governments and to the Neutral Custodian Consortium.

Administrative Buffer Window. A mandatory 48-hour Administrative Buffer Window shall be inserted between the verification of any milestone and the eligibility of the next paired obligation for activation. During this window, technical and bureaucratic teams have the necessary runway to execute physical and legal steps. Either party may invoke the Buffer Window by notification to the Joint Secretariat.

HUMAN-IN-THE-LOOP

Dual-Key Executive Activation

While technical milestones are verified by automation, the transition to a new phase (every 5 steps) requires explicit, simultaneous **dual-key digital sign-offs** by the United States Secretary of State and the Iranian Foreign Minister. Technical verification determines eligibility; political authorization determines execution. Neither side advances to a new phase without both keys turning.

HUMAN-IN-THE-LOOP

The "Political Capital" Circuit Breaker

Every fifth step in the Master Sequence Document triggers a mandatory **face-to-face political review** at the Joint Governing Council level. Before Steps 6, 11, 16, 21, 26, and 31 may commence, both parties' senior political representatives must certify in a joint memorandum that domestic political conditions in both capitals remain supportive of further micro-commitments. This circuit breaker prevents the staircase from outrunning the political foundation beneath it.

HUMAN-IN-THE-LOOP

The 48-Hour Buffer "Human Discretion" Override

The 48-hour Administrative Buffer Window does not automatically commence the next obligation upon expiration. Instead, it requires an affirmative **Notice of Readiness** signed by a designated senior bureaucrat (Deputy Assistant Secretary or equivalent) on the obligated side during the window. If no Notice of Readiness is issued, the window expires into a diplomatic pause rather than an automatic obligation. Either party may request a consultative extension of up to 7 days through the Joint Secretariat. **The 48-Hour Buffer may not be invoked, extended, or otherwise used to bypass or compress the mandatory 31-day congressional review period required by the Iran Nuclear Agreement Review Act of 2015 (INARA), as specified in Section 5.1.** No Phase One micro-transaction may activate, and no Notice of Readiness may be issued with respect thereto, prior to the expiration of the statutory INARA window.

Political Advantages

The GRTA offers profound political benefits to both sides. For Iranian leaders, it means never having to defend a single dramatic concession; instead, they can point to a steady accumulation of sanctions relief and economic benefits. For American leaders, it means never having to trust Iran's promises; every Iranian action is verified before the reciprocal American action is triggered. The HITL architecture ensures that no step is taken without both technical confidence and political intent.

MECHANISM 2

The Joint Sovereign Custody Protocol

Purpose: To resolve disputes over control of contested facilities by creating neutral technical zones where neither party exercises exclusive authority, managed instead by a mutually acceptable third-party consortium with sovereign oversight preserved.

Conceptual Foundation

The American position demands that Iran dismantle or transfer control of key facilities; the Iranian position insists that these facilities are sovereign property that cannot be surrendered. The Joint Sovereign Custody Protocol (JSCP) breaks this deadlock by **creating a third option beyond the binary of "Iran controls" versus "Iran dismantles."**

Under the JSCP, designated contested facilities are placed under the operational management of a **Technical Custody Consortium (TCC)** composed of engineers and managers from neutral countries. Neither the United States nor Iran exercises direct operational control, but both have real-time monitoring access through encrypted surveillance feeds and regular physical inspections.

Technical Design

The JSCP operates through a multi-layered governance structure. The **Operational Layer** means day-to-day management is conducted by TCC personnel. Iranian personnel serve as active participants rather than passive observers. The **Oversight Layer** consists of a Joint Oversight Board with American, Iranian, and TCC representatives meeting monthly. Major decisions require consensus. The **Monitoring Layer** provides continuous remote monitoring via encrypted satellite and fiber-optic feeds. The **Transition Layer** includes a pre-negotiated glide path governing how control evolves over time.

IAEA Supremacy Hierarchy. The IAEA retains exclusive statutory authority as the ultimate arbiter of nuclear compliance. Should the IAEA issue a negative compliance finding, that finding automatically overrides any TCC assessment and immediately halts all GRTA phase progression. The TCC's role is strictly operational; the IAEA's role is sovereign in all matters of verification and compliance determination.

HUMAN-IN-THE-LOOP

Bilateral Shadow Observers

Iranian personnel at TCC-managed facilities are elevated to the role of **"Co-Pilots."** They must shadow every operational command executed by TCC technicians, with the right to question, document, and escalate any operation they deem inconsistent with the facility's safeguarded charter. Co-Pilots do not exercise veto authority, but their written observations are automatically transmitted to the Joint Oversight Board and may trigger a Deadlock Mediation Panel review.

HUMAN-IN-THE-LOOP

The Deadlock Mediation Panel

When the Joint Oversight Board deadlocks on a safety or non-proliferation matter, the TCC's technical judgment does not automatically prevail. Instead, the deadlock is referred to a **three-person panel of retired senior diplomats** (one American, one Iranian, one neutral) who assess the political ramifications and recommend a course of action within 72 hours. Their recommendation is non-binding but carries substantial political weight; if either party rejects it, the matter escalates to the Escalation Ladder. **Throughout any escalation through the Escalation Ladder, the Technical Custody Consortium shall continue to operate the facility under the existing protocols in effect at the time of the deadlock (status quo ante)**, unless and until a binding decision at Rung 4 (Binding Arbitration) or a mutual agreement at Rung 5 (Political Dialogue) mandates a specific operational change. No party may unilaterally alter TCC operations during the pendency of an escalated deadlock.

HUMAN-IN-THE-LOOP

IAEA Finding Consultation Layer

Following any negative IAEA compliance finding, a mandatory **72-hour high-level diplomatic consultation window** opens immediately. During this window, technical teams from both sides and the IAEA may present contextual information (sample contamination, sensor malfunction, procedural error) that might affect the finding's interpretation. The IAEA finding is not suspended during consultation, but no punitive or reversal action may be taken until the consultation window closes. This prevents an entire architecture from freezing due to a single anomalous reading.

HUMAN-IN-THE-LOOP

The Transition Phase Human Audit

Restoration of operational roles to Iranian personnel is not based solely on pre-negotiated timeline sequences. Each transition requires a **qualitative peer-review assessment** signed by a panel of three international nuclear facility managers (one appointed by each party, one neutral) who evaluate the readiness of both the facility and the Iranian personnel to assume enhanced responsibilities safely and competently.

HUMAN-IN-THE-LOOP

The Flag and Sovereign Protocol Committee

At each TCC-managed facility, a joint **human protocol officer** (one Iranian, one neutral) manages daily symbolic, security, and jurisdictional issues. This includes ceremonial matters (flag protocols, national anthem observance), workplace harmony between international and domestic staff, and resolution of localized grievances. The protocol officer reports monthly to the Joint Oversight Board.

MECHANISM 3

Reversible Commitment Instruments

Purpose: To reduce the political risk of each concession by embedding every commitment within a cooling-off framework that permits reversal if reciprocity fails, with human judgment at every reversal node.

Conceptual Foundation

The single greatest fear that paralyzes negotiators is the fear of being played: of making a concession that cannot be undone, only to watch the other pocket the gain and demand more. Reversible Commitment Instruments (RCIs) directly address this fear by **designing every commitment to be technically and politically reversible if the other party fails to deliver its paired obligation.**

Technical Design

Every RCI contains five essential elements. **The Forward Commitment** specifies exactly what action the committing party will take, expressed in Total SWU Capacity per Month. **The Reciprocal Trigger** defines the specific, verifiable action the other party must take. **The Verification Window** establishes how long the other party has to complete the reciprocal trigger. **The Reversal Protocol** specifies how the committing party unwinds its commitment if reciprocity fails. **The Confidence Clock** provides that after a defined period of successful reciprocal implementation, the RCI's reversibility expires and the commitment becomes permanent. **The Buffer Window** applies the 48-hour Administrative Buffer described in Mechanism 1 to each RCI activation event.

HUMAN-IN-THE-LOOP

RCI Discretionary Extension Window

When a Verification Window closes without verification, the commitment does not automatically suspend. The Joint Secretariat's Executive Director has statutory authority to grant a **human-deliberated 7-day extension** if the delay appears to result from technical friction, bureaucratic backlog, or force majeure rather than bad faith. The Executive Director must consult both parties' technical representatives before granting the extension and must publish a written rationale.

HUMAN-IN-THE-LOOP

Playbook Execution Co-Signers

A Reversal Protocol cannot be physically or legally executed without a formal **Notice of Reciprocity Failure** co-signed by the complaining party's executive leadership (at the Deputy Minister level or above) and the head of the Neutral Custodian Consortium. Neither side can trigger a reversal unilaterally; both political and neutral institutional judgment must concur.

HUMAN-IN-THE-LOOP

The Confidence Clock Human Assessment

Reversibility does not expire automatically at the 24-month mark. Instead, it requires a joint **political declaration of "Sustained Strategic Trust"** issued by both parties' foreign ministers at the 24-month anniversary. If either minister declines to issue the declaration, the RCI remains reversible for an additional 6-month assessment period. This prevents an unresolved low-level dispute from being permanently locked into an irreversible commitment.

HUMAN-IN-THE-LOOP

The SWU Equivalence Consultative Council

Before any new centrifuge model is incorporated into the Master Sequence Document or escrow system, a **bilateral technical council** (two American engineers, two Iranian engineers, one neutral IAEA specialist) must manually verify and agree upon its SWU equivalence rating. No automated SWU calculation may override a disputed manual assessment. The Council meets quarterly or upon introduction of any new centrifuge design.

MECHANISM 4

Parallel Confidence Reservoirs

Purpose: To create tangible, escrowed assets that both parties can see and verify, releasing them through paired human-authorized micro-transactions as reciprocal steps are completed.

Conceptual Foundation

Promises are cheap; assets are real. The Parallel Confidence Reservoirs (PCR) mechanism addresses the fundamental trust deficit by requiring both parties to **deposit tangible, valuable assets into neutral escrow accounts** before negotiations even begin. These assets are released in carefully calibrated micro-transactions as each side fulfills its obligations. Both parties can log into a secure digital platform and see their own assets sitting in escrow, and see the other party's assets sitting in parallel escrow. This transforms abstract commitments into tangible reality.

Technical Design

The PCR operates through three parallel reservoirs. **The Iranian Material Reservoir** contains Iran's deposited assets, held in IAEA-monitored facilities in neutral territory, organized into discrete packets each linked to a specific reciprocal obligation. **The American Financial Reservoir** contains deposited American assets, denominated exclusively in non-USD currencies (Euros or Emirati Dirhams) and held in sovereign-backed clearing entities such as the Central Bank of Oman (Muscat) or Qatar National Bank (Doha). **The Neutral Custodian Ledger** is a tamper-evident record-keeping system maintained by the NCC.

Sovereign Immunity Shield. All escrowed funds, transactional pathways, and associated assets are held under the sovereign immunity of the designated neutral host nation and are completely legally insulated from domestic civil litigation, third-party court attachments, or judicial seizure within either signatory state. No court exercising jurisdiction within the United States or Iran shall have authority to attach, freeze, encumber, or seize any PCR assets.

Net Stockpile Inventory Cap. The Iranian Material Reservoir is subject to a strict cap: while enrichment is capped at 3.67% U-235, the total mass of all uranium hexafluoride (UF6) at any enrichment level shall not exceed 300 kilograms during Phase One. Iran must pause enrichment or downblend concurrently to remain under this ceiling.

HUMAN-IN-THE-LOOP

Manual Packet-Release Authorization

Escrowed packets do **not** release automatically upon automated verification. Instead, the designated escrow bank officers at the Central Bank of Oman or Qatar National Bank must receive a physically signed, notarized **Release Directive** from both parties' treasury officials before transferring assets. The Directive confirms that both sides' political leadership has reviewed and approved the corresponding milestone. Automation verifies eligibility; human authorization executes release.

HUMAN-IN-THE-LOOP

Volumetric Deviation Review

A hard automated pause is not triggered the exact moment the 300kg mass limit is breached. Instead, a **Stockpile Variance Committee** (one Iranian nuclear accountant, one American nuclear accountant, one IAEA metrologist) reviews any discrepancy exceeding 5kg within 72 hours. The Committee may authorize minor volumetric deviations caused by measurement margins of error, instrument calibration drift, or sampling protocol differences. Only deviations exceeding 10kg or persisting beyond 72 hours trigger formal compliance review.

HUMAN-IN-THE-LOOP

Sovereign Immunity Legal Liaison Team

A standing committee of legal experts from the United States, Iran, Oman, and Switzerland is established to **actively defend and maintain** the legal walls surrounding the Parallel Confidence Reservoirs. This team monitors domestic court dockets in both signatory states for any litigation that could threaten escrowed assets, files pre-emptive legal interventions, and coordinates with the host nation's foreign ministry to assert sovereign immunity defenses. The team meets monthly and reports quarterly to the Joint Governing Council.

HUMAN-IN-THE-LOOP

Humanitarian Carve-Out Review Board

An independent **Humanitarian Assessment Panel** with representatives from the WHO, the International Red Crescent, and the Red Cross has the authority to manually override any automated freeze on asset packets designated for medical, nutritional, or humanitarian relief. No escrow lockup, compliance dispute, or reversal protocol shall impede the flow of humanitarian goods. The Panel meets within 24 hours of any humanitarian freeze notification and may issue binding override directives.

Table 1: Illustrative Micro-Transaction Pairings

Iranian Obligation (SWU-based)	Escrowed Asset	American Obligation	Escrowed Asset
--------------------------------	----------------	---------------------	----------------

Declare all centrifuge manufacturing sites; reduce active SWU by 10%	50 kg hexafluoride	LEU	Issue medical device licenses	€140M	release authority
Permit 24/7 IAEA monitoring at Natanz	100 kg hexafluoride	LEU	Authorize civilian aircraft parts sales	€185M	release authority
Halt enrichment above 3.67% for 90 days; hold under 300 kg cap	200 kg hexafluoride	LEU	Suspend designated sanctions on oil sales	€370M	release authority
Transfer 20% stockpile to neutral custody	Full 20% inventory		Authorize SWIFT reconnection for 5 banks	€555M	release authority

MECHANISM 5

The Civilian Nuclear Joint Enterprise

Purpose: To transform Iran's nuclear program from a security threat into a shared commercial asset by creating a jointly-governed civilian nuclear energy company with American and international participation.

Conceptual Foundation

The fundamental stumbling block is the zero-sum framing: either Iran has enrichment capability (a threat) or it does not (an unacceptable surrender). The Civilian Nuclear Joint Enterprise (CNJE) reframes the issue by **creating a jointly-owned, commercially-oriented nuclear energy company in which Iran's nuclear expertise becomes a valuable asset rather than a security threat.**

Technical Design

The CNJE is structured as a multinational corporation. **Shareholding:** 40% Iranian, 30% American, 30% neutral international investors. No controlling majority. **Governance:** Major decisions require 75% supermajority. **Scope:** Restricted to civilian nuclear power generation, with enrichment capped at reactor grade and all operations under IAEA safeguards plus bilateral monitoring. **Regional Expansion:** Charter permits building and operating plants throughout the region. **Buyback Provisions:** Iran may buy back shares at fair market value after a defined period of successful operation.

Political Advantages

The CNJE offers each side a narrative of victory. Iranian leaders can say they leveraged their program into a revenue-generating commercial enterprise. American leaders can say they transformed the program into a transparent, safeguarded operation with American oversight. The CNJE also creates a powerful constituency for continued compliance: shareholders, employees, customers, and regional partners who would suffer financially from any diversion to military purposes.

MECHANISM 6

The Youth Observer Corps Protocol

Purpose: To build human relationships that outlast political administrations by creating a permanent exchange program for young scientists, engineers, and diplomats to work together on shared technical challenges.

Treaties signed by one generation are often torn up by the next. Sustainable peace requires **human relationships across societies**. The Youth Observer Corps Protocol (YOCP) creates a permanent exchange program in which young Iranians and Americans work together on technical projects serving shared interests. An Iranian engineering student who spent two years alongside American counterparts on a water desalination project is far less likely to support military confrontation. An American diplomat who studied with Iranian colleagues is far less likely to advocate for bombing.

The YOCP operates through five pillars. **The Joint Technical Academy**, in a neutral country, offers joint degree programs in nuclear engineering, water management, renewable energy, public health, and environmental science. **The Field Deployment Program** sends mixed teams to regional development projects. **The Young Diplomats Fellowship** brings promising foreign ministry officials together for structured dialogue. **The Scientific Exchange Network** facilitates laboratory exchanges and joint publications. **Alumni Governance**: graduates form a permanent network with institutionalized channels for engagement.

The YOCP is politically inexpensive to launch but pays compounding dividends. It creates a visible symbol of cooperation and builds human infrastructure for sustained engagement that survives changes of government. It creates ambassadors for peace who cannot be dismissed as political stooges.

MECHANISM 7

The Maritime Mutual Stewardship Compact

Purpose: To resolve the Strait of Hormuz security dilemma by creating a jointly staffed maritime coordination center under neutral flag, ensuring freedom of navigation while respecting both parties' security interests through real-time human de-confliction.

Conceptual Foundation

Control of the Strait of Hormuz is a flashpoint of existential concern. Iran views American naval dominance as a stranglehold on its economic lifeline; the United States views Iranian threats to close the Strait as a threat to global energy security. The Maritime Mutual Stewardship Compact (MMSC) breaks this deadlock by **creating a joint maritime coordination mechanism that neither party controls exclusively but in which both participate**. It is not a military alliance; it is a practical operational arrangement for managing maritime traffic, responding to incidents, and preventing misunderstandings.

Technical Design

The Hormuz Coordination Center (HCC) is a permanent operational facility in a neutral littoral state, staffed by naval officers from the United States, Iran, Oman, and other neutral parties. **Information Sharing Protocols**: The HCC maintains a real-time common operational picture of vessel traffic, drawing on radar, AIS, and satellite data from all parties. **Incident Response Procedures**: Pre-agreed protocols govern responses to maritime incidents. **Joint Patrol Coordination**: The HCC coordinates patrol activities by participating navies. **Commercial Vessel Registration**: A voluntary registration system allows commercial vessels to register transit plans.

HUMAN-IN-THE-LOOP

The Hormuz Human De-confliction Desk

The HCC shall maintain a **24/7 physical Human De-confliction Desk** staffed at all times by one active-duty U.S. naval officer and one active-duty Iranian naval officer sitting in the same room. Before any automated alarm escalates to a tactical maneuver, radio call, or alert, the two officers conduct an immediate human-to-human verbal verification. Either officer may raise a "yellow flag" to pause automated escalation for up to 30 minutes while they consult their respective command chains. The Desk operates under a protocol of "explain before you act" — no automated response may be executed without the two officers jointly acknowledging its necessity.

HUMAN-IN-THE-LOOP

Joint Rules of Engagement (ROE) Review Board

A **bi-weekly maritime ROE board**, chaired by the HCC Director and composed of operational commanders from both navies, reviews real-world encounters and manually updates the rules of engagement. The Board has authority to recommend temporary modifications to response protocols based on operational experience. Modifications take effect after 48 hours unless either party objects, at which point they are referred to the Joint Governing Council. This injects human operational experience into a system that would otherwise operate on static, pre-agreed protocols.

HUMAN-IN-THE-LOOP

Voluntary Registration Arbitrators

A **human ombudsman panel** representing the International Maritime Organization, local Gulf shipping lanes, and commercial vessel operators arbitrates maritime traffic priority disputes, registration conflicts, and emergency routing requests. The panel meets weekly (or within 4 hours of any declared emergency) and has authority to override automated scheduling algorithms when human judgment identifies a safety imperative that the algorithm missed.

Political Advantages

The MMSC addresses the core concern of both parties without requiring either to surrender its military capabilities. Iran gains a formal role in maritime security decision-making; the United States gains Iranian transparency about naval activities. Most importantly, the MMSC transforms the Strait from a zero-sum competition zone into a shared commons managed by human judgment as much as by technology.

MECHANISM 8

The Technological Transparency Depository

Purpose: To break the verification deadlock by creating a neutral-country facility where both parties deposit sensitive technical information under sealed conditions, progressively opened through human-authorized gates as confidence builds.

Conceptual Foundation

The verification dilemma is acute: the United States demands comprehensive disclosure of Iran's nuclear history; Iran fears that such disclosure would expose intelligence sources and personnel to risk. The Technological Transparency Depository (TTD) addresses this by **creating a facility where both parties deposit sensitive information under conditions that protect it until pre-agreed confidence thresholds are met.**

Technical Design

The Depository Facility is a physically secure facility in a neutral country. **Dual Deposits:** Iran deposits comprehensive technical documentation; the United States deposits its complete sanctions architecture. Both are organized into tiers of sensitivity. **Sealing Protocols:** Each deposit is organized into numbered packets, sealed with cryptographic and physical security. **Progressive Opening Conditions:** Each packet has pre-agreed opening conditions tied to verified implementation timelines.

HUMAN-IN-THE-LOOP

The Sealing Witness Protocol

Before any information packet is sealed, a **physical Sealing Ceremony** is conducted where senior archivists from both nations physically sign and witness each other's documentation, affixing both cryptographic seals and traditional wax seals to each packet. This ceremonial act builds institutional transparency and mutual confidence in the integrity of the deposited materials. Each Sealing Ceremony is photographed, the images are published to both parties' public archives, and the witnessing archivists' signed affidavits are filed with the Joint Secretariat.

HUMAN-IN-THE-LOOP

Tier-Opening Consultative Gate

TTD tiers do not open automatically when chronological thresholds are met. Instead, the opening of each tier requires a **joint declaration that "Strategic Reciprocity is Satisfactory"** issued by both parties' designated senior representatives (at the Assistant Secretary / Deputy Minister level or above). The declaration is a formal diplomatic instrument, not a technical checkbox. If either representative declines to issue the declaration, the tier remains sealed until the next quarterly review cycle, at which point the question is reconsidered. No party may be pressured to issue a declaration; the refusal itself is data about the state of the relationship.

Political Advantages

The TTD solves the political problem of disclosure timing. Iranian leaders can say they placed documentation in neutral custody, opened only if the Americans perform. American leaders can say they have access to Iran's complete nuclear archive, released in tranches as Iran performs. The human-authorized tier gates ensure that disclosure never outpaces political readiness.

MECHANISM 9

The Regional Economic Integration Corridor

Purpose: To create a broader economic context that makes Iran's prosperity dependent on regional stability and cooperation, generating powerful domestic constituencies for continued engagement through human-managed financial governance.

Conceptual Foundation

Nuclear agreements that stand alone are fragile. They lack domestic constituencies beyond the narrow circle of diplomats who negotiated them. The Regional Economic Integration Corridor (REIC) addresses this by **embedding any nuclear understanding within a broader economic framework that generates visible, widely distributed benefits across Iranian society.**

Technical Design

The REIC operates through five instruments. **The Persian Gulf Energy Grid** connects Iran, Iraq, the Gulf states, and potentially Pakistan and Turkey. **The Hormuz Trade and Transit Zone** reduces barriers to goods transiting through Iranian ports. **The Regional Development Bank** finances infrastructure projects throughout the region. **The Science and Technology Partnership** channels international investment into Iranian research institutions. **The Tourism and Cultural Exchange Network** facilitates travel and cultural programming.

Table 2: REIC Conditionality Framework

Nuclear Milestone	Economic Benefit Unlocked
Comprehensive declaration and initial monitoring	Humanitarian trade licenses; tourism pilot
90 days enrichment halt; IAEA full access	Energy grid feasibility; development bank membership
Stockpile transfer to neutral custody	Transit zone activation; tech partnership launch
Centrifuge mothballing under JSCP	Full energy grid construction; regional bank lending
2 years full compliance	Full REIC membership; normal trade relations

REIC Fallback Moat. The activation of any emergency fallback protocol under the Escalation Ladder explicitly disqualifies both parties from accessing any regional economic integration or development bank benefits under this Mechanism. Conditionality gates freeze at their current level during any emergency fallback.

HUMAN-IN-THE-LOOP

REIC Gatekeepers Review Panel

The Regional Development Bank is governed by a **board of regional finance ministers** (Iran, Oman, Qatar, Iraq, plus rotating representation from other Gulf states). No project may receive financing without a majority vote of the Board. Control shifts from automated conditionality triggers to human financiers who exercise independent judgment about creditworthiness, political risk, and developmental impact. The Board meets quarterly and may approve or reject projects regardless of whether the corresponding nuclear milestone has technically triggered.

HUMAN-IN-THE-LOOP

The Fallback Moat Discretionary Review

While the REIC Fallback Moat freezes conditionality gates at their current level during emergency fallbacks, the **Regional Development Bank Board may vote to maintain specific non-sensitive integration infrastructure** (public health partnerships, scientific exchange networks, educational programs) despite an isolated transactional freeze. **The vote requires a 75% supermajority of the Board's voting members, including affirmative votes from both American and Iranian representatives.** A single party cannot unilaterally block a discretionary maintenance decision, but neither party can be overruled without broad regional support. This prevents a single veto from killing people-to-people relationships during a crisis while ensuring no party is railroaded into maintaining cooperation it genuinely opposes.

MECHANISM 10

The Evergreen Reciprocity Architecture

Purpose: To eliminate the political poison of "permanent" commitments by creating an architecture of automatic renewal sustained by mutual performance, with a pre-negotiated glide path on non-renewal and human judgment at every critical node.

Conceptual Foundation

Neither Iranian nor American politicians can sell permanent commitments to their domestic audiences. **The Evergreen Reciprocity Architecture (ERA) eliminates this obstacle by making every commitment self-sustaining through automatic renewal.** Instead of asking either party to commit forever, the Framework operates as a living agreement that persists and deepens so long as both parties perform, with automatic renewal at each cycle and a pre-negotiated glide path if either party opts out.

Technical Design

The Renewal Cycle. Every provision operates on a defined cycle, typically five years. As each cycle approaches its end, both parties conduct a comprehensive review. If both certify substantial compliance, the provision automatically renews. Either party may affirmatively decline automatic renewal only by providing written notice within the 90-day review window preceding a cycle's end.

The Non-Renewal Protocol. If either party decides not to renew, it must provide 18 months' advance notice. During this period, a pre-negotiated glide path governs the unwinding: Months 1-6 are consultation; Months 7-12 see gradual reduction; Months 13-18 see full unwinding with continued IAEA safeguards.

Escrow Unwinding on Non-Renewal. Upon formal filing of an 18-month notice, all unreleased packets in the Parallel Confidence Reservoirs are permanently frozen. No micro-transactions may be initiated during the glide path. Frozen Iranian material packets are returned to Iranian sovereign custody at the Full Sunset date. Frozen American financial packets are returned to the United States Treasury at the Full Sunset date. Unspent escrow assets may not be claimed, transferred, or liquidated prior to the Full Sunset date except by mutual written consent.

Table 3: ERA Non-Renewal Escalation Ladder

Phase	Timeline	Iranian Status	American Status
-------	----------	----------------	-----------------

Active Framework	Years 1-5	Full obligations; full benefits	Full obligations; full benefits
Notice Period	Months 1-18	Gradual obligation reduction; escrow frozen	Gradual benefit reduction; escrow frozen
Residual Framework	Years 6-8	Core IAEA safeguards remain	Core humanitarian licenses remain
Transition	Years 9-10	Bilateral safeguards only; escrow returned	Pre-Framework sanctions; escrow returned
Full Sunset	Year 10+	Full sovereign discretion	Full sovereign discretion

Political Advantages

The ERA frames the agreement as something that endures and strengthens through performance. It transforms the psychological character of the Framework: not a prison from which escape is impossible, but a garden that both parties tend because it bears fruit. Agreements sustained by mutual benefit are far more durable than agreements sustained by coercion.

Part III: Implementation Architecture

3.1 The Joint Secretariat

The Joint Secretariat is the permanent institutional backbone of the Framework. It is headquartered in a neutral location (Geneva, Muscat, or Doha) and staffed by approximately 200 professionals. The staff is composed in equal thirds: one-third nominated by the United States, one-third nominated by Iran, and one-third selected by mutual agreement from neutral countries. The Executive Director serves a five-year term, renewable once, selected by consensus. The Joint Governing Council is composed of senior officials from both parties, meeting monthly.

Mandate and Functions

The Secretariat performs six core functions. **Sequence Management:** maintains the Master Sequence Document, tracks compliance, authorizes phase transitions (subject to dual-key human authorization per Section 1.5), and manages the 48-hour Administrative Buffer Window. **Dispute Facilitation:** serves as first port of call through a 24/7 Operations Center. **Information Management:** maintains official records in English and Persian with equal legal validity. **External Liaison:** coordinates with IAEA, UN, regional organizations. **Technical Support:** provides training and advisory services. **Adaptation Management:** proposes technical adaptations.

Cyber Incident Response

The Secretariat maintains a dedicated CIRT staffed by certified digital forensics experts from neutral countries.

HUMAN-IN-THE-LOOP

Bilateral Forensic Sieve for Cyber Violations

Before any cyber incident is delivered as "binding" to the Joint Secretariat, a **joint human review panel** within the CIRT — composed of one U.S. cyber specialist, one Iranian cyber specialist, and one neutral forensics expert — must co-sign the attribution report. All three signatories must concur that the incident meets the definitional threshold of a cyber violation set out in Section 1.2. If any signatory dissents, the incident is referred to the Escalation Ladder at Rung 3 (Neutral Expert Panel) rather than being treated as a confirmed violation. No compliance action may be taken until the panel's report is finalized.

Funding

The Secretariat is funded equally by both parties, with additional contributions from neutral states. Financial contributions are made into a neutral escrow account and released against audited expenditures.

HUMAN-IN-THE-LOOP

The Secretariat Human Sieve

The technical software outputs of the Master Sequence Document — including automated compliance determinations, trigger readiness reports, and phase transition recommendations — must be formally reviewed and **co-signed by the American and Iranian Deputy Executive Directors** of the Secretariat before any trigger becomes binding. Neither Deputy may delegate this signatory authority. If the two Deputies disagree on whether a trigger should activate, the matter is escalated to the Joint Governing Council for human deliberation. The software informs; the humans decide.

HUMAN-IN-THE-LOOP

Provisional Measures Executive Sign-Off

Before the Executive Director issues any provisional freeze order, temporary adjustment, or emergency directive, the Director must obtain **verbal or written concurrence from both parties' senior council officials** on the Joint Governing Council. If either official declines concurrence, the provisional measure may not be issued and the matter is referred to the full Council within 24 hours. This preserves political buy-in and prevents the Secretariat from acting as an autonomous arbiter of disputes.

3.2 The Neutral Custodian Consortium

The NCC provides independent verification, escrow, and authentication services. Founding members include the IAEA for nuclear verification; the Central Bank of Oman (Muscat) for primary financial escrow; Qatar National Bank (Doha) for supplementary custodianship; UBS AG, Zurich for Swiss-denominated escrow; ICSID for legal arbitration; and Swiss, Austrian, and Singaporean technical firms for facility management.

Mandate and Functions

The NCC performs four functions. **Escrow Management:** holds and administers all PCR assets, denominated in non-USD currencies. **Independent Verification:** conducts its own verification activities. **Authentication Services:** authenticates documents and assets. **Ledger Maintenance:** maintains the official compliance ledger.

Sovereign Immunity Guarantee

All escrowed assets are held in accounts expressly designated as sovereign property of the Sultanate of Oman and the State of Qatar, legally insulated from domestic civil litigation, third-party attachments, or judicial seizure within either signatory state.

Neutrality Guarantees

NCC personnel are prohibited from accepting employment from either party for five years after leaving service. Budgets are independently audited. Either party may request replacement of a member if it can demonstrate bias or incompetence.

3.3 Verification and Monitoring

Verification is the sine qua non of the Framework. Five principles govern it: comprehensiveness, transparency, intrusiveness calibrated to risk, redundancy, and mutuality.

Verification Methods

The Framework employs a layered architecture: remote monitoring through sensor networks and satellite surveillance; on-site inspections by IAEA and NCC personnel; environmental sampling; financial tracking; and human intelligence networks subject to sharing obligations with the NCC.

Data Relay Protocol

If encrypted data feeds from any safeguarded facility go dark due to an unverified technical interruption, the automated compliance clock is paused for up to 48 hours. The affected party must notify the Secretariat, permit secure data transfer, and cooperate with JTSC investigation.

HUMAN-IN-THE-LOOP

The Data Relay Technical Liaison Team

Within 2 hours of any feed going dark, a **Quick-Reaction Technical Team** consisting of one engineer from each side and one neutral IAEA technician must be physically dispatched or digitally connected to diagnose the fault. The Team has 24 hours to determine whether the interruption is technical (cable cut, power failure, satellite outage) or suspicious (indicating potential tampering or cyber compromise). The Team's written assessment, co-signed by all three members, determines whether the pause is extended or converted to a compliance event. Automation pauses; humans diagnose.

HUMAN-IN-THE-LOOP

Human Intelligence (HUMINT) Clarification Track

A secure, offline **human channel** is designated between the heads of intelligence of both states to quietly resolve or clarify sensitive raw intelligence before it is formalized into a public Escalation Ladder dispute. Either intelligence chief may initiate a "quiet clarification" request; the other must respond within 72 hours. Information shared through this channel is inadmissible in formal dispute proceedings but may be used to withdraw or modify a dispute that was initiated based on subsequently clarified intelligence. This channel exists to prevent politically sensitive intelligence from prematurely poisoning the formal dispute process.

Compliance Assessment

The NCC conducts quarterly assessments on a four-point scale: Full Compliance, Substantial Compliance, Partial Compliance, and Non-Compliance. Assessments are published simultaneously to both parties and inform decisions about phase transitions, asset releases, and renewal under the ERA.

Part IV: Dispute Resolution and Adaptation

4.1 The Escalation Ladder

When a dispute arises, the Framework channels it through a defined escalation ladder.

Rung 1: Technical Consultation (Days 1-15). The Secretariat convenes technical experts within 72 hours.

Rung 2: Senior Official Mediation (Days 16-45). Senior officials meet with the Executive Director as mediator.

Rung 3: Neutral Expert Panel (Days 46-90). A three-person panel investigates and issues a non-binding advisory opinion.

Rung 4: Binding Arbitration (Days 91-180). A five-person tribunal issues final, binding decisions.

Rung 5: Political Dialogue (Parallel Track). Either party may request foreign minister-level dialogue at any time.

Provisional Measures

During dispute resolution, provisional measures are temporary, reversible, designed to preserve the status quo, and automatically terminated when the dispute is resolved. The activation of any emergency fallback disqualifies both parties from REIC economic benefits.

4.2 The Adaptation Protocol

The Framework includes a formal Adaptation Protocol permitting evolution without renegotiation. Adaptation may be triggered by technical change, political change, regional change, compliance experience, or external shock.

When triggered: Notification to the Secretariat; Technical Assessment; Consultation with both parties (60 days); Decision by consensus; Ratification for significant adaptations.

Adaptations may not eliminate core reciprocity, may not reduce verification below safeguards standards, may not discriminate, and fundamental alterations require re-ratification.

HUMAN-IN-THE-LOOP

The Strategic Horizon Review Panel

In addition to scheduled technical reviews, a continuous **Strategic Horizon Panel** is established, composed of two historians, two sociologists, and two retired statesmen (one from each culture, plus two neutrals). The Panel meets semi-annually to provide qualitative, humanistic feedback on how the Framework is changing societal perceptions, workplace dynamics, strategic cultures, and generational attitudes in both nations. Their reports are advisory but are formally presented to the Joint Governing Council and published in both countries' media. The Panel's purpose is to steer the evergreen Framework away from cold, programmatic stagnation by ensuring that the human dimension of the relationship receives as much attention as the technical dimension.

Part V: Final Provisions

5.1 Entry into Force

This Framework shall enter into force upon deposit of instruments of ratification with the Joint Secretariat.

INARA Harmonization. The United States Executive Branch is prohibited from releasing any escrowed financial assets, suspending statutory sanctions, or activating any Phase One micro-transaction until the expiration of the mandatory 31-day congressional review period required by the Iran Nuclear Agreement Review Act of 2015. Phase One micro-transactions shall commence exactly 31 days after formal submission to Congress unless a joint resolution of disapproval is enacted.

Pending ratification, both parties may declare provisional application of selected mechanisms by mutual agreement, terminable upon 30 days' notice. Provisional application excludes escrowed asset releases and statutory sanctions suspension prior to the INARA review window.

5.2 Duration and Review

The Framework remains in force for an initial period of ten years, automatically renewable under the ERA unless either party provides written notice of non-renewal.

Escrow Unwinding on Non-Renewal. Upon formal filing of an 18-month notice, all unreleased packets are permanently frozen. Iranian material is returned to sovereign custody at Full Sunset; American financial packets are returned to the US Treasury. Unspent assets may not be liquidated prior to Full Sunset except by mutual consent.

Comprehensive reviews occur at Year 2, Year 5, Year 8, and every five years thereafter.

5.3 Signature and Ratification

This Framework is open for signature by the United States of America and the Islamic Republic of Iran. Instruments of ratification are deposited with the Joint Secretariat. Amendments require mutual agreement and exchange of confirming notes.

In witness whereof, the undersigned, being duly authorized by their respective governments, have signed this Framework.

This document is offered as a draft framework for academic and diplomatic discussion. Version 1.2 introduces a Human-in-the-Loop governance architecture designed to restore diplomatic agency, strategic discretion, and psychological safety to an instrument that would otherwise risk catastrophic automated cascades. It incorporates structural hardening from Version 1.1 while ensuring that automation serves human judgment rather than replacing it.
