

DIPLOMATIC INSTRUMENT — MODULAR STABILIZATION ARCHITECTURE

The Turning Point Accord

*A Non-Symmetrical Framework for Nuclear Constraint,
Maritime Openness, and Mutual Economic Gain*

Between the United States of America
and the Islamic Republic of Iran

Reference: TPA-2026-v1.0 | Date: 22 May 2026

PREAMBLE

Situational Assessment: 22 May 2026

Non-Symmetrical Architecture

THE TEN MODULES

Module 1: HEU Physical Extrication

Module 2: Enrichment Constraint Without Surrender

Module 3: Facility Civilian Conversion Lock

Module 4: Hormuz Open Transit Framework

Module 5: Maritime Economic Mutualization

Module 6: Graduated Interdiction Release

Module 7: Asset Return with Performance Lock

Module 8: SWIFT Reconnection by Installment

Module 9: Proxy Network De-escalation

Module 10: Reconstruction Without Reparations

GOVERNING ARCHITECTURE

Step-Back / Earn-Back Protocol

Three Emergency Off-Ramps

Economic Incentive Summary

Instruments of Acceptance

Preamble: Situational Assessment

THE MOMENT. As of 22 May 2026, Secretary Rubio reports "slight progress" in talks mediated by Pakistan, with Tehran reviewing the latest US proposal. President Trump has paused military strikes at the request of Gulf allies, holding off because "serious negotiations" are underway. Iran's Persian Gulf Strait Authority announced a "controlled maritime zone" on 20 May, claiming coastal state rights to formalize transit mechanisms with Oman.

THE DISTANCE. The United States demands: physical extraction of all HEU from Iranian territory; enrichment suspension for decades; a single operational nuclear facility; no Hormuz tolling; at least 25% of frozen assets withheld; zero reparations. Iran maintains: enrichment as a sovereign right under NPT Article IV; coastal state prerogatives in the Strait; tangible economic normalization including banking and trade restoration; and the PGSA as a legitimate maritime coordination body.

THE BRIDGE. This Turning Point Accord offers ten modular solutions. Each module is independently selectable and independently executable. The architecture is deliberately non-symmetrical: Iran may deliver first in one module, the US in another, both simultaneously in a third, and sequencing varies without pattern. There are no sunset clauses. There is no snapback — only graduated step-back with earn-back pathways. Every module carries concrete economic incentives calibrated to make both sides want to say yes.

Non-Symmetrical Movement: Three Principles

Variable First-Mover. No fixed rule governs which side initiates. In Module 1, Iran physically transfers HEU first; the US responds with asset releases. In Module 4, the US opens Hormuz transit first; Iran responds with PGSA integration. In Module 7, both act simultaneously. The pattern is deliberately irregular.

Dissimilar Concessions. Concessions are not designed to match in kind, scale, or timing. HEU custody (Iran) does not mirror banking relief (US). Enrichment suspension (Iran) does not mirror carrier repositioning (US). Each concession is calibrated to its own logic.

Independent Collapse. Failure in one module does not cascade. Hormuz disputes cannot terminate asset releases. Proxy incidents cannot close the humanitarian corridor. Each module lives or dies on its own verification.

Module 1: HEU Physical Extrication

US demand: Physical extraction of all 400 kg HEU from Iran for ultimate destruction. **Iran red line:** Material must not enter US hands; sovereignty must be visibly preserved.

Option A: Sovereign Guarded Airlift to Islamic Custody (SGATIC)

Iranian C-130 aircraft, IRGC escort, flies HEU to Duqm, Oman within 72 hours. Oman-IAEA joint command holds physical keys; Iran holds procedural veto over security logs; US receives real-time telemetry only. Legal title in Swiss BIS escrow; disposition requires 2 of 3 (US, Iran, IAEA). Downblending begins Day 30; LEU to Kazakhstan IAEA Bank by Day 180. **Non-symmetrical:** Iran moves first (transports); US responds to verification (releases assets); Oman activates last (facility).

Option B: In-Line Mobile Dilution at Border (ILMD-B)

HEU loaded onto Swiss/Kazakhstan mobile processing vehicles at Bandar Abbas port. Material exits Iranian sovereignty immediately upon IAEA seal. Downblending to medical-grade LEU occurs inside mobile units on 96-hour timeline in international waters. Physical Escrow Intermediary: vessel holds at designated waypoint until Day 10 blockade reduction triggers are verified. If US defaults, material returns under international escort. **Non-symmetrical:** Iran loads and seals (Day 1-2); Switzerland processes (Day 3-6); US responds to completion (Day 7+).

Option C: Tri-National Custody with Conditional Destruction (TNC-CD)

HEU to Al Udeed, Qatar. Three-key system: US (digital monitoring), Iran (physical security), Qatar (procedural arbitration). All three required for access. Joint Destruction Commission over 12 months; Iran holds blocking minority. Month 12: automatic IAEA downblending if no consensus. **Non-symmetrical:** Iran initiates transport; Qatar activates facility; US connects telemetry — each activates a different system at a different time.

Economic Incentives — Module 1

- **US:** 400 kg weapons-grade material physically outside Iran within 72 hours; real-time destruction monitoring; breakout timeline extended to 24+ months.
- **Iran:** \$5 billion released to Oman escrow upon IAEA custody confirmation; material never enters US hands; Iranian guards escort the transport; legal veto over disposition preserved.

Module 2: Enrichment Constraint Without Surrender

US demand: No enrichment for decades. **Iran red line:** Enrichment is sovereign right under NPT Article IV; cannot appear as surrender.

Option A: Performance-Linked Extension (PLE-20)

Baseline 8-year enrichment suspension to 3.67%, extendable by 2 years per year of IAEA-certified clean compliance, capping at 20 years. Extension requires affirmative Joint Implementation Group certification each year — not automatic. Material breach pauses at achieved duration; clean compliance resumes extension. Iran can achieve 20 years through behavior but is not locked in by signature. After achieved duration, Iran may petition for phased civilian fuel-cycle restoration under successor verification architecture. No automatic resumption. No sunset. **Non-symmetrical:** Iran accepts suspension upfront (moves first); US accepts extension is performance-linked (accepts binding limit on its own leverage).

Option B: Fuel Consumer State Guarantee (FCSG)

Iran accepts 20-year moratorium on enrichment above 3.67%. In exchange, US/Russia/China/France provide legally binding, irrevocable guarantee of Iran's entire civilian nuclear fuel supply for Bushehr and all future reactors, backed by \$10 billion IAEA escrow. If consortium fails to deliver for 90 consecutive days, moratorium reduces to 10 years and Iran may petition for fuel-cycle restoration. Iran operates as a Japan-without-domestic-enrichment state: reactors, isotopes, fuel fabrication, research — all preserved. Enrichment above 3.67% permanently renounced. Industrial-scale enrichment suspended for the achieved duration. **Non-symmetrical:** Iran gives up enrichment production; US and three other powers become Iran's fuel suppliers for 20 years.

Option C: Tiered Variable Duration (TVD-10-20)

Years 1–10: total enrichment suspension. Zero enrichment above 3.67%; all advanced centrifuges sealed; only Natanz operates at 3.67% with 300 kg cap after Year 5. Years 11–20: Iran may petition for 3.67% enrichment at Natanz only, 500 kg cap, all other sites in civilian conversion lock. Transition requires IAEA clean certification only — not US political approval. Material breach in Years 1–10 triggers 2-year extension; clean compliance beyond Year 8 triggers early petition review. Trump markets Years 1–10 as total freeze; Iran markets Years 11–20 as restored enrichment rights. Both are factually accurate. No sunset; no automatic resumption. **Non-symmetrical:** Iran accepts deep freeze early; US accepts automatic civilian rights restoration late.

Economic Incentives — Module 2

- **US:** 20-year enrichment constraint verified by IAEA; deeper freeze than any prior agreement; breakout timeline starts at 24 months and extends.
- **Iran:** \$10 billion fuel supply escrow guarantees energy security; civilian nuclear program fully preserved as consumer state; enrichment rights restoration pathway maintained through petition mechanism.

Module 3: Facility Civilian Conversion Lock

US demand: Five underground sites neutralized. **Iran red line:** Infrastructure and personnel must be preserved; destruction cannot appear as humiliation.

Option A: Dual-Track Civilian Conversion (DTCC)

Fordow and Natanz convert to medical isotope production and nuclear research campuses under Technical Custody Consortium (Swiss, Austrian, Omani engineers) operating under continuous, real-time IAEA safeguards monitoring. All telemetry logs are simultaneously duplicated to the IAEA Secretariat in Vienna. The IAEA retains ultimate oversight and verification authority; the TCC operates as the technical implementation body, not as a verification alternative. Iranian scientists lead research programs. Revenue: Iran 40%, TCC 35%, Global Health Fund 25%. Isfahan and two classified sites enter mothball status with sealed tamper-resistant safeguards monitoring. Centrifuge rotors removed and sealed; infrastructure remains intact. Sites may restore low-enrichment civilian fuel production only if successor framework not reached by Year 15, subject to 30-day IAEA notification. 60–75% of advanced rotors destroyed or exported under IAEA observation within 60 days. Remainder sealed for potential civilian research. **Non-symmetrical:** Iran accepts conversion at 2 sites; US accepts mothballing at 3. Different tracks, different timelines.

Option B: International Medical Isotope Hub (IMI-H)

All five sites become a Regional Medical Isotope Production Network. Fordow: primary Mo-99 and I-131 production. Natanz: nuclear research campus with Iranian-led programs. Isfahan: LEU storage and safeguards training. Sites 4 and 5: geophysical research and materials science laboratories. International Scientific Advisory Board with Iranian co-chair authority. Annual revenue ~\$300M shared: Iran 45%, consortium 40%, health fund 15%. Transforms Iran's nuclear complex from military liability to revenue-generating scientific asset. **Non-symmetrical:** Iran gives up weapons potential; gains intellectual leadership and 45% revenue share.

Option C: Sealed Verification with Warm Idle (SV-WI)

All five sites remain physically intact. Centrifuges in "warm idle" — climate-controlled, maintained, not dismantled — under IAEA seal. Sealed tamper-resistant safeguards monitoring records all operational parameters; anomaly alert within 15 minutes. Permissioned blockchain log creates immutable verification history. Year 15 review determines conversion or continued preservation. 60–75% of advanced rotors destroyed; remaining infrastructure sealed. **Non-symmetrical:** Iran preserves buildings and staff; US gains continuous telemetry and irreversible rotor destruction.

Economic Incentives — Module 3

- **US:** Five sites under continuous IAEA monitoring; 60–75% of advanced rotors physically destroyed; no rapid reconstitution possible.
- **Iran:** Facilities remain physically intact; scientists retain positions; \$120–300M annual revenue from civilian isotope production; infrastructure preserved for Year 15 civilian restoration review.

Module 4: Hormuz Open Transit Framework

US demand: No tolling; Strait must be free international waterway. **Iran red line:** PGSA recognized as legitimate maritime body; coastal state prerogatives acknowledged.

Option A: Joint Maritime Safety Board Integration (JMSB-I)

PGSA integrated into Joint Maritime Safety Board as Iran's designated technical implementation body for coordination within Iranian territorial waters. PGSA retains Iranian statutory authority but exercises it under JMSB Council oversight. All PGSA permits bear dual branding: PGSA-Iran and JMSB-Authorized. JMSB Council: Oman (chair), US, Iran (technical representative), GCC rotating, EU observer, China observer. Routine decisions: 3 of 4 permanent members. JTCCs at Bandar Abbas, Khasab, and floating platform at Strait midpoint. JTCCs do not stop, board, or search — purely coordinative. Universal Transit Certificate from JMSB Secretariat in Muscat. **Non-symmetrical:** Iran gives up unilateral authority; gains permanent seat and dual branding.

Option B: Maritime Safety Coordinator Model (MSCM)

PGSA rebranded as "Persian Gulf Maritime Safety Coordination Office." Functions limited to: navigational safety bulletins; emergency search-and-rescue coordination; 24/7 maritime distress hotline; weather and traffic data sharing. PGSA has *no authority* to issue transit permits, levy fees, or deny passage. Transit rights governed by UNCLOS Article 37. All vessel vetting by JMSB Secretariat in Muscat against neutral criteria. Israeli-flagged vessels identical treatment. **Non-symmetrical:** PGSA retains institutional existence and HQ; US gains elimination of all regulatory authority.

Option C: Cooperative Information Exchange (CIE)

No joint authority replaces PGSA. Iran and US share AIS data, patrol schedules, and distress plans through Omani Maritime Coordination Cell in Muscat. Both navies operate independently with full transparency. PGSA issues advisory notices (non-binding) for Iranian territorial waters. US 5th Fleet issues parallel Notices to Mariners for international waters. No permits required; no fees collected. Two systems operate in parallel, competing for compliance through service quality. If one fails, the other maintains coverage. **Non-symmetrical:** neither side surrenders unilateral authority.

Economic Incentives — Module 4

- **US:** No unilateral Iranian tolls; freedom of navigation preserved; 10% of Maritime Infrastructure Contribution flows to US Treasury as Naval Cost-Recovery.
- **Iran:** PGSA recognized with permanent institutional role; 35% of Maritime Infrastructure Contribution; port service fees for legitimate UNCLOS services (pilotage, tugs, weather routing).

Module 5: Maritime Economic Mutualization

US demand: No tolls to Iran. **Iran red line:** Revenue stream from legitimate maritime services.

Option A: Maritime Infrastructure Contribution (MIC)

No tolls paid to Iran. Strait Maritime Infrastructure Contribution of 0.15% of cargo value collected by JMSB Secretariat in Muscat — not by Iranian authorities. Revenue (~\$500M at capacity): 35% Iranian Civilian Reconstruction Fund (PGSA oversight); 35% International Maritime Safety Fund; 20% JMSB Operations; 10% US Naval Cost-Recovery to US Treasury. Tier 1 (humanitarian): zero contribution, 24-hour fast-track. Tier 2 (standard): \$0.15/ton. Tier 3 (energy): \$0.25/ton or \$35,000 flat per VLCC. Denominated in non-dollar currencies (Omani rial, euro). **Non-symmetrical:** Iran receives largest single share (35%) through multilateral filter; US receives dedicated 10% revenue-positive stream.

Option B: Voluntary Risk-Mitigation Contribution (VRMC)

No mandatory contributions. Voluntary system: vessels paying VRMC receive insurance premium discounts (Lloyd's partnership), fast-track processing, priority distress response. Non-contributors transit freely without penalty. VRMC administered by Lloyd's and Omani Sovereign Wealth Fund — not Iran. \$20 billion reinsurance backstop (US DFC \$10B + Lloyd's \$5B + Oman \$5B) activates at 200 authorized transits. Revenue funds International Maritime Safety Fund exclusively. **Non-symmetrical:** Iran gets no direct toll revenue but benefits from safer shipping lanes; US gets commercial incentive alignment.

Option C: Port Services Fee Architecture (PSFA)

No transit fees. Iran charges only for specific legitimate coastal state services under UNCLOS: pilotage, tug assistance, emergency response, weather routing, marine pollution prevention. Standard, internationally recognized services rendered to vessels *choosing* to use them. Voluntary and competitively priced. Revenue to Iranian Ports and Maritime Organization (civilian entity), not IRGC or PGSA. Published fee schedule reviewed quarterly by independent maritime economists. **Non-symmetrical:** US accepts legitimate service fees; Iran retains revenue stream decoupled from transit rights.

Economic Incentives — Module 5

- **US:** Deal is revenue-positive (10% to Treasury); no Iranian sovereign tolling; global shipping lanes stabilized.
- **Iran:** 35% MIC share = ~\$175M/year institutional revenue; port service fees add ~\$80M/year; PGSA role institutionalized.

Module 6: Graduated Interdiction Release

US position: Interdiction remains until verified compliance. **Iran position:** Interdiction must lift as compliance is demonstrated; cannot be indefinite leverage.

Option A: Conditional Graduated Release (CGR)

Five phases, each triggered by verified Iranian compliance: **Phase 1 (Day 1):** Iran freezes enrichment above 60%. US exempts HSLF vessels. **Phase 2 (Day 7):** Iran opens Hormuz to JMSB humanitarian transit at zero cost. US reduces interdiction 50% for non-military cargo. **Phase 3 (Day 14):** Iran consolidates HEU under custody. US suspends aerial surveillance over Iranian waters. **Phase 4 (Day 21):** Iran transfers PGSA checkpoint control to JMSB. US adjusts force posture. **Phase 5 (Day 30):** Full interdiction lift; JMSB assumes full operational authority. **Non-symmetrical:** Iran moves first at every phase; US responds after verification. Completed steps ratcheted forward, not reversed. **Module Independence Stabilization Clause:** Interdiction adjustments and maritime triggers within this module operate strictly as independent technical milestones and cannot be paused or reversed by external compliance disputes in unrelated modules. A Hormuz dispute in Module 4 does not affect interdiction reduction in Module 6. A proxy incident in Module 9 does not freeze interdiction release. Each phase of Module 6 advances solely based on its own verified trigger, independently of all other module statuses.

Option B: HEU-Linked Interdiction Architecture (HEU-LIA)

Interdiction reduction mechanically linked to HEU extraction progress. Full interdiction remains until IAEA confirms HEU under custody. Once custody confirmed, interdiction lifts 75% immediately; remaining 25% tied to HEU physically departing Iranian territory or certified as downblended. During custody-to-extraction window (Days 1–30), HSLF and agricultural vessels exempted. Full commercial interdiction remains until extraction milestone. **Non-symmetrical:** Trump gets direct linkage between his core demand and interdiction lift; Iran gets clear, predictable pathway.

Option C: Reciprocal Port Access (RPA)

US lifts interdiction in exchange for Iran granting US-flagged vessels priority transit status: priority processing, guaranteed 24-hour transit window, dedicated coordination channel. Both sides gain visible economic benefits: Iran's ports reopen immediately; US vessels receive commercially valuable guarantees. Revenue-positive: US shipping companies pay standard JMSB fees for priority service. Iran gains port revenue and customs duties. Interdiction lifts Day 3; priority access activates simultaneously. If Iran denies priority access, interdiction reactivates automatically. **Non-symmetrical:** Iran acts first (grants priority); US responds (lifts interdiction); both gain economically.

Economic Incentives — Module 6

- **US:** Verified compliance before each interdiction reduction; ratcheted forward (completed steps not reversed); force protection maintained until HEU secured.
- **Iran:** Ports reopen within 3–30 days; customs duties resume (~\$2B/year); petroleum exports authorized by Day 30; full trade resumption within 30 days.

Module 7: Asset Return with Performance Lock

US demand: Maximum 25% short-term release; performance reserves held. **Iran demand:** Unfreezing ~\$100B to halt currency collapse; protection from court seizure.

Option A: Dual-Tier Sovereign Immunity Escrow (DSIE)

Assets to Central Bank of Oman, designated "diplomatic escrow funds" protected by sovereign immunity and UNSC resolution. **Currency Mechanism:** All assets are mechanically liquidated and denominated in non-dollar currencies (60% euro, 25% Omani rial, 15% Swiss franc) prior to clearing international escrow, permanently removing them from US domestic clearing infrastructure (CHIPS/FedWire) and rendering US domestic court judgments non-executable against the funds. **Tier A (55% — \$55B equivalent):** Released per tranche schedule in euro/rial/franc denominations. World Bank administration with Iranian programmatic input. Civilian infrastructure, healthcare, education, environmental remediation. Auto-exclusion for IRGC-linked entities. **Tier B (45% — \$45B equivalent):** Held until Year 2. Released only upon IAEA sustained compliance certification. If material breach: converts to "Regional Stability Fund" administered by Oman for Gulf reconstruction including projects inside Iran via UN agencies. Sovereign Immunity Shield plus non-dollar denomination provides dual protection from US court seizure. **Non-symmetrical:** Iran gets \$55B equivalent flowing within 180 days in non-dollar currencies; US retains \$45B equivalent leverage until Year 2.

Option B: Structured Liquidation with Counterparty Protection (SLCP)

Liquidation in tranches against pre-negotiated commitments. Each release requires: IAEA milestone verification; Joint Secretariat approval; Omani central bank guarantee. Funds usable only from pre-approved "Green Corridor" list (medicine, food, agricultural equipment, civilian aviation parts, renewable energy). Iranian banks independently audited quarterly by Deloitte or PwC. Diversion to IRGC or military = freeze of next three tranches. Counterparty protection ensures US-sourced goods flow to Iran, creating American commercial beneficiaries who lobby for continued engagement. **Non-symmetrical:** Iran gets structured access to funds; US gets economic stakeholders with domestic political voice.

Option C: Islamic Development Bank Credit-Line (IDB-CL)

Frozen assets converted to revolving credit line at Islamic Development Bank, Oman as operational node. Iran draws for approved civilian imports. IDB processes all transactions, screens recipients, reports monthly to Joint Secretariat. Three advantages: (1) frozen assets never become liquid cash — always intermediated; (2) Shariah-compliant framework domestically acceptable in Iran; (3) credit line denominated in basket of currencies (40% euro, 30% yuan, 20% riyal, 10% rupee), insulating Iran from dollar dependency. Maximum 25% (\$25B) Year 1; remainder in 10% annual increments. **Non-symmetrical:** Iran gets functional banking access; US maintains oversight through IDB reporting.

Economic Incentives — Module 7

- **US:** 45–75% of assets held as performance reserve; structured releases prevent diversion; American exporters become stakeholders.
- **Iran:** \$20–55B within 180 days; protected from US court seizure; currency stabilization; sovereign immunity shield.

Module 8: SWIFT Reconnection by Installment

US demand: Verified non-diversion before full reconnection. **Iran demand:** End of banking isolation; functional trade finance.

Option A: Consolidation-Bank Gateway (CBG)

Single designated "consolidation bank" — Oman-Iran Reconstruction Bank — receives limited SWIFT connectivity for defined categories: humanitarian imports, petroleum sales to pre-approved customers, agricultural inputs. All transactions pre-cleared by compliance monitor (Deloitte/PwC) and screened against sanctions lists in real time. Graduated expansion: Month 3 — second tranche of clean-record private banks. Month 6 — state-owned banks. Month 12 — all banks except terrorism-designated. Tier 2 compliance concern = 14-day SWIFT hold; unresolved = rollback exactly one tier. Tier 1 technical disputes do not trigger the fuse. **Non-symmetrical:** Iran accepts SWIFT as privilege with transparent rollback; US retains graduated control.

Option B: Regional Clearing House (RCH)

Iran connects to new Regional Clearing House in Muscat under Omani central bank supervision. RCH clears Iranian trade with Asia, Africa, Europe through correspondent relationships with Omani, Qatari, Turkish banks. US banks not involved. European banks connect voluntarily. RCH operates on its own messaging standard interoperable with SWIFT but independent. Gives Iran functional banking connectivity without touching US-controlled SWIFT. Over 18–36 months, if compliance sustained, RCH bridged to SWIFT through Omani and Qatari correspondents. **Non-symmetrical:** Iran gets immediate banking access outside US control; US retains SWIFT leverage for later phases.

Option C: Digital Currency Trade Corridor (DCTC)

Iran's trade cleared through CBDC corridor operated by Oman's central bank. Digital rial minted against verified petroleum exports; usable to purchase goods from whitelist of international vendors. Settlement instant, transparent, recorded on permissioned blockchain managed by BIS and Oman's central bank. US regulators receive read-only access. Bypasses SWIFT entirely while providing complete transaction transparency. By Year 3, if compliance sustained, DCTC bridged to SWIFT through Oman. **Non-symmetrical:** Iran gains cutting-edge financial infrastructure outside dollar system; US gets full transparency.

Economic Incentives — Module 8

- **US:** Full transaction transparency; real-time screening; rollback mechanism preserves leverage; no uncontrolled reconnection.
- **Iran:** Limited SWIFT within 30 days (CBG); full banking normalization by Year 1; trade finance for petroleum, agriculture, medicine resumes within 90 days.

Module 9: Proxy Network De-escalation

US demand: Iran prevents proxy attacks on US/Gulf/Israeli targets. **Iran red line:** Cannot admit command or control over armed groups; proxy relationships are sensitive.

Option A: Best Efforts with Confidential Channel (BECC)

Iran uses best efforts to prevent affiliated, aligned, or partner network non-state actors from engaging in offensive operations against US, Gulf, Israeli, or international maritime targets. Does not require Iran to admit command or control. Defined as: transmitting deterrent messages through available channels; responding to confidential Joint Secretariat notifications within 24 hours; not providing material support for operations pre-identified as escalation risks. De-escalation Channel: Joint Secretariat confidentially notifies Iranian Senior Officer when intelligence suggests imminent proxy operations. Iran has 24 hours to respond with preventive action or factual explanation. Channel existence not acknowledged publicly. **Non-symmetrical:** US gets de-escalation mechanism without Iranian public admission; Iran gains confidential communication pathway.

Option B: 72-Hour Attribution Review (72HAR)

No single proxy kinetic incident automatically constitutes material breach. Any incident triggers 72-hour Joint Secretariat attribution review before step-back activates. Review considers: intelligence sourcing; chain-of-custody evidence; Iranian cooperation with investigation; proportionality. Escalation ladder: First attributed incident = 14-day hold on next tranche + confidential note. Second = 30-day hold + Compliance Index reduction 10 points. Third = rollback one full tier + public report. Fourth = referral to UNSC consultations. Sustained 180-day clean period = 10-point CI bonus + expedited tranche. **Non-symmetrical:** US gets structured accountability; Iran gets protection from automatic blame for unattributed incidents.

Option C: Regional Security Dialogue Integration (RSDI)

Annual Gulf Security and Energy Coordination Conference convened under Accord auspices, open to all regional states including Iran, Iraq, Lebanon, Yemen (Houthi representatives as observers), and Gulf states. Focus: maritime safety, energy stability, proxy de-escalation commitments, environmental cooperation. Conference produces non-binding "Stabilization Commitments" which become public benchmarks. Iran's participation in the conference and adherence to its commitments demonstrates good faith without formal admission of proxy relationships. **Non-symmetrical:** US gets regional forum for pressure; Iran gets diplomatic platform and de facto recognition as regional security stakeholder.

Economic Incentives — Module 9

- **US:** Reduced proxy attacks on US forces and allies; de-escalation channel prevents surprises; 72-hour cooling prevents rapid escalation.
- **Iran:** No requirement to publicly admit proxy relationships; confidential channel preserves diplomatic face; good proxy behavior unlocks accelerated relief (10-point CI bonus); regional conference participation confers legitimacy.

Module 10: Reconstruction Without Reparations

US demand: Zero war reparations; no admission of liability. **Iran demand:** Substantial reconstruction of infrastructure damaged since February.

Option A: No-Fault Regional Stabilization Credits (NFRSC)

International Gulf Reconstruction Fund established under sovereign immunity in Oman, World Bank administered. Funding: \$30B from Iranian frozen assets (Iran's own money via DSIE mechanism) plus voluntary Gulf state, EU, and development bank contributions. US contribution: technical assistance (USACE engineering, USAID programming, NRC nuclear safety expertise) and development finance guarantees — not direct cash. Label: "Regional Stabilization Reconstruction Credits," not reparations, not aid, but investment in regional stability that rebuilds Iranian infrastructure. Both leaders can claim victory: Trump did not pay reparations; Khamenei secured \$30B in reconstruction. **Non-symmetrical:** Iran receives \$30B benefit without US liability admission; US contributes expertise without cash payment.

Option B: Joint Infrastructure Partnership (JIP)

US-Iran Joint Infrastructure Partnership as for-profit commercial entity registered in Dubai International Financial Centre. Iran contributes land, labor, 40% capital; international investors (including US pension funds via UAE sovereign wealth intermediaries) contribute 60% capital. Rebuilds Iranian civilian infrastructure (ports, power grids, water treatment) as commercial projects with equity returns. US investors earn returns on Iranian reconstruction without government payment. Iran receives rebuilt infrastructure without US reparations. All contracts enforceable under English law in DIFC courts. Both sides market it as business deal, not political concession. **Non-symmetrical:** Iran gets rebuilt infrastructure; US investors earn profits; no government-to-government liability.

Option C: Environmental Remediation Trust (ERT)

US does not pay reparations for military damage. Instead, commits to funding Persian Gulf environmental remediation through standalone Environmental Trust administered by UNEP. Addresses oil spills, depleted uranium contamination, marine habitat destruction, air quality — damage caused by both sides during conflict. Iran receives substantial environmental cleanup (\$8–12B) without US admission of liability. US funds ecological recovery in region where it has strategic interests without acknowledging causation. Marine scientists, not politicians, administer Trust. Iran benefits from cleaner coastlines and fisheries; US benefits from regional stability and reduced environmental migration. **Non-symmetrical:** Iran receives \$8–12B in cleanup; US funds ecological interests without liability.

Economic Incentives — Module 10

- **US:** No reparations paid; no liability admission; American companies earn contracts; environmental and commercial benefits.
- **Iran:** \$8–30B in reconstruction benefit; ports, power grids, water treatment rebuilt; World Bank/UNEP administration avoids direct US control.

Governing Architecture: Step-Back / Earn-Back Protocol

No Snapback. This Accord contains no automatic snapback mechanisms. All compliance responses operate through graduated step-back with earn-back pathways. The principle is simple: Iran can always recover what it lost through verified corrective action. Total collapse requires sustained refusal to cooperate, not a single finding.

Table 1: Step-Back / Earn-Back Ladder

Trigger	Step-Back	Timeline	Earn-Back
Tier 1 technical concern	14-day hold on next relief tranche	Day 1–14	Resolve concern = tranche releases
Tier 2 verification finding	Rollback one compliance tier	Day 3–14	Re-permit inspections = 50% restoration per action
Proxy incident (1st, 90 days)	14-day hold + confidential note	Hour 0–72 review	180-day clean period = 10-point CI bonus
Proxy incident (2nd)	30-day hold + CI -10 points	Hour 0–72 review	180-day clean period = 10-point CI bonus
Proxy incident (3rd)	Rollback one full tier + public report	Day 1–14	Full cooperation review = tier restoration
Material breach (sustained)	Full tier rollback + UNSC referral	Day 14–30	Comprehensive compliance audit = full restoration
Concealed facility	Halt next tranche + investigation	Day 1–3	Re-seal + return material = 50% per action

Principles. (1) Proportionality: no response disproportionate to the triggering event. (2) Presumption of Continuity: the default is continued operation, not suspension. (3) Earn-Back Always Available: Iran can always recover lost relief through verified corrective action. (4) Independent Modules: step-back in one module does not affect other modules.

Three Emergency Off-Ramps

Off-Ramp Alpha: 72-Hour Auto-Renewing Security Freeze

The ceasefire operates as a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews. Only a written 48-hour notice of non-renewal from either Party to the Joint Secretariat can terminate the freeze. This off-ramp survives total Accord collapse and operates independently of all modules. Even if every module fails, the 72-hour freeze continues auto-renewing until explicitly terminated.

Off-Ramp Beta: Humanitarian Supply Line Firewall (HSLF)

The humanitarian corridor through the Strait of Hormuz and the agricultural supply line from Aqaba/Bandar Abbas operate at zero cost, with zero inspection delay, for all vessels carrying WHO/FAO-verified humanitarian and agricultural cargo. The HSLF continues regardless of any dispute, breach, suspension, or total Accord collapse. It is legally non-divertible. UN OCHA/WHO/FAO administrators hold sole disbursement authority. No Party may restrict, tax, or inspect HSLF vessels. Even in total war, food and medicine flow.

Off-Ramp Gamma: Emergency Reconstitution Protocol

If the Accord enters full suspension, both Parties commit to attend a Reconstitution Conference within 14 days, hosted by Oman, with mandatory participation. Either Party's refusal triggers the Facilitating State immediately requesting emergency UN Security Council consultations. The Conference has a single agenda: restoration of minimum viable core (ceasefire + HSLF + IAEA baseline monitoring). A \$50M escrow, pre-funded by both Parties at signature and administered by Switzerland, finances the Conference regardless of dispute status.

Economic Incentive Summary

Table 2: What the United States Gains

Category	Deliverable	Value
Nuclear	400 kg HEU physically out of Iran in 72 hours	Historic nonproliferation victory
Nuclear	20-year enrichment constraint (performance-linked)	Deeper freeze than JCPOA
Nuclear	60–75% of advanced rotors destroyed	Irreversible rollback
Nuclear	Anytime challenge inspections with Swiss concurrence	Toughest verification standard
Maritime	No unilateral Iranian tolls	Freedom of navigation preserved
Maritime	10% of MIC to US Treasury	Revenue-positive deal
Financial	45–75% of assets held until Year 2+	Performance leverage preserved
Security	Proxy de-escalation channel + 72-hour cooling	Force protection
Political	No reparations paid; no liability admission	Domestic survivability

Table 3: What Iran Gains

Category	Deliverable	Value
Nuclear	HEU never enters US hands; Iranian guards escort	Sovereignty preserved
Nuclear	Japan-without-domestic-enrichment status	Civilian program fully intact
Nuclear	Fuel supply guarantee (\$10B escrow)	Energy security insured
Nuclear	Enrichment petition pathway post-Year 10	No permanent surrender
Facilities	Buildings intact; scientists retained; revenue stream	No humiliation
Maritime	PGSA recognized as JMSB operational body	Institutional victory
Maritime	35% MIC share (~\$175M/year)	Institutional revenue
Financial	\$20–55B in assets within 180 days	Currency stabilization
Financial	SWIFT reconnection within 30–365 days	Banking isolation ends
Security	No regime change commitment	Political survival
Security	Dynamic deconfliction corridors (90 days)	Anti-decapitation insurance
Reconstruction	\$8–30B in no-fault credits	Infrastructure rebuilt

Additional Stabilization Incentives

Ceremonial Framework Designation. Upon signature, the international maritime coordination architecture established under Module 4 shall be formally designated the "Trump Maritime Stability Framework" in all official multilateral documentation. This is a ceremonial naming of the coordination system, not a renaming of the Strait itself. The geographic waterway retains all existing international designations. The naming recognizes the initiating role of the US administration in establishing the framework and is without prejudice to the sovereign rights of any coastal state.

Peace Recognition. The Sultanate of Oman, as Facilitating State, shall formally nominate the signatory leaders of both Parties for the Nobel Peace Prize upon ratification of this Accord. The

nomination is based on the prevention of catastrophic regional war and the establishment of the first post-escalation nonproliferation architecture in the Persian Gulf. The nomination is made by a sovereign neutral state and is independent of either Party's domestic political process.

Additional Economic Carrots — Both Parties

- **For the US:** Priority access to Iranian petroleum pre-sales at 5% below market rate for 24 months (valued at ~\$2B/year for American refiners); exclusive US contractor rights for civilian nuclear conversion projects at Fordow and Natanz (estimated \$800M in contracts); first-right-of-refusal on Iranian LNG export infrastructure development post-Year 3.
- **For Iran:** Automatic most-favored-nation tariff status on all non-sanctioned Iranian exports to the US market (textiles, carpets, pistachios, saffron) within 180 days; US agricultural export credits guaranteed by Commodity Credit Corporation for Iranian grain and livestock purchases (\$500M line); EU-China matching commitment: if US releases assets, EU and China commit to parallel unfreezing of their own frozen Iranian holdings (estimated additional \$8–15B); World Bank reconstruction lending at concessional rates (1.5% over 20 years) for infrastructure projects in Modules 3 and 10.

Instruments of Acceptance

Entry into Force. This Accord enters into force immediately upon signature by authorized representatives of both Parties. No domestic legislative approval required for the initial 90-day period. Deposited with the UN Secretary-General upon signature. Each Party selects one Option (A, B, or C) per Module and records its selection in the Module Selection Annex. All three Emergency Off-Ramps operate automatically regardless of module selection.

The Final Window. Both Parties acknowledge that 22 May 2026 represents a decisive moment. Signature today prevents kinetic re-escalation. Rejection today triggers consequences neither side can fully control. The Hourly Telemetry Protocol commences at H00 of the day following signature.

For the United States of America:

Name: Date:
Module Selections: [A/B/C per Module 1–10]

Facilitating State:

Sultanate of Oman

Maritime Guarantor:

Islamic Republic of Pakistan

For the Islamic Republic of Iran:

Name: Date:
Module Selections: [A/B/C per Module 1–10]

Verification Partner:
