Annex B: Domestic Narrative Guidance

Instruments of Acceptance

Preamble: Purpose and Non-Symmetrical Architecture

THE EMERGENCY CONTEXT. As of 22 May 2026, the United States and the Islamic Republic of Iran remain in a state of fragile ceasefire following Operation Epic Fury. President Trump has publicly outlined five preconditions: physical control of Iran's 400 kg HEU stockpile; retention of only one operational Iranian nuclear facility; linkage of negotiations to cessation of hostilities; withholding 25 percent of frozen Iranian assets; and rejection of Iranian war reparations. Iran, in turn, has established the Persian Gulf Strait Authority (PGSA) on 5 May 2026, and maintains that its enriched uranium must remain on Iranian soil, that all secondary sanctions must be lifted, and that the Strait falls under Iranian sovereign regulatory authority.

These positions have produced deadlock. The purpose of this Fallback Stabilization Agreement is not to replicate prior symmetrical frameworks. It is to create a *variable-sequence, non-symmetrical* instrument under which each party delivers substantively different concessions at irregular intervals, with no expectation of mirror-image reciprocity. The architecture reflects the reality that the parties face different domestic constraints, different risk appetites, and different timelines for deliverable results.

Core Principles of Non-Symmetrical Movement

A movement is non-symmetrical when it does not mirror itself, does not consistently differ in a directional way, and may be irregular, variable, or undefined in pattern. This Agreement applies that concept to diplomatic sequencing:

Principle 1: Variable First-Mover Advantage

There is no fixed rule about which side moves first. In some sequences, Iran acts first and the United States responds. In others, the United States acts first and Iran responds. In still others, both act simultaneously. The pattern is deliberately irregular to prevent either side from predicting or gaming the sequencing.

Principle 2: Dissimilar Concessions

Iranian concessions are not designed to match American concessions in kind, scale, or timing. Iran may deliver a nuclear constraint on Day 1; the United States may deliver banking relief on Day 7; Iran may deliver a maritime opening on Day 14; the United States may deliver asset releases on Day 21. Each concession is calibrated to its own logic, not to equivalence with the other's.

Principle 3: Asymmetric Verification

The verification burden is not distributed equally. Nuclear verification is IAEA-led and continuous. Maritime verification is Omani-led with dual observation. Financial verification is Swiss-led with single-point transparency. Each domain has its own verification architecture.

The Three Emergency Off-Ramps

This Agreement contains three independent emergency off-ramps designed to prevent full war even if the comprehensive framework collapses:

Off-Ramp One: The 72-Hour Auto-Renewing Ceasefire

Regardless of any breach, dispute, or suspension, the ceasefire operates as a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews. Only a written 48-hour notice of non-renewal from either Party to the Joint Secretariat can terminate the ceasefire. This off-ramp survives total Agreement collapse.

Off-Ramp Two: The Humanitarian Firewall

The humanitarian corridor through the Strait of Hormuz operates at zero cost, with zero inspection delay, for all vessels carrying WHO-verified humanitarian cargo. This corridor continues regardless of any dispute, breach, suspension, or total Agreement collapse. It is legally non-divertible and inviolable under all circumstances.

Off-Ramp Three: The Emergency Reconstitution Protocol

If the Agreement enters full suspension, both Parties commit to attend a Reconstitution Conference within 14 days (not 30), hosted by Oman, with mandatory participation. Either Party's refusal to attend triggers automatic UN Security Council convening under Chapter VII. The Conference has a single agenda item: restoration of the minimum viable core (ceasefire + humanitarian corridor + IAEA baseline monitoring).

Part I: Nuclear Stabilization

Article I: HEU Custody Without Transfer (Issue 1)

The Problem. President Trump demands physical recovery of Iran's 400 kg HEU stockpile. Supreme Leader Khamenei has declared it must remain on Iranian soil.

The Non-Symmetrical Solution: Tri-Lock In-Iran Custody. The entire HEU stockpile is consolidated at a single declared facility inside Iran. Custody is tri-lock: Iran holds physical perimeter keys and armed outer security; the IAEA holds exclusive digital encryption keys to all monitoring arrays and seal controls; a neutral third-party custodian (Oman) holds the procedural arbitration key for access disputes.

No single party can access sealed material without at least one other's presence. The United States receives real-time telemetry access via encrypted feed to a dedicated monitoring station. U.S. personnel are not physically present at the facility. The HEU never crosses an Iranian border. This gives Trump effective control over breakout capability; it gives Khamenei sovereign territorial integrity.

Variable Sequencing: Iran completes consolidation within 72 hours of signature (Iran moves first). The United States releases the \$250 million humanitarian tranche only upon IAEA confirmation of dual-lock activation (U.S. responds to verification, not to signature). Oman deploys its custodial contingent only after both Parties confirm compliance (third-party moves last).

Article II: Enrichment Moratorium with Variable Timeline (Issue 2)

The Problem. The U.S. demands zero enrichment or a 20-year moratorium. Iran counters with 12 years maximum.

The Non-Symmetrical Solution: Tiered Variable Moratorium. Rather than a fixed-duration compromise, the moratorium operates as a living timeline with automatic extension and contraction triggers:

Table 1: Tiered Enrichment Moratorium

Phase	Duration	Standard	Trigger for Advancement
Deep Freeze	Years 1–5	Zero enrichment above 3.67%; all higher centrifuges sealed	Clean IAEA certification at Year 5
Extended Pause	Years 6–10	3.67% enrichment at Natanz only; 300kg stockpile cap	Fuel supply guarantee activated
Civilian Transition	Years 11–15	3.67% enrichment; 500kg cap; mothballed sites may reopen for research	Successor framework confirmed
Steady State	Year 16+	Full NPT Article IV rights; standard IAEA safeguards	Both parties confirm by note verbale

Variable Contraction: Material breach (enrichment above 60%, removal of IAEA seals, or kinetic attack) triggers automatic 2-year extension per event, determined by Joint Secretariat majority on IAEA reporting — not unilateral U.S. certification. Sustained clean compliance beyond Year 8 may trigger early Civilian Transition review at Iran's request.

Non-Symmetrical Feature: Iran accepts the deep freeze upfront (Iran moves first). The United States accepts the automatic contraction mechanism (the U.S. accepts a binding limit on its own leverage). The variable timeline bridges one full U.S. electoral cycle while respecting Iran's insistence that suspension is not surrender.

Article III: Underground Site Conversion (Issue 3)

The Problem. Trump has threatened to "knock out" five underground sites. Iran demands preservation of its infrastructure.

The Non-Symmetrical Solution: Dual-Track Conversion. The five sites are addressed through two different tracks, not a uniform approach:

Track A — Active Conversion (Fordow and Natanz): These two facilities convert to civilian medical isotope production centers. A Technical Custody Consortium of Swiss, Austrian, and Omani engineers manages day-to-day operations. Iranian personnel serve as active co-pilots. Revenue is shared: Iran 40%, TCC 35%, Global Health Fund 25%. The U.S. receives quarterly physical inspection rights.

Track B — Mothball Status (Three Remaining Sites): The three other sites enter mothball status under continuous real-time IAEA remote feeds. Centrifuge rotors producing enrichment above 3.67% are removed, sealed with serial numbers, and stored in a UN-monitored facility within Iran. The casings and infrastructure remain in place. Iranian technicians perform the removal. These sites may be restored to low-enrichment civilian fuel production only if the successor framework is not reached by Year 15 and Iran faces genuine security threats, subject to 30-day IAEA notification.

Non-Symmetrical Feature: Iran accepts conversion at Fordow (a concession) while retaining mothball status at three sites (a preservation). The U.S. accepts mothballing rather than destruction at three sites (a concession) while gaining active civilian conversion at Fordow (a verification win). The two tracks move at different speeds and on different verification intensities.

Part II: Maritime Governance & the PGSA

Article IV: PGSA Integration into Joint Framework (Issue 4)

The Problem. Iran's PGSA asserts sovereign authority over Hormuz transit. The U.S. rejects any unilateral Iranian restrictions on international waters.

The Non-Symmetrical Solution: Upgrading, Not Dismantling. The PGSA is formally integrated into a Joint Hormuz Transit Authority (JHTA) as Iran's designated operational implementation body for transit coordination

within Iranian territorial waters. The PGSA retains its Iranian statutory authority but exercises that authority under JHTA Council oversight. All PGSA transit permits bear dual branding: PGSA-Iran and JHTA-Authorized.

The JHTA Governing Council has six permanent seats: Iran (permanent voting member, co-chair in alternating years); United States (permanent voting member, co-chair in alternating years); Oman (permanent voting member, Secretariat host); a GCC rotating member; and two non-voting observer seats for the EU and China. Routine decisions require three affirmative votes from the four permanent voting members.

Joint Transit Coordination Cells are established at Bandar Abbas (leveraging existing PGSA HQ), Khasab (Omani side), and a floating platform at the Strait midpoint. The JTCCs do not stop, board, or search vessels. Their function is purely coordinative: monitor AIS data, coordinate patrol schedules, respond to distress calls.

Non-Symmetrical Feature: Iran gives up unilateral PGSA authority (a concession) but gains permanent co-chairmanship and institutionalized PGSA branding (a win). The U.S. gains a formal seat and veto-equivalent power (a win) but accepts PGSA's continued operational existence (a concession). The integration is asymmetrical: Iran's authority is capped but not abolished; U.S. influence is formalized but not dominant.

Article V: Maritime Funding Without Tolls (Issue 5)

The Problem. Iran and Oman seek transit fees. President Trump explicitly stated, "We don't want tolls."

The Non-Symmetrical Solution: Cost-Recovery Architecture. There are no tolls paid to Iran. Instead, a Multilateral Maritime Maintenance Fund (MMMF) operates through a transparent, internationally governed maintenance pool. All commercial vessels pay a Strait Maintenance Contribution of 0.15% of cargo value, collected by the JHTA Secretariat in Muscat — not by Iranian authorities.

Annual revenue (estimated at ~\$500 million at capacity) is distributed asymmetrically:

Table 2: MMMF Revenue Allocation

Recipient	Share	Purpose
Iranian Civilian Reconstruction Fund	35%	Managed through PGSA oversight; Iranian programmatic control
International Maritime Safety Fund	35%	Joint patrol, mine clearance, navigation aids, emergency response
JHTA Operations & Secretariat	20%	Administrative costs, technology, personnel
U.S. Naval Cost-Recovery	10%	Performance-based patrol compensation to U.S. Treasury

Non-Symmetrical Feature: Iran receives the largest single share (35%) but through a multilateral filter, not as sovereign toll revenue. The U.S. receives a dedicated 10% cost-recovery stream — making the arrangement revenue-positive for the U.S. Treasury rather than a subsidy to Iran. Both sides gain economically, but through different mechanisms and at different magnitudes.

Article VI: Phased Blockade Reduction (Issue 6)

The Problem. CENTCOM enforces a naval blockade on Iranian ports. Iran considers this a violation of the ceasefire spirit and has made blockade lifting a precondition for Hormuz opening.

The Non-Symmetrical Solution: Variable-Rate Phased Reduction. Rather than a synchronized Day-7 simultaneous lift, the blockade is reduced in graduated, variable-rate phases triggered by different Iranian actions at each stage:

Phase 1 (Days 1–3): Iran freezes enrichment above 60%. U.S. exempts humanitarian vessels from blockade enforcement. Omani naval observers deploy.

Phase 2 (Days 4–7): Iran opens Hormuz to JHTA-authorized humanitarian transit at zero cost. U.S. reduces blockade intensity by 50% for all non-military cargo.

Phase 3 (Days 8–14): Iran consolidates HEU under tri-lock custody. U.S. suspends aerial surveillance over Iranian territorial waters, confines flights to international airspace.

Phase 4 (Days 15–21): Iran transfers PGSA operational control of checkpoint infrastructure to JHTA Joint Secretariat. U.S. withdraws carrier strike groups to 200 nautical miles from Strait mouth.

Phase 5 (Day 22+): Full blockade lift declared jointly. JHTA assumes full operational authority.

Non-Symmetrical Feature: Iran moves first at every phase (unilateral Iranian action triggers each U.S. response). The U.S. responds after verification at each stage (never unilaterally). The sequence is ratcheted forward — completed steps are not reversed over individual disputes. This is fundamentally different from a synchronized simultaneous exchange: it is a conditional, unilateral-first, verified-response architecture.

Part III: Economic Architecture

Article VII: Asymmetric Sanctions Relief (Issue 7)

The Problem. Iran demands immediate blanket lifting of all secondary sanctions. The U.S. refuses to yield primary leverage before compliance.

The Non-Symmetrical Solution: Staggered One-Way Relief with Irreversibility Locks. Sanctions relief is delivered in tranches triggered by Iranian compliance milestones, but the tranches are deliberately unequal in size and impact — calibrated to maximize early visible benefit for Iran while preserving late-stage U.S. leverage:

Table 3: Sanctions Relief Tranches

Tranche	Timing	Relief	Trigger	Reversible?
Pilot	Day 1	\$250M humanitarian; medicine, food, aviation safety parts	Signature + 72hr ceasefire	No
1	Day 7	\$5B to escrow; civilian aircraft parts; ag goods	HEU under tri-lock; OLEM confirms freeze	No
2	Day 30	Petroleum sales to existing customers authorized; \$15B escrow release	JHTA operational; 30 days clean compliance	No
3	Day 90	Petrochemical exports; metals and minerals trade	90-day compliance review	30-day hold only
4	Day 180	Automotive parts, textiles, general commercial license	180-day clean certification	30-day hold
5	Day 365	Full secondary sanctions lift; SWIFT normalization	1-year clean certification	Material breach only
Reserve	Year 2–3	Remaining frozen assets	Successor framework	Appetite-based

Non-Symmetrical Feature: Early tranches (1–2) are large, immediate, and irreversible — Iran receives visible benefits quickly. Late tranches (4–5) are smaller and conditional — the U.S. retains leverage for the long term. The asymmetry creates an incentive gradient: Iran's benefits come early; U.S. leverage extends late.

Article VIII: Neutral Escrow & Asset Shielding (Issue 8)

The Problem. Iran demands immediate unfreezing of ~\$100 billion in frozen assets. The U.S. requires performance reserves and fears diversion. American court judgments against Iran create seizure risk.

The Non-Symmetrical Solution: Dual-Tier Escrow with Sovereign Immunity Shield. Frozen assets are transferred to the Central Bank of Oman as escrow agent, designated as "diplomatic escrow funds" protected by sovereign immunity and a UN Security Council resolution recognizing their protected status.

Tier A (55% — Iranian Reconstruction Account): Released to Iranian civilian control per the tranche schedule. Administered by the World Bank with Iranian programmatic input. Eligible for civilian infrastructure, healthcare, education, environmental remediation. Automatic exclusion for military or IRGC-linked entities.

Tier B (45% — Performance Reserve): Held in escrow until Year 2. Released only upon IAEA certification of sustained compliance. If material breach occurs, Reserve converts to a "Regional Stability Fund" administered by Oman for Gulf reconstruction projects — including projects inside Iran implemented through UN agencies. Iran never receives direct control of the Reserve, but benefits from its deployment regardless.

Non-Symmetrical Feature: Iran receives 55% directly (a majority, but not all). The 45% Reserve satisfies Trump's precondition of withholding assets while ensuring Iran still benefits from the funds even if withheld.

The Sovereign Immunity Shield protects from U.S. court seizure — a concession to Iran that also serves U.S. interests by preventing decades of litigation.

Article IX: Phased Financial Reconnection (Issue 9)

The Problem. Iran's total disconnection from SWIFT has paralyzed its commercial sector. The U.S. demands verified non-diversion before full reconnection.

The Non-Symmetrical Solution: Consolidation-Bank Gateway. Rather than reconnecting all Iranian banks at once, a single designated "consolidation bank" — the Oman-Iran Reconstruction Bank — receives limited SWIFT connectivity for defined transaction categories: humanitarian imports, petroleum sales to pre-approved customers, and agricultural inputs. All transactions are pre-cleared by a compliance monitor (Deloitte or PwC) and screened against sanctions lists in real time.

Graduated expansion proceeds: Month 3 — second tranche of clean-record private banks connected. Month 6 — state-owned banks. Month 12 — all banks except terrorism-designated institutions. If IAEA identifies Tier 2 compliance concern, SWIFT holds for 14 days; unresolved, rolls back exactly one tier. Tier 1 technical disputes do not trigger the fuse.

Article X: Reconstruction Credits — No-Fault Architecture (Issue 10)

The Problem. Iran demands war reparations. The U.S. flatly rejects reparations as political poison.

The Non-Symmetrical Solution: Credits Without Admission. The International Gulf Reconstruction Fund is established under sovereign immunity in Oman, managed by the World Bank. Funding comes from 30% of Iranian frozen assets (Iran's own money) plus voluntary contributions from Gulf states, the EU, and development banks. The U.S. contribution is technical assistance and development finance guarantees — not direct cash. The label is "Regional Stability Reconstruction Credits," not reparations, not aid, but investment in regional stability that happens to rebuild Iranian infrastructure.

Non-Symmetrical Feature: Iran receives substantial economic reconstruction benefit without a U.S. admission of liability. The U.S. delivers meaningful support without paying "reparations." The framing allows both statements to be factually correct.

Part IV: Treaty Durability & Emergency Architecture

Article XI: Variable-Step Implementation (Issue 11)

The Problem. Previous 30-day negotiation windows have collapsed because both sides treat them as ultimatums.

The Non-Symmetrical Solution: Open-Duration Binding Timeline with Variable Steps. Instead of a fixed 30-day window, the Agreement operates on an 180-day open timeline with variable-length steps. Some steps take 3 days; others take 30. The irregular pacing prevents either side from gaming the clock:

Table 4: Variable-Step Timeline

Step	Window	Iranian Action	U.S. Action
1	Days 1–3	Freeze enrichment above 60%; activate tri-lock	Release \$250M humanitarian
2	Days 4–14	Complete HEU inventory; open humanitarian Hormuz transit	Issue OFAC general license; suspend new sanctions
3	Days 15–30	Establish JHTA cells; transfer PGSA checkpoint control	Release Tranche 1 assets (\$5B); reduce blockade 50%
4	Days 31–60	Sustained clean compliance; mothball centrifuges	Authorize petroleum sales; carrier withdrawal
5	Days 61–90	Full JHTA operational; dual-blockade lift complete	Release Tranche 2 (\$15B); SWIFT Phase 1
6	Days 91–180	Comprehensive negotiation; successor framework talks	Graduated relief expansion; Tranches 3–4

Article XII: Joint Secretariat & Guarantors (Issue 12)

The Non-Symmetrical Solution: Distributed Guarantor Matrix. Different domains have different guarantors — there is no single "referee":

Table 5: Domain-Specific Guarantors

Domain	Primary Facilitator	Verification Lead	Backup
Nuclear	IAEA (Vienna)	IAEA Technical Directorate	Switzerland
Maritime	Oman (Muscat)	Omani Naval Observers + Lloyd's List AIS	Pakistan
Financial	Switzerland (Geneva)	Swiss Financial Cell	Qatar
Political	UN Under-Secretary-General	Joint Secretariat (Geneva + Muscat)	EU High Representative

The Joint Secretariat comprises two senior officers from each Party, one neutral chair rotating among Oman, Switzerland, and Pakistan, one IAEA technical liaison, and one UN procedural observer. No single guarantor's incapacity suspends framework operations.

Article XIII: Humanitarian Firewall (Issue 13)

The Problem. Internal regime fractures and hardline spoilers may attempt to derail the Agreement.

The Non-Symmetrical Solution: Institutionalized Humanitarian Corridor + Step-Back Protocol. The humanitarian channel is legally non-divertible. It continues regardless of any dispute, breach, or suspension.

The UN OCHA/WHO administrator holds sole disbursement authority. Any attempt to redirect humanitarian funds triggers automatic IAEA investigation but does not affect the humanitarian flow.

The Step-Back Protocol allows any Party to request a 14-day "cooling period" for any provision without triggering breach status. During cooling, humanitarian operations continue, IAEA monitoring continues, and the ceasefire auto-renewal continues. A Party may invoke cooling up to three times per year without explanation. This prevents hardline spoilers from weaponizing technical disputes into crises.

Article XIV: Drone & Missile Pause (Issue 14)

The Problem. Iran is reportedly rebuilding drone and missile capabilities during the ceasefire. The U.S. views this as bad faith.

The Non-Symmetrical Solution: Deployment Pause with Industrial Grandfathering. Iran commits not to deploy drones or missiles against U.S. or allied interests during the 180-day period. Iran does not commit to halting production or research — this is a deployment pause, not an industrial freeze. In exchange, the U.S. refrains from targeting Iranian drone or missile manufacturing facilities during the same period.

Verification: Satellite thermal imaging monitors known launch sites, not factories. Any detected deployment preparation triggers a 48-hour consultation window, not automatic breach. This distinction — deployment versus production — creates a workable firewall that respects Iran's sovereign industrial base while addressing U.S. force protection concerns.

Article XV: Agrifood Emergency Valve (Issue 15)

The Problem. Iran faces severe food insecurity. The global agrifood supply chain is stressed by Hormuz closure.

The Non-Symmetrical Solution: Immediate Agricultural Release + Price Floor. Within 48 hours of signature, the U.S. issues OFAC general licenses for: wheat, rice, fertilizer, and agricultural machinery exports to Iran; Iranian petrochemical exports (fertilizer feedstock); and LPG exports for Iranian food processing and cold chain.

Simultaneously, an Oil Export Price Floor Guarantee activates: if Brent crude falls below \$65/barrel during the first 90 days of Iranian oil exports, the escrow supplements the difference up to \$15/barrel. The Floor is funded by a 2% levy on JHTA tolls during the guarantee period, deducted pro-rata from Iran's 35% share. This prevents oil market volatility from making the deal economically unattractive to Iran at the critical early stage when hardliner spoilers are most active.

Non-Symmetrical Feature: Iran receives immediate agricultural relief (Day 2) before delivering any nuclear milestone beyond the initial 72-hour freeze. The U.S. accepts this sequencing because agricultural relief is politically defensible as humanitarian and creates immediate Iranian domestic constituencies for Agreement survival.

Annex A: Non-Symmetrical Implementation Schedule

Table 6: Day-by-Day Variable-Sequence Actions

Day	Iranian Action	U.S. Action	Verification
1	Freeze enrichment above 60%; activate tri-lock	\$250M humanitarian tranche; freeze new sanctions	OLEM confirms; Swiss escrow confirms
2	Allow WHO humanitarian vessel transit at zero cost	OFAC general license for ag exports to Iran	WHO transit logs
3	IRGC withdraws fast-attack craft to 5nm anchorage	Exempt humanitarian vessels from blockade	Omani naval observers; AIS
7	HEU inventory complete; JHTA cells established	Release \$5B to escrow; civilian aircraft parts license	IAEA confirms; Swiss Cell
14	PGSA checkpoint control to JHTA; dual-branding live	Reduce blockade 50%; suspend aerial surveillance	JHTA operational; Lloyd's List
30	30 days clean compliance; mothballing underway	Authorize petroleum sales; release \$15B	IAEA 30-day report
45	Full Hormuz open to JHTA-authorized traffic	Carrier withdrawal to 200nm; SWIFT Phase 1	Lloyd's List volumes
60	Centrifuge rotors sealed; environmental sampling	Tranche 3 release; petrochemical exports OK	IAEA certifies mothball
90	Comprehensive talks commencement	Tranche 4; automotive/textile licenses	Joint Secretariat
180	Successor framework negotiation active	Full secondary sanctions review	Annual certification

Annex B: Domestic Narrative Guidance

Each Party requires a domestically defensible narrative. The following are factually accurate characterizations:

For the United States

- "Weapons-grade uranium locked down." Iran's entire 400 kg HEU stockpile is under tri-lock custody with U.S. telemetry access.
- "Zero enrichment above 3.67% for five years." The deepest freeze in history.
- "Hormuz is open, no tolls to Iran." Global energy flows resume; U.S. patrols receive cost-recovery payments.
- "45% of assets held in reserve." Iran receives only what it earns through verified compliance.

- "No reparations paid." All support is investment, not liability.

For Iran

- "Sovereignty preserved." The HEU never left Iranian soil. Facilities were not destroyed.
- "NPT rights intact." Enrichment to 3.67% continues. The limitation is time-bound, not surrender.
- "PGSA recognized globally." Iran's Strait Authority is the operational coordination body with permanent co-chairmanship.
- "Blockade lifted." U.S. offensive operations cease. Ports reopen.
- "Assets returning." 55% of frozen assets flow within 90 days, protected from U.S. court seizure.
- "Agricultural relief on Day 2." Food security addressed before nuclear concessions beyond initial freeze.

Instruments of Acceptance

This Fallback Stabilization Agreement is offered for signature as an emergency instrument. It does not require legislative ratification for the initial 90-day period. It enters into force upon signature by both Parties.

Entry into Force. This Agreement enters into force immediately upon signature by the authorized representatives of both Parties. No domestic legislative approval is required for the initial 90-day period. The Agreement is deposited with the UN Secretary-General upon signature and constitutes a binding international commitment.
