

DIPLOMATIC WORKING DOCUMENT

Modular Solutions Compendium

375 Negotiable Solutions for 15 Critical Blockers

U.S.-Islamic Republic of Iran

Comprehensive Peace Negotiation Support

Status: As of 22 May 2026

Classification: Authorized Negotiators Only

Issue 5: Transit "Security Fees" & Maritime Funding

Issue 6: Lifting the U.S. Naval Blockade

Part III: Economic Normalization

Issue 7: Sanctions Relief Sequencing

Issue 8: Frozen Assets Shielding & Liquidation

Issue 9: SWIFT Reconnection & Banking Isolation

Issue 10: War Reparations vs. Reconstruction Credits

Part IV: Treaty Durability & Regional Architecture

Issue 11: The 30-Day Negotiation Window

Issue 12: Institutional Guarantees & Third-Party Mediation

Issue 13: Human-in-the-Loop Governance & Regime Fractures

Issue 14: Drone/Missile Pause vs. Industrial Reconstitution

Issue 15: Agrifood Crisis & Humanitarian Supply Lines

Appendix: Cross-Reference Matrix

Introduction & Methodology

This **Modular Solutions Compendium** is a comprehensive diplomatic reference designed to support negotiators working to transform the fragile U.S.-Iran ceasefire of April 2026 into a durable, comprehensive peace agreement. It addresses **15 critical structural blockers** that have collapsed every previous negotiation attempt, providing **375 distinct, modular solutions** that can be mixed, matched, and adapted to the evolving negotiation environment.

Current Context (as of 22 May 2026): President Trump has issued five hard preconditions for any deal: (1) physical control of Iran's ~400kg HEU stockpile; (2) retention of only one operational Iranian nuclear facility; (3) linkage of all negotiations to cessation of hostilities; (4) withholding at least 25% of frozen Iranian assets; and (5) rejection of any Iranian war reparations claims. Supreme Leader Mojtaba Khamenei has established five sovereign red lines: HEU must remain on Iranian soil; enrichment rights under NPT Article IV are non-negotiable; all secondary sanctions must be lifted; the Strait of Hormuz falls under Iranian sovereign authority; and ballistic missile limitations are off the nuclear table.

How to Use This Document: Each of the 15 issues contains 25 modular solutions organized from least to most complex. Solutions are tagged by implementation speed (Immediate, Short-term, Medium-term, Long-term), diplomatic risk level (Low, Medium, High), and which side moves first (US-First, Iran-First, Simultaneous, Third-Party). Every solution is designed to be realistic, implementable, and respectful of both parties' core red lines. Negotiators should treat these as building blocks rather than fixed prescriptions.

Synthesis Sources: This Compendium draws from six prior bilateral frameworks: The Reciprocal Opening Window v1.1, the Framework for Reciprocal Stabilization v3.2, the Hormuz-First Enhanced Accord v2.4, CBSF v16.2, the Stability-First Enhanced Accord v5.7, The Final Steps Accord, the Gulf Stability Accord v1.5, The Step Forward Accord v2.0, the CRESCENT COMPACT v1.1, and current open-source intelligence including the White House preconditions of 17 May 2026.

PART 1

The Nuclear Deadlock

Issues 1-3: The HEU stockpile, enrichment constraints, and hardened underground facilities represent the technical core of the nuclear dispute. Without resolution on these three issues, no broader agreement is possible.

1 IAEA Dual-Lock Custody Exchange (In-Iran)

The entire 400kg HEU stockpile is consolidated at a single declared facility inside Iran under a dual-lock system: IAEA holds digital encryption keys to all monitoring arrays and seal controls, while Iran holds physical perimeter security keys. Neither party can access sealed containers without the other's presence. Unauthorized access triggers immediate Tier 2 breach notification.

Immediate | Low Risk | Simultaneous

2 Tripartite Physical Custody at Isfahan

HEU is moved to the Isfahan Nuclear Technology Center underground storage complex under tripartite custody involving Iran, the IAEA, and the U.S. (represented technically through the IAEA's American deputy director). Tamper-evident containers with continuous radiation monitoring, GPS-independent location verification, and seismic sensors ensure physical security.

Immediate | Low Risk | Third-Party

3 Cryptographic Key-Sharing Protocol

HEU containers are sealed with cryptographic locks whose key shares are distributed among the IAEA Director General, the rotating chair of the IAEA Board of Governors, and the Iranian Atomic Energy Organization. No single party can unilaterally access the material.

Immediate | Low Risk | Third-Party

4 Three-Ring Security Architecture

The storage facility is secured by a combined guard force: Iranian perimeter security (outer ring), IAEA technical monitors (inner ring), and a neutral third-country security contingent from Oman or Qatar (facility access control). This ensures the HEU cannot be moved without simultaneous cooperation from all three parties.

Short-term | Low Risk | Third-Party

5 Consolidated Custody Protocol (CCP)

The entire 400kg stockpile of 60%-enriched uranium is consolidated from dispersed locations (Isfahan, Natanz, Fordow, Pickaxe Mountain) to a single known, monitored location. Real-time U.S. technical monitoring access via encrypted telemetry eliminates the risk of hidden breakout stocks.

Short-term | Medium Risk | Simultaneous

6 HEU Export to IAEA Custody in Oman

Iran transfers its entire 60%-enriched uranium stockpile to IAEA custody in Oman (NOT the United States). Transfer is verified by mass spectrometry, continuous CCTV monitoring, and satellite surveillance. The stockpile remains under IAEA dual-lock custody until downblending or conversion to civilian fuel plates is completed.

Short-term | Medium Risk | Iran-First

7 Downblending to Medical-Grade LEU In-Place

The HEU is downblended in-place at Esfahan to medical-grade low-enriched uranium suitable for isotope production. This pathway takes approximately 142 days and converts weapons-capable material into cancer-medicine feedstock under continuous IAEA monitoring.

Medium-term | Low Risk | Iran-First

8 Transfer to IAEA LEU Bank in Kazakhstan

The HEU stockpile is downblended in Iran and transferred to the IAEA LEU Bank in Oskemen, Kazakhstan. This established multilateral facility already serves as a neutral fuel reserve for member states, providing a proven, non-political destination.

Medium-term | Low Risk | Third-Party

9 Rosatom Transfer Under IAEA Safeguards

The HEU is transferred to Rosatom under IAEA safeguards in the Russian Federation. This 60-90 day pathway leverages existing Russia-Iran nuclear cooperation frameworks and provides a non-Western destination acceptable to Tehran.

Medium-term | Medium Risk | Third-Party

10 Conversion to Bushehr Reactor Fuel Assemblies

The HEU is converted to reactor-grade LEU fuel assemblies for the Bushehr nuclear power plant. This 180-day pathway directly serves Iran's civilian energy program while permanently eliminating weapons-grade material.

Medium-term | Low Risk | Iran-First

11 Hybrid Multi-Pathway Disposition

The stockpile is divided into batches processed through different pathways concurrently: a portion downblended in-place for medical isotopes, a portion transferred to Oman for IAEA custody, and a portion converted to Bushehr fuel. Iran selects the allocation formula from six approved options.

Medium-term | Low Risk | Iran-First

12 Zero-Breakout Objective with Timed Milestones

Rather than focusing solely on physical location, the framework adopts a verifiable zero-breakout timeline. Through phased verification, centrifuge mothballing, stockpile transfer, and continuous monitoring, Iran's capacity to produce weapons-grade uranium without detection is eliminated within defined timeframes.

Medium-term | Medium Risk | Simultaneous

13 Sovereign Immunity Shield for Custody Facility

The facility housing the HEU is designated as having protected status under a UN Security Council resolution recognizing its diplomatic escrow function. This prevents any military targeting of the facility and establishes its status as inviolable under international law.

Short-term | Low Risk | Third-Party

14 Perimeter Shielding with Joint Monitoring Station

A joint U.S.-IAEA monitoring station is established outside the facility perimeter with real-time telemetry feeds. American technical personnel hold a physical key share and receive automatic alerts on any access attempts, providing Trump with 'physical control' optics while HEU remains in Iran.

Short-term | Medium Risk | Simultaneous

15 Rolling Inventory Verification Protocol

Instead of one-time consolidation, the HEU undergoes continuous rolling inventory verification where IAEA inspectors perform daily mass spectrometry checks and seal integrity confirmations. Any discrepancy triggers automatic escalation within 15 minutes.

Immediate | Low Risk | Third-Party

16 Neutral-Custody Blending with Fixed Timeline

The 400kg HEU stockpile is transferred to neutral third-party custody with downblending to LEU or conversion to civilian fuel plates proceeding on a fixed timeline pegged to Sprint completion. Neither Iran nor the U.S. holds unilateral access; Iran selects the pathway from approved options.

Medium-term | Low Risk | Third-Party

17 No Hidden U.S. Custody Clause

A binding, self-executing, non-waivable clause stipulates that at no stage may the United States receive, store, transport, or exercise operational control over the Iranian enriched-uranium stockpile. All custody remains with the IAEA and designated third-party facilitating states. US personnel are not present at any consolidation operation.

Immediate | Low Risk | Simultaneous

18 Black-Box Telemetry for Custody Verification

Tamper-evident data logging devices continuously record operational parameters (temperature, pressure, radiation signatures) and transmit encrypted data to IAEA nodes in Vienna and Geneva. Any anomaly triggers automatic alert within 15 minutes. Sensors cannot be disabled without triggering breach signals.

Immediate | Low Risk | Third-Party

19 IAEA Rapid Verification Team Deployment

Upon Accord activation, IAEA inspectors arrive at declared facilities within 12 hours, complete physical inventory within 24 hours, confirm isotopic composition via mass spectrometry within 48 hours, and apply tamper-evident seals within 72 hours. A Day-One compliance certificate is issued.

Immediate | Low Risk | Third-Party

20 Humanitarian-Linked Custody Incentive

HEU custody milestones are linked to humanitarian tranche releases: each verified custody stage triggers corresponding asset releases via Swiss escrow. This creates positive momentum where nuclear compliance produces immediate economic benefits for the Iranian population.

Immediate | Low Risk | Simultaneous

21 Regional Medical Isotope Hub Conversion

The HEU is converted into molybdenum-99, iodine-131, and xenon-133 for distribution to hospitals across the Middle East. This generates humanitarian goodwill and economic revenue while permanently eliminating weapons-capable material. Iran becomes a regional medical isotope production center.

Medium-term | Low Risk | Iran-First

22 UN-Monitored In-Country Storage with Two-Stage Lock

Sealed containers are transferred to a UN-monitored facility within Iran using a two-stage digital and physical locking system: IAEA holds digital encryption keys; Iran holds physical keys and armed outer-perimeter security. Neither party can access containers without the other's presence.

Short-term | Low Risk | Third-Party

23 Sprint Phase Verification Clock

A T+72h Day-One deadline requires dual-lock custody initiated and verified within 4 days of Accord activation. The Joint Secretariat confirms compliance at each 12-hour interval, creating discrete, measurable milestones that trigger corresponding U.S. commitments.

Immediate | Low Risk | Simultaneous

24 Custody-as-Insurance Financial Structure

The HEU custody arrangement is linked to a \$20 billion reinsurance backstop for Hormuz shipping. Custody verification milestones unlock proportional reinsurance coverage, creating commercial incentives for HEU compliance that benefit the global economy.

Medium-term | Low Risk | Simultaneous

25 Successor Framework Integration Clause

The custody arrangement is designed to survive into any successor framework beyond Year 15. Institutional bindings ensure that custody protocols, IAEA access rights, and monitoring technologies remain in force regardless of future political transitions in either capital.

Long-term | Low Risk | Third-Party

Issue 2: The Enrichment Cap & Moratorium Timeline

The Problem

The U.S. is pushing for an absolute 'zero enrichment' baseline or a strict 20-year moratorium. Iran has countered with a maximum 12-year suspension window. Neither position is domestically survivable for its proponent.

25 Modular Solutions for Issue 2

1 Sliding-Scale 12-15 Year Moratorium

An automated, sliding-scale duration tied to a step-by-step verification pipeline. Baseline 12-year moratorium with automatic extension to 15 years upon completion of specific IAEA verification milestones. Material breach triggers automatic 2-year extension per breach event. Sustained clean compliance beyond Year 10 may trigger early Civilian Transition review.

Medium-term | Low Risk | Simultaneous

2 Three-Tier Moratorium Structure

Moratorium I (Years 1-12): Zero enrichment above 3.67%; higher centrifuges under IAEA seal. Civilian Transition (Years 13-15): 3.67% enrichment at Natanz only; all other sites in mothball status. Steady-State Civilian (Year 16+): 3.67% under full IAEA safeguards. Each tier transition requires IAEA certification and successor framework confirmation.

Medium-term | Low Risk | Simultaneous

3 Graduated Enrichment Suspension (GES)

Four distinct enrichment tiers: Tier 1 (Months 1-36) total suspension; Tier 2 (Months 37-84) limited enrichment to 3.67% at single facility with 300kg cap; Tier 3 (Months 85-144) enrichment to 5% with 500kg cap; Tier 4 (Months 145-180 conditional) 5% with 1,000kg cap if milestones met. Auto-extension from 12 to 15 years based on verification performance.

Medium-term | Medium Risk | Simultaneous

4 Milestone-Linked Auto-Extension Mechanism

The baseline 12-year moratorium extends to 15 years only if three cumulative conditions are satisfied: (1) IAEA confirms no undeclared enrichment for 36 consecutive months; (2) Joint Sovereign Custody Protocol maintains full integrity; and (3) Joint Maritime Governance Framework operates without major incidents for 24 months. Breach of any condition pauses extension but does not collapse the agreement.

Medium-term | Medium Risk | Simultaneous

5 Annual Review with Performance Snapshots

Rather than fixed-duration lock-in, the moratorium is subject to annual review where IAEA performance snapshots determine trajectory. Clean compliance opens gradual enrichment expansion; material concerns trigger extension. This creates a living agreement that adapts to behavior.

Medium-term | Low Risk | Third-Party

6 1-Year Renewable Cap with 15-Year Maximum

Moratorium on enrichment above 3.67%, renewable annually for up to 15 years based on performance. This provides Iran with a sovereignty-preserving 'test period' structure while giving the U.S. a 15-year maximum window. Each annual renewal requires IAEA certification but is automatic if clean.

Medium-term | Low Risk | Simultaneous

7 Monitoring Sunset Tiers

Intrusive monitoring technologies subject to graduated sunset based on verified compliance: Seismic sensors reduce from continuous to weekly sampling after 12 months; satellite revisit frequency reduces from daily to 3x weekly after 18 months; unannounced inspection frequency reduces from 33% minimum to 20% after 24 months. Continuous camera monitoring remains as baseline.

Medium-term | Low Risk | Third-Party

8 U.S. Electoral Cycle Bridge Design

The 12-year baseline is calibrated to bridge one full U.S. electoral cycle and multiple Iranian parliamentary sessions, giving both governments time to demonstrate benefits before re-election pressure. This 'political half-life' design ensures the agreement outlives any single administration.

Medium-term | Medium Risk | Simultaneous

9 NPT Article IV Rights Preservation Clause

The agreement explicitly recognizes Iran's right to peaceful nuclear energy under NPT Article IV. Post-moratorium enrichment at 3.67% is guaranteed through an international fuel supply consortium. This clause is binding, non-waivable, and self-executing.

Immediate | Low Risk | Simultaneous

10 Fuel Supply Guarantee in Escrow

A fuel supply guarantee from an international consortium is held in escrow as the advancement condition for Civilian Transition phase. If the consortium fails to deliver, Iran's enrichment rights automatically expand to compensate. This gives Iran confidence that its energy needs will be met.

Medium-term | Low Risk | Third-Party

11 Section 123 Agreement Framework

A U.S.-Iran Section 123 Agreement is negotiated during the moratorium period, providing the statutory foundation for peaceful nuclear cooperation. This highly unusual arrangement signals long-term U.S. commitment to Iran's civilian program while imposing strict safeguards.

Long-term | Medium Risk | US-First

12 Quiet Compliance Track for Technical Disputes

Transient isotopic spikes below a defined mass threshold (50 grams U-235 equivalent above 3.67% within any rolling 30-day period) that occur during legitimate centrifuge cascade operations do not constitute material breach. These are addressed through the Quiet Compliance Track rather than escalating to treaty crises.

Immediate | Low Risk | Third-Party

13 Civilian Transition Fuel Bank Pre-Positioning

During Moratorium I, an international fuel bank is pre-positioned with sufficient LEU to fuel Iran's Bushehr reactor for 5 years. This eliminates Iran's stated need for indigenous enrichment during the transition period and provides tangible energy security.

Medium-term | Low Risk | Third-Party

14 Moratorium-as-Investment Framing

The enrichment suspension is framed not as a concession but as an investment in Iran's economic reconstruction. While enrichment is suspended, Iran receives priority access to international nuclear technology partnerships, medical isotope joint ventures, and civilian reactor construction assistance.

Medium-term | Low Risk | Simultaneous

15 Joint Scientific Publication Incentive

During the moratorium, Iranian nuclear scientists are enabled to publish in international journals, participate in IAEA technical conferences, and receive training at neutral-country facilities. This preserves scientific capacity and morale while redirecting expertise to civilian applications.

Short-term | Low Risk | Third-Party

16 Breakout Timeline Extension Verification

The primary metric of moratorium success is not the absence of enrichment but the extension of Iran's 'breakout timeline' — the time needed to produce weapons-grade material if Iran chose to do so. The moratorium aims to extend this from current estimates of weeks to more than 12 months through verified constraints.

Medium-term | Medium Risk | Third-Party

17 Regional Nuclear Energy Partnership

Iran's enrichment suspension is linked to the creation of a Regional Nuclear Energy Partnership including Gulf states, with Iran as a founding member. This reframes the moratorium as participation in a cooperative regional enterprise rather than unilateral disarmament.

Long-term | Medium Risk | Simultaneous

18 Emergency Fuel Supply Override

If Iran's civilian reactors face fuel supply disruption during the moratorium, an emergency override mechanism allows limited enrichment for reactor fuel production, subject to 48-hour IAEA notification and continuous monitoring. This prevents Iran from claiming the moratorium endangers its energy security.

Medium-term | Low Risk | Third-Party

19 Moratorium Compensation Fund

A dedicated fund compensates Iran for the economic opportunity cost of enrichment suspension — estimated revenue from nuclear fuel exports, technology licensing, and related industries. The fund is administered by the World Bank and distributed as grants for civilian infrastructure.

Medium-term | Medium Risk | Third-Party

20 Iranian Nuclear Research Campus at Natanz

Natanz is converted into an Iranian Nuclear Research and Training Campus hosting IAEA-certified training programs for nuclear scientists from across the developing world. Iranian scientists retain senior positions, preserving scientific capacity and national pride during the moratorium.

Medium-term | Low Risk | Iran-First

21 Dual-Use Technology Transfer Incentive

During the moratorium, Iran receives controlled transfers of dual-use nuclear technologies for medical, agricultural, and industrial applications — radiation therapy equipment, food irradiation systems, and materials science instruments. This 'technology dividend' offsets the loss of enrichment capability.

Medium-term | Medium Risk | Third-Party

22 Successor Framework Auto-Trigger

The moratorium includes an auto-trigger clause: if both parties fail to negotiate a successor framework by Year 10, the Civilian Transition phase automatically activates with pre-defined parameters. This prevents the agreement from expiring into a vacuum.

Long-term | Low Risk | Simultaneous

23 Performance-Based Centrifuge Idle Maintenance

During suspension, Iran's centrifuges are placed in 'warm idle' rather than dismantled — maintained in climate-controlled conditions under IAEA seal. If the moratorium succeeds, these centrifuges can be repurposed for civilian fuel production rather than destroyed.

Medium-term | Low Risk | Third-Party

24 International Enrichment Services Consortium Membership

Iran receives membership in an International Enrichment Services Consortium as a non-operating member with voting rights, profit-sharing, and guaranteed fuel supply. This gives Iran a stake in global enrichment without operating its own centrifuges.

Long-term | Low Risk | Third-Party

25 Moratorium Verification via Online Enrichment Monitors (OLEM)

Continuous Online Enrichment Monitors are installed at all declared facilities, providing real-time isotopic analysis without requiring physical inspector presence. OLEM data is transmitted weekly to Vienna and mirrored to neutral backup nodes, creating tamper-evident verification.

Immediate | Low Risk | Third-Party

Issue 3: Advanced Centrifuge Hardening & Underground Sites

The Problem

President Trump has threatened to permanently ‘knock out’ five deeply buried underground storage and manufacturing sites (including Fordow and Natanz) if a deal isn’t struck. Iran demands the preservation of its infrastructure as sovereign property and a symbol of scientific achievement.

25 Modular Solutions for Issue 3

1 Civilian Conversion with Black-Box Telemetry

Heavily fortified bunkers are converted into civilian nuclear research or global medical isotope centers, verified by continuous black-box telemetry. Fordow becomes the Regional Medical Isotope Production Center; Natanz becomes a Nuclear Research and Training Campus; Isfahan becomes consolidated HEU storage with safeguards training above-ground.

Medium-term | Low Risk | Simultaneous

2 Fordow International Medical Isotope Research Centre (IMIRC)

Fordow is converted to produce molybdenum-99 and other critical medical isotopes for global distribution. A Technical Custody Consortium of engineers from Switzerland, Austria, and Oman manages day-to-day operations. Iranian personnel serve as 'Co-Pilots' with the right to question any operation. Revenue is shared: Iran 40%, TCC 35%, Global Health Fund 25%.

Medium-term | Low Risk | Iran-First

3 Mothball Protocol with Continuous Remote Feeds

Non-core enrichment sites are placed under 'mothball status' with continuous real-time IAEA remote feeds. The U.S. receives operational limitation to a single declared site (Natanz). Iran keeps its sovereign infrastructure intact. The Mothball Procedure proceeds in four phases: Inventory (Day 1-14), Removal (Day 15-44), Storage (Day 45-60), Monitoring (Day 60+).

Medium-term | Medium Risk | Simultaneous

4 Natanz Nuclear Research and Training Campus

Natanz is converted into an IAEA-certified training campus hosting programs for nuclear scientists from across the developing world. Above-ground buildings house classrooms and laboratories; underground halls are adapted for low-enrichment experiments and materials science research under full international supervision.

Medium-term | Low Risk | Iran-First

5 Pickaxe Mountain Seismological Station

Pickaxe Mountain is converted to a Seismological and Geothermal Research Station, leveraging its deep tunnels for geophysical research with no fissile material present. This preserves the physical infrastructure while permanently eliminating weapons pathways.

Medium-term | Low Risk | Iran-First

6 Undeclared Site #5 Verified Dismantlement

Any undeclared facilities (classified locations) undergo verified dismantlement of all nuclear equipment under IAEA supervision, with the facility either sealed or repurposed for conventional industrial use. This addresses U.S. concerns about clandestine programs while preserving Iranian dignity through confidential handling.

Short-term | Medium Risk | Third-Party

7 Isfahan Consolidated HEU Storage + Safeguards Training

The Isfahan underground facility becomes the consolidated HEU storage site under the Consolidated Custody Protocol, with above-ground facilities converted to nuclear safeguards training for IAEA inspectors. This creates a center of excellence for verification technology.

Short-term | Low Risk | Third-Party

8 Centrifuge Rotor Removal and Serial Tracking

All rotors and bellows producing enrichment above 3.67% are removed under IAEA supervision, sealed with serial numbers in tamper-evident containers, and stored in a UN-monitored facility within Iran. Centrifuge casings and infrastructure remain in place. Iranian technicians perform the removal, preserving employment and dignity.

Short-term | Medium Risk | Iran-First

9 Two-Stage Digital and Physical Locking System

Sealed centrifuge containers use a two-stage system: IAEA holds digital encryption keys; Iran holds physical keys and armed outer-perimeter security. Neither party can access containers without the other's physical presence. This creates procedural equality symbolizing sovereign equality.

Immediate | Low Risk | Third-Party

10 Regional Counter-Proliferation Showcase

The converted Fordow facility hosts an annual International Medical Isotope Summit, positioning Iran as a humanitarian nuclear leader rather than a proliferation threat. Global health ministers visit, generating positive media coverage and diplomatic goodwill that reinforces the conversion's permanence.

Medium-term | Low Risk | Third-Party

11 Infrastructure Preservation with Civilian Redirection

Rather than destroying Iran's hardened underground sites, the physical infrastructure — buildings, tunnels, scientific equipment — is preserved and redirected to prestigious civilian applications. Iranian engineers remain employed; Iranian science continues; Iran becomes a regional hub for medical isotope production.

Medium-term | Low Risk | Iran-First

12 Black-Box Sensor Network Deployment

All mothballed and converted facilities are equipped with Black-Box Sensors that continuously record operational parameters (temperature, pressure, electromagnetic signatures) and transmit encrypted data to IAEA nodes in Vienna and Geneva. Any anomaly triggers automatic alert within 15 minutes. Sensors cannot be disabled without triggering breach signals.

Immediate | Low Risk | Third-Party

13 Joint Facility Conversion Planning Commission

A commission of Iranian, IAEA, and neutral-country engineers jointly develops facility-specific conversion plans for each of the five sites. Iranian engineers lead the design process, ensuring national pride is preserved while weapons pathways are eliminated.

Short-term | Low Risk | Third-Party

14 Equipment Replacement with Civilian Technology

At Fordow, enrichment centrifuges are replaced with medical isotope separation equipment. At Natanz, weapons-relevant equipment is replaced with research-grade instruments. The replacement process is funded by international partners, so Iran bears no conversion cost.

Medium-term | Medium Risk | Third-Party

15 Continuous Camera Monitoring with Quarterly Sampling

All converted and mothballed facilities maintain IAEA continuous cameras and quarterly environmental sampling. If Online Enrichment Monitors confirm no active enrichment, 72-hour safety extensions are permitted for maintenance. This provides assurance without being overly intrusive.

Immediate | Low Risk | Third-Party

16 Iranian Scientific Advisory Board Co-Chair Authority

The IMIRC at Fordow operates under an International Scientific Advisory Board with Iranian co-chair authority. Iranian scientists lead major research programs, demonstrating international recognition of Iranian scientific expertise and ensuring national pride in the conversion.

Medium-term | Low Risk | Iran-First

17 Commercial Output Distribution Network

Medical isotopes produced at Fordow are distributed to hospitals across the Middle East, Central Asia, and Africa through WHO-coordinated logistics. Iran receives revenue from each shipment, creating an economic incentive to maintain civilian operations and resist re-militarization.

Medium-term | Low Risk | Third-Party

18 Geothermal Research Partnership with International Universities

Pickaxe Mountain enters into research partnerships with leading international universities for geophysical studies. Iranian scientists co-author publications, present at conferences, and receive visiting researcher appointments — converting a secret military site into an open scientific institution.

Long-term | Low Risk | Iran-First

19 Nuclear Archaeology Documentation Project

Iranian and international historians document the scientific achievements of Iran's nuclear program for publication in a 'Nuclear Archaeology' monograph. This preserves the historical record of Iranian scientific accomplishment while acknowledging the pivot to purely civilian applications.

Long-term | Low Risk | Third-Party

20 Facility Conversion Loan Facility

The World Bank provides a low-interest loan facility for facility conversions, with repayment deferred until commercial operations reach profitability. This removes financial barriers to conversion and ensures Iran receives international support for the transition.

Medium-term | Low Risk | Third-Party

21 Safeguards Technology Export from Iran

Iran's experience in nuclear safeguards and monitoring becomes a commercial export. Iranian experts train inspectors from other NPT member states, consult on facility design, and sell Iranian-developed monitoring equipment. This turns compliance expertise into economic opportunity.

Long-term | Low Risk | Iran-First

22 UNESCO World Heritage Technical Site Nomination

The converted facilities are nominated as UNESCO technical heritage sites recognizing Iran's contribution to nuclear science and its pivot to peaceful applications. This provides international prestige and tourism/research revenue while symbolizing Iran's commitment to non-proliferation.

Long-term | Low Risk | Third-Party

23 Emergency Conversion Reversal Safeguard

If a successor framework is not reached by Year 15 and Iran faces genuine security threats, a limited conversion reversal protocol allows mothballed equipment to be restored for low-enrichment civilian fuel production only, subject to 30-day IAEA notification. This prevents Iran from feeling permanently disarmed.

Long-term | Medium Risk | Simultaneous

24 Joint U.S.-Iran Scientific Collaboration at Converted Sites

A groundbreaking provision allows American scientists to collaborate with Iranian counterparts at the converted facilities on civilian nuclear research — cancer treatment, materials science, agricultural irradiation. This creates human-to-human connections that reinforce political commitments.

Long-term | High Risk | Simultaneous

25 Facility Conversion as Economic Zone

The converted nuclear sites are designated as Special Economic Zones with tax incentives for international biotech and pharmaceutical companies to establish operations. This accelerates the transition from military to commercial use and creates jobs for former nuclear weapons program personnel.

Medium-term | Low Risk | Iran-First

PART 2

Maritime Governance & Sovereignty

Issues 4-6: The Strait of Hormuz is the aorta of the global economy. Iran's establishment of the PGSA, U.S. rejection of unilateral Iranian control, and the ongoing naval blockade create a maritime crisis that threatens global energy security.

1 Joint Maritime Governance Framework (JMGF)

Iran's unilateral Persian Gulf Strait Authority (PGSA) is multilateralized into a formal, treaty-based international body with Iranian co-chairmanship. The six-party Governing Council includes Iran (co-chair), Oman (co-chair), U.S. (permanent seat), Qatar (permanent seat), a rotating IMO Council member, and IAEA Maritime Office (technical observer). Routine decisions require 3 affirmative votes from Seats 1-4; governance amendments require unanimous consent of Iran, Oman, and U.S.

Short-term | Medium Risk | Simultaneous

2 Joint Hormuz Transit Authority (JHTA)

The JHTA is established as a permanent multilateral maritime governance body under Swiss law, headquartered in Geneva. The Council has ten members: two U.S., two Iranian, one Omani, one Swiss, one Pakistani, and three rotating seats. The Council Chair alternates every 18 months between U.S. and Iranian nominees. Operational decisions require simple majority; charter amendments require U.S.-Iran consensus ('Dual Veto').

Short-term | Medium Risk | Simultaneous

3 PGSA Integration Clause

The PGSA is formally integrated into the JHTA as Iran's designated operational implementation body for transit coordination within Iranian territorial waters. The PGSA retains its Iranian statutory authority but exercises that authority under JHTA Council oversight. All PGSA transit permits bear dual branding: PGSA-Iran and JHTA-authorized.

Short-term | Medium Risk | Simultaneous

4 Joint Transit Coordination Centers (JTCCs)

Three JTCCs are established at Bandar Abbas (Iranian side, leveraging existing PGSA HQ), Khasab (Omani side), and a floating platform in international waters at the Strait midpoint. Each JTCC is staffed by personnel from all JMGF members wearing unified uniforms. They do not stop, board, or search vessels — their function is purely coordinative: monitor AIS data, coordinate patrol schedules, respond to distress calls.

Short-term | Low Risk | Simultaneous

5 Universal Transit Certificate (UTC) System

All commercial vessels receive a UTC issued by the JMGF Secretariat in Muscat (physically separate from Iranian territory). The UTC certifies three things only: valid registration and insurance, cargo manifest does not include prohibited materials per UNSC resolutions, and AIS transponder is functional. The UTC does not discriminate based on flag state, cargo type, or port of origin. Israeli-flagged vessels receive the same UTC as any other vessel.

Short-term | Low Risk | Third-Party

6 Coordinated Patrol Architecture

Naval patrols are formally assigned by sector: Iranian forces patrol the northern half; Omani and Qatari forces patrol the southern half. A joint rapid-response task force, composed of units from all JMGF members and commanded on a rotating six-month basis, is stationed at the floating platform for emergency intervention. U.S. naval forces operate as JMGF participants, not unilateral enforcers.

Short-term | Medium Risk | Simultaneous

7 Deconfliction Hotline with 60-Second Response

A 24/7 Maritime Deconfliction Hotline is staffed jointly by U.S., Iranian, and Omani officers from the Maritime Coordination Cell in Muscat. Response time: officers answer within 60 seconds. Language: English, with Persian and Arabic interpreters. All communications recorded, encrypted, and stored for 90 days. Either party may request immediate consultation; the other responds within 15 minutes.

Immediate | Low Risk | Third-Party

8 Cooperative Trans-Strait Transit Protocol

Both navies exchange automated, encrypted transponder data via the Maritime Coordination Cell exactly 12 hours before entering the transit corridor. Data includes vessel identity, type classification, approximate transit timing (6-hour window), and direction. Exact course, speed, and weapons status are NOT disclosed. This preserves tactical security while eliminating surprise friction.

Short-term | Low Risk | Simultaneous

9 PG-MSC Council with Permanent Iranian Seat

The Persian Gulf Maritime Security Contribution Council includes Iran as a permanent voting member with a senior seat, territorial sovereignty recognition, and chairmanship in alternating years. The U.S. holds a permanent seat as primary naval guarantor. A GCC rotating chair provides advisory input. This gives Iran institutional parity it has never before secured.

Short-term | Medium Risk | Simultaneous

10 Dual-Branded Transit Permit System

Vessel operators submit documentation through the PGSA portal (Iranian node). The JHTA Transit Permit Processing Unit cross-references against international databases (IMO, Lloyd's List, INTERPOL). Upon clearance, vessels receive a JHTA-AUTHORIZED AIS designation valid for single transit or 30 days for frequent operators. Fees collected through the Multilateral Maritime Maintenance Fund, not paid directly to Iran.

Short-term | Low Risk | Third-Party

11 Symmetrical Stand-Off Distance Schedule

Learning Period (Days 1-14): IRGC and U.S. forces both maintain 3nm stand-off (expanding to 5nm by Day 8). Operational Period (Day 15+): 5nm from respective baselines. Elevated Posture (Tier 2): 8nm from respective baselines. The same number applies to both parties, measured from each party's sensitive boundary.

Immediate | Medium Risk | Simultaneous

12 Maritime Incident Response Protocol

In the event of any maritime incident, an automatic protocol activates: Immediate notification within 15 minutes; stand-down order for all vessels in vicinity; joint assessment team (U.S., Iranian, Omani) dispatched within 2 hours; preliminary report within 24 hours; full report within 7 days. Neither party may take military action in response pending joint assessment.

Immediate | Low Risk | Simultaneous

13 Neutral Nomenclature Registry

The Joint Coordination Secretariat maintains a neutral Nomenclature Registry documenting each party's official designations for the waterway. The U.S. may use its established operational nomenclature; Iran may use Persian Gulf designations. Both are recognized for domestic communications only. All binding legal instruments filed with UNCLOS and IMO retain 'Strait of Hormuz' for enforceability.

Short-term | Low Risk | Third-Party

14 Floating Coordination Platform

A dedicated floating platform in international waters at the Strait midpoint serves as a neutral meeting point, joint rapid-response task force station, and emergency coordination hub. The platform flies the IMO flag and hosts personnel from all JMGF members, creating a physical symbol of multilateral governance.

Medium-term | Low Risk | Third-Party

15 Joint Forensic Maritime Board

For any incident involving suspected Iranian-supplied weapons, an explosive ordnance disposal board composed of U.S., Iranian, Omani, and UN experts issues binding attribution reports within 96 hours using component serial tracing, chemical residue analysis, and signal tracking. No single verification channel may unilaterally declare attribution without Board certification.

Short-term | Medium Risk | Third-Party

16 Humanitarian Corridor Exemption

Vessels carrying medicine, food, medical equipment, and UN supplies receive zero-fee, no-inspection-delay transit through Hormuz. This corridor continues regardless of any dispute, breach, or suspension — it is inviolable under all circumstances. Emergency mechanical distress, severe weather, and medical emergencies are also exempt from standard transit quotas.

Immediate | Low Risk | Third-Party

17 Maritime Safety and Revenue Architecture

The Persian Gulf Maritime Security Contribution is funded through toll revenues, voluntary contributions, and a 0.05% levy on energy transit values. The fund is administered by the Financial Operations Cell with quarterly transparency reporting. Revenue allocation: 40% Iranian Civilian Reconstruction, 35% International Maritime Safety, 25% PG-MSO Operations.

Short-term | Low Risk | Third-Party

18 Lloyd's List Independent Verification

Independent maritime monitors (Lloyd's List, BIMCO observers) confirm unrestricted transit. Third-party tanker traffic data confirms commercial volumes returning to pre-war levels. This commercial verification channel supplements official JMGO reporting with industry-trusted data.

Short-term | Low Risk | Third-Party

19 IHTA Governance Supremacy over Security Operations

The JHTA is the supreme neutral civilian governing authority for all Hormuz matters. All operational security bodies derive legitimacy from and report to the JHTA Council. Governance decisions supersede operational planning. The IHTA-PGMSO Operations Committee ensures seamless coordination without governance merger.

Short-term | Low Risk | Third-Party

20 Cross-Representation and Unified Data Architecture

The PGMSO Commander holds a permanent non-voting seat on the JHTA Council; the JHTA Maritime Director holds an advisory position on the PGMSO Command Group. Both feed operational data into a single Maritime Domain Awareness system hosted by Oman. The IHTA holds master administrative rights; PGMSO holds operational read-write access.

Short-term | Low Risk | Third-Party

21 Emergency Maritime Safety Carve-Out

Vessels experiencing verified mechanical distress, severe weather, medical emergencies, or environmental containment failure are exempt from weekly transit quotas. Such vessels may seek safe harbor under PG-MSD monitoring without triggering blockade violation. Emergency status verified within 2 hours by the Maritime Operations Cell.

Immediate | Low Risk | Third-Party

22 Weekly Joint Patrol Schedule Publication

Joint patrol schedules are published weekly to all JMGP members, showing which forces patrol which sectors when. This transparency eliminates surprise encounters and allows commercial shipping to plan transits around naval movements. Schedules are coordinated, not commanded — each nation maintains sovereignty over its own forces.

Short-term | Low Risk | Simultaneous

23 Maritime Domain Awareness (MDA) Shared Platform

All JMGP members contribute radar, AIS, and satellite data to a shared MDA platform hosted in Muscat. Each member sees the same operational picture, eliminating the 'fog of war' that causes accidental confrontations. Data is shared in real-time but military vessels may mask certain classified capabilities.

Short-term | Low Risk | Third-Party

24 Confidence-Building Naval Exercise

Within 90 days of Accord activation, a joint naval exercise focused on search-and-rescue, pollution response, and counter-piracy is conducted involving U.S., Iranian, Omani, and Qatari vessels. This exercise builds operational familiarity and trust without touching sensitive combat capabilities.

Short-term | Medium Risk | Simultaneous

25 Successor Framework Maritime Permanent Architecture

All long-term architecture — permanent Joint Transit Authorities, remaining asset returns, full diplomatic relations — is deferred to a Phase II negotiation track. The Sprint establishes precedent and plumbing; Phase II scales it. This prevents the Sprint from collapsing under the weight of unresolved structural questions.

Long-term | Low Risk | Simultaneous

Issue 5: Transit “Security Fees” and Maritime Funding

The Problem

Iran and Oman are actively negotiating a permanent toll/fee system for commercial traffic traversing the Strait. President Trump explicitly rejected this, stating ‘We don’t want tolls.’ Iran views transit fees as legitimate compensation for providing security services in its territorial waters.

25 Modular Solutions for Issue 5

1 Multilateral Maritime Maintenance Fund (MMMF)

Unilateral Iranian fees are restructured into a transparent, internationally governed maintenance pool funding waterway safety services rather than Iranian state revenue. All commercial vessels pay a Strait Maintenance Contribution of 0.15% of cargo value, collected by the JMGF Secretariat in Muscat (not Iranian authorities).

Short-term | Low Risk | Third-Party

2 IHTA Toll Revenue Trust in Switzerland

All IHTA toll revenue is deposited into a Trust established under Swiss law, maintained in a Swiss-domiciled custodial account. The Trust is administered by a three-person Board: one Swiss Chair, one U.S. appointee, one Iranian appointee. All disbursements require at least two Board signatures including the Swiss Chair.

Short-term | Low Risk | Third-Party

3 Three-Tier Fee Structure

Tier 1 (Humanitarian — medicine, food, medical equipment): Zero fee with 24-hour fast-track. Tier 2 (Standard commercial): \$0.15 per ton deadweight. Tier 3 (Energy/premium — oil, LNG, chemicals): \$0.25 per ton or \$35,000 flat fee per VLCC. JHTA Council member state vessels are exempt.

Immediate | Low Risk | Third-Party

4 Revenue Allocation Formula

Annual revenue (~\$500 million at capacity) is distributed: 40% Iranian Civilian Reconstruction Fund (managed through PGSA oversight), 35% International Maritime Safety Fund (joint patrol, mine clearance, navigation aids), 25% JHTA Operations and Secretariat costs. The formula is binding and enshrined in the JMGF charter.

Short-term | Low Risk | Third-Party

5 Automated Toll Disbursal Default

If the JHTA Council fails to pass an annual budget due to U.S.-Iran deadlock, toll revenues automatically distribute per baseline percentages. The neutral Secretariat executes within 7 days. Political deadlock cannot freeze baseline distributions — this is the critical resilience feature.

Short-term | Low Risk | Third-Party

6 Cost-Recovery for Patrol Contributions

Iranian cost-recovery payments are calculated based on actual patrol days provided by Iranian naval forces — a performance-based metric that avoids the appearance of Iranian toll revenue while still compensating Iran for legitimate security contributions. At current deployment levels, this generates approximately \$180-220 million annually.

Short-term | Low Risk | Simultaneous

7 \$20 Billion Reinsurance Backstop

The U.S. Development Finance Corporation commits \$10 billion, Lloyd's of London underwrites \$5 billion, and the Omani Sovereign Wealth Fund contributes \$5 billion, creating a \$20 billion reinsurance facility. This backstop activates upon JHTA certification of the first 200 authorized transits and renders the corridor commercially navigable within days.

Short-term | Medium Risk | Third-Party

8 Non-USD Currency Denomination

The MMMF operates through a basket of non-USD currencies (EUR, RMB, AED) to prevent unilateral structural control by any single member state. This currency diversification protects Iranian revenue from dollar weaponization while giving the U.S. confidence that funds cannot be diverted to sanctioned activities.

Short-term | Low Risk | Third-Party

9 Performance-Based Patrol Compensation

Rather than fixed payments, patrol cost-recovery is tied to measurable outputs: patrol hours logged, incidents responded to, distress calls answered, and environmental monitoring data collected. This ensures Iranian patrol contributions are demonstrably valuable to the international community.

Short-term | Low Risk | Simultaneous

10 Maritime Safety Investment Pool

20% of MMMF revenue funds a Maritime Safety Investment Pool for regional port infrastructure, search-and-rescue capability, and environmental protection. Projects are selected by joint U.S.-Iran-Oman technical committee with published criteria, ensuring transparent allocation of resources.

Medium-term | Low Risk | Third-Party

11 Humanitarian Corridor Zero-Fee Guarantee

All vessels carrying WHO-verified humanitarian cargo transit Hormuz at zero cost, with fast-track processing. This guarantee is inviolable — it continues regardless of political disputes, framework suspensions, or military tensions. Funding for humanitarian transit security comes from the general MMMF pool, not vessel fees.

Immediate | Low Risk | Third-Party

12 Iranian Port Infrastructure Investment

A portion of MMMF revenue is directed to upgrade Iranian civilian ports (Bandar Abbas, Chabahar) to international safety standards. This investment benefits global shipping (safer ports = safer cargo) while providing visible economic improvement for Iranian coastal communities.

Medium-term | Low Risk | Third-Party

13 Transparent Quarterly Reporting

The JMGF Secretariat publishes quarterly reports showing all revenue collected, all expenditures made, and all patrol contributions logged. Reports are audited by a Big Four accounting firm and published on a public website. This transparency prevents corruption and builds donor confidence.

Short-term | Low Risk | Third-Party

14 Lloyd's of London Rate Reduction Incentive

As Hormuz transit safety improves, maritime insurance rates decrease from current ~1.5% of hull value to ~0.15%. The reinsurance backstop guarantees this reduction within 30 days of JHTA certification. Lower insurance costs offset the transit fee for commercial shippers, making the fee politically acceptable.

Short-term | Low Risk | Third-Party

15 Floating Platform Maintenance Endowment

A dedicated endowment funds the operation and maintenance of the floating coordination platform, ensuring it remains functional regardless of annual budget disputes. The endowment is seeded with \$50 million from initial toll collections and managed under Swiss fiduciary standards.

Medium-term | Low Risk | Third-Party

16 Environmental Protection Levy

A dedicated 5% environmental levy on Tier 3 (energy) vessel fees funds Persian Gulf marine ecosystem protection: oil spill response capability, coral reef monitoring, marine mammal protection, and pollution remediation. This creates ecological value from commercial transit.

Medium-term | Low Risk | Third-Party

17 U.S. Cost-Recovery Payment Structure

The United States receives cost-recovery payments for American naval patrol contributions, making the arrangement revenue-positive for the U.S. Treasury rather than a subsidy to Iran. Trump can state that the U.S. is being paid for its security contributions rather than paying for Iranian cooperation.

Short-term | Low Risk | Simultaneous

18 Frequency Discount for Regular Shippers

Frequent operators (defined as 12+ transits per year) receive a 25% discount on transit fees, incentivizing registration with the JMGP and reducing incentives to evade the system. This loyalty discount increases compliance and provides predictable revenue.

Immediate | Low Risk | Third-Party

19 Emergency Response Fund

10% of toll revenue funds an Emergency Response Fund for maritime disasters: major oil spills, collision salvage, search-and-rescue for missing vessels, and counter-piracy rapid response. The fund is accessible within 4 hours of any declared emergency, without requiring Council approval.

Short-term | Low Risk | Third-Party

20 Technology Upgrade Fund for Iranian Monitoring

A dedicated fund provides Iranian maritime authorities with modern monitoring technology — AIS receivers, coastal radar, satellite terminals — to ensure Iran can perform its patrol duties to international standards. This is framed as capability-building, not charity.

Short-term | Medium Risk | Third-Party

21 Joint Procurement for Naval Equipment

JMGF members jointly procure patrol vessels, communications equipment, and surveillance technology through bulk purchasing. Iran receives the same equipment at the same price as other members, eliminating quality disparities that could create operational vulnerabilities.

Medium-term | Low Risk | Third-Party

22 Fee Waiver for Developing Country Flag States

Vessels registered in Least Developed Countries (per UN classification) receive a 50% fee waiver. This developmental provision builds support for the JMGF among the global South and aligns with Iran's rhetorical commitment to developing world solidarity.

Immediate | Low Risk | Third-Party

23 Sunset Review for Fee Rates

Transit fee rates are subject to mandatory review every 3 years by an independent panel of maritime economists. Rates can be adjusted up or down based on operating costs, shipping volume, and inflation. This prevents fees from becoming politically weaponized over time.

Medium-term | Low Risk | Third-Party

24 Commercial Shipping Advisory Board

A board of commercial shipping executives (from Maersk, MSC, COSCO, and regional lines) advises the JHTA Council on fee structures, transit procedures, and operational improvements. This industry voice ensures the system remains commercially viable.

Short-term | Low Risk | Third-Party

25 Successor Framework Full Fiscal Integration

The MMMF is designed to transition into a permanent International Maritime Fund under UN auspices in Phase II. This long-term vision gives the current arrangement institutional depth and ensures it outlives the initial political compromise.

Long-term | Low Risk | Third-Party

Issue 6: Lifting the U.S. Naval Blockade

The Problem

CENTCOM continues to enforce a crippling naval blockade on Iranian ports, intercepting commercial vessels and tankers. Iran considers this a direct violation of the ceasefire spirit and has made blockade lifting a precondition for any Hormuz opening.

25 Modular Solutions for Issue 6

1 Synchronized Day-7 Dual-Blockade Lift

A precisely choreographed simultaneous lift linking verifiable withdrawal of IRGC craft to formal suspension of the U.S. naval blockade. Both actions occur at the same UTC timestamp within a 60-second window under simultaneous observation by neutral parties. This eliminates the 'who moves first' problem entirely.

Immediate | Medium Risk | Simultaneous

2 Seven-Day Reciprocal Withdrawal Sequence

Day 1: Iran withdraws IRGC fast-attack craft to designated anchorage. Day 2: U.S. suspends intercept operations. Day 3: Iran opens Strait to UTC-cleared traffic. Day 4: U.S. suspends aerial surveillance over Iranian waters. Day 5: Iran transfers PGSA control to JMGF. Day 6: U.S. withdraws carrier groups to 200nm holding position. Day 7: Joint declaration.

Immediate | Medium Risk | Simultaneous

3 Mechanical Linkage with Ratchet Protection

Each step is verified by the JMGF technical monitoring team before the next triggers. If Iran fails to complete a step, the sequence pauses — the U.S. does not proceed but also does not reverse completed steps. The sequence is ratcheted forward, not subject to rollback over individual disputes.

Immediate | Low Risk | Third-Party

4 Day-7 UTC Timeline Choreography

T-60 min: Both commanders transmit stand-by. T-15 min: IRGC withdraws to 5nm; U.S. Navy withdraws to 5nm. T=0: Iran issues Hormuz opening declaration; U.S. issues blockade lift declaration — SIMULTANEOUS within 60 seconds. T+15 min: First authorized vessel commences transit. T+24h: 24-Hour Bright-Line Period ends.

Immediate | Medium Risk | Simultaneous

5 24-Hour Bright-Line Period

The 24 hours following Day-7 constitute heightened monitoring. Any deviation constitutes protocol violation regardless of intent. Category A violations (vessels within 3nm of exclusion zones, kinetic action, failure to issue declarations) trigger automatic bilateral suspension — both blockades reactivate, neither benefits from the other's non-compliance.

Immediate | High Risk | Simultaneous

6 Omani Naval Observer Verification

Omani naval observers log both IRGC and U.S. Navy positions continuously throughout the sequence. Lloyd's List AIS tracking confirms vessel movements. The Omani facilitating state logs both stand-by signals at T-60, providing neutral verification that neither side moved unilaterally.

Immediate | Low Risk | Third-Party

7 Carrier Strike Group Holding Position

On Day 6, the two U.S. carrier strike groups withdraw to a holding position 200 nautical miles from the Strait mouth. This reduces immediate strike capability while preserving rapid response. The 200nm distance is calibrated to be visible (Iran can verify) while still within operational range.

Immediate | Medium Risk | US-First

8 IRGC Fast-Attack Craft Anchorage Points

Designated anchorage points inside Iranian territorial waters are pre-agreed where IRGC craft withdraw to during the sequence. These points are visible to satellite surveillance and Omani observation, providing verifiable proof of Iranian compliance without requiring Iranian forces to return to port.

Immediate | Low Risk | Iran-First

9 Partial Blockade Lift for Humanitarian Vessels

As a confidence-building measure, the U.S. announces on Day 1 that humanitarian vessels (food, medicine, UN supplies) are exempt from blockade enforcement effective immediately. This creates goodwill while preserving pressure on oil and military cargo until Day 7.

Immediate | Low Risk | US-First

10 Graduated Blockade Reduction Schedule

Rather than a single Day-7 lift, the blockade is reduced in graduated stages: Days 1-3, 25% reduction; Days 4-5, 50% reduction; Days 6-7, 75% reduction; Day 7, full lift. Each stage is triggered by verified Iranian compliance at the previous stage. This reduces the risk of a single catastrophic failure point.

Short-term | Low Risk | Simultaneous

11 Joint Implementation Group (JIG) Breach Review

If any stage of the blockade lift sequence encounters problems, the JIG convenes within 48 hours for breach review. Technical disputes are distinguished from material breaches: technical problems trigger remediation; only material breaches trigger reversal. Human deliberation, not automated triggers, governs escalation.

Short-term | Low Risk | Third-Party

12 Port-of-Call Verification System

U.S. naval vessels make scheduled port calls in Oman and Qatar during the blockade reduction period. These visible departures from Iranian waters provide tangible evidence of American withdrawal that Iranian media can photograph and broadcast, supporting the Iranian narrative of negotiated compromise.

Short-term | Low Risk | US-First

13 Commercial Shipping Pre-Clearance

Before Day 7, commercial vessels can pre-register for UTC transit permits. Pre-cleared vessels are guaranteed no-interference passage beginning at T+15 minutes. This incentivizes early registration and creates a visible queue of international shipping ready to transit, demonstrating global confidence in the new system.

Short-term | Low Risk | Third-Party

14 Blockade Lift Linked to Asset Release

The Day 7 full blockade lift is mechanically linked to release of Tranche 2 frozen assets (\$25B). This creates a powerful simultaneous win: Iran sees its economy reopen as its ports reopen; the U.S. sees Iranian nuclear material under verified custody as shipping flows. The linkage is announced in advance so both sides prepare.

Short-term | Medium Risk | Simultaneous

15 UN Security Council Resolution Backstop

A UNSC resolution adopted concurrently with the Accord authorizes the maritime governance framework and calls on all member states to respect Hormuz transit rights. This provides legal cover for the blockade lift and deters third-party spoilers from disrupting the process.

Short-term | Low Risk | Third-Party

16 NATO/EU Parallel Statement

NATO and the EU issue parallel statements welcoming the blockade lift and authorizing their member states' vessels to resume Hormuz transit under JHTA rules. This multilateral endorsement provides political cover for the U.S. administration and demonstrates international support.

Short-term | Low Risk | Third-Party

17 Russian and Chinese Transit Guarantees

Russia and China provide diplomatic guarantees that their-flagged vessels will resume Hormuz transit immediately upon JHTA certification. These guarantees signal great-power support for the new system and ensure significant shipping volume from Day 7, creating momentum.

Short-term | Low Risk | Third-Party

18 Insurance Rate Reduction Announcement

Lloyd's of London announces the reinsurance backstop activation simultaneously with the blockade lift, immediately reducing insurance rates from 1.5% to 0.15% of hull value. This commercial benefit is felt within hours, creating positive economic feedback that reinforces political commitments.

Immediate | Low Risk | Third-Party

19 Daily Joint Compliance Reports

For the first 30 days after blockade lift, the JMGS Secretariat publishes daily Joint Compliance Reports showing patrol positions, transit statistics, incident logs, and verification confirmations. This transparency builds confidence and provides early warning of any backsliding.

Short-term | Low Risk | Third-Party

20 Blockade Re-Entry Safeguard

If a material breach occurs, a re-entry protocol allows graduated re-imposition: first, diplomatic consultations; second, increased patrol presence; third, limited inspection requirements; fourth, partial restriction; full blockade only as last resort after 30-day remediation period. This prevents hair-trigger re-escalation.

Short-term | Medium Risk | Simultaneous

21 Iranian Port Rehabilitation Program

Simultaneous with blockade lift, an international consortium begins rehabilitation of Iranian civilian ports damaged during the conflict. Visible construction activity at Bandar Abbas and Chabahar provides tangible evidence that the blockade lift is producing real economic benefits.

Medium-term | Low Risk | Third-Party

22 Commercial Vessel Escort Service

During the initial 30-day period, the joint rapid-response task force provides free escort services for vessels requesting additional security. This voluntary service demonstrates JMGF capability while allowing commercial operators to choose their comfort level.

Short-term | Low Risk | Third-Party

23 Media Access to Floating Platform

International media are invited to visit the floating coordination platform on Day 7 to observe the multilateral operation. Positive coverage of U.S. and Iranian officers working together creates narrative momentum that makes reversal politically costly for either side.

Short-term | Low Risk | Third-Party

24 Oil Price Stabilization Mechanism

The U.S. Treasury and Department of Energy coordinate with OPEC to stabilize oil prices during the blockade transition, preventing price spikes that could create political pressure to reverse the lift. Strategic Petroleum Reserve releases are authorized as backup.

Immediate | Low Risk | Third-Party

25 Successor Framework Permanent Maritime Regime

The blockade lift is designed to be irreversible — the legal authority for the blockade is formally revoked through executive order, not merely suspended. Re-imposition would require new legal findings and congressional notification, creating procedural barriers to casual reversal.

Long-term | Medium Risk | Simultaneous

PART 3

Economic Normalization

Issues 7-10: Iran's economy has been devastated by sanctions compounded by war and blockade. Sanctions relief sequencing, frozen assets, SWIFT reconnection, and reconstruction financing must be resolved to create sustainable peace.

1 Milestone-Triggered Cascading Release (MTCR)

Sanctions relief is broken into discrete, rapidly delivered tranches mechanically linked to specific verifiable Iranian actions. Rather than all-or-nothing, MTCR delivers meaningful relief within days of signature but conditions full normalization on phased compliance. Four tranches: Day 3 humanitarian, Day 7 petroleum, Day 15 general commercial, Day 30 full normalization.

Short-term | Medium Risk | Simultaneous

2 15-Day Micro-Cycle Pacing Model

Relief is delivered in eight precisely defined tranches operating on 15-day micro-cycles: Days 1-5 (IAEA verifies milestone), Days 6-10 (escrow processes release; OFAC issues guidance), Days 11-15 (funds credited; relief takes commercial effect). If verification fails, the tranche holds until remediation — no tranche is permanently blocked.

Short-term | Low Risk | Simultaneous

3 Eight-Tranche Architecture

Tranche 1 (Day 1): \$250M humanitarian + medicine/food licenses. Tranche 2 (Day 14): 25% remaining frozen assets + civilian aircraft parts + petrochemical exports. Tranche 3 (Day 44): 25% remaining + metals/minerals trade. Tranche 4 (Day 120): 20% + automotive/textiles. Tranche 5 (Day 180): 15%. Tranche 6 (Day 365): 10%. Balance (Year 2-3): Remainder upon full successor framework compliance.

Short-term | Medium Risk | Simultaneous

4 Irreversibility Mechanism

Each tranche, once triggered, cannot be reimposed for technical or minor compliance disputes. Only 'material breach' (defined as resumption of enrichment above agreed levels, removal of IAEA seals, attack on U.S. forces, or material support for terrorist organizations resulting in casualties) can trigger reimposition. Technical disagreements do not constitute material breach.

Short-term | Medium Risk | Simultaneous

5 Humanitarian Firewall Protection

The \$250M initial humanitarian tranche is protected: it cannot be frozen, clawed back, or subject to rollback under any breach scenario. Humanitarian trade channels remain open regardless of nuclear disputes. This creates a floor below which the agreement cannot collapse.

Immediate | Low Risk | US-First

6 OFAC General Licenses for Humanitarian Trade

On Day 1, OFAC issues general licenses authorizing exports of medicine, food, medical equipment, and civilian aviation safety parts to Iran. These licenses are irrevocable for 365 days and explicitly shield U.S. and non-U.S. persons from sanctions liability for authorized transactions.

Immediate | Low Risk | US-First

7 Sanctions Relief Pilot with Auto-Advancement

A pilot tranche of limited sanctions relief is granted immediately upon signature. If Iran complies with associated verification requirements within 30 days, the pilot auto-advances to Tranche 1 status. If not, the pilot expires but does not trigger penalties. This creates low-risk momentum.

Immediate | Low Risk | US-First

8 Performance-Gated Relief with 25% Reserve

Trump's 17 May precondition that 25% of assets be withheld is embedded in the escrow structure: 25% of all frozen assets remain in Joint Sovereign Custody Escrow until Month 12 as a performance reserve. This can be released early for exceptional compliance or retained if disputes occur.

Short-term | Medium Risk | Simultaneous

9 Currency Protection via SDR Denomination

All downstream asset releases from Tranche 3 onward are denominated in IMF Special Drawing Rights (SDR) or a fixed basket of Swiss Francs and Omani Rials (60/40). This protects real economic value from dollar inflation or monetary shocks. Exchange rate is locked at signature using IMF published rate.

Short-term | Low Risk | Third-Party

10 Petroleum Sales to Existing Customers

Tranche 2 lifts sanctions on Iranian petroleum sales to existing customers (China, India, Turkey, Japan) up to pre-sanctions volumes. These customers have established payment channels and proven compliance records, minimizing diversion risk while delivering immediate revenue to Iran.

Short-term | Medium Risk | US-First

11 Petrochemical Export Authorization

Tranche 2 authorizes Iranian petrochemical exports, which generate approximately \$20 billion annually. This sector is less politically sensitive than crude oil and has established markets in Asia and Europe. Authorization includes OFAC comfort letters to European clearinghouses.

Short-term | Medium Risk | US-First

12 Automotive and Textile Sector Relief

Tranches 4-5 lift sanctions on Iranian automotive parts, textiles, and light manufacturing. These labor-intensive sectors create visible employment improvements that benefit ordinary Iranians, generating domestic political support for continued compliance.

Medium-term | Low Risk | US-First

13 Banking Reconnection Sequencing

Banking normalization proceeds in parallel with trade relief: Days 1-30 (humanitarian payments only), Days 30-60 (5 designated banks, limited message types), Days 60-120 (all clean-record banks, humanitarian and approved commercial), Day 120+ (full SWIFT membership for compliant institutions).

Short-term | Medium Risk | US-First

14 OFAC Comfort Letters to Clearinghouses

The U.S. Treasury issues comprehensive, irrevocable OFAC Comfort Letters to all participating European and Gulf clearinghouses. These letters explicitly provide that all transactions routed through the designated Central Bank of Oman escrow account for humanitarian or civilian purposes are legally pre-cleared and exempt from secondary sanctions.

Immediate | Low Risk | US-First

15 Non-U.S. Person Protection Clause

Non-U.S. financial institutions, shipping companies, insurers, and commodity traders facilitating or benefiting from escrow-routed transactions are explicitly shielded from secondary sanctions designation, from restrictions on U.S. financial system access, and from any penalties for activities that would otherwise be sanctionable.

Immediate | Low Risk | US-First

16 180-Day Notice of Revocation Protection

Immunization is legally binding and cannot be revoked by executive discretion without 180 days' prior written notice to all participating clearinghouses and the Joint Secretariat. No notice of revocation may be issued during the first 365 days of Accord operation. This gives Iran confidence to make irreversible commitments.

Immediate | Medium Risk | Simultaneous

17 Sanctions Reciprocity Ceiling

For the lifespan of the Accord, no new economic, financial, or primary sectoral sanctions shall be imposed on Iranian entities unless approved by unanimous vote of the Joint Implementation Group. If Congress passes new unilateral sanctions, the President utilizes statutory waiver authority to suspend implementation.

Short-term | High Risk | US-First

18 Lifting of Secondary Sanctions on Insurance

Sanctions on Iranian access to maritime insurance, cargo insurance, and reinsurance are lifted in Tranche 3. This enables Iranian-flagged vessels to obtain standard commercial coverage, dramatically reducing shipping costs and making Iranian exports internationally competitive.

Short-term | Medium Risk | US-First

19 Technology Transfer for Civilian Sectors

Sanctions relief includes authorization for technology transfers to Iranian civilian sectors: medical devices, renewable energy equipment, water treatment systems, and telecommunications infrastructure. These transfers improve Iranian quality of life while having no weapons applications.

Medium-term | Low Risk | US-First

20 Agricultural Input and Equipment Authorization

Tranche 1 includes specific authorization for agricultural inputs (seeds, fertilizers, irrigation equipment) and farming machinery. This addresses Iran's food security crisis and creates visible improvements in rural communities, generating grassroots support for the agreement.

Immediate | Low Risk | US-First

21 Scholarship and Educational Exchange Exemption

All restrictions on Iranian students studying abroad, academic exchanges, and educational institution partnerships are lifted. This people-to-people channel creates long-term goodwill while having no security implications. Iranian students contribute billions to host economies.

Short-term | Low Risk | US-First

22 Cultural Heritage and Museum Cooperation

Sanctions relief explicitly authorizes cooperation between American and Iranian museums, archaeological institutions, and cultural heritage organizations. This high-visibility, zero-risk channel generates positive media coverage and demonstrates that engagement produces cultural benefits.

Short-term | Low Risk | US-First

23 Pharmaceutical Research Collaboration

Iranian and American pharmaceutical companies are authorized to collaborate on drug development, clinical trials, and vaccine production. Iran has advanced pharmaceutical capabilities; this cooperation addresses global health needs while generating commercial revenue for both sides.

Medium-term | Low Risk | US-First

24 Sports and Olympics Exemption

All sanctions restrictions on Iranian participation in international sports events, including Olympics, World Cup, and regional competitions, are lifted. Athletic exchanges, training camps, and competition hosting are explicitly authorized. This channel reaches Iranian youth directly.

Immediate | Low Risk | US-First

25 Successor Framework Full Normalization

The ultimate goal is full lifting of all secondary sanctions (oil, banking, shipping, insurance) by Month 12 upon IAEA comprehensive compliance certification. This endpoint is clearly defined and binding, giving Iran a predictable pathway to full economic reintegration.

Long-term | Medium Risk | Simultaneous

Issue 8: Frozen Assets Shielding & Liquidation

The Problem

Iran is demanding the immediate unfreezing of its sovereign assets worldwide (~\$80-120 billion) to halt currency collapse and rolling blackouts. The U.S. requires performance reserves and fears diversion to military programs. American court judgments against Iran totaling over \$50 billion create legal seizure risk.

25 Modular Solutions for Issue 8

1 Joint Sovereign Custody Escrow (JSCE)

All frozen Iranian assets (~\$100-120 billion) are transferred to a dedicated escrow account at the Central Bank of Oman. The account is governed by a Tripartite Custody Agreement among Iran (beneficial owner), U.S. (sanctions releaser), and Oman (escrow agent). Funds are released per the MTCR schedule, with each tranche requiring digital authorization from two of three parties.

Short-term | Medium Risk | Third-Party

2 Swiss Escrow Architecture

The Swiss Federal Office for Customs and Border Security (FOCBS) administers the primary escrow. Assets remain under Swiss custody until released through framework-specified triggers. A formal Presidential Policy Directive prohibits unilateral re-freezing except in event of nuclear test or direct attack on U.S. forces.

Short-term | Medium Risk | Third-Party

3 Three-Sub-Account Allocation

Account A (75%): Released to Iranian government control per MTCR schedule for civilian economic reconstruction. Account B (25%): Performance reserve held until Month 12, released upon IAEA certification or retained if material breach occurs. Account C (Humanitarian): Immediately available for food, medicine, agricultural imports — not subject to two-of-three authorization.

Short-term | Medium Risk | Third-Party

4 Sovereign Immunity Shield Protocol

All assets transferred to escrow are designated as 'diplomatic escrow funds' protected by the escrow agent's sovereign immunity and by a UNSC resolution recognizing their protected status. This prevents seizure by American courts under terrorism judgments, as escrow funds held by a neutral sovereign for diplomatic purposes are immune from attachment.

Short-term | Medium Risk | Third-Party

5 Humanitarian Firewall (25% Protected)

25% of escrow funds are designated as a Humanitarian Firewall administered by UN OCHA/WHO. These funds are protected from any breach scenario and flow directly to approved vendors for medicine, food, and medical equipment. They cannot be frozen, clawed back, or subject to rollback.

Immediate | Low Risk | Third-Party

6 Critical Infrastructure Sub-Account (45%)

45% of escrow is allocated to critical infrastructure reconstruction — power generation, water treatment, telecommunications — administered by the World Bank/Swiss Financial Cell. This is protected under Tranches 1-2 and subject to transparent procurement processes preventing IRGC diversion.

Short-term | Low Risk | Third-Party

7 Iranian Civilian Reconstruction Sub-Account (20%)

20% is allocated to Iranian civilian reconstruction with JHTA oversight and Iranian programmatic control. This gives Iran direct decision-making over how a portion of its own money is spent, preserving sovereign dignity. Subject to Tier 3 review but not unilateral U.S. veto.

Short-term | Medium Risk | Third-Party

8 Maritime Safety Sub-Account (10%)

10% funds the International Maritime Safety Fund for joint patrol, mine clearance, and navigation aids. This is protected from any political dispute and administered independently. It ensures that maritime safety continues regardless of nuclear compliance disputes.

Short-term | Low Risk | Third-Party

9 OFAC Waiver Protecting Fund Assets

On Day 1, the U.S. issues a binding national security waiver protecting all fund assets from domestic judicial seizure, private civil litigation, or secondary sanctions enforcement. No U.S. court may attach, freeze, or garnish Fund assets. This shield applies retroactively from first deposit and survives any framework suspension.

Immediate | Medium Risk | US-First

10 Multi-Jurisdiction Asset Consolidation

Frozen assets held across China, Japan, South Korea, India, Iraq, Oman, and European jurisdictions are consolidated into the Oman escrow through a coordinated transfer operation. Each holding jurisdiction receives legal comfort letters confirming the transfer's legitimacy under local law.

Short-term | Medium Risk | Third-Party

11 Rolling Release with 15-Day Cycles

Each asset tranche operates on a 15-day cycle: Days 1-5 (milestone verification), Days 6-10 (escrow processing and OFAC guidance), Days 11-15 (funds credited to Iranian accounts). This predictable rhythm allows Iranian financial planners to schedule imports and payments with confidence.

Short-term | Low Risk | Third-Party

12 Performance Reserve with Early Release Incentive

The 25% performance reserve (Account B) can be released early if Iran achieves exceptional compliance milestones: 6 consecutive months of clean IAEA certification releases 10%; 12 months releases the remaining 15%. This incentivizes sustained compliance beyond minimum requirements.

Medium-term | Low Risk | Simultaneous

13 Currency Diversification Protection

Asset releases are denominated in multiple currencies: Tranches 1-2 in USD for immediate liquidity; Tranches 3+ in SDR or Swiss Franc/Omani Rial basket. This protects Iran from dollar depreciation and gives the U.S. confidence that released funds cannot be easily redirected to sanctioned activities.

Short-term | Low Risk | Third-Party

14 World Bank Fiduciary Oversight

The World Bank provides fiduciary oversight for infrastructure spending, ensuring procurement follows international standards and funds reach intended beneficiaries. This independent oversight addresses U.S. concerns about diversion while giving Iran access to World Bank technical expertise.

Short-term | Low Risk | Third-Party

15 Iranian Sovereign Wealth Sub-Accounts

Released assets are deposited into sovereign wealth sub-accounts held in Switzerland or Oman. These assets may be drawn down at a capped monthly rate or converted directly into letters of credit for non-sanctioned industrial trade, preventing capital flooding that could trigger domestic currency volatility or hyperinflation.

Short-term | Low Risk | Third-Party

16 Legal Protection from Terrorism Judgments

The escrow structure includes a specific provision that escrow funds are not subject to attachment under the Foreign Sovereign Immunities Act or any terrorism-related court judgments. This \$50+ billion legal overhang has blocked every previous asset release and must be explicitly addressed.

Immediate | Medium Risk | Third-Party

17 Transparency Portal with Public Reporting

All escrow transactions are recorded on a public transparency portal showing: amounts deposited, amounts released, dates, triggering milestones, and beneficiary categories. Quarterly reports are audited by a Big Four firm and published in English, Persian, and Arabic.

Short-term | Low Risk | Third-Party

18 Emergency Liquidity Facility

A \$5 billion emergency liquidity facility is established within the escrow structure, accessible within 48 hours for genuine humanitarian or economic emergencies (natural disaster, pandemic, food crisis). Access requires only IAEA + Oman approval, not U.S. concurrence.

Short-term | Low Risk | Third-Party

19 Asset Tracing Technology

All released funds are tagged with digital tracing technology that follows them through the financial system. This tracing is not surveillance — it is aggregate tracking to detect patterns of diversion to prohibited activities. If no diversion is detected after 12 months, tracing is deactivated.

Short-term | Medium Risk | Third-Party

20 Graduated Iranian Control Expansion

Month 1-3: Iran has programmatic input but all spending requires World Bank approval. Month 4-6: Iran has autonomous control over 25% of releases. Month 7-12: Iran has autonomous control over 50%. Year 2+: Full autonomous control subject only to annual audit. This builds Iranian financial management capacity while preventing early-stage diversion.

Medium-term | Medium Risk | Third-Party

21 Direct Vendor Payment System

For the first 6 months, escrow funds are paid directly to international vendors supplying Iran with authorized goods, rather than transferred to Iranian government accounts. This vendor-direct model ensures funds purchase actual products rather than entering opaque government coffers.

Short-term | Low Risk | Third-Party

22 Asset Release Linked to IAEA Certification

Each asset tranche is mechanically linked to specific IAEA certification milestones: HEU custody verified (Tranche 2), moratorium declared active (Tranche 3), JMGM operational (Tranche 4), 180-day compliance review (Tranche 5), 12-month clean certification (Tranche 6). This linkage is automatic, not discretionary.

Short-term | Low Risk | Third-Party

23 Iranian Domestic Stabilization Buffer

The first \$10 billion released is specifically earmarked for domestic economic stabilization: currency support, essential imports, and electricity grid repair. This front-loaded approach addresses Iran's immediate crisis (rolling blackouts, currency collapse) and generates visible improvements within 30 days.

Immediate | Low Risk | Third-Party

24 Retained-in-Place Alternative for Key Holdings

For politically sensitive asset holdings (e.g., funds in U.S. banks subject to congressional pressure), an alternative structure allows assets to remain in place legally but functionally be 'unfrozen' — Iran gains economic benefit through derivatives, letters of credit, and counter-trade arrangements without physical transfer.

Short-term | Medium Risk | Simultaneous

25 Successor Framework Full Asset Return

All remaining sovereign asset returns (\$70-80 billion of ~\$120 billion total) are deferred to Phase II negotiation. The Sprint releases are non-reversible. This architecture gives Iran immediate, irreversible wins while protecting U.S. interests and preserving leverage for the comprehensive follow-on agreement.

Long-term | Medium Risk | Simultaneous

Issue 9: SWIFT Reconnection & Banking Isolation

The Problem

Iran's total disconnection from SWIFT since 2018 has paralyzed its commercial sector. Iranian banks cannot process international payments, issue letters of credit, or receive remittances. Reconnection is Iran's most urgent economic demand after sanctions relief itself.

25 Modular Solutions for Issue 9

1 Phased Multi-Tier Virtual Consolidation

A graduated SWIFT access model creating a pathway for Iranian banks to reconnect without granting immediate unrestricted access. Four phases: Phase 0 (Days 1-30): Qatari riyal bridge for humanitarian payments only. Phase 1 (Days 30-60): 5 designated Iranian banks; MT 103/202 only; \$1M daily cap. Phase 2 (Days 60-120): All clean-record banks; full message types; humanitarian trade. Phase 3 (Day 120+): Full SWIFT membership.

Short-term | Medium Risk | Simultaneous

2 Phased Virtual Reintegration (PVR)

Three-tier reintegration: Tier 1 — A single designated 'consolidation bank' (Bank of Oman-Iran Reconstruction Bank, jointly capitalized by Oman, Qatar, and Pakistan) receives limited SWIFT connectivity for humanitarian imports, petroleum sales to pre-approved customers, and agricultural inputs. All transactions pre-cleared by a compliance monitor (Deloitte or PwC).

Short-term | Medium Risk | Third-Party

3 Consolidation Bank Model

Rather than reconnecting all Iranian banks simultaneously, a single new entity — the Bank of Oman-Iran Reconstruction Bank — receives SWIFT connectivity. This 'one-bank, limited-scope' model gives Iran functional SWIFT access for urgent trade within days while keeping most Iranian banks off SWIFT until compliance is verified.

Short-term | Medium Risk | Third-Party

4 Compliance Monitor Gatekeeping

All Phase 0-1 transactions are pre-cleared by a contracted compliance monitor (Deloitte or PwC) and screened against sanctions lists in real time. The compliance monitor can block individual transactions, and the U.S. representative on the JMGF financial committee can freeze reconnection of subsequent tranches.

Short-term | Medium Risk | Third-Party

5 SWIFT Remediation Fuse

If IAEA identifies a Tier 2 compliance concern, the SWIFT phase holds for exactly 14 days as a remediation window. Resolved within 14 days: phase advances normally. Unresolved after 14 days: SWIFT rolls back exactly one tier. Only Tier 2 material disruptions trigger the fuse — Tier 1 technical disputes do not.

Short-term | Low Risk | Third-Party

6 Qatari Riyal Bridge Facility

During Phase 0, a Qatari riyal-denominated bridge facility handles humanitarian payments. Qatar provides the clearing infrastructure; Iran receives functional payment capability without SWIFT connectivity. This bridge operates until OLEM confirms 60% HEU custody within 72 hours.

Immediate | Low Risk | Third-Party

7 Graduated Institutional Reconnection

Upon IAEA certification at Month 3, a second tranche of Iranian banks — starting with privately owned banks with no IRGC ownership — receive SWIFT connectivity for general commercial trade. By Month 6, if compliance remains clean, a third tranche including smaller state-owned banks is connected.

Medium-term | Medium Risk | Third-Party

8 Exclusion List for Terrorism-Designated Banks

All Iranian banks except those specifically designated for terrorism or proliferation involvement (a list agreed by both parties) are eligible for reconnection. This agreed exclusion list permanently keeps problematic institutions isolated while giving clean banks a clear path to normalization.

Short-term | Low Risk | Simultaneous

9 Transaction Cap with Graduated Lifting

Phase 1 imposes a \$1 million per day per bank transaction cap. This cap lifts to \$10M at Month 3, \$50M at Month 6, and unlimited at Month 12 for banks with clean compliance records. The graduated lifting creates incentives for banks to maintain clean records.

Short-term | Low Risk | Third-Party

10 Message Type Graduation

Phase 1 allows only MT 103/202 (standard payment messages). Phase 2 adds MT 700 (letters of credit). Phase 3 adds MT 760 (guarantees) and MT 202COV (cover payments). Full SWIFT membership (Phase 3) includes all message types subject to the same compliance standards as all other member banks.

Short-term | Low Risk | Third-Party

11 Iranian Banking Sector Transparency Reform

As a condition of SWIFT reconnection, Iran commits to banking sector reforms: beneficial ownership disclosure for all banks, separation of military-affiliated financial institutions from civilian banking, adoption of FATF standards, and establishment of an independent banking supervisory authority.

Medium-term | Medium Risk | Iran-First

12 Dual SWIFT-Iran Switch Architecture

Iran maintains its domestic financial messaging system (SEPA) for domestic transactions while SWIFT handles international payments. A dual-switch architecture allows Iranian banks to route international payments through SWIFT while domestic transactions remain on SEPA. This preserves Iranian financial sovereignty while enabling international connectivity.

Short-term | Low Risk | Simultaneous

13 Correspondent Bank Liability Shield

OFAC issues explicit guidance that correspondent banks processing Iranian transactions through the consolidation bank are not exposed to sanctions liability for activities that would otherwise be sanctionable. This liability shield is the critical enabler — without it, no bank will process Iranian payments regardless of SWIFT connectivity.

Immediate | Medium Risk | US-First

14 European Clearinghouse Coordination

The European Central Bank and major European clearinghouses (TARGET2, EBICS) receive joint U.S.-Iranian assurances that Iranian transactions processed through the consolidation bank will not trigger European sanctions enforcement. This opens the European payment channel, which handles 60% of Iran's trade.

Short-term | Medium Risk | Third-Party

15 Asian Clearing Union Integration

Iran reactivates its membership in the Asian Clearing Union (ACU), which processes payments among South and Southeast Asian central banks. ACU operates outside Western financial infrastructure, providing Iran with a complementary payment channel that reduces over-dependence on SWIFT.

Short-term | Low Risk | Third-Party

16 Digital Currency Bridge Pilot

A pilot program using central bank digital currencies (CBDCs) — specifically the digital yuan and digital rial — enables cross-border payments without SWIFT. This pilot operates alongside traditional SWIFT reconnection, providing technological diversification and resilience against future financial weaponization.

Medium-term | Medium Risk | Third-Party

17 Banking Personnel Exchange Program

Iranian central bank officials spend 6-month rotations at the Central Bank of Oman and Qatar Central Bank, learning international compliance standards and building personal relationships. These exchanges create human-to-human connections that facilitate informal problem-solving when formal channels stall.

Medium-term | Low Risk | Third-Party

18 Iranian Bank Rating Upgrade Pathway

International credit rating agencies (Moody's, S&P, Fitch) establish a formal pathway for upgrading Iranian bank ratings as compliance milestones are met. Each upgrade reduces Iranian banks' cost of international borrowing and increases their attractiveness to foreign correspondent banks.

Medium-term | Low Risk | Third-Party

19 Trade Finance Guarantee Facility

A \$10 billion trade finance guarantee facility, backed by the JMGF and administered by the Islamic Development Bank, provides payment guarantees for Iranian imports. This facility de-risks trade for international suppliers who might otherwise refuse to sell to Iran due to payment concerns.

Short-term | Low Risk | Third-Party

20 Pre-Existing Obligation Recognition

All legitimate pre-sanctions Iranian financial obligations (letters of credit, trade debts, contractual payments) are recognized and authorized for settlement through the consolidation bank. This clears the backlog of frozen transactions that has paralyzed Iranian commercial relationships.

Immediate | Low Risk | Third-Party

21 Iranian Bank Branch Licensing Abroad

As SWIFT connectivity expands, Iranian banks are authorized to reopen branches in Dubai, Istanbul, Mumbai, and Shanghai. These branches provide Iranian businesses with local banking services in major trade hubs, dramatically improving payment efficiency.

Medium-term | Medium Risk | Third-Party

22 Real-Time Transaction Monitoring

All SWIFT transactions involving Iranian banks are subject to real-time AI-powered monitoring that flags potentially suspicious transactions for review. This monitoring is transparent to both U.S. and Iranian regulators and operates under joint oversight, preventing unilateral weaponization of financial data.

Short-term | Medium Risk | Third-Party

23 SWIFT Governance Reform Participation

Iran is invited to participate in SWIFT governance reform discussions, including the SWIFT Board of Directors observer seat. This institutional participation gives Iran a voice in the organization that controls its financial connectivity, addressing sovereignty concerns.

Long-term | Low Risk | Third-Party

24 Financial Sector Capacity Building

International financial institutions (IME, World Bank, IFC) provide technical assistance to Iran's banking sector: anti-money laundering systems, risk management frameworks, corporate governance standards, and stress testing. This capacity building improves Iranian banks' compliance and operational quality.

Medium-term | Low Risk | Third-Party

25 Successor Framework Full Banking Normalization

Full normalization of Iran's banking sector — including removal of all residual restrictions, Iranian bank access to Fedwire and CHIPS, and Iran's participation in global financial governance — is deferred to Phase II. The Sprint establishes the foundation; Phase II completes the integration.

Long-term | Medium Risk | Simultaneous

Issue 10: War Reparations vs. Reconstruction Credits

The Problem

Tehran formally requested U.S.-funded war reparations for infrastructure damage sustained since February 2026. The Trump administration flatly rejected the concept of reparations but signaled willingness to assist with regional reconstruction. The framing has blocked all economic assistance discussions.

25 Modular Solutions for Issue 10

1 Regional Stability Reconstruction Credits (RSRC)

A pure reframing that preserves both sides' political requirements. The substance — substantial American financial support for Iranian economic reconstruction — is preserved. The label — 'reparations' versus 'investment' — is replaced with 'Regional Stability Reconstruction Credits.' The U.S. maintains its stance against direct reparations; Iran receives economic relief. Both statements remain factually correct.

Short-term | Medium Risk | Simultaneous

2 International Gulf Reconstruction Fund

Established under sovereign immunity in Oman, managed by the World Bank with Iranian programmatic input. Funding: 30% of Iranian frozen assets (already Iranian money) plus contributions from Gulf states, EU, and international development banks. U.S. Contribution: Technical assistance, engineering expertise, and development finance guarantees — not direct cash payments.

Short-term | Medium Risk | Third-Party

3 No-Fault Architecture

The United States maintains its stance against direct reparations. Iran receives economic relief. Both statements remain factually correct through a structure where the U.S. provides 'technical assistance and development finance guarantees' while Iranian frozen assets and international contributions fund actual reconstruction.

Short-term | Low Risk | Simultaneous

4 Iranian Frozen Assets as Primary Funding Source

30% of Iranian frozen assets already belong to Iran — using them for reconstruction is not a U.S. payment but an Iranian sovereign decision. This reframes the funding: Iran is spending its own money on its own reconstruction, with the U.S. merely unfreezing what was already Iranian.

Short-term | Low Risk | Simultaneous

5 Gulf State Contribution Requirement

Gulf states (Saudi Arabia, UAE, Qatar, Kuwait) contribute to the reconstruction fund as part of their regional stability obligation. This internationalizes the burden so it does not fall solely on the U.S. Gulf contributions also serve as de facto recognition of Iran's reintegration into the regional order.

Short-term | Medium Risk | Third-Party

6 World Bank Management with Iranian Programmatic Input

The World Bank manages the fund with Iranian representatives on the board determining expenditure priorities. This gives Iran decision-making authority over reconstruction while the World Bank ensures fiduciary standards, transparent procurement, and compliance with international norms.

Short-term | Low Risk | Third-Party

7 Eligible Expenditure Categories

Civilian Infrastructure (power generation, water treatment, telecommunications) — open tender, IAEA diversion clearance. Healthcare (hospitals, medical equipment, pharmaceutical production) — WHO verification. Education (schools, universities, vocational training) — UNESCO oversight. Environmental Remediation — UNEP assessment. Excluded: Military facilities, dual-use research, IRGC-linked entities.

Short-term | Low Risk | Third-Party

8 U.S. Technical Assistance, Not Cash

The U.S. contribution is limited to technical assistance (engineering expertise, project management, technology transfer) and development finance guarantees (OPIC/DFC-backed loans for American companies investing in Iranian reconstruction). No direct U.S. government cash payments to Iran.

Short-term | Low Risk | US-First

9 Reconstruction Credit Labeling

The financial packages are explicitly labeled 'Regional Stability Reconstruction Credits' — not reparations, not aid, but investment in regional stability that happens to rebuild Iranian infrastructure. This linguistic innovation allows both sides to claim victory: the U.S. did not pay reparations; Iran received reconstruction support.

Immediate | Low Risk | Simultaneous

10 Iranian Sovereign Decision on Allocation

Iran decides how reconstruction credits are allocated across eligible categories, subject only to international fiduciary standards. This sovereign decision-making preserves Iranian dignity: Iran is not receiving charity but directing investment in its own development.

Short-term | Low Risk | Simultaneous

11 Transparent Procurement with International Oversight

All reconstruction contracts are awarded through open international tender, with procurement oversight by the World Bank and independent audit by a Big Four accounting firm. This transparency prevents corruption and ensures funds reach intended projects rather than regime pockets.

Short-term | Low Risk | Third-Party

12 Quick-Impact Projects for Immediate Visibility

The first \$500 million is allocated to 'quick-impact' projects: hospital renovation, school repair, water purification plants, and electricity substations. These projects produce visible improvements within 90 days, generating popular Iranian support for continued compliance.

Short-term | Low Risk | Third-Party

13 Employment Generation Requirement

All reconstruction projects must include Iranian labor content requirements: minimum 70% Iranian workforce, with preference for hiring in conflict-affected regions. This ensures reconstruction creates jobs for ordinary Iranians rather than profits for international contractors.

Short-term | Low Risk | Iran-First

14 Technology Transfer as In-Kind Contribution

American engineering firms provide technology transfer as an in-kind contribution to the reconstruction fund: seismic-resistant construction techniques, water treatment systems, renewable energy technology. This 'knowledge dividend' has economic value but does not require cash transfers.

Medium-term | Low Risk | US-First

15 Public-Private Partnership Framework

Reconstruction is delivered through PPPs where international investors provide capital, Iranian firms provide labor and local knowledge, and the World Bank provides risk guarantees. This blended finance model leverages limited public funds to attract substantial private investment.

Medium-term | Low Risk | Third-Party

16 Regional Development Corridor

Reconstruction is framed as creating a 'Regional Development Corridor' connecting Iran's economy to Gulf, Central Asian, and South Asian markets. Iranian infrastructure (rail, ports, pipelines) becomes the backbone of regional trade, generating economic returns that justify international investment.

Medium-term | Low Risk | Third-Party

17 Environmental Remediation Component

A dedicated 15% of reconstruction credits funds environmental remediation: oil spill cleanup, desertification programs, water conservation, and renewable energy development. This 'green reconstruction' aligns with international climate commitments and attracts additional environmental funding.

Short-term | Low Risk | Third-Party

18 Healthcare Infrastructure as Regional Hub

Iranian hospital reconstruction includes capacity to serve patients from neighboring countries (Afghanistan, Pakistan, Central Asia). This 'medical tourism' revenue stream makes healthcare investment economically sustainable while positioning Iran as a regional health leader.

Medium-term | Low Risk | Iran-First

19 Education and Vocational Training Focus

Reconstruction credits fund vocational training centers that prepare Iranian workers for employment in the reconstructed economy. Training programs are designed with input from international employers to ensure graduates have marketable skills.

Medium-term | Low Risk | Third-Party

20 Conflict-Affected Community Priority

Reconstruction prioritizes communities directly affected by military operations: families of civilian casualties, displaced persons, and residents of damaged neighborhoods. This targeted approach addresses humanitarian needs while generating grassroots support for peace.

Immediate | Low Risk | Iran-First

21 Women's Economic Empowerment Component

A dedicated 20% of reconstruction credits targets women's economic empowerment: women-owned business loans, female vocational training, childcare facilities enabling women to work, and women's health infrastructure. This component attracts additional funding from international women's organizations.

Short-term | Low Risk | Third-Party

22 Agricultural Reconstruction and Food Security

Reconstruction includes modernization of Iranian agriculture: irrigation systems, cold storage, food processing facilities, and distribution networks. This addresses Iran's food security crisis and reduces dependence on food imports, freeing foreign exchange for other needs.

Short-term | Low Risk | Iran-First

23 Digital Infrastructure and E-Government

Reconstruction credits fund Iran's digital infrastructure: broadband expansion, e-government systems, digital payment platforms, and cybersecurity. This modernizes Iran's economy and creates opportunities for international technology partnerships.

Medium-term | Low Risk | Third-Party

24 Heritage Site Restoration

Cultural heritage sites damaged during the conflict are restored with international expertise. This high-visibility work generates positive media coverage and demonstrates respect for Iranian civilization. UNESCO coordinates the heritage restoration component.

Short-term | Low Risk | Third-Party

25 Successor Framework Full Reconstruction Scale-Up

The Sprint establishes the reconstruction fund and initial projects. Phase II scales the fund to \$50+ billion with full international participation. The long-term vision: Iran's post-conflict reconstruction becomes the largest development project in the Middle East, attracting global investment.

Long-term | Medium Risk | Simultaneous

PART 4

Treaty Durability & Regional Architecture

Issues 11-15: An agreement that collapses upon the first breach is worse than no agreement. The negotiation timeline, institutional guarantees, regime management, missile constraints, and humanitarian protection determine whether peace endures.

1 Mutual Letter of Intent with Auto-Renewing Ceasefire

Both parties deposit a Letter of Intent with the Joint Secretariat affirming commitment to the 180-day implementation timeline, authorization for emergency consultations within 4 hours, agreement that no military action shall be taken during the 180-day period without exhausting dispute procedures, and acceptance that the 72-hour ceasefire auto-renews at Hour 71 provided verification teams report compliance.

Immediate | Low Risk | Simultaneous

2 Escrow Ceasefire Architecture

The ceasefire is a self-renewing 72-hour module. If verification teams report compliance at Hour 71, the module auto-renews for another 72 hours. Peace is maintained without either side signing away long-term leverage upfront. Separating the ceasefire clock (72-hour loops) from the implementation clock (30-day phases) neutralizes the 'negotiation about negotiation' trap.

Immediate | Low Risk | Simultaneous

3 Binding 30-Day Negotiation Timeline

A binding 30-day timeline locked via mutual Letter of Intent creates momentum and prevents stalling. Day 1-7: HEU consolidation and initial custody. Day 8-15: Enrichment moratorium declaration and initial sanctions relief. Day 16-22: Maritime governance activation and blockade reduction. Day 23-30: Full implementation verification and Phase II negotiation launch.

Immediate | Low Risk | Simultaneous

4 Auto-Escalation Brake

If talks stall on Day 14 over HEU down-blending details, the guns do not automatically resume firing. The 72-hour military freeze module continues auto-renewing quietly in the background. This brake prevents technical disputes from triggering military escalation.

Immediate | Low Risk | Simultaneous

5 Emergency Consultation Mechanism

The Joint Secretariat is authorized to convene emergency consultations within 4 hours of any reported violation. This rapid-response mechanism prevents disputes from festering and escalating. Consultations are mandatory — neither party may refuse without triggering Tier 2 review.

Immediate | Low Risk | Third-Party

6 180-Day Implementation Roadmap

A detailed 180-day roadmap with specific milestones for each 30-day phase provides structure and predictability. Each phase builds on the previous: Phase I (Days 1-30) nuclear stabilization, Phase II (Days 31-60) maritime governance, Phase III (Days 61-90) economic normalization, Phase IV (Days 91-180) treaty durability and Phase II preparation.

Short-term | Low Risk | Simultaneous

7 Verification Team Continuous Deployment

Joint verification teams (U.S., Iranian, Omani, IAEA personnel) are deployed to all relevant sites within 48 hours of signature. These teams provide continuous on-site monitoring that auto-renews the ceasefire and reports compliance to the Joint Secretariat every 71 hours.

Immediate | Low Risk | Third-Party

8 No Military Action Without Exhaustion of Procedures

Both parties agree that no military action shall be taken during the 180-day period without first exhausting the dispute resolution procedures. This commitment is binding and verifiable through troop movement monitoring and satellite surveillance.

Immediate | Medium Risk | Simultaneous

9 Phase II Auto-Launch Commitment

Upon successful completion of the 180-day Sprint, both parties commit to launching Phase II comprehensive negotiations within 30 days. Phase II addresses the permanent architecture: full diplomatic relations, complete sanctions removal, regional security framework, and successor nuclear agreement.

Short-term | Low Risk | Simultaneous

10 Daily Joint Status Reports

The Joint Secretariat publishes daily status reports showing: ceasefire compliance status, milestone progress, verification team locations, and any incidents or disputes. This transparency prevents misinformation and builds confidence in the process.

Immediate | Low Risk | Third-Party

11 Third-Party Escrow for Timeline Enforcement

A neutral third party (Oman or Pakistan) holds an escrow of \$100 million from each side. If either party violates the timeline without exhausting dispute procedures, the escrow is forfeited to the other party. This financial incentive reinforces political commitment.

Short-term | Low Risk | Third-Party

12 Media Blackout for First 7 Days

Both parties agree to a media blackout for the first 7 days of implementation, preventing premature spin and inflammatory rhetoric from derailing fragile early progress. After Day 7, coordinated positive messaging replaces inflammatory statements.

Immediate | Low Risk | Simultaneous

13 Opposition Party Briefing (U.S.)

The Trump administration privately briefs key congressional leaders (Graham, Schumer, relevant committee chairs) on the framework before signature, securing their tacit acceptance or at least preventing immediate legislative sabotage. This domestic political management is essential for U.S. implementation.

Immediate | Medium Risk | US-First

14 Iranian Faction Coordination via Supreme Leader

The Supreme Leader issues a binding directive to all Iranian factions (IRGC, Guardian Council, Basij) that the framework has his full support and any attempt to sabotage it will be treated as treason. This top-down enforcement is essential given Iranian regime fragmentation.

Immediate | High Risk | Iran-First

15 NATO/EU Parallel Endorsement

NATO and EU issue statements welcoming the framework and calling on all parties to respect the timeline. This international endorsement provides political cover for both sides and deters spoilers from disrupting the process.

Short-term | Low Risk | Third-Party

16 UN Security Council Resolution Mandate

A UNSC resolution is adopted within 72 hours of signature, mandating the framework and authorizing UN support for implementation. The resolution is sponsored by China and Russia (ensuring Iranian acceptance) and supported by the U.S. (ensuring Western compliance).

Immediate | Low Risk | Third-Party

17 Regional Arab State Buy-In

Saudi Arabia, UAE, and Egypt issue statements of support for the framework, ideally including offers of financial contribution to the reconstruction fund. This Arab buy-in prevents Israel from isolating Iran and demonstrates that the region accepts Iran's reintegration.

Short-term | Medium Risk | Third-Party

18 Israeli Non-Obstruction Commitment

Through U.S. mediation, Israel commits to not taking military action against Iran during the 180-day period and to not publicly criticizing the framework. In exchange, the U.S. provides enhanced intelligence sharing and security guarantees. This Israeli commitment is essential for framework survival.

Short-term | High Risk | US-First

19 Confidence-Building Sports Exchange

As a symbolic gesture, the U.S. and Iran organize a friendly soccer match (or wrestling exhibition) within the first 30 days, broadcast live in both countries. This people-to-people event generates positive emotion that reinforces political commitments.

Short-term | Low Risk | Simultaneous

20 Joint Economic Commission Launch

A Joint U.S.-Iran Economic Commission is established by Day 30, co-chaired by the U.S. Treasury Secretary and Iranian Minister of Economy. The Commission meets monthly to review economic implementation and address commercial disputes. This institutionalizes economic cooperation.

Short-term | Low Risk | Simultaneous

21 Scientific Collaboration Announcement

By Day 15, both governments announce a joint scientific collaboration on climate change, water scarcity, or public health. This high-visibility, low-risk cooperation demonstrates that engagement produces tangible benefits and creates constituencies for continued peace.

Short-term | Low Risk | Simultaneous

22 Tourism and Cultural Exchange Pilot

A pilot program allows limited tourist visa issuance between the two countries, starting with academic, medical, and cultural delegations. This people-to-people channel generates human connections that make reversal politically costly.

Medium-term | Medium Risk | Simultaneous

23 Emergency Summit Provision

If the framework faces imminent collapse at any point, an emergency summit between the two heads of state (or their personal representatives) is automatically convened within 48 hours. This leadership-level intervention can break bureaucratic deadlocks that technical teams cannot resolve.

Immediate | Medium Risk | Simultaneous

24 Weekly Video Conference Between Lead Negotiators

The U.S. Special Envoy and Iranian Deputy Foreign Minister hold a weekly video conference to review progress, address concerns, and maintain personal rapport. This regular contact prevents misunderstandings from festering and builds interpersonal trust.

Immediate | Low Risk | Simultaneous

25 Successor Framework Pre-Negotiation

During the 180-day Sprint, technical teams quietly draft the Phase II comprehensive agreement, so it is ready for signature immediately upon Sprint completion. This parallel track ensures no gap between Sprint and Phase II that spoilers could exploit.

Short-term | Low Risk | Simultaneous

Issue 12: Institutional Guarantees & Third-Party Mediation

The Problem

An agreement without credible guarantors collapses at the first crisis. The Sprint requires a robust institutional architecture that provides verification, dispute resolution, and political cover for both parties when implementation encounters inevitable friction.

25 Modular Solutions for Issue 12

1 Distributed Guarantor Matrix (6 States)

A six-state guarantor framework: Oman (primary mediator and host), Pakistan (Islamabad diplomatic host), Switzerland (financial and legal custodian), Turkey (regional security guarantor with NATO membership), Russia (permanent UNSC member), and China (economic guarantor with UNSC leverage). Each guarantor has a defined role and specific responsibilities.

Short-term | Low Risk | Third-Party

2 Joint Implementation Group (JIG)

The JIG is the primary operational body, co-chaired by U.S. and Iranian deputies, with all guarantor states as members. It meets weekly (virtually) and monthly (in person). The JIG reviews compliance, addresses disputes, and approves milestone certifications. Decisions require consensus among U.S., Iran, and three guarantors.

Short-term | Low Risk | Third-Party

3 Oman as Permanent Secretariat Host

The Sultanate of Oman hosts the Joint Secretariat in Muscat, providing neutral territory, experienced diplomatic facilitation, and established bilateral relationships with both the U.S. and Iran. Oman's role as 'Switzerland of the Middle East' makes it the natural institutional anchor.

Short-term | Low Risk | Third-Party

4 Pakistan as Crisis Mediator

Pakistan, with its existing relationships with both parties and its Islamic identity, serves as the primary crisis mediator. Pakistani Interior Minister and Army Chief conduct regular shuttle diplomacy. Pakistan's nuclear status gives it credibility on non-proliferation issues.

Short-term | Low Risk | Third-Party

5 Switzerland as Financial Custodian

Switzerland hosts the escrow accounts, administers the transparency portal, and provides legal arbitration services. Swiss neutrality, banking expertise, and legal tradition make it the ideal financial custodian. The Swiss Federal Office for Customs and Border Security administers asset releases.

Short-term | Low Risk | Third-Party

6 Turkey as Regional Security Guarantor

Turkey provides regional security guarantees backed by its NATO membership and military capability. Turkish forces could participate in Hormuz patrols, and Turkey's unique position as a Muslim-majority NATO member gives it credibility with both Western and Iranian audiences.

Short-term | Medium Risk | Third-Party

7 Russia as UNSC Guarantor

Russia, as a permanent UNSC member, provides the political guarantee that no UNSC resolution will be adopted that undermines the framework. Russia also serves as a destination for HEU transfer (Rosatom) and hosts backup diplomatic channels. Russian involvement ensures Iranian confidence.

Short-term | Low Risk | Third-Party

8 China as Economic Guarantor

China provides economic guarantees: commitments to purchase Iranian oil, invest in Iranian infrastructure, and use its UNSC veto to protect the framework. China's Belt and Road Initiative aligns with Iranian reconstruction needs. Chinese economic engagement gives Iran an alternative to Western dependence.

Short-term | Low Risk | Third-Party

9 Arbitration Panel with Enforceable Decisions

A three-member arbitration panel — one U.S. nominee, one Iranian nominee, and one mutually agreed chair — adjudicates disputes that the JIG cannot resolve. Panel decisions are binding and enforceable through the escrow mechanism (non-compliant parties forfeit escrow funds).

Short-term | Medium Risk | Third-Party

10 Regional Stabilization Council

A broader Regional Stabilization Council including all Gulf states, Turkey, Egypt, and Pakistan provides multilateral political cover. The Council issues statements of support, coordinates economic contributions, and deters bilateral spoilers. Council meetings coincide with JIG sessions.

Short-term | Low Risk | Third-Party

11 UN Special Coordinator Role

The UN Secretary-General appoints a Special Coordinator for Framework Implementation who chairs JIG meetings, issues public compliance assessments, and reports quarterly to the UNSC. The Coordinator's office provides institutional continuity beyond any single administration.

Short-term | Low Risk | Third-Party

12 European Union Observer Status

The EU holds permanent observer status at JIG meetings, contributes to the reconstruction fund, and provides technical assistance. EU involvement opens European markets to Iranian exports and signals that the international community (not just the U.S.) supports the framework.

Short-term | Low Risk | Third-Party

13 International Atomic Energy Agency Verification Authority

The IAEA holds independent verification authority under its existing statutory mandate. IAEA Director General reports directly to the JIG and can escalate concerns without diplomatic filtering. IAEA technical assessments are presumed authoritative unless challenged with specific counter-evidence.

Short-term | Low Risk | Third-Party

14 Red Crescent/Cross Observer Network

The International Red Crescent (Iranian affiliate) and International Red Cross deploy observers to monitor humanitarian conditions, report on civilian impacts, and verify that humanitarian protections remain in force. Their reports are public and politically influential.

Short-term | Low Risk | Third-Party

15 Academic Verification Consortium

A consortium of universities (Harvard, Tehran University, Oxford, Sharif University of Technology) provides independent technical analysis of framework implementation. Academic reports carry credibility with educated publics in both countries and provide non-governmental verification.

Short-term | Low Risk | Third-Party

16 Business Council for Economic Implementation

A joint U.S.-Iran Business Council, co-chaired by American and Iranian business leaders, monitors economic implementation from the private sector perspective. Council reports on trade volumes, investment flows, and commercial obstacles complement official government reporting.

Short-term | Low Risk | Third-Party

17 Media Monitoring and Transparency Network

Independent media organizations (Reuters, AP, IRNA, Fars News) collaborate on a transparency network that cross-reports on framework implementation. Discrepancies between official reports and on-the-ground reality are flagged for JIG review.

Short-term | Low Risk | Third-Party

18 Civil Society Dialogue Platform

A platform for civil society organizations from both countries — human rights groups, environmental organizations, women's groups, religious leaders — to discuss framework implementation and voice concerns. While not decision-making, this platform provides early warning of public dissatisfaction.

Short-term | Low Risk | Third-Party

19 Military-to-Military Communication Channel

A direct military-to-military communication channel between CENTCOM and the Iranian Armed Forces General Staff operates 24/7 through the Deconfliction Hotline. This channel prevents military incidents from escalating and allows rapid clarification of ambiguous situations.

Immediate | Medium Risk | Simultaneous

20 Intelligence Sharing on Common Threats

Limited intelligence sharing on threats of mutual concern: ISIS resurgence, drug trafficking from Afghanistan, maritime piracy, and nuclear terrorism. This cooperation demonstrates that U.S. and Iranian security interests can align even while broader disagreements persist.

Short-term | High Risk | Simultaneous

21 Judicial Cooperation Framework

A framework for judicial cooperation on criminal matters (drug trafficking, money laundering, cybercrime) that does not require diplomatic recognition. This functional cooperation builds institutional relationships and demonstrates that legal systems can interact productively.

Medium-term | Medium Risk | Simultaneous

22 Environmental Cooperation Protocol

A protocol for cooperation on environmental issues: Persian Gulf marine protection, dust storm mitigation, water resource management, and climate adaptation. Environmental cooperation is low-risk, high-visibility, and benefits future generations.

Short-term | Low Risk | Simultaneous

23 Health Security Partnership

A partnership on health security: pandemic preparedness, vaccine production, medical research, and healthcare infrastructure. COVID-19 demonstrated that health threats transcend politics; this partnership institutionalizes that lesson.

Short-term | Low Risk | Simultaneous

24 Cultural Heritage Protection Agreement

An agreement to protect cultural heritage sites in both countries, including sites damaged during the conflict. This cooperation is symbolic, non-controversial, and generates positive media coverage that supports broader political objectives.

Short-term | Low Risk | Simultaneous

25 Successor Framework Permanent Institutional Architecture

The Sprint's institutional arrangements — JIG, guarantor matrix, arbitration panel — are designed to evolve into permanent institutions under a comprehensive peace treaty. This long-term vision gives participants incentive to invest in institutional quality rather than treating arrangements as temporary.

Long-term | Low Risk | Third-Party

Issue 13: Human-in-the-Loop Governance & Regime Fractures

The Problem

Neither the U.S. nor Iranian regimes are monolithic. Hardline factions within the IRGC, Guardian Council, and Basij may attempt to derail provisions even after Supreme Leader approval. Similarly, domestic U.S. political opposition, congressional war powers resolutions, and allied pressure could destabilize American implementation.

25 Modular Solutions for Issue 13

1 Human-in-the-Loop Governance Protocol

Automated systems (black-box telemetry, AI monitoring, automated alerts) inform but do not trigger escalatory actions. All escalation decisions require human deliberation by the Joint Implementation Group. No machine-generated signal alone can trigger sanctions reimposition, military response, or framework suspension. Human judgment, not algorithmic determinism, governs the framework.

Immediate | Low Risk | Third-Party

2 Step-Back Protocol for Internal Opposition

If internal opposition in either country threatens implementation, the framework includes a 'step-back' mechanism: implementation pauses at current level for 30 days, emergency consultations are convened, and face-saving adjustments are negotiated. The framework does not collapse — it adjusts.

Immediate | Low Risk | Simultaneous

3 Procedural Pause Without Penalty

Any party may request a procedural pause of up to 14 days without triggering breach penalties. The pause must be accompanied by a written explanation and a proposed resolution. This allows both governments to manage internal politics without being accused of bad faith by the other side.

Immediate | Low Risk | Simultaneous

4 IRGC Faction Management via Economic Incentives

IRGC hardliners are managed through targeted economic incentives: IRGC-linked construction companies receive reconstruction contracts, IRGC veterans' pensions are paid from escrow funds, and IRGC-controlled ports receive infrastructure investment. These incentives align IRGC economic interests with framework success.

Short-term | Medium Risk | Iran-First

5 U.S. Congressional Management via Transparency

The Trump administration manages congressional opposition through maximum transparency: all framework documents are shared with Gang of Eight, quarterly classified briefings are provided, and any Iranian violations are immediately reported. This transparency prevents Congress from feeling blindsided.

Short-term | Medium Risk | US-First

6 Dual Domestic Messaging Strategy

Both governments agree on a 'dual messaging' approach: each frames the agreement in terms that work for its domestic audience without contradicting the other. The U.S. emphasizes toughness and verification; Iran emphasizes sovereignty preservation and economic recovery. Both are factually accurate.

Immediate | Low Risk | Simultaneous

7 Supreme Leader Directive as Internal Enforcement

The Supreme Leader issues a binding directive (hokm) that the framework has his full support, any faction attempting to sabotage it will face severe consequences, and compliance is a religious and national duty. This clerical authority is essential for managing Iranian hardliners.

Immediate | High Risk | Iran-First

8 Presidential Policy Directive as U.S. Enforcement

President Trump issues a Presidential Policy Directive establishing the framework as administration policy, directing all agencies to implement it fully, and authorizing the use of emergency powers to override bureaucratic obstruction. This top-down direction prevents agencies from slow-walking implementation.

Immediate | Medium Risk | US-First

9 Guardian Council Review with Expedited Timeline

The Iranian Guardian Council reviews the framework for constitutional compliance within 14 days (expedited from the usual 30-day timeline). The Council is pre-briefed by the Supreme Leader's office, ensuring a favorable review. This formal legal approval protects the framework from constitutional challenges.

Short-term | Medium Risk | Iran-First

10 Iranian Parliamentary Oversight Committee

The Iranian Majlis establishes a special oversight committee to monitor implementation, receive reports from the Joint Secretariat, and advise the government on Iranian public concerns. This parliamentary involvement gives the Iranian public a voice and prevents hardliners from claiming the process is undemocratic.

Short-term | Low Risk | Iran-First

11 U.S. Congressional Notification with Waiver Authority

The Trump administration notifies Congress of the framework and asserts waiver authority under IEEPA and the National Emergencies Act. While Congress could pass legislation to block the framework, the administration frames it as a national security imperative that supersedes normal legislative process.

Immediate | Medium Risk | US-First

12 IRGC Separate Economic Track

The IRGC is offered a separate economic track: legitimate business opportunities in reconstruction, infrastructure, and trade, in exchange for staying out of nuclear and military matters. This 'carrot separation' gives IRGC factions a stake in economic normalization without requiring them to abandon their ideology.

Short-term | High Risk | Iran-First

13 Basij Mobilization for Reconstruction

The Basij paramilitary force is mobilized for civilian reconstruction projects: building homes, repairing roads, planting trees. This redirects Basij energy from political opposition to productive national service, giving young Basij members a positive identity and income.

Short-term | Medium Risk | Iran-First

14 Iranian Opposition Group Engagement

Exiled Iranian opposition groups (MEK, monarchists, secular democrats) are engaged through third parties and informed that the framework does not legitimize the regime but addresses humanitarian needs. This engagement prevents opposition groups from becoming active spoilers.

Short-term | High Risk | Third-Party

15 U.S. Think Tank and Expert Engagement

American foreign policy experts, including critics of the framework, are engaged through briefings and invited to submit concerns to the JIG. This engagement co-opts potential critics by giving them a voice and demonstrates that the administration is not afraid of scrutiny.

Short-term | Low Risk | US-First

16 Media Management Through Embed Program

International journalists are embedded with verification teams, providing real-time (but security-reviewed) reporting on implementation. This transparency prevents misinformation and gives the public in both countries confidence that they are getting accurate information.

Short-term | Low Risk | Third-Party

17 Social Media Monitoring and Response

A dedicated team monitors social media in both countries for misinformation, inflammatory rhetoric, and coordinated spoiler campaigns. When misinformation is detected, factual corrections are issued through official channels and trusted influencers. This digital diplomacy prevents online escalation.

Short-term | Low Risk | Third-Party

18 Religious Leader Engagement (Iran)

Senior Shia clerics in Qom and Najaf are briefed on the framework's humanitarian benefits and asked to issue supportive fatwas. Religious endorsement provides moral cover for Iranian officials and makes opposition seem un-Islamic.

Short-term | Medium Risk | Iran-First

19 Evangelical Leader Engagement (U.S.)

American evangelical leaders, who wield significant influence with the Trump base, are briefed on the framework's protection of religious minorities in Iran and its potential to open Iran to Christian influence. This framing builds support among a key Trump constituency.

Short-term | Medium Risk | US-First

20 Business Community Lobbying Coalition

American and Iranian business communities form a joint lobbying coalition advocating for framework implementation. Business pressure on politicians is often more effective than diplomatic arguments — jobs and profits speak louder than strategic abstractions.

Short-term | Low Risk | Simultaneous

21 Youth Engagement Through Technology

A joint U.S.-Iranian tech entrepreneurship program is launched, bringing together young programmers, designers, and entrepreneurs from both countries. This youth-focused initiative creates a new generation with personal stakes in continued engagement.

Medium-term | Low Risk | Simultaneous

22 Women's Leadership Exchange

A women's leadership exchange program brings Iranian and American women professionals together in neutral locations (Dubai, Istanbul) to discuss business, science, and social issues. This women-to-women diplomacy builds relationships that transcend government-level disputes.

Short-term | Low Risk | Simultaneous

23 Academic and Scientific Bridge Building

University partnerships between American and Iranian institutions are announced, focusing on non-controversial fields: mathematics, physics, medicine, climate science. These academic bridges create intellectual communities that advocate for continued cooperation.

Short-term | Low Risk | Simultaneous

24 Sports Diplomacy Continuation

Building on the initial sports exchange, a formal sports diplomacy program is established: annual wrestling competitions, soccer friendlies, and Olympic training exchanges. Athletic competition provides a structured, low-stakes channel for ongoing interaction.

Short-term | Low Risk | Simultaneous

25 Successor Framework Political Resilience Design

The Sprint is designed to create constituencies for peace in both countries — business owners, workers, students, scientists, athletes — who will advocate for Phase II continuation. This political resilience design ensures the framework survives leadership transitions.

Long-term | Low Risk | Simultaneous

Issue 14: Drone/Missile Pause vs. Industrial Reconstitution

The Problem

The U.S. demands constraints on Iran's ballistic missile program and drone transfers to regional proxies. Iran views these as sovereign defense capabilities and legitimate support for allied forces. Both sides recognize that unconstrained proliferation destabilizes the region.

25 Modular Solutions for Issue 14

1 Deployment Pause with Industrial Reconstitution Grandfathering

Iran agrees to a verifiable pause in deployment of advanced drones and ballistic missiles to regional proxies. The industrial base for production is not dismantled but subject to export control monitoring. Existing stockpiles are inventoried and sealed. New production is limited to replacement rates with IAEA-level verification.

Short-term | Medium Risk | Simultaneous

2 Missile Range Cap with Verification

Iran agrees not to test, deploy, or transfer ballistic missiles with ranges exceeding 2,000 km. This range covers regional targets (Israel, Gulf states) but not Europe or the continental U.S. The cap is verified through satellite surveillance, telemetry monitoring, and on-site inspections of production facilities.

Short-term | Medium Risk | Simultaneous

3 Drone Export Licensing System

All Iranian drone exports require a license from a joint U.S.-Iranian-Omani export control board. Licenses are granted for civilian applications (agricultural surveillance, mapping, search-and-rescue) and denied for military applications. This system prevents diversion to proxies while preserving legitimate trade.

Short-term | Medium Risk | Third-Party

4 Regional Missile Notification Protocol

Iran agrees to provide 48-hour advance notification of all missile tests to the Joint Secretariat. Notifications include launch location, expected trajectory, and safety parameters. This transparency prevents surprise and miscalculation while preserving Iran's sovereign right to test defensive systems.

Short-term | Low Risk | Simultaneous

5 Proxy Disengagement Incentive Structure

Iran receives economic incentives for each proxy group that verifiably ceases attacks on U.S. and allied interests: \$500 million per group for 6-month cessation, \$1 billion for 12-month cessation. These payments are made through the reconstruction fund, not direct cash transfers.

Medium-term | High Risk | Simultaneous

6 Yemen Houthi Disengagement Track

A separate track addresses Houthi disengagement: Iran commits to cease weapons transfers to Houthis; Saudi Arabia commits to cease airstrikes; a UN-mediated Yemeni ceasefire is activated. This track is linked to but separate from the Iran-U.S. framework, allowing progress on one to support the other.

Medium-term | High Risk | Third-Party

7 Iraqi Militia Restraint Agreement

Iran uses its influence with Iraqi Shia militias to secure their commitment to: cease attacks on U.S. facilities, participate in Iraqi political process, and integrate into Iraqi security forces. In exchange, the U.S. commits to gradual troop reduction from Iraq and support for Iraqi government authority.

Medium-term | High Risk | Simultaneous

8 Syria Military Presence Freeze

Iran freezes its military personnel increase in Syria at current levels and commits to not establish new bases. Existing bases are declared to the Joint Secretariat. In exchange, the U.S. does not expand its military presence in eastern Syria and accepts Iranian participation in Syrian political reconciliation.

Medium-term | Medium Risk | Simultaneous

9 Lebanon Hezbollah Civilian Integration

Iran encourages Hezbollah to accelerate its civilian integration in Lebanon: participate in government, disarm heavy weapons (but retain light arms for security), and cease cross-border attacks on Israel. In exchange, Israel commits to not attack Lebanese civilian infrastructure.

Medium-term | High Risk | Third-Party

10 Gaza Humanitarian Corridor (No Direct Hamas Link)

A humanitarian corridor to Gaza is established through Egypt, with UN monitoring. Iran commits to not obstruct humanitarian flows and to encourage Hamas to accept a long-term ceasefire. The U.S. ensures Israeli cooperation with humanitarian access. This indirect channel addresses Gaza without formal U.S.-Hamas contact.

Medium-term | Medium Risk | Third-Party

11 Missile Production Facility Monitoring

Key Iranian missile production facilities are subject to IAEA-style monitoring: continuous camera surveillance, environmental sampling, and periodic inspections. This monitoring does not prevent production but verifies that production stays within agreed limits (range, volume, purpose).

Short-term | Medium Risk | Third-Party

12 Drone Technology Civilian Conversion

Iranian drone technology is converted to civilian applications: precision agriculture, disaster response, infrastructure inspection, environmental monitoring. International partnerships with civilian drone companies accelerate this conversion and create legitimate revenue streams.

Medium-term | Low Risk | Iran-First

13 Regional Arms Control Dialogue

A regional arms control dialogue including Iran, Saudi Arabia, UAE, Turkey, and Israel is launched under UN auspices. The dialogue addresses missile proliferation, drone transfers, and conventional force imbalances. This multilateral approach avoids singling out Iran.

Long-term | Medium Risk | Third-Party

14 Military Procurement Transparency

Iran agrees to publish an annual report of its major military procurement, including drones and missiles, through the UN Register of Conventional Arms. This transparency does not restrict procurement but creates international visibility that deters destabilizing acquisitions.

Short-term | Low Risk | Iran-First

15 Cyber Operations Restraint Pledge

Both sides pledge to refrain from offensive cyber operations against each other's critical infrastructure during the framework period. This pledge is verified through third-party cyber monitoring and intelligence sharing. Violations are addressed through the JIG, not retaliation.

Short-term | Medium Risk | Simultaneous

16 Space Launch Vehicle Separation

Iranian space launch vehicles (SLVs) are treated separately from ballistic missiles: civilian space activities (satellite launches) are permitted subject to notification and monitoring; missile tests are subject to range caps. This separation preserves Iran's space program while addressing U.S. concerns.

Short-term | Medium Risk | Simultaneous

17 Military Exercise Notification

Both sides agree to provide 14-day advance notification of major military exercises near shared boundaries. Notifications include exercise scope, participating forces, and duration. This transparency prevents military exercises from being misinterpreted as preparation for attack.

Short-term | Low Risk | Simultaneous

18 Hotline for Military Incident Deconfliction

A 24/7 military hotline between CENTCOM and the Iranian Armed Forces General Staff operates for rapid deconfliction of any military incidents. The hotline is tested weekly and staffed by fluent English and Persian speakers. Response time target: 5 minutes.

Immediate | Low Risk | Simultaneous

19 Proxy Group Amnesty for Ceasefire Compliance

Proxy groups that comply with the ceasefire for 12 consecutive months receive amnesty from U.S. sanctions designations. This amnesty is conditional on continued compliance and can be revoked for violations. The amnesty provides an incentive for proxies to choose politics over violence.

Medium-term | High Risk | US-First

20 Iranian Defense Budget Transparency

Iran agrees to publish its defense budget through the IMF, including IRGC allocations. This transparency does not restrict spending but creates international visibility. The IMF reviews the budget for consistency with macroeconomic stability commitments.

Short-term | Low Risk | Iran-First

21 Counter-Piracy Cooperation in Gulf of Aden

U.S. and Iranian naval forces coordinate counter-piracy operations in the Gulf of Aden, building operational trust through a shared mission that threatens both countries' shipping. This cooperation creates military-to-military relationships that support broader de-escalation.

Short-term | Medium Risk | Simultaneous

22 Joint Counter-Terrorism Intelligence Sharing

Limited intelligence sharing on ISIS, Al-Qaeda, and other Sunni extremist groups that threaten both countries. This cooperation acknowledges that Iran and the U.S. share enemies and that counter-terrorism is a legitimate area of mutual interest.

Short-term | High Risk | Simultaneous

23 Military Confidence-Building Site Visits

Senior officers from both militaries conduct reciprocal site visits to non-sensitive facilities: military academies, hospitals, memorials. These visits build personal relationships and humanize the 'enemy,' reducing the risk of dehumanization-driven escalation.

Medium-term | Medium Risk | Simultaneous

24 Successor Framework Regional Security Architecture

The missile/drone pause is designed as a stepping stone to a comprehensive Regional Security Architecture in Phase II, addressing conventional arms control, confidence-building measures, and eventually a regional security treaty. The long-term vision transforms the pause into permanent stability.

Long-term | Medium Risk | Third-Party

25 Grand Bargain Regional Security Framework

The ultimate vision: a Grand Bargain where Iranian missile constraints, proxy disengagement, and regional conventional arms control are exchanged for U.S. security guarantees, economic integration, and Iran's recognition as a regional power. This vision motivates compromise on both sides.

Long-term | High Risk | Simultaneous

Issue 15: Agrifood Crisis & Humanitarian Supply Lines

The Problem

Iran's economy is in catastrophic condition: currency collapse, rolling blackouts, food shortages, and medicine scarcity. The global agrifood system is stressed by Hormuz closure. Humanitarian supply lines must be protected regardless of political disputes, or the framework will collapse under popular pressure.

25 Modular Solutions for Issue 15

1 Humanitarian Supply Line Firewall

A dedicated humanitarian supply line operates through the Strait of Hormuz, fully insulated from political disputes. This firewall guarantees continuous flow of food, medicine, and agricultural inputs to Iran regardless of nuclear compliance, maritime tensions, or military incidents. The firewall is inviolable under all circumstances.

Immediate | Low Risk | Third-Party

2 Immediate Humanitarian Tranche (\$250M Day 1)

Upon signature, \$250 million is released via Swiss escrow for immediate humanitarian procurement: medicine, food, medical equipment, and agricultural inputs. This tranche is non-reversible and triggers immediately, providing tangible benefits before any nuclear compliance steps are taken.

Immediate | Low Risk | Third-Party

3 Energy and Agricultural Release Valve

A release valve mechanism allows immediate humanitarian shipments to resume regardless of other framework status. If political disputes block progress on nuclear or maritime issues, the humanitarian channel continues. This valve prevents humanitarian catastrophe from becoming a negotiating tactic.

Immediate | Low Risk | Third-Party

4 OFAC General License for Humanitarian Trade (90 Days)

On Day 1, OFAC issues a general license authorizing exports of food, medicine, medical devices, and agricultural commodities to Iran for 90 days. This license explicitly shields all participants — U.S. and non-U.S. persons — from sanctions liability for authorized transactions.

Immediate | Low Risk | US-First

5 Civilian Aviation Safety Parts Exemption

Sanctions on civilian aviation safety parts (aircraft maintenance, safety equipment, pilot training materials) are lifted immediately. This exemption addresses the humanitarian risk of aviation accidents due to maintenance gaps, which endangers civilian passengers regardless of political disputes.

Immediate | Low Risk | US-First

6 WHO-Coordinated Medical Supply Pipeline

The World Health Organization coordinates a dedicated medical supply pipeline to Iran, pre-positioning 6-month stockpiles of essential medicines and vaccines in Dubai and Baku for rapid transshipment. WHO verifies end-use and prevents diversion to military medical facilities.

Short-term | Low Risk | Third-Party

7 FAO Agricultural Input Program

The Food and Agriculture Organization launches an emergency program providing Iran with seeds, fertilizers, pesticides, and irrigation equipment for the upcoming planting season. FAO technical advisors assist with distribution to small farmers, ensuring inputs reach rural communities.

Short-term | Low Risk | Third-Party

8 WFP Emergency Food Assistance

The World Food Programme scales up emergency food assistance to vulnerable Iranian populations: refugees, internally displaced persons, low-income families, and children. WFP monitoring ensures food reaches intended beneficiaries and is not diverted to military or regime purposes.

Immediate | Low Risk | Third-Party

9 Red Crescent/Cross Humanitarian Corridor

The International Red Crescent and Red Cross establish a dedicated humanitarian corridor through Turkey, Azerbaijan, and Dubai, providing neutral, non-governmental delivery of aid that does not require direct U.S.-Iranian government cooperation. This NGO channel operates independently of political disputes.

Immediate | Low Risk | Third-Party

10 European Humanitarian Exception Enforcement

The EU enforces its existing humanitarian exception to Iran sanctions, instructing all European banks to process humanitarian payments to Iran without requiring special licenses. The European Central Bank issues guidance confirming that humanitarian transactions are legally pre-cleared.

Immediate | Low Risk | Third-Party

11 Japanese and South Korean Humanitarian Financing

Japan and South Korea provide humanitarian financing through their development agencies (JICA, KOICA), leveraging their positive relationships with both the U.S. and Iran. This Asian financing channel supplements Western humanitarian efforts.

Short-term | Low Risk | Third-Party

12 Chinese Food and Medicine Exports

China increases food and medicine exports to Iran through existing trade channels, using yuan-denominated payments that bypass SWIFT. Chinese state-owned enterprises are indemnified by Beijing against U.S. sanctions, ensuring continuous supply regardless of framework status.

Immediate | Low Risk | Third-Party

13 Indian Pharmaceutical and Rice Exports

India, as a major pharmaceutical and rice producer, scales up exports to Iran through rupee-denominated trade arrangements. The Iranian port of Chabahar receives priority clearance for Indian humanitarian shipments. This South-South channel provides resilience against Western supply disruptions.

Short-term | Low Risk | Third-Party

14 UN Humanitarian Air Bridge

The UN establishes a humanitarian air bridge to Tehran using World Food Programme aircraft, flying regular routes from Dubai, Baku, and Istanbul. This air bridge bypasses maritime risks entirely and provides guaranteed delivery of time-sensitive medical supplies.

Immediate | Low Risk | Third-Party

15 Medical Isotope Priority Shipment

Medical isotopes (molybdenum-99, iodine-131) produced at the converted Fordow facility receive priority shipment through Hormuz, with dedicated JMGP fast-track processing. Isotope shipments are zero-fee, no-inspection, and inviolable.

Short-term | Low Risk | Third-Party

16 Agricultural Technical Assistance

International agricultural experts (FAO, CGIAR centers) provide technical assistance to Iranian farmers: drought-resistant crop varieties, water-efficient irrigation, pest management, and post-harvest storage. This assistance improves domestic food production and reduces import dependence.

Short-term | Low Risk | Third-Party

17 Water Crisis Mitigation Support

International support for Iran's water crisis: desalination technology, water recycling systems, aquifer recharge programs, and transboundary water management with neighbors. This addresses a root cause of Iran's agricultural crisis and rural discontent.

Medium-term | Low Risk | Third-Party

18 Food Price Stabilization Mechanism

The Central Bank of Iran, with IMF technical assistance, implements a food price stabilization mechanism using released escrow funds. Targeted subsidies keep staple food prices affordable for low-income families while allowing market prices for higher-income consumers.

Short-term | Low Risk | Third-Party

19 School Meal Program Expansion

Released funds expand Iran's school meal program, ensuring all primary school children receive at least one nutritious meal daily. This program is visible, popular, and directly benefits families. UNESCO monitors implementation and reports on outcomes.

Short-term | Low Risk | Third-Party

20 Rural Health Clinic Rehabilitation

Rural health clinics damaged during the conflict or degraded by sanctions are rehabilitated with international support. Mobile health units reach remote villages. This primary healthcare investment addresses the most vulnerable populations first.

Short-term | Low Risk | Third-Party

21 Maternal and Child Health Program

A dedicated program for maternal and child health: prenatal care, safe delivery services, childhood vaccination, and nutrition supplementation. UNICEF co-manages the program with Iranian health authorities, ensuring international standards and preventing diversion.

Short-term | Low Risk | Third-Party

22 Refugee and IDP Assistance

Assistance for Afghan refugees in Iran and internally displaced persons from conflict-affected regions: shelter, food, healthcare, education, and livelihood support. UNHCR coordinates assistance, ensuring that vulnerable populations are not forgotten in the political negotiation.

Immediate | Low Risk | Third-Party

23 Disability and Elderly Care Support

Support for Iran's disability and elderly care systems: mobility aids, home care services, specialized medical equipment, and pension payments. This vulnerable population assistance demonstrates the framework's humanitarian commitment to those who cannot advocate for themselves.

Short-term | Low Risk | Third-Party

24 Mental Health and Trauma Recovery

Mental health services for populations traumatized by conflict: counseling, psychiatric care, community support programs, and trauma-informed training for healthcare workers. WHO provides technical assistance and training materials.

Short-term | Low Risk | Third-Party

25 Successor Framework Humanitarian Treaty Protocol

The Sprint's humanitarian protections are designed to become a permanent Humanitarian Treaty Protocol in Phase II, legally binding and enforceable regardless of political disputes. This institutionalization ensures that humanitarian considerations can never again be held hostage to nuclear negotiations.

Long-term | Low Risk | Third-Party

Appendix: Cross-Reference Matrix

The following matrix provides a quick-reference guide showing which solutions address multiple issues simultaneously, which solutions are interdependent, and which can be implemented independently. This cross-referencing enables negotiators to construct package deals where progress on one issue unlocks progress on others.

Implementation Speed Classification

Classification	Timeline	Description
Immediate	Days 1-7	Can be implemented within the first week of Accord signature
Short-term	Days 8-30	Requires up to 30 days for full implementation
Medium-term	Months 2-6	Requires 2-6 months for complete implementation
Long-term	Months 6-12	Part of Phase II successor framework development

Risk Level Classification

Classification	Description
Low Risk	Minimal political or security risk; high probability of successful implementation
Medium Risk	Manageable risk requiring careful political management and verification
High Risk	Significant political or security challenges; requires leadership-level commitment

Initiator Classification

Classification	Description
US-First	Requires United States to take initial action
Iran-First	Requires Iran to take initial action
Simultaneous	Requires both parties to act at the same time
Third-Party	Implemented by guarantor states, international organizations, or neutral parties

Solution Count by Classification

Category	Count	Percentage
Immediate Implementation	112	29.9%
Short-term Implementation	128	34.1%
Medium-term Implementation	107	28.5%
Long-term Implementation	28	7.5%
Total	375	100%

Risk Level	Count	Percentage
Low Risk	218	58.1%
Medium Risk	135	36.0%
High Risk	22	5.9%
Total	375	100%

Initiator	Count	Percentage
US-First	58	15.5%
Iran-First	42	11.2%
Simultaneous	136	36.3%
Third-Party	139	37.1%
Total	375	100%

Document Synthesis Sources

This Compendium synthesizes the following prior diplomatic frameworks, current intelligence, and open-source materials:

- **The Reciprocal Opening Window v1.1** — Custody Exchange, Safe Passage, Sanctuary Protocol
- **Framework for Reciprocal Stabilization v3.2** — Cascading Releases, Sanctuary Cities, Black-Box Telemetry
- **Hormuz-First Enhanced Accord v2.4** — Gulf Safety Net, Multilateral Fund, Safe Passage
- **CBSF v16.2** — Multi-Phased Implementation, Revenue-Positive Arrangements
- **Stability-First Enhanced Accord v5.7** — Legalistic Architecture, Escrow for Peace
- **The Final Steps Accord** — Perimeter Shielding, Joint Facility, Day-7 Protocol
- **Gulf Stability Accord v1.5** — Strategic Trade Offsets, IHTA Governance
- **The Step Forward Accord v2.0** — Golden Archive, Financial Escrow, PG-MSR Structure
- **CRESCENT COMPACT v1.1** — Regional Stabilization Protocol
- **White House Preconditions (17 May 2026)** — Five Trump administration conditions
- **Current Open-Source Intelligence** — As of 22 May 2026

All 375 solutions have been designed to be realistic, implementable, and respectful of both parties' core red lines. They are offered as building blocks for negotiators working under extraordinary time pressure to prevent renewed hostilities and establish a foundation for durable peace.

-e
