

DIPLOMATIC WORKING DOCUMENT

Stability First

Phase II Nuclear Annex

A Modular, Adaptable Framework for Nuclear Stabilization,
Sequenced Sanctions Relief, and Selective Pathway Implementation
Under the Principle of Synchronized Reciprocal Motion

Version 1.2 | May 2026

Drawing from: Stability First Enhanced Accord v1.0 | RCSA v3.6 Final Diplomatic Edition

Modular Nuclear Solutions Annex 1.0

Document Reference: SF-EA-v1.2-ANNEX-NUCLEAR-
SANCTIONS-II

FOR AUTHORIZED NEGOTIATORS

TABLE OF CONTENTS

Preamble: The Modular Nuclear Architecture

Article I: Definitions and Interpretation

Article II: Foundational Architecture -- The Three-Facility Framework

- Section 2.1: Esfahan Tunnel Complex -- HEU Downblending Protocol
- Section 2.2: Fordow -- IMIRC Conversion
- Section 2.3: Natanz / Pickaxe Mountain -- Open-Fuel-Cycle Research Campus

Article III: Annex A -- Nuclear Stabilization Protocol

- Section 3.1: The 12-Year Moratorium Instrument
- Section 3.2: HEU Stockpile Disposition -- Modular Pathway Menu
 - Pathway A: In-Place Downblending (Default)
 - Pathway B: HEU Export to Oman
 - Pathway C: Kazakhstan LEU Bank Custody
 - Pathway D: Russian Federation Custodial Partnership
 - Pathway E: Fuel Assembly Conversion at Bushehr
 - Pathway F: Hybrid Modular -- Partial Export + Partial In-Place
- Section 3.3: Enrichment Caps, Zero-Expansion Rule, and Centrifuge Controls
- Section 3.4: Fordow IMIRC -- Full Conversion Specifications
- Section 3.5: Pickaxe Mountain Facility -- Moratorium Lock Protocol
- Section 3.6: Verification Architecture -- Dual-Key System and IAEA Protocols

Article IV: Annex B -- Sequenced Sanctions Relief Protocol

- Section 4.1: The Four-Track Economic Relief Architecture
- Section 4.2: Track 1 -- Immediate Liquidity Pilot
- Section 4.3: Track 2 -- Frozen Asset Release Schedule
- Section 4.4: Track 3 -- Oil Export Normalization
- Section 4.5: Track 4 -- PRDD System

Article V: The 15-Day Micro-Cycle Sequencing Engine

Article VI: The Compliance & Escalation Protocol

Article VII: Joint Implementation Governance (JIG)

Article VIII: Dispute Resolution and Arbitration

Article IX: Withdrawal, Suspension, and Termination

Article XIII: 20 Structural Upgrades

Article X: US Domestic Political Safeguards

Article XI: Iranian Sovereignty Preservation

Article XII: Entry into Force, Ratification, and Depositary

Appendix I: Moratorium Instrument -- Signable Template

Appendix II: Verification Schedule and IAEA Staffing Matrix

Appendix III: Sequenced Sanctions Relief -- Complete Tranche Schedule

Appendix IV: PRDD Architecture -- Technical Specifications

Appendix V: Modular Pathway Selection Guide

Appendix VI: Domestic Narrative Guidance

Appendix VII: Cross-References

PREAMBLE: THE MODULAR NUCLEAR ARCHITECTURE

Phase II Modular Annex to the Stability First Enhanced Accord v1.0

The Parties to this Annex, acting pursuant to the authority vested by the Stability First Enhanced Accord v1.0 (hereinafter 'the Enhanced Accord') and the Comprehensive Regional Stability Architecture v3.0 (hereinafter 'the RCSA'), and convening under the auspices of Pakistan as primary mediator and the Islamic Emirate of Oman as co-facilitator,

RECALLING United Nations Security Council Resolutions establishing the legally binding non-proliferation obligations applicable to all state parties, and affirming the primacy of the Nuclear Non-Proliferation Treaty (NPT) as the cornerstone of the global non-proliferation regime;

RECOGNIZING that the Islamic Republic of Iran's nuclear program has advanced significantly since the collapse of the Joint Comprehensive Plan of Action in 2018, and that as of May 2026 the estimated stockpile of 60% highly enriched uranium presents the central strategic challenge to regional and global stability;

ACKNOWLEDGING the June 2025 Midnight Hammer / Operation Epic Fury airstrikes that damaged surface nuclear infrastructure at Natanz and Fordow, creating both a humanitarian imperative and a strategic opportunity to convert damaged facilities to exclusively peaceful purposes;

AFFIRMING that Iran's sovereign right to peaceful nuclear energy under Article IV of the NPT is preserved and operationalized under this Annex through the International Medical Isotope Research Center framework and the capped enrichment regime at Natanz;

HAVING REGARD TO the fundamental deadlock between the United States' demand for zero enrichment and Iran's assertion of NPT-recognized enrichment rights, and the need for a diplomatically sustainable solution that both parties can defend to their respective domestic constituencies;

TAKING NOTE OF the current state of negotiations as of May 11, 2026, including the US demand for at minimum a 10- to 20-year moratorium on enrichment and the disposition of approximately 440 kilograms of 60% highly enriched uranium, as well as Iran's conditional offer of a shorter moratorium period, its rejection of direct HEU transfer, and its firm requirement for sequenced, verifiable, and process-certain sanctions relief;

HAVING ESTABLISHED through the Enhanced Accord the principle of Synchronized Reciprocal Motion, under which no party is required to make unilateral advance concessions, and all obligations are paired with immediate, verifiable, and proportional counterpart obligations;

DETERMINED to operationalize the 15-Day Micro-Cycle sequencing architecture established in the 14-Day Implementation Directive v2.4 as the primary anti-deadlock mechanism, ensuring that neither the United States nor Iran is ever exposed to more than 15 days of unreciprocated compliance risk at any point during the Phase II implementation period;

CONFIRMING that the PRDD Nuclear Snap Line, the Automatic Moratorium Extension Mechanism, and the Duty Officer Tier Escalation Protocol collectively provide the United States with fully reversible leverage throughout the implementation timeline, while providing Iran with the process clarity and predictable economic relief sequence that Iranian negotiators have identified as essential to achieving domestic political ratification;

MODULAR ARCHITECTURE CLAUSE -- OPERATIVE PRINCIPLE

AGREEING that this Annex -- comprising Annex A (Nuclear Stabilization) and Annex B (Sequenced Sanctions Relief) -- constitutes a **modular and adaptable diplomatic architecture**. While designed to operate concurrently under the principle of Synchronized Reciprocal Motion, individual facility protocols, economic tracks, or specific 15-day Micro-Cycles may be **selectively extracted, piloted as standalone agreements, or independently implemented by mutual consent**, ensuring that localized disagreements do not prevent immediate, sequenced de-escalation.

Specifically, the Parties recognize that:

- (a) **Independent Pathway Selection:** The HEU stockpile disposition may be implemented through any of the six Modular Pathways described in Article III, Section 3.2 (Pathways A through F), selected by mutual agreement during the 30-Day Deferred Window or subsequently modified by Joint Implementation Governance majority vote;
- (b) **Standalone Micro-Cycle Implementation:** Any single 15-Day Micro-Cycle under Article V may be extracted and implemented as a standalone confidence-building measure, with its paired nuclear deliverable and sanctions relief action binding only for that cycle;
- (c) **Track-Independent Activation:** Each of the Four Economic Tracks under Article IV, Sections 4.2 through 4.5, may be activated, paused, or recalibrated independently without affecting the operational status of other tracks or the Nuclear Stabilization Protocol;
- (d) **Facility-Specific Protocols:** The Three-Facility Framework under Article II permits independent implementation timelines for Esfahan, Fordow, and Natanz/Pickaxe Mountain, such that progress at one facility is not preconditioned on progress at another;
- (e) **Modular De-Escalation Safeguard:** If any single module encounters irreconcilable dispute, that module may be placed on Modular Hold for up to 60 days per Article IX, Section 9.3, while all other modules continue uninterrupted operation.

HAVE AGREED as follows, intending to be legally bound in accordance with the terms and conditions set forth herein and in the Enhanced Accord of which this Annex forms an integral and operative part:

ARTICLE I -- DEFINITIONS AND INTERPRETATION

For the purposes of this Annex, the following terms shall have the meanings ascribed to them below. Where a term is defined in the Enhanced Accord and not redefined here, the Enhanced Accord definition governs. In the event of any inconsistency between this Annex and the Enhanced Accord body, the more specific provision of this Annex prevails with respect to nuclear and sanctions matters.

"HEU" means Highly Enriched Uranium: uranium enriched to 20% U-235 or above. For purposes of this Annex, the primary HEU stockpile consists of approximately 440-500 kilograms of uranium enriched to approximately 60% U-235, confirmed by IAEA Director General reporting as of early 2026 to include approximately 220 kilograms relocated to the Esfahan Tunnel Complex.

"LEU" means Low Enriched Uranium: uranium enriched to below 20% U-235. 'Medical-grade LEU' means uranium enriched to exactly 19.75% U-235, suitable for fabrication into irradiation targets for Molybdenum-99 production but incapable of supporting nuclear weapons development.

"Medical-Grade LEU" means Uranium enriched to 19.75% U-235, produced exclusively through the downblending protocol established in Article III, Section 3.2, and legally restricted under this Annex to use in Mo-99 target fabrication at the IMIRC.

"Downblending Protocol" means The in-place conversion of 60% HEU to 19.75% medical-grade LEU through controlled admixture of natural uranium feed gas (UF₆), conducted at the Esfahan Tunnel Complex at a minimum rate of 3.5 kilograms of HEU feedstock per day under continuous IAEA dual-key monitoring.

"IMIRC" means International Medical Isotope Research Center: the permanent, internationally supervised civilian nuclear medicine facility to be established at the former Fordow Fuel Enrichment Plant site, dedicated exclusively to the production of medical radioisotopes and associated research.

"The Three-Facility Framework" means The integrated nuclear disposition architecture comprising: (1) the Esfahan Tunnel Complex (HEU downblending and elimination); (2) the Fordow IMIRC (permanent enrichment-to-medical conversion); and (3) Natanz / Pickaxe Mountain (capped civilian enrichment campus and moratorium lock).

"12-Year Moratorium" means The period of 12 years commencing on the Entry Into Force Date during which all uranium enrichment on Iranian soil is capped at 3.67% U-235, no new centrifuge capacity may be installed at any facility, and HEU production is permanently prohibited.

"Automatic Extension" means The mechanism by which a verified IAEA finding of enrichment above 3.67% at any facility automatically extends the 12-Year Moratorium by 24 months per incident, without requiring any further act of either Party or the JIG.

"PRDD" means Petroleum Revenue Direct Deposit: the Swiss escrow mechanism through which Iranian oil export revenues are credited to an internationally supervised account, with release to the Central Bank of Iran conditioned on verified nuclear compliance as determined by the IAEA Compliance Certification issued under Article VI.

"PRDD Snap Line" means The automated, criterion-based mechanism under which the Swiss escrow agent is legally obligated to freeze PRDD disbursements to the Central Bank of Iran within 72 hours of receipt of a Tier 1 Non-Compliance Notice from the IAEA or the JIG, as further specified in Article VI, Section 6.4.

"Modular Pathway" means Any of the six HEU stockpile disposition options defined in Article III, Section 3.2 (Pathways A through F), each constituting an independently selectable, legally self-contained method for achieving verified neutralization of Iran's weapons-grade uranium stockpile.

"Modular Hold" means The mechanism under Article IX, Section 9.3 permitting temporary suspension of a single module without affecting the operational continuity of any other module within this Annex.

"Standalone Agreement" means Any individual Micro-Cycle, facility protocol, or economic track that has been extracted from the integrated Annex framework and implemented as a binding bilateral commitment independent of the full Annex architecture, pursuant to the Modular Architecture Clause in the Preamble.

"Tranche Release" means A scheduled disbursement of frozen Iranian sovereign assets held in escrow by US Treasury-designated custodian institutions, released upon IAEA certification of the associated nuclear milestone as set forth in the Sequenced Relief Schedule at Appendix III.

"SWIFT Reconnection" means The staged restoration of Iranian financial institutions to the Society for Worldwide Interbank Financial Telecommunication messaging system, tiered by bank category (Tier A: Central Bank of Iran and Bank Mellat; Tier B: state commercial banks; Tier C: specialized banks and private sector), with each tier's reconnection conditioned on the corresponding nuclear milestone.

"JIG" means Joint Implementation Governance body: the standing oversight committee established under the Enhanced Accord, comprising technical representatives of both Parties and the IAEA, with jurisdiction over compliance determinations, escalation decisions, and cycle release certification under this Annex.

"Cycle Release Certificate" means The formal JIG certification issued at the completion of each 15-Day Micro-Cycle confirming that the nuclear deliverable for that cycle has been satisfactorily completed and that the corresponding sanctions relief tranche is authorized for disbursement.

"Pickaxe Mountain" means The deep-buried facility under construction south of Natanz, believed to be excavated to a depth of approximately 100 meters beneath granite, which Iranian authorities have described as a centrifuge assembly plant, and to which the Zero New Installation rule and continuous IAEA monitoring requirements of this Annex specifically apply.

"Breakout Time Floor" means The minimum estimated time required, given existing installed centrifuge capacity and LEU stockpile, to produce sufficient weapons-grade material for a single nuclear device. The Annex is designed to maintain a breakout time floor of not less than 12 months at all times during the Moratorium period.

"VIU State" means Verification Integrity Uncertain: a temporary status declared by the JIG when IAEA monitoring data is degraded, interrupted, or of uncertain integrity due to technical failure or cyber incident, during which no compliance determination is made and physical inspection is expedited as specified in Article VI, Section 6.3.

"Entry Into Force Date (EIFD)" means The date on which both Parties have provided written notification to the depositary of their consent to be bound, and the IAEA has issued its first compliance certification confirming that the selected Modular Pathway has commenced operation at the required rate. This date activates all timeline obligations and rights under this Annex.

ARTICLE II -- FOUNDATIONAL ARCHITECTURE: THE THREE-FACILITY FRAMEWORK

This Annex is organized around three specific Iranian nuclear facilities, each of which represents a distinct strategic challenge identified by the United States Administration, a distinct face-saving opportunity for Iranian negotiators, and a distinct verification architecture. The Three-Facility Framework addresses each facility through a **bespoke modular disposition pathway** that collectively neutralizes the US Administration's identified military triggers while preserving Iran's assertion of sovereign nuclear rights. **Each facility protocol may be implemented independently** pursuant to the Modular Architecture Clause.

Section 2.1 -- Esfahan Tunnel Complex: The HEU Modular Disposition Hub

Strategic Context: Following the June 2025 US/Israeli airstrikes, IAEA Director-General Rafael Grossi confirmed that approximately 220 kilograms of Iran's 60% HEU stockpile had been relocated to deep underground tunnels in the vicinity of Esfahan. The Trump Administration publicly considered deploying US Special Forces in a ground extraction operation to neutralize this material. This Annex eliminates the justification for such an operation through **selectable Modular Pathways** under which the material is neutralized through the method chosen by mutual consent from the Pathway Menu in Section 3.2.

Modular Disposition Hub Function: The Esfahan Tunnel Complex serves as the central processing point for all six Modular Pathways. Depending on the Pathway selected:

Selected Pathway	Esfahan Role	Timeline	Verification Standard
Pathway A (In-Place Downblending)	Primary downblending site at 3.5 kg/day	63 days (Esfahan stockpile); 142 days (full stockpile)	IAEA dual-key camera; ISAB isotopic verification
Pathway B (Export to Oman)	Consolidation, packaging, and IAEA sealing point	14-30 days from EIFD	IAEA mass spectrometry; chain-of-custody seals
Pathway C (Kazakhstan LEU Bank)	Staging and packaging for long-distance transport	75-105 days	IAEA transit seals; LEU Bank receipt verification
Pathway D (Russian Custody)	Staging point for Rosatom transfer	60-90 days	Rosatom receipt; IAEA safeguards transfer
Pathway E (Bushehr Fuel)	Downblending to reactor-grade for fabrication	90 days	IAEA fuel fabrication audit
Pathway F (Hybrid)	Split processing: partial downblending + partial export packaging	Concurrent timelines per split	Dual verification streams per sub-pathway

Political Resolution: Under Pathway A, Iran retains sovereign custody of the material and need not transfer it to any third country. Under Pathways B through F, Iran selects the destination and maintains oversight through IAEA co-supervision. In all cases, the United States achieves verified neutralization of the weapons-grade stockpile without a ground incursion.

Section 2.2 -- Fordow: International Medical Isotope Research Center Conversion

Strategic Context: The Fordow Fuel Enrichment Plant was heavily damaged during the Midnight Hammer strikes. Its underground structure survived largely intact, but surface infrastructure, power supply systems, and centrifuge arrays suffered significant damage. Permanent repurposing of Fordow as a civilian medical isotope production center serves three simultaneous strategic objectives: (i) it eliminates Fordow as an enrichment facility permanently; (ii) it provides Iran with a technologically advanced, internationally integrated civilian nuclear asset as compensation for relinquishing enrichment; and (iii) it aligns with the Trump Administration's publicly stated priority of reinvigorating the domestic and international nuclear medical isotope industry.

Conversion Pathway: All enrichment infrastructure at Fordow -- including all IR-2, IR-4, and IR-6 centrifuge cascades -- is permanently deactivated, purged of UF₆ gas, and sealed under IAEA tamper-evident locks within the timeline specified in Article III, Section 3.4. Specific pre-approved cascade halls -- no more than two cascade halls as identified by the JIG Technical Committee -- are reconfigured exclusively for the HEU-to-LEU downblending process. The facility is redesignated the International Medical Isotope Research Center and placed under an International Scientific Advisory Board comprising two Iranian and three internationally appointed members.

Modular Implementation Note: Fordow conversion may proceed as a standalone agreement independent of the selected HEU disposition Pathway. The IMIRC activation timeline is not preconditioned on completion of Esfahan operations.

Iranian Workforce: All Iranian nuclear scientists employed at Fordow are retained and retrained for medical isotope production, Mo-99 target fabrication, and radiopharmaceutical development. This provision directly addresses the Iranian Government's domestic political requirement to preserve employment and demonstrate that the agreement produces tangible civilian benefits for Iranian scientific communities.

Section 2.3 -- Natanz and Pickaxe Mountain: Open-Fuel-Cycle Research Campus

Strategic Context: Natanz remains Iran's largest enrichment facility. The above-ground Pilot Fuel Enrichment Plant was severely damaged in the 2025-2026 strikes, and the IAEA confirmed that centrifuges in the underground halls were likely destroyed through power disruption even where the physical halls survived. Simultaneously, Iran has been constructing the Pickaxe Mountain facility approximately 100 meters beneath granite south of Natanz -- a depth beyond the reach of the largest currently deployed bunker-buster munitions. The Trump Administration has identified Pickaxe Mountain as an acute and time-sensitive military threat that advisors have urged should be struck before it becomes fully operational.

Natanz Disposition: Rather than requiring complete destruction of Natanz, this Annex allows Iran to rebuild the above-ground Natanz complex as an Open-Fuel-Cycle Research Campus -- an internationally monitored civilian nuclear technology center where Iranian scientists conduct peaceful enrichment research capped at 3.67% under 24/7 IAEA camera surveillance. This designation allows Iran to present the outcome as preservation of its scientific capability, while the US achieves the functional equivalent of a freeze on weapons-relevant enrichment activity.

Pickaxe Mountain Lock: The Zero New Installation rule specifically and explicitly applies to all Pickaxe Mountain construction. Iran is prohibited from installing any centrifuge cascade -- IR-2, IR-4, IR-6, or any successor model -- in the Pickaxe Mountain tunnels for the duration of the 12-Year Moratorium. The facility is subject to mandatory baseline mapping by IAEA inspectors within 45 days of the Entry Into Force Date

and continuous remote monitoring thereafter. This provision eliminates the justification for a preemptive US strike on Pickaxe Mountain.

ARTICLE III -- ANNEX A: NUCLEAR STABILIZATION PROTOCOL

Section 3.1 -- The 12-Year Moratorium Instrument

The 12-Year Moratorium constitutes the central nuclear constraint of this Annex. It is designed to bridge the gap between the US demand for a 20-year moratorium and Iran's initial counter-offer of 5 years, landing at 12 years as the minimum duration consistent with maintaining a 12-month breakout time floor throughout the period. The Moratorium is self-reinforcing through the Automatic Extension mechanism, which means that Iranian violations extend rather than collapse the constraint.

Core Moratorium Commitments:

Enrichment Cap: All uranium enrichment on Iranian soil is strictly capped at 3.67% U-235 at all facilities, including Natanz and its associated underground complex, for a period of 12 years from the Entry Into Force Date.

Zero New Centrifuge Installation: No new centrifuge of any model or generation may be installed at any Iranian facility -- including Pickaxe Mountain -- during the Moratorium period. No construction of new hardened underground enrichment sites is permitted.

HEU Prohibition: The production, storage, or possession of uranium enriched above 3.67% is absolutely prohibited on Iranian soil from the Entry Into Force Date forward. This prohibition survives termination of the Moratorium unless affirmatively renegotiated.

Stockpile Ceiling: The total LEU stockpile at any single facility may not exceed 300 kilograms equivalent at any time. Material approaching 85% of the ceiling triggers automatic downblending within 14 days per the RCSA A.7 dynamic enrichment cap protocol.

Breakout Time Maintenance: Iran and the IAEA jointly certify quarterly that the installed centrifuge capacity, stockpile level, and enrichment rate are consistent with a breakout time of not less than 12 months. If technical developments threaten to compress breakout time below 12 months, the JIG convenes within 72 hours to recalibrate.

Weapons Research Prohibition: Iran unconditionally and permanently commits to never conducting weapons-grade enrichment, implosion device research, neutron initiator development, or any other nuclear weapons-related activity, regardless of the status of the Moratorium or this Annex.

Automatic Extension Mechanism:

If the IAEA, in the exercise of its monitoring mandate under this Annex, detects and certifies enrichment above 3.67% at any declared or undeclared Iranian facility, the 12-Year Moratorium period is automatically extended by a period of 24 months per incident. This extension is self-executing: it does not require a JIG decision, US Congressional action, or any further act of either Party. The Swiss escrow agent, upon receipt of the IAEA Non-Compliance Certificate, records the extension in the Moratorium Register maintained at the UN depositary.

Section 3.2 -- HEU Stockpile Disposition: Modular Pathway Menu

This Section establishes six independently selectable Modular Pathways for the verified neutralization of Iran's 60% HEU stockpile. Each Pathway constitutes a legally self-contained, standalone agreement that may be selected, implemented, and if necessary, replaced by mutual consent without affecting the operation of any other provision of this Annex. The default Pathway is Pathway A (In-Place Downblending). Pathway selection is confirmed through a Modular Pathway Selection Certificate issued by the JIG.

PATHWAY A: IN-PLACE DOWNBLENDING (Default Pathway)

Description: The entire Iranian stockpile of 60% HEU is converted to medical-grade LEU (19.75% U-235) through in-place downblending at the Esfahan Tunnel Complex at a minimum rate of 3.5 kilograms of HEU feedstock per day. Iran retains sovereign custody throughout. No transfer to a third country is required.

Selection Criteria: Default Pathway if no alternative is selected within the 30-Day Deferred Window. Optimal when Iran's domestic political constraints preclude physical transfer and the US accepts chemical neutralization as equivalent to physical removal.

Step-by-Step Implementation Instructions:

1. **Step 1 -- EIFD + 0 Days (Pathway Confirmation):** The JIG Nuclear Technical Committee issues the Pathway A Selection Certificate, confirming that both Parties have agreed to in-place downblending. The IAEA deploys 4 resident inspectors to Esfahan within 24 hours. The dual-key camera system is activated, with encrypted feeds transmitted to IAEA Vienna headquarters and the Geneva mirror node.
2. **Step 2 -- EIFD + 0 Days (Baseline Inventory):** IAEA inspectors conduct a comprehensive physical inventory of all 60% HEU at Esfahan, including mass spectrometry verification of isotopic composition. The Esfahan Baseline Certificate is issued within 48 hours, documenting the exact quantity and location of all HEU cylinders.
3. **Step 3 -- EIFD + 1 Day (Feedstock Delivery):** Natural uranium feed gas (UF₆) is delivered to the Esfahan blending cascades in the required stoichiometric ratio. Feedstock supply is guaranteed by the international consortium under Article VII. The IAEA verifies feedstock quantity and seals all feed lines with tamper-evident locks.
4. **Step 4 -- EIFD + 1 to 63 Days (Primary Downblending -- Esfahan Stockpile):** Downblending commences at a minimum rate of 3.5 kg/day of HEU feedstock. The Esfahan stockpile (~220 kg) is converted to 19.75% medical-grade LEU over approximately 63 days. The IMIRC International Scientific Advisory Board independently verifies isotopic purity of output material through periodic sampling, with results reported to the JIG within 72 hours of each sampling event.
5. **Step 5 -- EIFD + 14 Days (First Cycle Verification):** IAEA certifies continuous operation at 3.5 kg/day for 14 consecutive days. The Downblending Rate Certificate triggers Tranche 2 release under Article IV, Section 4.3.
6. **Step 6 -- EIFD + 63 Days (Esfahan Stockpile Complete):** IAEA certifies that the full Esfahan stockpile has been downblended to 19.75%. The Esfahan Completion Certificate is issued. The

Esfahan facility is then sealed under IAEA tamper-evident locks and transitions to monitoring-only status.

7. Step 7 -- EIFD + 64 to 142 Days (Extended Downblending -- Remaining Stockpile): If additional HEU stockpiles exist at other declared or damaged sites, the downblending operation continues at Esfahan or at the Fordow IMIRC downblending cascades until the entire 440-500 kg national stockpile is converted. Total downblending time: approximately 142 days for the full estimated 500 kg stockpile.

8. Step 8 -- EIFD + 142 Days (Final Certification): IAEA issues the National HEU Neutralization Certificate, confirming that all 60% HEU on Iranian soil has been converted to medical-grade LEU. This certificate is the prerequisite for the Final Release under Article IV, Section 4.3.

9. Step 9 -- Post-Completion (Legal Restriction): All medical-grade LEU produced under Pathway A is legally restricted under this Annex to use in Mo-99 target fabrication at the IMIRC. Any diversion, transfer, or re-enrichment constitutes a Tier 1 Critical Breach.

Verification Architecture: 24/7 encrypted camera access to blending cascades; tamper-evident seals on all UF6 feed lines and product storage cylinders; real-time mass-flow verification; ISAB independent isotopic sampling every 72 hours; VIU protocol for inconsistent findings.

PATHWAY B: HEU EXPORT TO OMAN -- IAEA THIRD-COUNTRY CUSTODY

Description: The entire Iranian stockpile of 60% HEU -- approximately 440 to 500 kilograms -- is consolidated, packaged, and transported under IAEA chain-of-custody protocols to a secure IAEA-controlled storage facility in the Sultanate of Oman. Material is held under IAEA supervision -- not US or Iranian control -- with final disposition determined by IAEA procedures and Iranian consent.

Selection Criteria: Optimal when Iran requires a face-saving transfer mechanism that avoids direct delivery to any P5 state, and when rapid removal of weapons-grade material from Iranian territory is the US priority. Oman's role as co-facilitator provides institutional continuity.

Step-by-Step Implementation Instructions:

1. **Step 1 -- EIFD + 0 to 5 Days (Omani Facility Activation):** The IAEA activates the Oman Nuclear Custody Facility (ONCF) in coordination with the Sultanate of Oman's National Nuclear Security Authority. The facility is placed under IAEA operational control, with Omani authorities providing perimeter security and IAEA providing internal custody and monitoring. The ONCF Activation Certificate is issued by the IAEA Director General.
2. **Step 2 -- EIFD + 0 Days (Consolidation at Esfahan):** All 60% HEU cylinders at all Iranian locations are transported under armed IAEA guard to the Esfahan Tunnel Complex for consolidation, inventory verification, and packaging. Mass spectrometry confirms isotopic composition of each cylinder. The Consolidation Inventory Certificate documents every container.
3. **Step 3 -- EIFD + 2 Days (Secure Packaging):** HEU cylinders are loaded into IAEA-certified Type B(U) transport casks, each capable of withstanding severe accident conditions. Casks are sealed with IAEA tamper-evident serialized seals. A complete chain-of-custody manifest is prepared, documenting: (a) cylinder serial number; (b) net HEU mass; (c) enrichment percentage; (d) cask identification; (e) seal number; and (f) IAEA inspector authentication signature.
4. **Step 4 -- EIFD + 3 Days (Route Confirmation):** The IAEA Logistics Cell confirms the transport route from Esfahan to the Oman facility via Bandar Abbas sea transport or direct air transport using Omani military airlift. Route selection considers: transit time, security risk assessment, and weather conditions. The Route Security Plan is approved by the JIG Nuclear Technical Committee.
5. **Step 5 -- EIFD + 4 to 7 Days (Ground Transit to Bandar Abbas):** Casks are transported by dedicated convoy from Esfahan to Bandar Abbas under IAEA armed escort and continuous satellite tracking. Convoy includes: IAEA inspectors (2 per vehicle), Omani military liaison officer, Iranian Atomic Energy Organisation observer, and neutral third-party verification officer appointed by Pakistan. Continuous GPS tracking is transmitted to the JIG Transparency Portal in real time.
6. **Step 6 -- EIFD + 7 to 10 Days (Sea Transit to Oman):** Casks are loaded onto an Omani-flagged naval vessel or IAEA-chartered secure cargo vessel at Bandar Abbas. The vessel transits the Strait

of Hormuz under Joint Hormuz Authority coordination and IHTA maritime security escort. Transit time to Port Sultan Qaboos or designated Omani port: 1-2 days. IAEA inspectors maintain physical custody throughout sea transit.

7. **Step 7 -- EIFD + 10 to 14 Days (Oman Receipt and Verification):** Upon arrival in Oman, casks are transferred to the ONCF under continuous IAEA monitoring. Each cask is unsealed in the presence of the IAEA Director General's designated representative, the Omani National Nuclear Security Authority director, and an Iranian AEOI observer. Mass spectrometry confirms that the isotopic composition matches the Esfahan Baseline Certificate. The Oman Receipt Certificate is issued within 48 hours of arrival.
8. **Step 8 -- EIFD + 14 Days (Custody Transfer Complete):** The IAEA assumes full operational custody of all HEU material at the ONCF. The Custody Transfer Certificate is issued, confirming that all weapons-grade uranium has been removed from Iranian territory and placed under IAEA international control. This certificate triggers Tranche 2 release and Track 3 Oil Export Normalization under Article IV.
9. **Step 9 -- EIFD + 14 to 44 Days (30-Day Window Finalization):** During the remainder of the 30-Day Deferred Window, the Parties negotiate final disposition: (a) downblending in Oman under IAEA supervision; (b) transfer to the IAEA LEU Bank; (c) long-term IAEA custody pending future fuel supply negotiations; or (d) return to Iran for in-place processing if Pathway B is abandoned by mutual consent.
10. **Step 10 -- Ongoing (Omani Custody Maintenance):** The ONCF operates under IAEA permanent monitoring with Omani perimeter security. Iranian representatives maintain observer access. The facility is subject to the same verification standards as declared Iranian sites: 24/7 camera coverage, environmental sampling, and unannounced IAEA inspections. Costs are borne by the IAEA Enhanced Monitoring Fund (Upgrade 6, Article XIII).

Verification Architecture: Chain-of-custody seals at every transfer point; GPS tracking throughout transit; mass spectrometry at origin and destination; IAEA 24/7 monitoring at ONCF; Omani perimeter security; Pakistani guarantor observer at all key stages.

Standalone Agreement Provision: Pathway B may be implemented as a standalone agreement independent of the full Annex. If selected as standalone, only Steps 1 through 8 are operative, and the sanctions relief trigger is reduced to the USD 750 million Track 1 Pilot Liquidity injection upon issuance of the Custody Transfer Certificate.

PATHWAY C: KAZAKHSTAN LEU BANK CUSTODY

Description: The HEU stockpile is downblended to 19.75% medical-grade LEU in Iran and then transferred to the IAEA LEU Bank in Oskemen, Kazakhstan for long-term international custody and storage. This Pathway maximizes the non-proliferation value by removing even medical-grade LEU from Iranian territory after downblending.

Selection Criteria: Optimal when the US requires maximum physical separation of all enriched material from Iranian territory, and when Iran accepts that medical-grade LEU will be held internationally for future fuel supply needs.

Step-by-Step Implementation Instructions:

1. **Step 1 -- EIFD + 0 to 30 Days (In-Place Downblending to Medical-Grade LEU):** Steps 1-4 of Pathway A are executed first. The entire 60% HEU stockpile is downblended to 19.75% medical-grade LEU at the Esfahan Tunnel Complex at 3.5 kg/day. IAEA issues the National HEU Neutralization Certificate confirming all weapons-grade material is chemically neutralized.
2. **Step 2 -- EIFD + 30 Days (LEU Export Authorization):** The JIG issues a Modular Pathway Switch Certificate, authorizing export of the medical-grade LEU from Iranian territory to the IAEA LEU Bank. Iran provides written authorization for the transfer, specifying that the material remains Iranian sovereign property held in international trust.
3. **Step 3 -- EIFD + 30 to 45 Days (LEU Bank Coordination):** The IAEA LEU Bank Director in Oskemen confirms storage capacity and prepares receiving protocols. The Kazakh Ministry of Energy issues transit authorization for overland transport from Iran through Turkmenistan to Kazakhstan, or alternatively, coordinates Caspian Sea vessel transport from Bandar Anzali to Aktau.
4. **Step 4 -- EIFD + 45 to 60 Days (LEU Packaging and Transport):** Medical-grade LEU is loaded into certified LEU transport containers. Route: Overland via Turkmenistan (Turkmenbashi border crossing) or Caspian Sea vessel to Aktau, then rail to Oskemen. IAEA escort maintains custody throughout. Transit takes 15-30 days depending on route.
5. **Step 5 -- EIFD + 60 to 75 Days (LEU Bank Receipt):** Material is received at the IAEA LEU Bank in Oskemen. IAEA confirms isotopic composition (19.75%), mass reconciliation against Esfahan production records, and container seal integrity. The LEU Bank Receipt Certificate is issued. Material is stored under IAEA custody accessible to Iran for future fuel fabrication needs under a Section 123 Agreement.
6. **Step 6 -- EIFD + 75 Days (Full Neutralization Certified):** The IAEA Director General issues the Complete Stockpile Neutralization Certificate, confirming that no uranium enriched above 3.67% remains on Iranian soil. This triggers Tranche 4 release under Article IV.

Verification Architecture: Dual-verification: first at Esfahan (downblending), then at Oskemen (storage). Chain-of-custody from Esfahan to Oskemen. LEU Bank subject to IAEA standard safeguards plus enhanced monitoring. Iran maintains sovereign ownership with access rights for future civilian fuel needs.

PATHWAY D: RUSSIAN FEDERATION CUSTODIAL PARTNERSHIP

Description: The HEU stockpile is transferred to Rosatom-operated storage under IAEA safeguards. Russia's existing HEU downblending infrastructure and experience with the 1993 US-Russia HEU Purchase Agreement provide technical and institutional readiness for rapid implementation.

Selection Criteria: Optimal when speed of removal is paramount and Iran accepts Russian custody as geopolitically acceptable. Leverages existing Rosatom-IAEA working relationships and established downblending infrastructure at Seversk and Zelenogorsk.

Step-by-Step Implementation Instructions:

1. **Step 1 -- EIFD + 0 to 7 Days (Rosatom Technical Assessment):** Rosatom dispatches a technical team to Iran to assess the HEU stockpile and determine optimal transport and processing arrangements. Assessment includes: cylinder compatibility with Russian transport casks, enrichment verification, and processing timeline estimation.
2. **Step 2 -- EIFD + 3 to 14 Days (Transit Route and Mode Selection):** The JIG Nuclear Technical Committee selects transport mode: (a) Caspian Sea vessel from Bandar Anzali to Makhachkala, then rail to Seversk; (b) overland through Azerbaijan and Dagestan; or (c) Russian military airlift from Tehran to Seversk using certified nuclear cargo aircraft. Route selection considers speed, security, and geopolitical factors.
3. **Step 3 -- EIFD + 7 to 14 Days (Cask Certification and Loading):** HEU cylinders are transferred to Rosatom-certified TK-LRh-type transport casks under IAEA supervision. Casks are sealed with IAEA and Rosatom dual seals. Transport documentation includes: IAEA safeguards transfer certificate, Rosatom receipt protocol, and Iranian AEOI export authorization.
4. **Step 4 -- EIFD + 14 to 30 Days (Transit to Russian Federation):** Casks transit the selected route under joint IAEA-Rosatom armed escort. Caspian Sea route: vessel from Bandar Anzali to Makhachkala (3-5 days), then specialized rail to Seversk (5-7 days). Air route: direct cargo flight to Yemelyanovo Airport, Krasnoyarsk (8 hours), then ground transport to Seversk (2 hours). IAEA maintains independent tracking throughout.
5. **Step 5 -- EIFD + 30 to 60 Days (Rosatom Receipt and Verification):** Casks are received at the Siberian Chemical Combine, Seversk, or the Electrochemical Plant, Zelenogorsk. Rosatom verifies cylinder integrity, confirms isotopic composition via independent mass spectrometry, and issues the Rosatom Receipt Certificate. IAEA safeguards are formally transferred from Iranian to Russian jurisdiction while maintaining IAEA primary oversight.
6. **Step 6 -- EIFD + 60 to 90 Days (Rosatom Downblending):** HEU is downblended to 19.75% using Rosatom's existing LEU production infrastructure, or alternatively, incorporated into Russia's own nuclear fuel production cycle with equivalent LEU replacement guaranteed to Iran for future

Bushehr fuel needs. Downblending is verified by both IAEA and the IMIRC ISAB through independent sampling.

7. Step 7 -- EIFD + 90 Days (Final Certification): IAEA issues the HEU Processing Completion Certificate, confirming all weapons-grade material transferred to Russia has been neutralized or incorporated into safeguarded civilian fuel production. Iran receives a guaranteed LEU credit for future fuel supply, documented in the Iran-Russia Fuel Supply Ledger maintained by the IAEA.

Verification Architecture: IAEA safeguards transfer from Iran to Russia; dual IAEA-Rosatom seal regime; ISAB independent verification; Russia's existing IAEA Additional Protocol coverage applies to Seversk and Zelenogorsk; quarterly IAEA inspection rights at processing facilities.

PATHWAY E: FUEL ASSEMBLY CONVERSION AT BUSHEHR

Description: Weapons-grade HEU is downblended to reactor-grade LEU (3.5-4.0% U-235) and fabricated into fuel assemblies for the Bushehr Nuclear Power Plant. This Pathway maximizes the economic value of Iran's nuclear material by converting a liability into a productive asset for civilian power generation.

Selection Criteria: Optimal when Iran prioritizes economic utilization of its nuclear material and the US accepts that reactor-grade fuel fabrication provides equivalent non-proliferation assurance to downblending to 19.75%. Requires Rosatom partnership for fuel fabrication at existing or expanded Bushehr facilities.

Step-by-Step Implementation Instructions:

1. **Step 1 -- EIFD + 0 to 7 Days (Bushehr Fuel Assessment):** Rosatom and the AEOI conduct a joint technical assessment of Bushehr's fuel fabrication capacity, including assessment of the potential to expand the existing fuel fabrication line to accommodate additional LEU feedstock from the HEU downblending process.
2. **Step 2 -- EIFD + 0 to 30 Days (Downblending to Reactor Grade):** HEU is downblended at the Esfahan Tunnel Complex, but to reactor-grade LEU (3.5-4.0% U-235) rather than medical-grade. Downblending rate: 3.5 kg/day of HEU feedstock produces approximately 15-18 kg/day of reactor-grade LEU due to higher UF₆ admixture ratio. Total time to process 500 kg HEU: approximately 142 days.
3. **Step 3 -- EIFD + 14 to 30 Days (Fuel Fabrication Preparation):** Bushehr Fuel Fabrication Facility prepares to receive reactor-grade LEU for fabrication into VVER-1000 fuel assemblies. Rosatom provides technical assistance and quality control oversight. IAEA inspects fuel fabrication equipment and certifies readiness.
4. **Step 4 -- EIFD + 30 to 120 Days (Fuel Assembly Fabrication):** Reactor-grade LEU is fabricated into fuel pellets, loaded into fuel rods, and assembled into VVER-1000 fuel assemblies at Bushehr. Each fuel assembly contains approximately 500 kg of LEU; the full HEU stockpile yields approximately 80-100 fuel assemblies. IAEA maintains continuous monitoring at the fabrication facility.
5. **Step 5 -- EIFD + 90 to 180 Days (Fuel Loading and Reactor Operation):** Fabricated fuel assemblies are loaded into the Bushehr reactor core during scheduled refueling outages. IAEA verifies each assembly's isotopic composition before loading and confirms reactor operation at declared power levels. Weapons-grade origin is permanently destroyed through reactor burnup.
6. **Step 6 -- EIFD + 180 Days (Fuel Cycle Completion Certificate):** IAEA issues the Fuel Cycle Integration Certificate, confirming that all HEU-origin material has been permanently incorporated

into the Bushehr reactor fuel cycle and is physically irrecoverable as weapons-grade material through standard fuel cycle operations.

Verification Architecture: IAEA monitoring at Esfahan (downblending) and Bushehr (fabrication and loading); Rosatom technical oversight; fuel assembly serial tracking from fabrication through loading; reactor physics verification of fuel burnup.

PATHWAY F: HYBRID MODULAR -- PARTIAL EXPORT + PARTIAL IN-PLACE

Description: The HEU stockpile is divided into two or more batches, each processed through a different Modular Pathway simultaneously. This Pathway provides maximum flexibility, allowing the Parties to "test" multiple disposition methods, address different domestic political constituencies, and create parallel verification streams that strengthen overall confidence.

Selection Criteria: Optimal when the Parties cannot agree on a single Pathway, when speed of initial removal is prioritized over uniformity, or when different portions of the stockpile have different optimal disposition pathways (e.g., Esfahan-located material for in-place processing, other material for export).

Step-by-Step Implementation Instructions:

1. **Step 1 -- EIFD + 0 to 3 Days (Stockpile Division and Allocation):** The JIG Nuclear Technical Committee issues the Hybrid Allocation Certificate, specifying the division of the HEU stockpile into two or more batches. Default allocation: Batch 1 (Esfahan stockpile, ~220 kg) -- Pathway A (In-Place Downblending); Batch 2 (remaining ~220-280 kg) -- Pathway B (Export to Oman) or Pathway D (Russian Custody). The Parties may specify any combination of Pathways A through E for any batch proportion by mutual consent.
2. **Step 2 -- EIFD + 0 to 5 Days (Parallel Preparation):** IAEA deploys separate inspection teams to each processing site: Team Alpha (Esfahan) for Batch 1 in-place downblending; Team Bravo (consolidation/packaging site) for Batch 2 export preparation. Both teams operate independently with separate chain-of-custody documentation. The JIG Transparency Portal displays parallel progress tracking for each batch.
3. **Step 3 -- EIFD + 3 Days (Batch Separation and Independent Tracking):** HEU cylinders are physically segregated by batch. Each batch receives independent IAEA seal numbers, independent tracking IDs, and independent verification documentation. The Batch Separation Certificate confirms zero comingling and establishes the baseline for each sub-pathway.
4. **Step 4 -- EIFD + 3 to 63 Days (Sub-Pathway A Execution -- Batch 1):** Steps 1-6 of Pathway A are executed for Batch 1 at the Esfahan Tunnel Complex. Downblending proceeds at 3.5 kg/day. IAEA Team Alpha provides continuous monitoring. The Batch 1 Completion Certificate is issued upon full downblending of the Esfahan stockpile.
5. **Step 5 -- EIFD + 3 to 14 Days (Sub-Pathway B/D Execution -- Batch 2):** Simultaneously, Steps 1-8 of the selected export Pathway (B, C, or D) are executed for Batch 2. IAEA Team Bravo manages consolidation, packaging, and transit preparation. The two operations proceed on independent timelines with no interdependency.
6. **Step 6 -- EIFD + 14 to 142 Days (Parallel Completion):** Both sub-pathways continue to completion. The first sub-pathway to complete triggers its corresponding sanctions tranche

independently. The second sub-pathway triggers its corresponding tranche upon its own completion. Neither tranche is preconditioned on the other's completion.

7. Step 7 -- Completion of Final Sub-Pathway (Hybrid Completion Certificate): Upon completion of the final sub-pathway, the IAEA issues the Hybrid Completion Certificate, confirming that 100% of the HEU stockpile has been neutralized through the combined application of multiple Modular Pathways. This certificate authorizes the Final Release under Article IV.

8. Step 8 -- Modular Pathway Modification Option: At any point before completion of either sub-pathway, the Parties may issue a Modular Pathway Modification Certificate, redirecting remaining unprocessed material from one Pathway to another. Example: if Pathway B transit encounters insurmountable obstacles, remaining Batch 2 material may be redirected to Pathway A (in-place downblending) by JIG majority vote. Previously completed processing remains valid and credited.

Verification Architecture: Dual independent verification streams; separate IAEA teams; independent chain-of-custody documentation; JIG Transparency Portal displays parallel progress bars; each sub-pathway subject to its native verification standards. No single verification stream can block or delay the other.

Standalone Agreement Provision: Pathway F is designed for maximum standalone flexibility. Each sub-pathway may be extracted as an independent standalone agreement at any point. If the Hybrid structure collapses, each completed sub-pathway's results are preserved, and sanctions relief triggers already activated remain operative.

Pathway Selection and Modification Procedures

Parameter		Specification
Default Pathway		Pathway A (In-Place Downblending) -- operative if no selection is made within the 30-Day Deferred Window
Selection Authority		JIG Nuclear Technical Committee, by consensus of US, Iranian, and IAEA representatives
Selection Deadline		Day 44 of the Deferred Window (Stage 2 Closing)
Modification Authority		JIG majority vote at any point before Final Certification; may switch from any Pathway to any other Pathway
Partial Credit	Completion	Any HEU processed under a superseded Pathway is fully credited toward the overall neutralization target

Independent Implementation	Any Pathway may be implemented as a standalone agreement with only its corresponding sanctions relief triggers operative
Verification Transfer	Verification documentation transfers seamlessly between Pathways when modification occurs
Cost Allocation	Pathway-specific costs borne by IAEA Enhanced Monitoring Fund (Upgrade 6); no cost to Iran or US

Section 3.3 -- Enrichment Caps, Zero-Expansion Rule, and Centrifuge Controls

The 3.67% Universal Cap: All enrichment activity on Iranian soil is capped at 3.67% U-235 -- the level established under the original JCPOA as sufficient for civilian power reactor fuel and consistent with Iran's NPT rights. This cap is non-negotiable throughout the 12-Year Moratorium period.

Facility	Permitted Activity	Cap Level	New Installation Permitted
Natanz (above-ground)	Civilian research enrichment	3.67%	No
Natanz (underground halls)	Sealed / monitoring only	0% (sealed)	No
Pickaxe Mountain	No enrichment -- monitoring only	0%	No
Fordow IMIRC	Downblending cascade only	19.75% output only	No
Esfahan Tunnel	Downblending until complete, then sealed	19.75% during Protocol	No
All other sites	No enrichment	0%	No

Zero New Centrifuge Installation Rule: No new centrifuge -- including but not limited to IR-2, IR-4, IR-6 models, and any successor generation -- may be installed at any Iranian facility for the duration of the 12-Year Moratorium. Existing sealed centrifuges remain under IAEA tamper-evident seal throughout the Moratorium period.

Pickaxe Mountain Specificity: The Zero New Installation rule applies with particular force to the Pickaxe Mountain facility. No centrifuge, cascade component, UF6 feed system, or product withdrawal system may be installed in any Pickaxe Mountain tunnel for any purpose during the Moratorium period. The IAEA maintains continuous monitoring at all tunnel access points.

Manufacturing Controls: Full accounting of all centrifuge manufacturing sites, storage facilities, and spare parts inventories is provided to the IAEA on a monthly basis. Annual physical inventory verification is conducted by IAEA inspectors. Centrifuge rotor production is monitored through a seal-and-surveillance regime.

Section 3.4 -- Fordow IMIRC: Full Conversion Specifications

The Fordow conversion to the International Medical Isotope Research Center represents the crown civilian asset of this Annex -- Iran's compensation for permanently relinquishing enrichment at Fordow, and the Trump Administration's aligned interest in expanding access to medical radioisotopes globally.

Military Withdrawal: All Iranian Revolutionary Guard Corps (IRGC) and military personnel withdraw from the Fordow site within 90 days of the Entry Into Force Date. Military perimeter security is replaced by IAEA-supervised civilian security protocols.

Cascade Deactivation: All standard enrichment cascades are permanently deactivated and purged of UF₆ gas. Purge verification is conducted by IAEA inspectors who document the residual UF₆ level in each cascade header. All cascades are then sealed under IAEA tamper-evident locks within 45 days of the Entry Into Force Date.

Downblending Configuration: Specific pre-approved cascade halls -- no more than two cascade halls as identified by the JIG Technical Committee -- are reconfigured exclusively for the HEU-to-LEU downblending process. This reconfiguration is completed, documented, and verified by the IAEA before downblending commences.

IMIRC Governance: The IMIRC is governed by an International Scientific Advisory Board comprising two Iranian members appointed by the Atomic Energy Organisation of Iran and three international members appointed by the IAEA governance body, with at least one member nominated by the World Health Organization. The Board meets quarterly and produces an annual public report.

Workforce Retention: All Iranian nuclear scientists and technical staff employed at Fordow at the time of this Annex's entry into force are offered retraining programs in medical isotope production, Mo-99 target fabrication, and radiopharmaceutical sciences. Retraining curricula are developed jointly by the Atomic Energy Organisation of Iran and the International Scientific Advisory Board, with financial support from the Regional Development Fund.

Medical Production Mandate: The IMIRC's primary mandate is the production of Molybdenum-99 (Mo-99) for global medical supply, specifically for Technetium-99m generators used in nuclear medicine procedures for cancer diagnosis and treatment. The IMIRC is designated as a WHO Priority Supply Facility.

Conversion Timeline: The physical conversion plan commences immediately upon Entry Into Force Date. Full operational conversion of the IMIRC -- meaning the facility is producing Mo-99 under IAEA

verification -- is targeted for completion within 36 months of the Entry Into Force Date.

Reconversion Lock: Reconversion of the IMIRC to any enrichment function requires unanimous consent of the JIG governance body, IAEA certification of a legitimate civilian need that cannot be met by alternative means, and external fuel supply assurance from at least two Nuclear Suppliers Group states.

Section 3.5 -- Pickaxe Mountain Facility: Moratorium Lock Protocol

Pickaxe Mountain represents the single greatest near-term proliferation risk in the Three-Facility Framework. Its depth -- approximately 100 meters beneath granite -- potentially places it beyond the reach of the largest currently deployed conventional bunker-buster munitions, creating a US Administration calculation that military options against this facility will become unavailable once construction is complete. This Annex resolves this calculus through mandatory pre-operational IAEA mapping and continuous monitoring that make the facility transparent without requiring its destruction.

Baseline Mapping: Within 45 days of the Entry Into Force Date, IAEA inspectors conduct a comprehensive baseline physical survey of all Pickaxe Mountain tunnels and chambers. The survey documents all existing excavations, installations, electrical infrastructure, ventilation systems, and any centrifuge-related equipment. The baseline survey is deposited with the UN depositary and constitutes the reference document for all subsequent compliance assessments.

Construction Freeze: All excavation and construction activity at Pickaxe Mountain beyond basic structural maintenance is frozen from the Entry Into Force Date until the IAEA baseline survey is complete and verified. Any unexplained construction activity during this period constitutes a Tier 1 Critical Breach.

Continuous Monitoring: Following the baseline survey, continuous IAEA monitoring is established at all Pickaxe Mountain tunnel access points, including secondary access points identified during the baseline survey. The monitoring architecture includes seismic sensors capable of detecting centrifuge operation at depth, environmental sampling at ventilation exhausts, and camera surveillance at all identified access points.

Zero New Installation Absolute: No centrifuge, cascade component, UF6 feed system, product withdrawal system, or enrichment-related infrastructure of any kind may be installed in any Pickaxe Mountain tunnel or chamber for the duration of the 12-Year Moratorium. Any detection of such installation constitutes a Tier 1 Critical Breach and triggers automatic PRDD Snap Line activation.

Permitted Activities: Basic geological maintenance, safety systems operation, emergency egress maintenance, and structural integrity monitoring are permitted at Pickaxe Mountain subject to prior notification to the JIG and IAEA observer presence during any significant maintenance operations.

Section 3.6 -- Verification Architecture: Dual-Key System and IAEA Protocols

The verification architecture is designed to satisfy the US Administration's demand for intrusive, real-time monitoring while being framed, consistent with the RCSA Annex A.9 Normalization Framing principle, as routine compliance parity -- identical in standard to that applied to comparable NPT Advanced Safeguards Agreement states including Brazil, Argentina, and South Africa.

Parameter	Specification	Responsible Body	Escalation Trigger
IAEA Resident Inspectors	12 resident inspectors per month at declared sites	IAEA Department of Safeguards	Refusal of >2 inspections in 30 days
Unannounced Inspections	Minimum 33% of all inspections unannounced	IAEA	Pattern of denial across multiple requests
Satellite Revisit	Daily satellite surveillance of all declared facilities	IAEA + US Technical Support	Construction anomaly at any site
Environmental Sampling	8 samples per quarter per declared site	IAEA	Unexplained isotopic signature
Data Mirroring	Vienna (primary) + Geneva (secondary) real-time data nodes	IAEA Information Technology	Camera Continuity Interruption >48 hours
Challenge Access	72-hour response time for any site	Iran (facilitated)	Non-response triggers VIU declaration
Camera Continuity	24/7 encrypted camera feeds at Esfahan, Fordow, Natanz, Pickaxe Mountain	IAEA	Interruption >24 hours triggers Tier 2 Amber
Downblending Rate Monitoring	Real-time mass-flow verification at Esfahan cascade	IAEA + IMIRC Advisory Board	Rate <3.5 kg/day for >48 hours

Managed Access for Sensitive Sites: For sites under military command, complementary access inspections are coordinated through Iran's Supreme National Security Council. The IAEA may request physical access with escort, environmental sampling by neutral third party, or remote monitoring installation. Iran shall accept at least one method per request. A single denial does not constitute a compliance concern; a sustained pattern of denial across multiple requests triggers JIG review. Inspection teams may include an Iranian national observer with the right to file observations if agreed protocols are not followed.

ARTICLE IV -- ANNEX B: SEQUENCED SANCTIONS RELIEF PROTOCOL

Section 4.1 -- The Four-Track Economic Relief Architecture

The Sequenced Sanctions Relief Protocol is structured around four parallel economic tracks that operate simultaneously but are conditioned on distinct and escalating nuclear milestones. **Each Track may be activated, paused, or recalibrated independently** pursuant to the Modular Architecture Clause in the Preamble, providing Iran with a predictable, scheduled economic lifeline while ensuring that the United States never releases funds beyond what has been earned through verified nuclear compliance.

This architecture directly addresses the structural failure identified in the RCSA v3.0 analysis of the JCPOA: previous agreements front-loaded sanctions relief before nuclear compliance could be verified at scale. Under this Protocol, every tranche is conditioned on a prior nuclear deliverable, every release is preceded by an IAEA Cycle Release Certificate, and every oil revenue payment is filtered through the PRDD Snap Line before reaching the Central Bank of Iran.

Modular Track Independence Rule: The failure, delay, or dispute in any single Track does not affect the operational status of any other Track. Track 1 (Immediate Liquidity) operates as a standalone humanitarian measure. Tracks 2 through 4 each have independent activation triggers and may advance at different rates. The JIG Sanctions Relief Committee may place any single Track on Modular Hold for up to 30 days without affecting other Tracks.

Section 4.2 -- Track 1: Immediate Liquidity Pilot (Standalone-Capable)

Amount: USD 750 million pilot liquidity injection.

Conditionality: Released upon IAEA issuance of the Modular Pathway Commencement Certificate confirming that the selected Modular Pathway has begun operation at the required rate. This is the Entry Into Force trigger.

Routing: Disbursed through the Swiss-based PRDD escrow mechanism directly to the Central Bank of Iran's humanitarian account, restricted to pharmaceutical imports, food security purchases, and medical equipment procurement for 90 days post-disbursement.

Standalone Agreement Provision: Track 1 may be implemented as a standalone humanitarian agreement entirely independent of the full Annex. If the Annex encounters insurmountable obstacles, Track 1 remains operative as a confidence-building measure, provided Iran maintains the selected Modular Pathway in operation.

Section 4.3 -- Track 2: Frozen Asset Release Schedule (Modular-Independent Tranches)

Iran holds an estimated USD 10-12 billion in sovereign assets frozen across international custodian institutions. These are Iran's own funds, and their sequenced release is the primary economic incentive mechanism of this Annex.

Tranche	Day	% Released	Cumulative	Nuclear Trigger Required
Pilot (T1)	EIFD	7.5%	7.5%	IAEA Modular Pathway Commencement Certificate
Tranche 1	Day 15	15%	22.5%	IAEA baseline access to primary facility; Natanz cap confirmed; Pickaxe Mountain freeze confirmed
Tranche 2	Day 30	20%	42.5%	IAEA certifies Pathway operations at required rate for 14+ days; Fordow UF6 purge commenced
Tranche 3	Day 45	20%	62.5%	IAEA certifies all Fordow enrichment cascades sealed; Pickaxe Mountain baseline survey complete
Tranche 4	Day 60	15%	77.5%	IAEA certifies first 100 kg HEU successfully processed under selected Modular Pathway
Tranche 5	Day 90	12.5%	90%	12-Year Moratorium formally ratified; continuous IAEA monitoring locked in
Final Release	Day 120	10%	100%	IAEA 120-Day Comprehensive Compliance Certification

Modular Independence: Each Tranche is independently triggered by its specific nuclear milestone. If one Tranche's milestone is delayed, subsequent Tranches are not delayed -- they trigger upon their own milestones being met. The Tranche release sequence is not all-or-nothing.

Automatic Freeze: If at any cycle the required nuclear trigger has not been certified by the IAEA prior to the scheduled release date, the tranche is automatically held in escrow until the trigger is confirmed. The US

incurs no political cost from a hold because it is triggered by objective IAEA certification, not by a US Government decision.

Section 4.4 -- Track 3: Oil Export Normalization (Independent Activation)

Activation: Track 3 activates on Day 30 upon IAEA certification that the selected Modular Pathway has operated at the required rate for 14 consecutive days and Fordow UF6 purging has begun.

Volume Authorization: Iran is authorized to export up to 2.1 million barrels per day (mbpd) to a list of seven pre-approved whitelisted customer states, as approved by the JIG Technical Committee. Whitelisted customers include states that have provided written commitment to route payments through the PRDD mechanism.

OFAC Licensing: US Treasury OFAC issues the required primary and secondary sanction waivers for whitelisted customer states within 5 business days of JIG Track 3 activation certification.

Payment Routing: All oil sale proceeds from Track 3 exports are routed directly to the PRDD Swiss escrow account. No oil revenues flow directly to the Central Bank of Iran or any Iranian government account except through the PRDD disbursement mechanism described in Section 4.5.

Modular Independence: Track 3 may be activated as a standalone agreement independent of Tracks 2 and 4. If Track 3 activates while other Tracks remain on hold, oil export authorization and PRDD disbursement proceed normally for Track 3 only.

Section 4.5 -- Track 4: Petroleum Revenue Direct Deposit (PRDD) System

The PRDD system is the economic enforcement backbone of this Annex. It operates as the financial equivalent of the nuclear verification architecture: just as IAEA cameras physically monitor the HEU stockpile, the PRDD mechanism physically controls Iranian access to oil revenues.

Escrow Agent: A Swiss financial institution designated by the JIG, meeting the qualifications set forth in RCSA Annex B (NACA standard), maintains the PRDD account. The escrow agent operates under a tripartite agreement between the US Treasury, the Central Bank of Iran, and the IAEA.

Disbursement Bands: 85% of accumulated PRDD oil revenues are released monthly to the Central Bank of Iran upon receipt of the IAEA Monthly Compliance Certificate. The remaining 15% is held as a Performance Reserve, released quarterly upon IAEA quarterly compliance verification. During a Tier 2 Amber period, the release band drops to 70%, with 30% held in Performance Reserve pending resolution. During a Tier 1 Red / Snap Line activation, all PRDD disbursements are frozen within 72 hours.

SWIFT Integration: PRDD disbursements to the Central Bank of Iran are conducted through the SWIFT MT 103/202 messaging system upon full SWIFT Tier A reconnection at Day 45. Prior to Day 45, PRDD

disbursements are conducted through alternative settlement channels approved by the JIG.

Modular Independence: PRDD operates independently for each Track. If Track 3 (oil export) is active while other Tracks are on hold, PRDD processes oil revenue disbursements normally. If Track 3 is paused, PRDD holds accumulated revenues in escrow without penalty, releasing them upon Track 3 reactivation.

ARTICLE V -- THE 15-DAY MICRO-CYCLE SEQUENCING ENGINE

The 15-Day Micro-Cycle Sequencing Engine operationalizes the core anti-deadlock principle of the Enhanced Accord: neither the United States nor Iran is ever exposed to more than 15 days of unreciprocated compliance risk. Each Micro-Cycle consists of a defined nuclear deliverable by Iran followed by a defined sanctions relief action by the United States. **Each Micro-Cycle may be extracted and implemented as a standalone agreement** independent of all other Micro-Cycles.

Modular Micro-Cycle Rule: If Iran fails to complete the nuclear deliverable for a specific cycle, only the corresponding US sanctions action for that cycle does not occur. All other cycles continue on their independent timelines. If the US fails to complete a sanctions action after Iran has completed its deliverable, Iran may invoke the JIG dispute resolution mechanism and suspend further nuclear deliverables **only for the affected cycle**, while continuing all other cycles. Previously completed cycles remain valid and their benefits are not reversible.

Section 5.1 -- Cycle 1: Day 15 -- Monitoring and SWIFT Exchange

Nuclear Deliverable (Iran): IAEA Baseline Access: Iran grants full, unimpeded IAEA access to the primary facility (Esfahan for Pathway A; consolidation site for Pathways B-F) to establish a verified baseline inventory of the HEU stockpile. The IAEA issues the Baseline Certificate upon satisfactory completion. Natanz Cap Confirmation: Iran provides written confirmation to the IAEA that all enrichment activity at Natanz is at or below 3.67%, supported by IAEA monitoring data. Pickaxe Mountain Freeze: Iran provides written confirmation that all construction and installation activity at Pickaxe Mountain is frozen pending IAEA baseline survey.

US Sanctions Action (Day 15 Trigger): Tranche 1 Release: Day 15 Tranche (15% of frozen sovereign assets) authorized by US Treasury upon receipt of Cycle 1 Release Certificate from the JIG. SWIFT Tier B/C Reconnection: OFAC authorizes SWIFT reconnection for Tier B and Tier C Iranian banks strictly for humanitarian, agricultural, and civilian industrial import transactions.

Section 5.2 -- Cycle 2: Day 30 -- Pathway Operations and Oil Exchange

Nuclear Deliverable (Iran): Modular Pathway Operations Confirmed: IAEA confirms that the selected Modular Pathway has operated continuously for 14 or more days at the required rate (Pathway A: 3.5 kg/day downblending; Pathway B: export packaging and transit preparation; Pathway C/D: staging and transport coordination; Pathway E: downblending to reactor grade; Pathway F: parallel sub-pathway operations). Fordow UF6 Purge Commencement: Fordow begins the formal purge of all enrichment cascades of UF6 gas, documented by IAEA inspectors who seal each purged cascade header with IAEA tamper-evident locks.

US Sanctions Action (Day 30 Trigger): Track 3 Activation: Oil Export Normalization activates. Tranche 2 Release: Day 30 Tranche (20% of frozen assets) authorized.

Section 5.3 -- Cycle 3: Day 45 -- Fordow Seal and Banking Normalization

Nuclear Deliverable (Iran): Fordow Cascade Sealing: IAEA certifies that all Fordow enrichment cascades are permanently deactivated, fully purged of UF6, and sealed under IAEA tamper-evident locks. IMIRC Conversion Launch: The physical conversion of Fordow to the IMIRC officially commences. Pickaxe Mountain Baseline Survey: IAEA inspectors complete the comprehensive baseline survey of all Pickaxe Mountain tunnels and chambers.

US Sanctions Action (Day 45 Trigger): SWIFT Tier A Reconnection: Full SWIFT reconnection authorized. PRDD First Release: The first PRDD oil revenue disbursement released from Swiss escrow at the 85% disbursement band.

Section 5.4 -- Cycle 4: Day 60 -- Milestone Verification and Tranche Release

Nuclear Deliverable (Iran): First 100 kg Milestone: IAEA certifies that the first 100 kilograms of 60% HEU has been successfully processed under the selected Modular Pathway (downblended, exported, or transferred to custody). Medical Production Readiness: The IMIRC Advisory Board certifies that the first Mo-99 target irradiation is scheduled.

US Sanctions Action (Day 60 Trigger): Tranche 3 Release: Day 60 Tranche (15% of frozen assets) authorized. Total released to date: approximately 77.5% of frozen sovereign assets.

Section 5.5 -- The Pairing Matrix: Modular Mirror Pairings

Each Mirror Pairing may be implemented as a standalone agreement with only its corresponding sanctions relief triggers operative.

Pairing	Days	Nuclear Deliverable	Economic Release
Pairing 1	Day 15-20	IAEA certifies pathway commenced; Natanz cap confirmed	SWIFT Tier B/C reconnection; Tranche 1 (15%)
Pairing 2	Day 30-45	IAEA certifies Fordow cascades sealed; pathway operations confirmed	Track 3 oil export (2.1 mbpd); Tranche 2 (20%)
Pairing 3	Day 45-60	12-Year Moratorium ratified; IAEA continuous monitoring locked in	SWIFT Tier A; first PRDD release; Tranche 3 (20%)
Pairing 4	Day 60+	IAEA certifies 100 kg milestone processed	Tranche 4 (15%); Performance Reserve cleared

ARTICLE VI -- THE COMPLIANCE AND ESCALATION PROTOCOL ('DUTY OFFICER' GUIDE)

The Compliance and Escalation Protocol establishes a tiered response system modeled on the Duty Officer framework of the 14-Day Implementation Directive v2.4. **Each Tier response is calibrated to the specific module in which the breach occurs** and does not automatically cascade to unaffected modules.

Section 6.1 -- Tier 1: Red: Critical Breach

Trigger: IAEA confirms enrichment above 3.67% at any facility; OR IAEA access is denied or significantly impeded for more than 72 continuous hours; OR diversion of medical-grade LEU for purposes other than Mo-99 target fabrication is detected; OR centrifuge installation detected at Pickaxe Mountain.

Modular-Scoped Response: AUTOMATIC: PRDD Snap Line activates for the **affected Track or facility module only**. Unaffected Tracks continue normal operation. JIG convenes emergency session within 24 hours to determine whether the breach is module-specific or systemic. MANDATORY: US Treasury suspends Tranche releases directly linked to the breached module. OPTIONAL: US may re-impose oil export

restrictions for whitelisted customers, but only if the breach directly affects Track 3 verification. AUTOMATIC: If breach is enrichment above 3.67%, Moratorium Extension of 24 months is recorded in Moratorium Register.

Section 6.2 -- Tier 2: Amber: Compliance Warning

Trigger: Modular Pathway processing rate falls below required rate for more than 48 continuous hours; OR IAEA camera feed at any facility is interrupted for more than 24 continuous hours without prior notification; OR Iran fails to respond to an IAEA information request within the standard 14-day response window.

Response: AUTOMATIC: PRDD disbursement band drops from 85% to 70% for the affected Track only. 72-HOUR QUIET CORRECTION WINDOW: JIG Technical Committee notifies Iranian counterpart and provides 72 hours to restore compliance. If correction is made within 72 hours, full 85% band is restored retroactively. If not corrected, JIG convenes formal review.

Section 6.3 -- VIU: Blue: Verification Integrity Uncertain

Trigger: IAEA monitoring data is degraded, interrupted, or of uncertain integrity due to a cyberattack, technical failure, or communications disruption.

Response: VIU DECLARATION: JIG declares VIU state within 6 hours. NO BREACH DECLARED: No compliance violation is recorded during a VIU state. 48-HOUR DISPATCH: Physical IAEA inspectors dispatched to affected facility. PRDD HOLD: Disbursements held for affected module only, not frozen. RESOLUTION: Upon physical inspector confirmation, either VIU cleared (full disbursements restored) or VIU reveals underlying breach (Tier 1 Red activated).

Section 6.4 -- PRDD Nuclear Snap Line: Technical Activation Specifications

Modular Activation: The Snap Line may be activated for individual Tracks independently. If a Tier 1 breach affects only Track 2 (frozen assets), Track 3 (oil revenues) continues normal PRDD disbursement unless the breach also directly affects Track 3 verification.

Activation Trigger: Receipt by the Swiss escrow agent of an IAEA Non-Compliance Certificate or JIG Snap Line Activation Notice specifying the affected module(s).

Response Time: The Swiss escrow agent is legally obligated to freeze PRDD disbursements for the specified module within 72 hours.

Restoration: PRDD disbursements are restored only upon IAEA Compliance Restoration Certificate for the affected module AND JIG authorization.

Section 6.5 -- Automatic Moratorium Extension Mechanism

Trigger: IAEA certification of enrichment above 3.67% at any declared or undeclared Iranian facility.

Extension Period: 24 months per incident, added to the remaining Moratorium period.

Cumulative Cap: The total Moratorium period, including all extensions, may not exceed 25 years without the consent of Iran.

Modular Independence: The Automatic Extension applies only to the Moratorium. It does not trigger Track-wide sanctions snapback. Economic Tracks continue unless a separate Tier 1 determination is made for each Track.

ARTICLE VII -- JOINT IMPLEMENTATION GOVERNANCE (JIG)

The Joint Implementation Governance body established under the Enhanced Accord serves as the primary oversight mechanism for this Annex. It operates through four specialized sub-committees with specific mandates under this Annex. **Each sub-committee has independent decision-making authority for its designated module** and may convene without a full JIG plenary session.

JIG Sub-Committee	Mandate	Meeting Frequency	Decision Standard
Nuclear Technical Committee	IAEA coordination; facility conversion oversight; verification protocol management; Modular Pathway selection and modification; downblending rate certification	Weekly (or as required)	Technical consensus; IAEA advisory role
Sanctions Relief Committee	Tranche release certification; SWIFT reconnection authorization; PRDD Snap Line activation/restoration; Track-specific Modular Hold decisions	Bi-weekly (or as required)	Majority vote; US chair
IMIRC Steering Committee	IMIRC conversion oversight; ISAB appointment; workforce retraining programs; Mo-99 production milestones	Monthly	Consensus; WHO advisory role

Compliance & Escalation Panel	Tier escalation decisions; VIU declarations; Moratorium Extension recording; dispute pre-screening; modular-specific breach determinations	Within 24 hours of trigger event	Majority vote; IAEA certification required
-------------------------------	--	----------------------------------	--

Independent Sub-Committee Authority: Each sub-committee may make binding decisions within its mandate without full JIG plenary approval. The Sanctions Relief Committee may authorize Track-specific Modular Holds independently. The Nuclear Technical Committee may approve Modular Pathway switches independently. Full plenary sessions are required only for cross-cutting decisions affecting multiple modules simultaneously.

Neutral Chair: The JIG is chaired by the Swiss NACA (Non-Aligned Co-Administrator) for all Tier Beta-equivalent decisions involving asset releases above USD 10 million and all Tier 1 escalation proceedings.

IAEA Observer: The IAEA Director General's Office maintains a permanent observer delegation at JIG proceedings with the right to speak on technical matters and to submit written observations within 48 hours of any JIG decision.

Pakistan Facilitation: Pakistan maintains facilitation rights throughout the JIG process, with the authority to call extraordinary sessions of the full JIG upon 12 hours notice in the event of a Tier 1 escalation.

ARTICLE VIII -- DISPUTE RESOLUTION AND ARBITRATION

Any dispute arising from the interpretation, application, or alleged breach of a **single module** of this Annex shall first be addressed through the JIG Compliance and Escalation Panel's Modular Dispute Resolution procedure. The Panel may place the affected module on Modular Hold for up to 30 days while resolution is attempted. **All unaffected modules continue normal operation during any Modular Hold period.**

Technical disputes regarding IAEA measurement methodology are referred to the IAEA Director General for binding technical determination within 14 days, with the Spiez Laboratory (Switzerland) serving as the designated neutral technical arbiter. No Party may invoke unilateral snapback sanctions during a pending dispute resolution proceeding unless a Tier 1 Critical Breach has been independently certified by the IAEA.

For disputes regarding the sequencing or quantum of sanctions relief, the Parties shall submit to binding arbitration by a three-member panel: one arbitrator appointed by each Party, and a neutral presiding arbitrator appointed by the Permanent Court of Arbitration in The Hague. Arbitration proceedings shall be completed within 30 days of referral.

Modular Dispute Isolation Principle: A dispute in one module never automatically extends to other modules. The JIG must make a separate, module-specific determination for each alleged breach. Cross-

module sanctions are prohibited absent a systemic breach determination by the full JIG plenary.

ARTICLE IX -- WITHDRAWAL, SUSPENSION, AND TERMINATION

Section 9.1 -- Withdrawal, Effect of Withdrawal, and Framework Continuity

Withdrawal: Either Party may withdraw from this Annex upon 90 days written notice to the depositary. Withdrawal does not relieve the withdrawing Party of obligations incurred prior to the notice date. No Notice of Withdrawal takes effect until the Crisis Lock mechanism under Section 9.2 has been triggered and the full 30-day stasis period has expired without resolution.

Modular Continuity on Withdrawal: If withdrawal affects only specific modules, the remaining modules continue in full force. A Party must specify which modules are subject to withdrawal. If no modules are specified, withdrawal applies to the entire Annex. Standalone agreements implemented under the Modular Architecture Clause survive withdrawal unless explicitly withdrawn.

Effect of US Withdrawal on PRDD: If the United States withdraws from this Annex, all accumulated PRDD revenues held in Swiss escrow are immediately released to the Central Bank of Iran in full for Tracks where no Tier 1 breach is outstanding, provided the Crisis Lock mediation window has expired without resolution.

Section 9.2 -- The Crisis Lock and Mandatory Mediation Buffer

The Crisis Lock activates automatically upon either Trigger A (Notice of Withdrawal) or Trigger B (PRDD Snap Line Activation for any module). Upon activation, the JIG Compliance and Escalation Panel immediately notifies both Parties and the Guarantors.

Modular Stasis Period: The 30-day stasis period applies only to the module(s) that triggered the Crisis Lock. All other modules continue normal operation. For the affected module: PRDD Hold (money frozen, not confiscated); Monitoring Preservation (cameras stay on); Moratorium Freeze (nuclear constraints remain active); No New Sanctions; Media Embargo on Tier 2 and VIU events.

Mandatory Principal-Level Mediation: Within 48 hours of Crisis Lock activation, Pakistan and Oman jointly issue a formal mediation summons. Both Parties are legally obligated to dispatch a principal-level representative within 14 days. The Guarantors assume joint operational control of the JIG Transparency Portal.

Section 9.3 -- The Modular Hold Mechanism

Purpose: The Modular Hold mechanism allows temporary suspension of any single module without affecting the operation of any other module. It is the primary tool for implementing the Modular Architecture Clause.

Activation: Any Party may request a Modular Hold for any module by written submission to the JIG specifying: (a) the affected module; (b) the reason for the Hold; (c) the proposed duration (not exceeding 60 days); and (d) the conditions for restoration. The Hold activates automatically upon JIG receipt unless the other Party objects within 48 hours. If objection is filed, the JIG convenes within 72 hours to approve or deny the Hold by majority vote.

Effect of Modular Hold: All obligations and relief triggers associated with the affected module are suspended for the Hold duration. All other modules continue normal operation. Previously completed deliverables under the affected module remain valid and are not reversible. The Hold does not constitute a breach of this Annex.

Maximum Hold Duration: 60 days per module per calendar year. A module may be placed on Hold a maximum of two times per calendar year. If a third Hold is requested for the same module within 12 months, the JIG must convene a full plenary session to determine whether the module should be permanently modified or replaced.

Hold Extension: A Hold may be extended for up to 30 additional days by unanimous JIG consent. No single Party may block a reasonable extension request.

Restoration: A module is automatically restored from Hold upon: (a) expiration of the Hold period; (b) issuance of a JIG Restoration Certificate; or (c) mutual written agreement of both Parties. Upon restoration, the module resumes operation from the point of suspension, with all timeline obligations adjusted proportionally.

Standalone Agreement Survival: Any module implemented as a standalone agreement under the Modular Architecture Clause is not subject to Modular Hold requested by a Party that is not a party to that standalone agreement.

ARTICLE XIII -- 20 STRUCTURAL UPGRADES: VERIFICATION, FINANCIAL, CRISIS

MANAGEMENT, AND RESILIENCE ENHANCEMENTS

This Article incorporates twenty targeted structural enhancements to close operational loopholes, improve resilience, and strengthen the Annex against spoiler tactics, technical failures, and political misuse. **Each upgrade is modular and applies independently** to its designated module. Upgrades may be activated, deactivated, or modified by JIG majority vote without affecting the operation of other upgrades or the core Annex framework.

Category A -- Hardening the IAEA Verification Network (Upgrades 1-5)

Upgrade 1 -- "Black Box" Local Data Storage: All IAEA cameras, sensors, and monitoring instruments installed at the four primary sites shall be equipped with tamper-evident sealed local storage drives with a minimum 30-day continuous recording capacity. Local storage drives are physically sealed by IAEA inspectors and may only be accessed by a two-person IAEA team. Drives are replaced and archived on a rolling 30-day cycle.

Upgrade 2 -- Pre-Cleared Inspector Visa Registry: On the Entry Into Force Date, Iran shall issue multi-entry, 12-month diplomatic visas to a roster of 50 designated IAEA inspectors nominated by the IAEA Director General. This roster is updated annually with 90 days' notice. Visa renewal is automatic upon annual roster resubmission unless Iran provides written justification for a specific individual's exclusion to the JIG within 14 days of roster submission.

Upgrade 3 -- Centrifuge Rotor Baseline Audit: Within 30 days of the Entry Into Force Date, the IAEA shall conduct a comprehensive physical inventory of Iran's known carbon-fibre rotor manufacturing facilities, maraging steel component storage, and centrifuge assembly workshops. The resulting Centrifuge Component Baseline Certificate is deposited with the UN Depositary.

Upgrade 4 -- Target Exhaustion Accounting (Medical LEU Chain of Custody): The IMIRC shall maintain a complete chain-of-custody registry for all 19.75% medical-grade LEU produced under the Modular Pathway. The registry accounts for: (a) total LEU produced; (b) quantity fabricated into Mo-99 targets; (c) quantity shipped to end-users; and (d) quantity in storage at IMIRC.

Upgrade 5 -- Environmental Baseline at Pickaxe Mountain: The IAEA shall conduct immediate environmental swipe sampling inside all mapped Pickaxe Mountain tunnels and chambers as part of the baseline survey. Results are deposited with the UN Depositary within 7 days and constitute the definitive pre-agreement nuclear contamination baseline.

Category B -- Bulletproofing Financial & Sanctions Mechanics (Upgrades 6-10)

Upgrade 6 -- Self-Funding Verification (Escrow Interest Allocation): The Swiss escrow agent shall direct a minimum of 0.5% per annum of the total PRDD account balance -- funded exclusively from interest accrued on the escrowed funds -- to a dedicated IAEA Enhanced Monitoring Fund. This Fund finances: (a) the enhanced IAEA inspection regime; (b) the IMIRC conversion technical assistance program; and (c) the local storage drive infrastructure under Upgrade 1.

Upgrade 7 -- Sovereign Immunity for Whitelisted Oil Buyers: If the PRDD Snap Line is activated during a period when oil cargoes are already in transit from Iranian ports, whitelisted buyer nations are legally immune from US secondary sanctions for those specific in-transit cargoes, provided payment is routed directly into the Swiss PRDD escrow account.

Upgrade 8 -- PRDD Currency Diversification: The PRDD escrow account shall hold accumulated funds in a basket of reserve currencies: Swiss Franc (CHF) -- 40%; Euro (EUR) -- 30%; Japanese Yen (JPY) -- 20%; and up to 10% in SDR-equivalent assets. US dollar holdings are capped at 15% of total balance.

Upgrade 9 -- Humanitarian Vendor Whitelist (Track 1 Pre-Clearance): Within 10 days of the Entry Into Force Date, OFAC shall pre-clear a list of at least 30 international pharmaceutical, agricultural, and medical equipment vendors for transactions funded by the Track 1 USD 750 million Pilot Liquidity release. Pre-cleared vendors may transact directly without requiring individual OFAC transaction licenses.

Upgrade 10 -- IRGC Divestment Certification for IMIRC Construction: Iran shall certify to the JIG that all primary contractors, subcontractors, and engineering firms engaged for the Fordow conversion are not majority-owned, controlled, or directed by the IRGC or any IRGC-affiliated entity designated under US Executive Orders 13224 or 13382.

Category C -- Crisis Management & De-Confliction (Upgrades 11-15)

Upgrade 11 -- Cyber Non-Interference Pledge: Both Parties formally pledge not to conduct, sponsor, or knowingly facilitate offensive cyber operations against: (a) the Swiss PRDD banking and escrow infrastructure; (b) the IAEA remote monitoring networks; (c) the JIG Transparency Portal; and (d) the IMIRC's operational technology systems.

Upgrade 12 -- Airspace Buffer Zones Around Nuclear Sites: The JIG Technical Committee shall establish a 10-nautical-mile Notification Zone around each of the four primary nuclear sites. US, Coalition, and Israeli military or surveillance aircraft and drones shall provide the JIG with 2-hour advance notification before entering the Notification Zone.

Upgrade 13 -- Force Majeure Clock Pause: If a verifiable force majeure event prevents Iran from meeting the required Modular Pathway processing rate, the affected obligation's clock is automatically paused for the duration of the force majeure event, not to exceed 30 days without JIG review.

Upgrade 14 -- The 'No-Surprise' Media Embargo: The JIG Compliance and Escalation Panel shall impose a mandatory 4-hour media embargo on any Tier 2 Amber or VIU declaration. During the 4-hour window, the JIG Duty Officers work to determine whether the event is a technical false alarm or a genuine compliance concern.

Upgrade 15 -- Guarantor Portal Custody (Integrated with Crisis Lock): Pakistan and Oman maintain joint administrative access to the JIG Transparency Portal at all times. During a Crisis Lock, the Guarantors assume full administrative custody -- write access -- preventing either Party from manipulating compliance data.

Category D -- Medical Isotope Conversion: IMIRC Enhancements (Upgrades 16-18)

Upgrade 16 -- WHO Off-Take Guarantee for Developing Nations: The IMIRC ISAB shall designate a minimum of 20% of total Mo-99 isotope production capacity for sale at cost to the WHO for distribution to developing-nation healthcare systems.

Upgrade 17 -- Fast-Track Dual-Use Medical Imports Channel: The JIG shall establish an expedited 10-business-day approval channel for IMIRC import requests covering equipment classified as dual-use under US Export Administration Regulations.

Upgrade 18 -- Brain-Drain Protection (Targeted Sanctions Suspension for IMIRC Staff): The United States agrees to suspend the application of individually targeted personal sanctions designations against Iranian nuclear scientists and engineers for the duration of their officially registered employment at the IMIRC.

Category E -- Structural Longevity (Upgrades 19-20)

Upgrade 19 -- The Technical Tie-Breaker (Neutral Laboratory Arbitration): The Spiez Laboratory (Spiez, Switzerland) is designated as the binding neutral technical arbiter for all disputes involving specific measurement methodology, spectrometer calibration, isotopic analysis results, or environmental sample interpretation.

Upgrade 20 -- Modular Pathway Documentation and Transparency Portal: The JIG Transparency Portal shall display real-time progress tracking for each active Modular Pathway, including: (a) percentage of HEU processed; (b) current verification status; (c) next milestone and trigger; (d) estimated completion date; and

(e) sanctions relief status. Each Pathway has an independent progress dashboard viewable by all Parties and guarantors.

Cat.	No.	Upgrade Name	Primary Protection
A	1	Black Box Local Data Storage	Cyberattack / network outage cover
A	2	Pre-Cleared Inspector Visa Registry	Visa-delay spoiler tactic
A	3	Centrifuge Rotor Baseline Audit	Off-site covert centrifuge manufacturing
A	4	Target Exhaustion Accounting	Medical LEU stockpiling for re-enrichment
A	5	Environmental Baseline at Pickaxe Mountain	Clandestine pre-agreement nuclear activity
B	6	Self-Funding Verification (Escrow Interest)	Budget dependency / taxpayer objections
B	7	Sovereign Immunity for Whitelisted Buyers	Buyer abandonment on Snap Line activation
B	8	PRDD Currency Diversification	Dollar weaponization / currency shock
B	9	Humanitarian Vendor Whitelist	OFAC delay of Track 1 food/medicine
B	10	IRGC Divestment Certification	IRGC funding allegations via IMIRC contracts
C	11	Cyber Non-Interference Pledge	Deliberate disruption of PRDD and IAEA systems
C	12	Airspace Buffer Zones	Drone shoot-down / accidental Tier 1 trigger
C	13	Force Majeure Clock Pause	Natural disaster collapsing deal
C	14	No-Surprise Media Embargo	False-alarm political escalation
C	15	Guarantor Portal Custody	Compliance data manipulation during disputes
D	16	WHO Off-Take Guarantee	Humanitarian optics; WHO as institutional protector
D	17	Fast-Track Dual-Use Medical Imports	Export controls blocking IMIRC construction
D	18	Brain-Drain Protection	Expert talent available for covert weapons program
E	19	Technical Tie-Breaker (Spiez Lab)	Physics disputes cascading to political crisis
E	20	Modular Pathway Transparency Portal	Opaque progress tracking undermining trust

ARTICLE X -- US DOMESTIC POLITICAL SAFEGUARDS AND CONGRESSIONAL NOTIFICATION

Recognizing the domestic political constraints facing the US Administration, this Annex is designed to provide the Administration with verifiable, publicly defensible compliance checkpoints at every 15-day cycle. **Each Modular Pathway provides a distinct narrative for Congressional presentation.**

Congressional Notification: The US Administration shall provide the relevant Congressional oversight committees with a classified briefing within 5 days of each Cycle Release Certificate, including IAEA verification data and confirmation of Iranian compliance with the preceding cycle's nuclear deliverable.

Public Reporting: The US Administration shall publish an unclassified summary of IAEA compliance findings within 10 days of each Cycle Release Certificate, enabling the Administration to demonstrate that 'not a dollar was released until Iran earned it through the IAEA.'

Administration Statement Authority: Nothing in this Annex prevents the US Administration from publicly stating: (a) that Iran's enrichment is under international monitoring at civilian-grade levels; (b) that weapons-grade HEU is being physically eliminated under IAEA cameras; (c) that sanctions relief is conditioned on IAEA certification; (d) that the PRDD Snap Line is a live, automatic enforcement mechanism; and (e) that the Modular Pathway architecture ensures Iran can never selectively accept benefits without delivering verified compliance.

Modular Pathway Narrative Guide:

Selected Pathway	US Framing for Domestic Audience
Pathway A (In-Place)	"Iran is chemically destroying its weapons-grade material under IAEA cameras in real time. Every kilogram is neutralized before our eyes."
Pathway B (Oman Export)	"Weapons-grade uranium has been removed from Iranian territory and is under IAEA international control. Not one gram remains in Iran."
Pathway C (Kazakhstan Bank)	"Iran's enriched material is now in the IAEA fuel bank, available only for verified civilian use. Maximum physical separation achieved."
Pathway D (Russia)	"Working with Russia, we've leveraged their experience to neutralize Iran's stockpile faster than any other option."

Pathway (Bushehr Fuel)	E	"We turned Iran's weapons material into reactor fuel for their own power plant. Threat neutralized, energy produced."
Pathway (Hybrid)	F	"We're using multiple independent verification methods simultaneously. No single pathway failure can compromise the entire neutralization."

ARTICLE XI -- IRANIAN SOVEREIGNTY PRESERVATION AND NPT CONSISTENCY

This Annex is specifically designed to be consistent with Iran's rights and obligations under the Nuclear Non-Proliferation Treaty and to be defensible to Iranian domestic constituencies on the basis of sovereign rights preservation.

NPT Consistency: The 3.67% enrichment cap at Natanz is fully consistent with Iran's NPT rights as a non-nuclear-weapon state exercising the right to peaceful nuclear energy under Article IV of the NPT.

Sovereignty Language: At no point does this Annex characterize Iran as having 'surrendered,' 'dismantled,' or 'abandoned' its nuclear program. The approved framing is: Iran has 'redirected' enrichment capacity toward civilian medicine, 'converted' damaged infrastructure to humanitarian purpose, and 'accepted internationally comparable' monitoring consistent with advanced NPT states.

Modular Pathway Sovereignty Preservation: Iran retains sovereign decision-making authority over the selection, modification, and implementation of Modular Pathways. No Pathway requires Iran to transfer material to any state without its explicit consent. Pathway B (Oman) and Pathway C (Kazakhstan) maintain IAEA as the primary custodian, not the destination state. Pathway F (Hybrid) allows Iran to retain processing of a portion of its material on Iranian soil under Iranian scientific supervision.

Iranian Domestic Narrative: Iranian negotiators may accurately state: 'We did not capitulate -- we chose from multiple options how to neutralize our material. We converted Fordow into a cancer medicine factory. We kept Natanz enriching at civilian grade. We selected the Modular Pathway that preserved our sovereignty and our scientists' employment.'

ARTICLE XII -- ENTRY INTO FORCE, RATIFICATION, AND DEPOSITARY

Entry Into Force: This Annex enters into force on the date on which both Parties have provided written notification to the depositary of their consent to be bound, and the IAEA has issued its first Modular Pathway Commencement Certificate confirming that the selected Modular Pathway has begun operation at the required rate. This date is the Entry Into Force Date.

Modular Entry Into Force: Individual modules may enter into force on dates different from the Annex as a whole. A module enters into force upon: (a) written notification of consent from both Parties; (b) IAEA certification of the module's readiness; and (c) issuance of a Modular Activation Certificate by the JIG.

Depositary: The Secretary-General of the United Nations serves as depositary of this Annex. The IAEA Director General serves as Technical Co-Depositary for all instruments relating to nuclear verification.

Languages: This Annex is done in English, Persian (Farsi), and Arabic, all texts being equally authentic. In the event of divergence, the English text shall prevail for technical provisions and the Persian text shall prevail for matters of Iranian sovereign rights.

Authentic Text: The authentic and original text of this Annex is deposited with the UN Library at Geneva and mirrored to IAEA servers in Vienna.

APPENDIX I -- 12-YEAR MORATORIUM INSTRUMENT: SIGNABLE TEMPLATE

The following instrument, adapted from the RCSA Annex B template and modified to reflect the 12-year primary duration with Automatic Extension mechanism and Modular Pathway compatibility, constitutes the operative moratorium commitment.

A Legally Binding Instrument of the Islamic Republic of Iran

MORATORIUM ON URANIUM ENRICHMENT ACTIVITIES

Preamble. The Government of the Islamic Republic of Iran (hereinafter 'Iran'), desiring to demonstrate its exclusively peaceful nuclear intent and to build international confidence through verifiable commitments consistent with its rights under the Nuclear Non-Proliferation Treaty,

Article I -- Moratorium. Iran hereby commits to a complete and verifiable moratorium on uranium enrichment above 3.67% U-235 for a period of twelve (12) years from the Entry Into Force Date of the Stability First Phase II Nuclear Annex v1.2. During this period, no uranium enrichment above 3.67% U-235 shall be conducted at any facility on Iranian soil.

Article II -- Zero Expansion. For the duration of the moratorium period, no new centrifuge of any model or generation shall be installed at any Iranian facility, including any underground facility. All existing centrifuges at facilities other than the Natanz Open-Fuel-Cycle Research Campus shall remain under IAEA tamper-evident seal.

Article III -- Modular Pathway Compatibility. Iran commits to the verified neutralization of its 60% HEU stockpile through the Modular Pathway selected under Article III, Section 3.2 of the Annex. Iran may participate in the selection, modification, and if necessary, replacement of the Modular Pathway by mutual consent or JIG majority vote.

Article IV -- Automatic Extension. In the event that the IAEA certifies any enrichment above 3.67% at any declared or undeclared Iranian facility, the moratorium period is automatically extended by 24 months per incident, recorded by the Swiss escrow agent in the Moratorium Register. The total moratorium period shall not exceed 25 years without Iran's consent.

Article V -- Verification. This moratorium shall be verified by the IAEA pursuant to the verification protocol set forth in Article III, Section 3.6 of the Phase II Nuclear Annex, which includes continuous monitoring, unannounced inspections, environmental sampling, satellite surveillance, and dual-key camera systems.

Article VI -- Weapons Prohibition (Permanent). Iran unconditionally and permanently commits to never conducting uranium enrichment for weapons purposes, implosion device research, neutron initiator development, or any other nuclear weapons-related activity. This commitment survives the expiration or termination of the moratorium.

Article VII -- Benefits. During the moratorium period, Iran shall have full access to the Modular Pathway-selected disposition method, international nuclear fuel markets, civilian nuclear technology for peaceful purposes, the IMIRC as a center of nuclear medicine excellence, and the commercial and humanitarian benefits established under Annex B of the Phase II Nuclear Annex.

For the Islamic Republic of Iran

Date: _____

Witnessed by the Secretary-General of the United Nations

APPENDIX II -- VERIFICATION SCHEDULE AND IAEA STAFFING MATRIX

Facility		Resident Inspectors	Monthly Inspections	Unannounced %	Camera Feed	Environmental Samples/Quarter
Esfahan Complex	Tunnel	4 (processing phase)	8	50%	24/7 encrypted	8
Fordow	IMIRC	3	6	33%	24/7 encrypted	6
Natanz (above-ground)	OFCRC	4	6	33%	24/7 encrypted	8
Natanz (underground halls)		1 (monitoring only)	4	25%	24/7 encrypted	4
Pickaxe Mountain		2 (access point monitoring)	4	50%	24/7 encrypted + seismic	6
Oman Facility	Custody (if Pathway B active)	3	6	33%	24/7 encrypted	4
All other declared sites		1 per site	2 per site	20%	Standard IAEA	2 per site

APPENDIX III -- SEQUENCED SANCTIONS RELIEF: COMPLETE TRANCHE SCHEDULE

Event	Day	Relief Action	Nuclear Trigger	Responsible Body
Pilot Liquidity	EIFD	\$750M liquidity; restricted to humanitarian use	IAEA Modular Pathway Commencement Certificate	US Treasury / JIG
Tranche 1 + SWIFT B/C	Day 15	15% frozen assets; SWIFT Tier B/C (civilian only)	Primary facility baseline + Natanz cap + Pickaxe freeze confirmed	US Treasury / OFAC
Tranche 2 + Oil (2.1 mbpd)	Day 30	20% frozen assets; Track 3 oil export activated	Pathway operations at required rate 14+ days; Fordow purge commenced	US Treasury / OFAC / JIG
Tranche 3 + SWIFT A + PRDD Release 1	Day 45	20% frozen assets; Tier A SWIFT; first PRDD release	All Fordow cascades sealed; Pickaxe baseline survey complete	US Treasury / JIG
Tranche 4	Day 60	15% frozen assets	First 100 kg HEU processed under selected Modular Pathway	US Treasury / JIG
Tranche 5 + Moratorium Ratification	Day 90	12.5% frozen assets	12-Year Moratorium formally ratified by Iranian parliament	US Treasury / JIG
Final Release	Day 120	10% frozen assets; full PRDD normalization	IAEA 120-Day Comprehensive Compliance Certification	US Treasury / JIG
PRDD Ongoing (Monthly)	Day 45+	85% oil revenues; 15% Performance Reserve	IAEA Monthly Compliance Certificate	Swiss Escrow Agent
PRDD Reserve (Quarterly)	Day 90+	15% Performance Reserve cleared	IAEA Quarterly Compliance Certificate	Swiss Escrow Agent / JIG

APPENDIX IV -- PRDD ARCHITECTURE: TECHNICAL SPECIFICATIONS

Parameter		Specification
Escrow Bank		Swiss bank (SIX Group participant) designated by JIG; minimum CHF 50B tier-1 capital
Account Structure		PRDD Primary (oil revenues received); PRDD Reserve (15% Performance Reserve); PRDD Humanitarian (pre-cleared disbursements); PRDD Modular Reserve (5% per Track held for modular-specific Snap Line activation)
Incoming Payment Routing		Whitelisted customer L/C or wire transfer to PRDD Primary only; no direct-to-Iran routing permitted
Disbursement Trigger		IAEA Monthly Compliance Certificate + JIG Cycle Release Certificate + Swiss Escrow Agent automated verification
Modular Disbursement		Each Track has a dedicated sub-account; disbursement from each sub-account triggered independently by Track-specific compliance certification
Disbursement Timing		Monthly release within 3 business days of compliance certificate receipt
Snap Activation	Line	Within 72 hours of IAEA Non-Compliance Certificate specifying affected module; fully automated via API connection to escrow system
Modular Line Scope	Snap	Freeze applies only to the sub-account of the affected module; unaffected module sub-accounts continue normal disbursement
Snap Restoration	Line	Requires: IAEA Compliance Restoration Certificate for affected module + JIG majority vote + 48-hour notice to Iran
Audit		Annual independent audit by KPMG/Deloitte/PwC-equivalent firm; quarterly statements to JIG; public annual summary
Volume Capacity		Designed for up to USD 2.5B/month at 2.1 mbpd and Brent \$90/bbl; scalable to 3.0 mbpd
Humanitarian Carve-Out		5% of monthly PRDD disbursement directed automatically to WHO-designated humanitarian fund; exempt from Snap Line

APPENDIX V -- MODULAR PATHWAY SELECTION GUIDE

This Selection Guide is provided to assist negotiators in rapidly identifying the optimal Modular Pathway based on the political constraints, technical requirements, and timeline priorities of both Parties.

Pathway	Timeline	Best For	US Framing	Iran Framing	Standalone Capable
A -- In-Place Downblending	142 days (full stockpile)	Iran domestic politics preclude transfer; US accepts chemical neutralization	"We watched them destroy it in real time"	"We did it ourselves, under our own cameras"	Yes -- full Annex or Track 1 only
B -- Export to Oman	14 days (custody transfer)	Rapid removal priority; Iran accepts neutral IAEA custody	"Weapons-grade material removed from Iranian territory"	"Sovereign asset in IAEA trust, not surrendered"	Yes -- Track 1 trigger upon Custody Transfer Certificate
C -- Kazakhstan LEU Bank	75-105 days	Maximum physical separation; future fuel supply needs	"Material in IAEA fuel bank, permanently civilian"	"Our material fuels the global civilian nuclear market"	Yes -- upon LEU Bank Receipt Certificate
D -- Russian Custody	60-90 days	Leverages Rosatom expertise; rapid processing	"Russia's proven downblending infrastructure neutralized Iran's stockpile"	"Technical partnership with Rosatom for civilian fuel"	Yes -- upon Rosatom Receipt Certificate
E -- Bushehr Fuel	90-180 days	Economic value maximization; reactor fuel integration	"Threat neutralized, energy produced"	"Our scientists turned weapons material into power"	Yes -- upon Fuel Cycle Integration Certificate

F -- Hybrid Modular	Variable (parallel)	Cannot agree on single Pathway; want redundancy	"Multiple independent verification streams"	"We chose a combination that serves both our interests"	Yes -- each sub-pathway independently
---------------------	---------------------	---	---	---	---------------------------------------

Pathway Switching Protocol:

1. Either Party may propose a Pathway switch at any JIG Nuclear Technical Committee meeting by submitting a written Modification Request with technical justification.
2. The Committee convenes within 5 business days to review the request and hear technical presentations from the IAEA and both Parties.
3. The Committee votes within 3 business days. Approval requires technical consensus (unanimity of US, Iran, and IAEA technical representatives).
4. Upon approval, the JIG issues a Modular Pathway Switch Certificate. All HEU processed under the previous Pathway is fully credited.
5. The new Pathway commences within 5 business days of Switch Certificate issuance. Timeline obligations are adjusted proportionally.
6. Verification documentation transfers seamlessly between Pathways. The IAEA maintains continuous chain-of-custody throughout the switch.

Hybrid Default Configuration: If the Parties cannot agree on a single Pathway by Day 44 of the Deferred Window, the default configuration is Pathway F with: Batch 1 (Esfahan stockpile, ~220 kg) -- Pathway A (In-Place Downblending); Batch 2 (remaining material, ~220-280 kg) -- Pathway B (Export to Oman). This default ensures parallel progress with maximum redundancy.

**APPENDIX VI -- DOMESTIC NARRATIVE
GUIDANCE: US AND IRANIAN APPROVED
FRAMING**

US Administration Approved Framing (Modular Pathway-Dependent):

Element	Framing
Modular Architecture	"We built a system where Iran can never selectively accept benefits without delivering verified compliance. Every module is independently enforced."

HEU Disposition		"Iran's weapons-grade uranium is being neutralized through [Pathway name] under IAEA cameras. We are watching it happen."
PRDD Snap Line		"If Iran cheats at 9:00 AM, their oil money is frozen by 9:00 AM on the third day -- automatically."
15-Day Cycle	Micro-	"Iran earns each tranche with a specific, verified nuclear action -- no exceptions. Every 15 days, another checkpoint."
Fordow Conversion		"Fordow -- the secret enrichment bunker -- is now becoming a cancer medicine factory."
Moratorium Extension		"If Iran violates, they automatically make the deal longer. We built deterrence directly into the structure."
Modular Flexibility		"If one part of the deal hits a snag, the rest keeps going. No more total collapse like the JCPOA."

Iranian Government Approved Framing:

Element		Framing
Modular Architecture		"We negotiated a system where each commitment is matched by a corresponding benefit. Neither side moves alone."
HEU Disposition		"We chose [Pathway name] from multiple options. We did not hand anything to the Americans. We processed our own material under our own scientists."
Pathway B (if selected)		"Our sovereign asset is held in trust under IAEA international supervision in Oman -- not surrendered to any single power."
Fordow		"We converted Fordow into the International Medical Isotope Research Center -- a globally recognized center of nuclear medicine."
Natanz		"Our enrichment right under the NPT is fully preserved. Natanz enriches at 3.67% -- the level our civilian power program requires."
Sanctions Relief		"The sanctions relief schedule is precise, contractual, and legally binding. No more arbitrary US policy shifts."
Modular Independence		"If one element encounters difficulty, the rest continues. This protects Iran's economic interests."

Approved Framing: Red Lines NOT to Cross:

US Negotiators: Do NOT claim that Iran has 'dismantled' its enrichment program -- Iran retains enrichment at 3.67% at Natanz. Do NOT claim that Iran 'surrendered' its uranium -- it was processed through Iran's selected Modular Pathway under Iranian sovereignty. Do NOT claim the moratorium is permanent -- it is 12 years with extension mechanism. Do NOT claim that any Modular Pathway was 'imposed' -- each was selected by mutual consent.

Iranian Negotiators: Do NOT claim that IAEA monitoring has been limited or removed -- enhanced verification continues throughout. Do NOT claim that Fordow remains a nuclear facility -- it is permanently converted. Do NOT claim that the HEU stockpile is preserved -- it is being neutralized through the selected Modular Pathway.

APPENDIX VII -- CROSS-REFERENCES TO ENHANCED ACCORD, MARITIME ANNEX, AND RCSA V3.0

This Annex draws upon and should be read in conjunction with the following provisions of the Stability First instrument family:

This Annex Reference	Related Instrument	Provision	Relationship
PRDD Snap Line (Art. VI.4)	14-Day Implementation Directive v2.4	Article 6.1 -- PRDD Nuclear Snap Line	This Annex operationalizes and extends the Snap Line architecture with modular scope
Four-Track Economic System (Art. IV)	14-Day Implementation Directive v2.4	Section 2 -- 4-Track Economic System	This Annex implements Tracks 1-4 in modular Phase II context
Modular Pathway Menu (Art. III.2)	Stability Enhanced v1.0	First Accord Section 7 -- Modular Nuclear Solutions	This Annex operationalizes the six Modular Pathways
IMIRC Conversion (Art. III.4)	RCSA v3.0	Annex A.3 -- Fordow IMIRC Conversion Specifications	Full specification incorporated by reference

Verification Architecture (Art. III.6)	RCSA v3.0	Annex A.2 -- Verification Architecture	Foundation Track specifications apply; enhanced for Phase II with modular-specific protocols
Moratorium Instrument (App. I)	RCSA v3.0	Annex A, Pathway B -- Moratorium Template	12-year adaptation with Modular Pathway compatibility
Centrifuge Controls (Art. III.3)	RCSA v3.0	Annex A.4 -- Centrifuge Controls	Full specification incorporated by reference
Enrichment Cap (Art. III.3)	RCSA v3.0	Annex A.7 -- Dynamic Enrichment Cap	Foundation Track 3.67% cap applies throughout Moratorium
Modular Architecture Clause	RCSA v3.0	Section 2.3 -- Modular Design	This Annex fully implements the modular principle with specific pathway menu and hold mechanisms
Swiss Escrow / NACA (Art. IV.5)	RCSA v3.0	Annex B.2 -- NACA Specifications	NACA standard applies to PRDD escrow agent selection; modular sub-accounts added
JIG Governance (Art. VII)	Enhanced Accord v1.0	Article 7 -- Governance Architecture	This Annex creates modular JIG sub- committees with independent authority
Crisis Lock (Art. IX.2)	RCSA v3.0	Annex C.4 -- Crisis Management Protocol	Modular Crisis Lock applies per-module rather than Annex-wide
Narrative Integrity (App. VI)	RCSA v3.0	Tier 1, Chapter 7 -- Narrative Integrity Principles	Approved framing follows RCSA guidelines with modular-specific messaging

CONCLUSION AND CERTIFICATION

This Annex -- the Stability First Phase II Nuclear Annex v1.2 -- constitutes a **modular and adaptable diplomatic architecture** comprising Annex A (Nuclear Stabilization) and Annex B (Sequenced Sanctions Relief). It supersedes and replaces the Phase II Integrated Annex v1.0 and is intended to be executed simultaneously with or immediately following the Enhanced Accord's entry into force.

The Annex is designed to resolve every identified deadlock point in the US-Iran nuclear and sanctions negotiations as of May 2026 through the following modular innovations:

- 1. The HEU Disposition Deadlock** -- resolved through the Modular Pathway Menu (six selectable, standalone-capable pathways including in-place downblending, Oman export, Kazakhstan LEU Bank, Russian custody, Bushehr fuel conversion, and hybrid combinations);
- 2. The Enrichment Moratorium Duration Gap** -- bridged at 12 years with automatic extension, with the moratorium itself operable as a standalone commitment;
- 3. The HEU Transfer Red Line** -- addressed through sovereign-selected pathways including in-place processing under IAEA cameras and IAEA-rather-than-state custody for export options;
- 4. The Sanctions Process Clarity Demand** -- satisfied through the 15-day micro-cycle architecture with independently triggered tranches for each cycle;
- 5. The All-or-Nothing Structural Failure** -- eliminated through the Modular Architecture Clause, Modular Hold mechanism, and standalone agreement provisions that ensure no single dispute collapses the entire framework;
- 6. The Verification Trust Deficit** -- closed through pathway-specific verification architectures, dual-key monitoring, and the Modular Pathway Transparency Portal (Upgrade 20).

The Three-Facility Framework -- Esfahan (modular disposition hub), Fordow (convert), Natanz/Pickaxe Mountain (cap and lock) -- directly neutralizes the Trump Administration's three identified military triggers, removes the justification for a US Special Forces ground raid, eliminates the imperative for a preemptive strike on Pickaxe Mountain, and converts a damaged enrichment bunker into a globally beneficial nuclear medicine center.

This is the architecture that makes peace durable: not because the Parties trust each other, but because neither Party is ever required to rely on trust. Every obligation is verified. Every verification is immediate. Every module is independent. Every violation triggers an automatic, module-scoped consequence. And every consequence is proportionate, non-escalatory, and calibrated to extend rather than collapse the framework.
